

RTI Connex Modern C++ API

Generated by Doxygen 1.9.3

1 RTI Connex	1
1.1 Getting Started	1
1.2 Available Documentation.	2
1.2.1 The documents for the Core Libraries and Utilities are:	2
1.2.2 The API Reference HTML documentation contains:	2
1.3 Feedback and Support for this Release.	2
2 Module Index	3
2.1 Modules	3
3 Namespace Index	7
3.1 Namespace List	7
4 Hierarchical Index	9
4.1 Class Hierarchy	9
5 Class Index	21
5.1 Class List	21
6 Module Documentation	41
6.1 Clock Selection	41
6.1.1 Available Clocks	41
6.1.2 Clock Selection Strategy	42
6.1.3 Configuring Clock Selection	42
6.2 Domain Module	42
6.2.1 Detailed Description	43
6.3 DomainParticipants	43
6.3.1 Detailed Description	43
6.4 Built-in Topics	44
6.4.1 Detailed Description	44
6.5 Topic Module	46
6.5.1 Detailed Description	47
6.6 Topics	47
6.6.1 Detailed Description	48
6.6.2 Function Documentation	48
6.6.2.1 sql_filter_name()	48
6.6.2.2 stringmatch_filter_name()	49
6.7 Zero Copy Transfer Over Shared Memory	49
6.8 Built-in Types	49
6.8.1 Detailed Description	50
6.8.2 Managing Memory for Builtin Types	50

6.8.3	Typecodes for Builtin Types	51
6.9	Built-in Topic's Trust Types	53
6.9.1	Detailed Description	53
6.10	Publication Module	54
6.10.1	Detailed Description	54
6.11	Publishers	54
6.11.1	Detailed Description	55
6.12	Data Writers	55
6.12.1	Detailed Description	56
6.13	Flow Controllers	56
6.13.1	Detailed Description	57
6.13.2	Typedef Documentation	57
6.13.2.1	FlowControllerSchedulingPolicy	57
6.13.3	Variable Documentation	57
6.13.3.1	DEFAULT_NAME	57
6.13.3.2	FIXED_RATE_NAME	58
6.13.3.3	ON_DEMAND_NAME	59
6.14	Subscription Module	60
6.14.1	Detailed Description	61
6.14.2	Access to data samples	61
6.14.2.1	Data access patterns	61
6.15	Subscribers	62
6.15.1	Detailed Description	62
6.16	DataReaders	62
6.16.1	Detailed Description	63
6.17	Read Conditions	64
6.17.1	Detailed Description	64
6.18	Query Conditions	64
6.18.1	Detailed Description	64
6.18.2	Function Documentation	65
6.18.2.1	create_query_condition_ex() [1/2]	65
6.18.2.2	create_query_condition_ex() [2/2]	65
6.19	Data Samples	65
6.19.1	Detailed Description	66
6.20	Topic Queries	66
6.20.1	Detailed Description	67
6.20.2	Debugging Topic Queries	68
6.20.2.1	The Built-in ServiceRequest DataReader	68
6.20.2.2	The on_service_request_accepted DataWriter Listener Callback	68

6.20.2.3 Reading TopicQuery Samples	69
6.20.3 Typedef Documentation	69
6.20.3.1 TopicQuerySelectionKind	69
6.21 Sample Information	69
6.21.1 Detailed Description	69
6.22 Data State	69
6.22.1 Detailed Description	70
6.23 Infrastructure Module	70
6.23.1 Detailed Description	71
6.24 Multi-channel DataWriters	71
6.24.1 What is a Multi-channel DataWriter?	71
6.24.2 Configuration on the Writer Side	72
6.24.3 Configuration on the Reader Side	72
6.24.4 Reliability with Multi-Channel DataWriters	72
6.24.4.1 Reliable Delivery	72
6.24.4.2 Reliable Protocol Considerations	72
6.25 Transports	73
6.25.1 Detailed Description	73
6.25.2 Overview	73
6.25.3 Transport Aliases	74
6.25.4 Transport Lifecycle	74
6.25.5 Transport Class Attributes	75
6.25.6 Transport Instance Attributes	76
6.25.7 Transport Network Address	77
6.25.8 Transport Send Route	77
6.25.9 Transport Receive Route	77
6.26 Installing Transport Plugins	78
6.26.1 Loading Transport Plugins through Property QoS Policy of Domain Participant	79
6.27 Built-in Transport Plugins	81
6.27.1 Detailed Description	81
6.28 Creating New Transport Plugins	82
6.29 Queries and Filters Syntax	82
6.29.1 Syntax for DDS Queries and Filters	82
6.29.2 SQL grammar in BNF	83
6.29.3 Token expression	83
6.29.4 String Parameters	86
6.29.5 Type compatability in Predicate	86
6.29.6 SQL Extension: Regular Expression Matching	86
6.29.7 Character Encoding	87

6.29.8 Unicode Normalization	87
6.29.9 Examples	88
6.30 Logging and Version	88
6.30.1 Detailed Description	89
6.31 General Utilities and Compliance Configuration	89
6.31.1 Detailed Description	89
6.32 Observability	89
6.32.1 Detailed Description	89
6.33 Request-Reply Pattern	90
6.33.1 Detailed Description	90
6.34 Requester	90
6.34.1 Detailed Description	91
6.35 Replier	91
6.35.1 Detailed Description	91
6.36 Queuing Pattern	91
6.36.1 Detailed Description	92
6.37 QueueProducer	93
6.37.1 Detailed Description	93
6.38 QueueConsumer	93
6.38.1 Detailed Description	94
6.39 QueueRequester	94
6.39.1 Detailed Description	94
6.40 QueueReplier	94
6.40.1 Detailed Description	95
6.41 Remote Procedure Call	95
6.41.1 Detailed Description	96
6.42 Utilities	97
6.43 Durability and Persistence	97
6.43.1 Durable Writer History	97
6.43.2 Durable Reader State	98
6.43.3 Data Durability	98
6.43.4 Durability and Persistence Based on Virtual GUID	98
6.43.5 Configuring Durable Writer History	99
6.43.6 Configuring Durable Reader State	101
6.43.7 Configuring Data Durability	102
6.44 System Properties	102
6.44.1 System Properties List	102
6.44.2 System Resource Consideration	103
6.45 Configuring QoS Profiles with XML	103

6.45.1 Detailed Description	103
6.45.2 Loading QoS Profiles from XML Resources	104
6.45.3 URL	105
6.45.3.1 URL groups	105
6.45.3.2 NDDS_QOS_PROFILES environment variable	106
6.45.3.3 Built-In QoS Profiles	106
6.46 Publication Example	106
6.46.1 A typical publication example	106
6.47 Subscription Example	107
6.47.1 A typical subscription example	107
6.48 Participant Use Cases	107
6.48.1 Turning off auto-enable of newly created participant(s)	108
6.48.2 Setting up a DomainParticipant	108
6.48.3 Looking up DomainParticipants	108
6.48.4 Tearing down a Participant	109
6.48.5 Finalizing the factory	109
6.49 Topic Use Cases	109
6.49.1 Registering a user data type	109
6.49.2 Setting up a Topic	109
6.49.3 Discovering Topics	110
6.49.4 Tearing down a topic	111
6.50 Publisher Use Cases	111
6.50.1 Setting up a publisher	111
6.50.2 Looking up Publishers	112
6.50.3 Tearing down a publisher	112
6.51 DataWriter Use Cases	112
6.51.1 Setting up a DataWriter	112
6.51.2 Managing instances	113
6.51.3 Sending data	114
6.51.4 DataWriter Listeners	114
6.51.5 Looking up DataWriters	115
6.51.6 Getting Matched Subscriptions	116
6.51.7 Tearing down a DataWriter	116
6.52 Subscriber Use Cases	116
6.52.1 Setting up a subscriber	117
6.52.2 Looking up Subscribers	117
6.52.3 Tearing down a subscriber	117
6.53 DataReader Use Cases	118
6.53.1 Setting up a DataReader	118

6.53.2	Managing instances	118
6.53.3	Set up a DataReader to access received data	119
6.53.4	Accessing Received Data	119
6.53.4.1	Reading data samples	119
6.53.4.2	Selecting what samples to read	120
6.53.4.3	Reading samples using coherent access	121
6.53.5	DataReader Listeners	122
6.53.6	Looking up DataReaders	123
6.53.7	Getting Matched Publications	124
6.53.8	Accessing the Built-in Subscriber and DataReaders	125
6.53.9	Using untyped DataReaders	125
6.53.10	Tearing down a DataReader	126
6.54	Entity Use Cases	126
6.54.1	Changing the QoS for an entity	126
6.54.2	Changing the listener and enabling/disabling statuses associated with it	127
6.54.3	Enabling/Disabling statuses associated with a status condition	128
6.54.4	Ignoring Entities	129
6.54.5	Tearing Down An Entity	129
6.55	Waitset Use Cases	131
6.55.1	Setting up a WaitSet	131
6.55.2	Waiting for Condition(s) to trigger	131
6.56	Filter Use Cases	132
6.56.1	Introduction	132
6.56.2	Code Examples	133
6.56.3	Filtering with ContentFilteredTopic	133
6.56.4	Filtering with Query Conditions	133
6.56.5	Filtering Performance	134
6.57	Creating Custom Content Filters	134
6.57.1	Introduction	134
6.57.2	The Custom Content Filter API	135
6.57.2.1	The compile function	135
6.57.2.2	The evaluate function	136
6.57.2.3	The finalize function	136
6.57.2.4	The writer_attach function	136
6.57.2.5	The writer_compile function	136
6.57.2.6	The writer_evaluate function	136
6.57.2.7	The writer_detach function	136
6.57.2.8	The writer_return_loan function	136
6.57.2.9	The writer_finalize function	137

6.57.3 Example Custom Writer Content Filter	137
6.57.3.1 Writing the Compile Function	138
6.57.3.2 Writing the Evaluate Function	138
6.57.3.3 Writing the Finalize Function	139
6.57.3.4 Writing the Writer Attach Function	139
6.57.3.5 Writing the Writer Compile Function	139
6.57.3.6 Writing the Writer Evaluate Function	140
6.57.3.7 Writing the Writer Detach Function	140
6.57.3.8 Writing the Writer Return Loan Function	140
6.57.3.9 Writing the Writer Finalize Function	140
6.57.3.10 Creating a CustomFilter	141
6.57.3.11 Registering the Filter	141
6.57.3.12 Unregistering the Filter	141
6.57.3.13 Using a CustomFilter	141
6.57.3.14 Looking up the Filter	142
6.58 XML Application Creation	143
6.58.1 Introduction 	143
6.58.2 Setting up this Example	144
6.58.2.1 Using XML Application Creation	144
6.59 Request-Reply Examples	145
6.59.1 Request-Reply Examples	145
6.59.2 Requester Creation	146
6.59.3 Creating a Requester with optional parameters	146
6.59.4 Basic Requester example	147
6.59.5 Correlating requests and replies	147
6.59.6 Creating a Replier	148
6.59.7 Basic Replier example	149
6.59.8 SimpleReplier example	149
6.59.9 Configuring Request-Reply QoS profiles	149
6.60 Documentation Roadmap	151
6.61 Conventions	152
6.61.1 Type system	152
6.61.1.1 Value types	152
6.61.1.2 Reference types	153
6.61.1.3 Move-only types	155
6.61.2 C++11 Support	155
6.61.3 Exceptions in the API	155
6.61.4 Extensions to the standard API	156
6.61.5 Experimental	157

6.61.6 Method Parameters	157
6.62 Namespaces and headers	157
6.62.1 Header Files	157
6.62.2 Namespaces	158
6.63 RTI Connex DDS API Reference	159
6.63.1 Detailed Description	160
6.63.2 Overview	161
6.63.3 Conceptual Model	161
6.63.4 Modules	163
6.64 Additional RTI Connex Communication Patterns	163
6.64.1 Detailed Description	164
6.65 Programming How-To's	164
6.65.1 Detailed Description	165
6.66 Interface	165
6.66.1 Detailed Description	165
6.66.2 Enumeration Type Documentation	166
6.66.2.1 NDDS_Transport_Interface_Status_t	166
6.67 Transport Plugins Configuration	166
6.67.1 Detailed Description	168
6.67.2 Macro Definition Documentation	168
6.67.2.1 NDDS_TRANSPORT_PORT_INVALID	168
6.67.2.2 NDDS_TRANSPORT_UUID_SIZE	168
6.67.2.3 NDDS_TRANSPORT_LENGTH_UNLIMITED	168
6.67.2.4 NDDS_TRANSPORT_INTERFACE_RANK_UNKNOWN	168
6.67.2.5 NDDS_TRANSPORT_UUID_UNKNOWN	169
6.67.2.6 NDDS_TRANSPORT_ALLOCATION_SETTINGS_MAX_COUNT_UNLIMITED	169
6.67.2.7 NDDS_TRANSPORT_ALLOCATION_SETTINGS_INCREMENTAL_COUNT_AUTOMATIC	169
6.67.2.8 NDDS_TRANSPORT_ALLOCATION_SETTINGS_DEFAULT	169
6.67.2.9 NDDS_TRANSPORT_CLASSID_INVALID	170
6.67.2.10 NDDS_TRANSPORT_CLASSID_UDPv4	170
6.67.2.11 NDDS_TRANSPORT_CLASSID_SHMEM	170
6.67.2.12 NDDS_TRANSPORT_CLASSID_SHMEM_510	170
6.67.2.13 NDDS_TRANSPORT_CLASSID_UDPv6	170
6.67.2.14 NDDS_TRANSPORT_CLASSID_UDPv6_510	170
6.67.2.15 NDDS_TRANSPORT_CLASSID_TCPV4_LAN	171
6.67.2.16 NDDS_TRANSPORT_CLASSID_TCPV4_WAN	171
6.67.2.17 NDDS_TRANSPORT_CLASSNAME_TCPV4_WAN	171
6.67.2.18 NDDS_TRANSPORT_CLASSID_TLSV4_LAN	171
6.67.2.19 NDDS_TRANSPORT_CLASSID_TLSV4_WAN	171

6.67.2.20	NDDS_TRANSPORT_CLASSID_UDPv4_WAN	171
6.67.2.21	NDDS_TRANSPORT_CLASSID_RESERVED_RANGE	172
6.67.2.22	NDDS_TRANSPORT_PROPERTY_BIT_BUFFER_ALWAYS_LOANED	172
6.67.2.23	NDDS_TRANSPORT_PROPERTY_GATHER_SEND_BUFFER_COUNT_MIN	172
6.67.3	Typedef Documentation	172
6.67.3.1	NDDS_Transport_Port_t	172
6.67.3.2	NDDS_Transport_ClassId_t	173
6.68	Transport Address	173
6.68.1	Detailed Description	174
6.68.2	Macro Definition Documentation	174
6.68.2.1	NDDS_TRANSPORT_ADDRESS_INVALID_INITIALIZER	175
6.68.2.2	NDDS_TRANSPORT_ADDRESS_STRING_BUFFER_SIZE	175
6.68.3	Function Documentation	175
6.68.3.1	NDDS_Transport_Address_to_string()	175
6.68.3.2	NDDS_Transport_Address_to_string_with_protocol_family_format()	176
6.68.3.3	NDDS_Transport_Address_from_string()	176
6.68.3.4	NDDS_Transport_Address_print()	177
6.68.3.5	NDDS_Transport_Address_is_ipv4()	177
6.68.3.6	NDDS_Transport_Address_is_multicast()	178
6.68.4	Variable Documentation	178
6.68.4.1	NDDS_TRANSPORT_ADDRESS_INVALID	178
6.69	UDP Transport Plugin definitions	178
6.69.1	Detailed Description	179
6.69.2	Macro Definition Documentation	179
6.69.2.1	NDDS_TRANSPORT_UDP_PROPERTIES_BITMAP_DEFAULT	179
6.69.2.2	NDDS_TRANSPORT_UDP_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT	179
6.69.2.3	NDDS_TRANSPORT_UDP_SOCKET_BUFFER_SIZE_OS_DEFAULT	180
6.69.2.4	NDDS_TRANSPORT_UDP_SEND_SOCKET_BUFFER_SIZE_DEFAULT	180
6.69.2.5	NDDS_TRANSPORT_UDP_RECV_SOCKET_BUFFER_SIZE_DEFAULT	180
6.69.2.6	NDDS_TRANSPORT_UDP_MULTICAST_TTL_DEFAULT	180
6.69.3	Typedef Documentation	180
6.69.3.1	NDDS_Transport_UDP_Port	180
6.70	Shared Memory Transport	180
6.70.1	Detailed Description	181
6.70.2	Compatibility of Sender and Receiver Transports	182
6.70.3	Crashing and Restarting Programs	182
6.70.4	Shared Resource Keys	182
6.70.5	Creating and Registering Shared Memory Transport Plugin	183
6.70.6	Shared Memory Transport Property Names in Property QoS Policy of Domain Participant	183

6.70.7 Macro Definition Documentation	184
6.70.7.1 NDDS_TRANSPORT_SHMEM_ADDRESS_BIT_COUNT	184
6.70.7.2 NDDS_TRANSPORT_SHMEM_PROPERTIES_BITMAP_DEFAULT	184
6.70.7.3 NDDS_TRANSPORT_SHMEM_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT	185
6.70.7.4 NDDS_TRANSPORT_SHMEM_MESSAGE_SIZE_MAX_DEFAULT	185
6.70.7.5 NDDS_TRANSPORT_SHMEM_RECEIVED_MESSAGE_COUNT_MAX_DEFAULT	185
6.70.7.6 NDDS_TRANSPORT_SHMEM_RECEIVE_BUFFER_SIZE_DEFAULT	185
6.70.7.7 NDDS_TRANSPORT_SHMEM_MAJOR_AFTER_BUG_14240_FIX	185
6.70.7.8 NDDS_TRANSPORT_SHMEM_PROPERTY_DEFAULT	186
6.70.8 Function Documentation	186
6.70.8.1 NDDS_Transport_Shmem_new()	186
6.71 UDPv4 Transport	186
6.71.1 Detailed Description	188
6.71.2 UDPv4 Transport Property Names in Property QoS Policy of Domain Participant	188
6.71.3 Macro Definition Documentation	190
6.71.3.1 NDDS_TRANSPORT_UDPv4_ADDRESS_BIT_COUNT	190
6.71.3.2 NDDS_TRANSPORT_UDPv4_WAN_ADDRESS_BIT_COUNT	191
6.71.3.3 NDDS_TRANSPORT_UDPv4_PROPERTIES_BITMAP_DEFAULT	191
6.71.3.4 NDDS_TRANSPORT_UDPv4_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT	191
6.71.3.5 NDDS_TRANSPORT_UDPv4_SOCKET_BUFFER_SIZE_OS_DEFAULT	191
6.71.3.6 NDDS_TRANSPORT_UDPv4_SEND_SOCKET_BUFFER_SIZE_DEFAULT	191
6.71.3.7 NDDS_TRANSPORT_UDPv4_RECV_SOCKET_BUFFER_SIZE_DEFAULT	192
6.71.3.8 NDDS_TRANSPORT_UDPv4_PAYLOAD_SIZE_MAX	192
6.71.3.9 NDDS_TRANSPORT_UDPv4_MESSAGE_SIZE_MAX_DEFAULT	192
6.71.3.10 NDDS_TRANSPORT_UDPv4_MULTICAST_TTL_DEFAULT	192
6.71.3.11 NDDS_TRANSPORT_UDPv4_BLOCKING_NEVER	192
6.71.3.12 NDDS_TRANSPORT_UDPv4_BLOCKING_ALWAYS	193
6.71.3.13 NDDS_TRANSPORT_UDPv4_BLOCKING_DEFAULT	193
6.71.3.14 NDDS_TRANSPORT_UDPv4_PROPERTY_DEFAULT	193
6.71.3.15 NDDS_Transport_UDPv4_string_to_address_cEA	193
6.71.4 Function Documentation	194
6.71.4.1 NDDS_Transport_UDPv4_new()	194
6.72 Real-Time WAN Transport	195
6.72.1 Detailed Description	195
6.72.2 Real-Time WAN Transport Property	196
6.72.3 Macro Definition Documentation	198
6.72.3.1 NDDS_TRANSPORT_UDPv4_WAN_PROPERTY_DEFAULT	198
6.72.4 Function Documentation	198
6.72.4.1 NDDS_Transport_UDPv4_WAN_new()	199

6.73	UDPv6 Transport	199
6.73.1	Detailed Description	201
6.73.2	UDPv6 Transport Property Names in Property QoS Policy of Domain Participant	201
6.73.3	Macro Definition Documentation	203
6.73.3.1	NDDS_TRANSPORT_UDPv6_ADDRESS_BIT_COUNT	203
6.73.3.2	NDDS_TRANSPORT_UDPv6_PROPERTIES_BITMAP_DEFAULT	204
6.73.3.3	NDDS_TRANSPORT_UDPv6_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT	204
6.73.3.4	NDDS_TRANSPORT_UDPv6_SOCKET_BUFFER_SIZE_OS_DEFAULT	204
6.73.3.5	NDDS_TRANSPORT_UDPv6_SEND_SOCKET_BUFFER_SIZE_DEFAULT	204
6.73.3.6	NDDS_TRANSPORT_UDPv6_RECV_SOCKET_BUFFER_SIZE_DEFAULT	204
6.73.3.7	NDDS_TRANSPORT_UDPv6_PAYLOAD_SIZE_MAX	205
6.73.3.8	NDDS_TRANSPORT_UDPv6_MESSAGE_SIZE_MAX_DEFAULT	205
6.73.3.9	NDDS_TRANSPORT_UDPv6_MULTICAST_TTL_DEFAULT	205
6.73.3.10	NDDS_TRANSPORT_UDPv6_BLOCKING_NEVER	205
6.73.3.11	NDDS_TRANSPORT_UDPv6_BLOCKING_ALWAYS	205
6.73.3.12	NDDS_TRANSPORT_UDPv6_PROPERTY_DEFAULT	205
6.73.3.13	NDDS_Transport_UDPv6_string_to_address_cEA	205
6.73.4	Function Documentation	206
6.73.4.1	NDDS_Transport_UDPv6_new()	206
6.74	Client-side API	207
6.74.1	Detailed Description	207
6.74.2	Typedef Documentation	207
6.74.2.1	RobotControlClientEndpoint	207
6.75	Server-side API	208
6.75.1	Detailed Description	208
6.75.2	Typedef Documentation	208
6.75.2.1	RobotControlService	208
6.75.2.2	ServiceParams	208
6.76	FlatData Builders	209
6.76.1	Detailed Description	209
6.76.2	Builder Error Management	210
6.76.3	Function Documentation	211
6.76.3.1	build_data()	211
6.76.3.2	discard_builder()	211
6.77	FlatData Samples	212
6.77.1	Detailed Description	212
6.77.2	Typedef Documentation	213
6.77.2.1	MyFlatFinal	213
6.77.2.2	MyFlatMutable	213

6.77.2.3 MyFlatUnion	214
6.78 FlatData Offsets	214
6.78.1 Detailed Description	215
6.78.2 Offset Error Management	216
6.78.3 Function Documentation	217
6.78.3.1 plain_cast() [1/2]	217
6.78.3.2 plain_cast() [2/2]	219
6.79 FlatData Topic-Types	219
6.79.1 Detailed Description	219
6.79.2 Publishing FlatData	220
6.79.3 Subscribing to FlatData	221
6.80 RPC Tutorial	221
6.80.1 Defining a service interface in IDL	222
6.80.2 Writing the Service application	222
6.80.3 Writing the Client application	224
6.80.4 Advanced interface definition	224
6.81 Conditions and WaitSets	226
6.81.1 Detailed Description	226
6.82 Time Support	227
6.82.1 Detailed Description	227
6.83 Exceptions	227
6.83.1 Detailed Description	228
6.83.2 Standard Exceptions	228
6.83.3 Catching exceptions	228
6.84 QoS Policy Traits	229
6.84.1 Detailed Description	229
6.85 Safe Enumeration	229
6.85.1 Detailed Description	229
6.86 Status Kinds	229
6.86.1 Detailed Description	231
6.86.2 Changes in Status	232
6.86.2.1 Changes in plain communication status	232
6.86.2.2 Changes in read communication status	232
6.87 Supporting Types and Constants	233
6.87.1 Detailed Description	235
6.87.2 Typedef Documentation	235
6.87.2.1 shared_ptr	235
6.87.2.2 string	235
6.87.2.3 wstring	235

6.87.2.4 ByteSeq	236
6.87.2.5 StringSeq	236
6.87.2.6 null_type	236
6.87.2.7 optional	236
6.87.2.8 sequence	236
6.87.2.9 bounded_sequence	237
6.87.2.10 string_view	237
6.87.2.11 wstring_view	237
6.87.3 Function Documentation	237
6.87.3.1 unregister_thread()	237
6.87.4 Variable Documentation	238
6.87.4.1 LENGTH_UNLIMITED	238
6.87.4.2 null	238
6.87.4.3 length_auto	238
6.87.4.4 qos_print_all	239
6.88 DynamicType and DynamicData	239
6.88.1 Detailed Description	240
6.88.2 Typedef Documentation	240
6.88.2.1 TypeKind	240
6.89 Participant Built-in Topics	241
6.89.1 Detailed Description	241
6.89.2 Function Documentation	241
6.89.2.1 participant_topic_name()	241
6.90 Topic Built-in Topics	241
6.90.1 Detailed Description	242
6.90.2 Function Documentation	242
6.90.2.1 topic_topic_name()	242
6.91 Publication Built-in Topics	242
6.91.1 Detailed Description	242
6.91.2 Function Documentation	243
6.91.2.1 publication_topic_name()	243
6.92 Subscription Built-in Topics	243
6.92.1 Detailed Description	243
6.92.2 Function Documentation	243
6.92.2.1 subscription_topic_name()	243
6.93 Topic traits and data-type support	244
6.93.1 Detailed Description	245
6.93.2 Typedef Documentation	245
6.93.2.1 PrintFormatKind	245

6.93.3 Function Documentation	245
6.93.3.1 to_string() [1/2]	245
6.93.3.2 to_string() [2/2]	246
6.93.3.3 from_string()	246
6.94 Activity Context	247
6.94.1 Detailed Description	247
6.94.2 Function Documentation	248
6.94.2.1 set_attribute_mask()	248
6.95 Compliance Configuration	248
6.95.1 Detailed Description	249
6.95.2 Function Documentation	249
6.95.2.1 get_xtypes_mask()	249
6.95.2.2 set_xtypes_mask()	250
6.95.2.3 load_compliance_masks()	250
6.96 Logging	251
6.96.1 Detailed Description	252
6.96.2 Typedef Documentation	252
6.96.2.1 LogLevel	252
6.96.2.2 Verbosity	253
6.96.2.3 LogCategory	253
6.96.2.4 PrintFormat	253
6.96.3 Enumeration Type Documentation	253
6.96.3.1 SyslogLevel	253
6.96.3.2 SyslogVerbosity	254
6.96.3.3 LogFacility	255

Chapter 1

RTI Connex

Core Libraries and Utilities

Real-Time Innovations, Inc.

RTI Connex is network middleware for real-time distributed applications. It provides the communications services that programmers need to distribute time-critical data between embedded and/or enterprise devices or nodes. RTI Connex uses the publish-subscribe communications model to make data distribution efficient and robust.

The RTI Connex Application Programming Interface (API) is based on the OMG's Data Distribution Service (DDS) specification, version 1.4. The most recent publication of this specification can be found in the `Catalog of OMG Specifications` under "Platform Categories".

This documentation is for the **RTI Connex Modern C++ API**, based on the ISO/IEC C++ 2003 Language DDS PSM (DDS-PSM-Cxx) specification, version 1.0. The `RTI Connex Traditional C++ API` is also available.

1.1 Getting Started

- Learn about the **conventions** (p. 152) used in the API (such as type semantics, C++11 support, use of standard and extension APIs...) and the **headers and namespaces** (p. 157)
- Look at the **programming tutorials** (p. 164). These are a good starting point: **Publication Example** (p. 106) and **Subscription Example** (p. 107).
- Browse the API reference: **RTI Connex DDS API Reference** (p. 159) and **Additional RTI Connex Communication Patterns** (p. 163).
- Browse, download, and build these RTI Community `code examples`.

1.2 Available Documentation.

The documentation for this release is provided in two forms: the API Reference HTML documentation and PDF documents. If you are new to RTI Connex, the **Documentation Roadmap** (p. 151) will provide direction on how to learn about this product.

1.2.1 The documents for the Core Libraries and Utilities are:

- **What 's New.** An overview of the new features in this release.
- **Release Notes.** System requirements, compatibility, what's fixed in this release, and known issues.
- **Platform Notes.** Specific details, such as compilation setting and libraries, related to building and using RTI Connex on the various supported platforms.
- **Getting Started Guide.** Core value and concepts behind the product, taking you step-by-step through the creation of a simple example application. Developers should read this document first.
- **Code Generator User's Manual.** Information about using rttidsgen to generate code from data types.
- **User's Manual.** Introduction to RTI Connex, product tour and conceptual presentation of the functionality of RTI Connex.
- **QoS Reference Guide.** A compact summary of supported Quality of Service (QoS) policies.
- **XML-Based Application Creation Getting Started Guide.** Details on how to use XML-↔ Based Application Creation.
- **Extensible Types Guide.** Additional information about extensible types.
- See more `documentation` on RTI Community.

1.2.2 The API Reference HTML documentation contains:

- **RTI Connex DDS API Reference** (p. 159) - The RTI Connex API reference.
- **Additional RTI Connex Communication Patterns** (p. 163) - RTI Connex APIs for additional communication patterns
- **Programming How-To's** (p. 164) - Describes and shows the common tasks done using the API.

The API Reference HTML documentation can be accessed through the tree view in the left frame of the web browser window. The bulk of the documentation is found under the entry labeled "Modules".

1.3 Feedback and Support for this Release.

We welcome any input on how to improve RTI Connex to suit your needs. If you have questions or comments about this release, please visit the RTI Customer Portal at <https://support.rti.com>.

The Customer Portal provides access to RTI software, documentation, and support. It also allows you to log support cases. Furthermore, the portal provides detailed solutions and a free public knowledge base. To access the software, documentation or log support cases, the RTI Customer Portal requires a username and password. You will receive this in the email confirming your purchase. If you do not have this email, please contact `license@rti.com`. Resetting your login password can be done directly at the RTI Customer Portal.

Chapter 3

Namespace Index

3.1 Namespace List

Here is a list of all documented namespaces with brief descriptions:

dds	The dds namespace. The dds namespace includes all of the standard types, classes, and functions	403
dds::all	<< <i>extension</i> >> (p. 156) A single namespace where all standard symbols are included	403
dds::core	The core namespace contains infrastructure types and functions	404
dds::core::cond	Contains the Condition (p. 729) classes	415
dds::core::policy	Contains the standard Qos policy classes	415
dds::core::status	Contains the Status and State classes	418
dds::core::xtypes	Contains the types and functions to support Extensible Types	419
dds::domain	The domain namespace contains types, classes, and functions related to DomainParticipants	422
dds::domain::qos	Contains DomainParticipantQos (p. 1136)	428
dds::pub	Contains the type and functions to support publishing topics	433
dds::pub::qos	Contains PublisherQos (p. 1733) and DataWriterQos (p. 994)	441
dds::sub	Contains the types and functions to support subscribing to topics	446
dds::sub::cond	Contains Conditions specific to DataReaders	468
dds::sub::qos	Contains DataReaderQos (p. 848) and SubscriberQos (p. 2129)	469
dds::sub::status	Contains DataState (p. 888)	474

dds::topic	Contains topic related classes and functions, the built-in topics and topic traits used by IDL-generated types	476
dds::topic::qos	Contains TopicQos (p. 2213)	483
rti	<< <i>extension</i> >> (p. 156) The namespace that contains the extension types and functions to the DDS standard	486
rti::all	<< <i>extension</i> >> (p. 156) A single namespace where all symbols are included	487
rti::config	<< <i>extension</i> >> (p. 156) Logging configuration and version information	487
rti::core	<< <i>extension</i> >> (p. 156) Extensions to dds::core (p. 404)	489
rti::core::builtin_profiles	<< <i>extension</i> >> (p. 156) Contains the names of the built-in profiles	499
rti::core::builtin_profiles::qos_lib	<< <i>extension</i> >> (p. 156) Contains the names of the built-in profiles in the regular (non-experimental) qos library	499
rti::core::builtin_profiles::qos_lib_exp	<< <i>extension</i> >> (p. 156) << <i>experimental</i> >> (p. 157) Contains the names of the built-in profiles in the experimental qos library	502
rti::core::builtin_profiles::qos_snippet_lib	<< <i>extension</i> >> (p. 156) Contains the names of the built-in QoS Snippets	503
rti::core::xtypes	<< <i>extension</i> >> (p. 156) Extensions to dds::core::xtypes (p. 419)	505
rti::domain	<< <i>extension</i> >> (p. 156) Extensions to dds::domain (p. 422)	514
rti::flat	<< <i>extension</i> >> (p. 156) Support for FlatData Topic-Types (p. 219)	522
rti::pub	<< <i>extension</i> >> (p. 156) Extensions to dds::pub (p. 433)	523
rti::sub	<< <i>extension</i> >> (p. 156) Extensions to dds::sub (p. 446)	538
rti::topic	<< <i>extension</i> >> (p. 156) Extensions to dds::topic (p. 476)	558
rti::util	<< <i>extension</i> >> (p. 156) Contains general-purpose utilities	564
rti::util::activation	<< <i>extension</i> >> (p. 156) Contains the necessary functions related to Activation	564
rti::util::discovery	<< <i>extension</i> >> (p. 156) Contains the functions to take discovery snapshot for DomainParticipant, DataWriter and DataReader entities	565
rti::util::function_history	<< <i>extension</i> >> (p. 156) Contains the functions to enable Function History feature	565
rti::util::heap_monitoring	<< <i>extension</i> >> (p. 156) Contains the functions to enable and use the heap-monitoring utility	566
rti::util::network_capture	<< <i>extension</i> >> (p. 156) Contains the functions to enable and use the Network Capture utility	566

Chapter 4

Hierarchical Index

4.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

rti::flat::AbstractBuilder	571
rti::flat::AbstractListBuilder< detail::DHeaderGenerator >	579
rti::flat::AbstractSequenceBuilder< detail::DHeaderGenerator >	582
rti::flat::FinalSequenceBuilder< ElementOffset >	1313

Chapter 5

Class Index

5.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

rti::flat::AbstractAlignedList < ElementOffset >	
Base class of Offsets to sequences and arrays of non-primitive members	569
rti::flat::AbstractBuilder	
Base class of all Builders (p. 209)	571
dds::core::xtypes::AbstractConstructedType < MemberType >	
The base class of types that have members and an extensibility kind	573
rti::flat::AbstractListBuilder < DHeaderGen >	
Base class of all array and sequence builders	579
rti::flat::AbstractPrimitiveList < T >	
Base class for Offsets to sequences and arrays of primitive types	580
rti::flat::AbstractSequenceBuilder < DHeaderGen >	
Base class of Builders for sequence members	582
rti::pub::AcknowledgmentInfo	
<< <i>extension</i> >> (p. 156) << <i>value-type</i> >> (p. 152) Information about an application- acknowledged sample	583
rti::core::policy::AcknowledgmentKind_def	
<< <i>extension</i> >> (p. 156) The enumeration for Reliability acknowledgment kinds	585
rti::sub::AckResponseData	
<< <i>extension</i> >> (p. 156) Data payload associated to an application-level acknowledgment	586
rti::flat::AggregationBuilder	
Base class of struct and union builders	588
dds::core::xtypes::AliasType	
<< <i>value-type</i> >> (p. 152) Represents and IDL <code>typedef</code>	589
rti::core::AllocationSettings	
<< <i>extension</i> >> (p. 156) Resource allocation settings	591
dds::core::AlreadyClosedError	
Indicates that an object has been closed	594
dds::sub::AnyDataReader	
<< <i>reference-type</i> >> (p. 153) This class provides an non-template holder for representing a DataReader (p. 756) of any type	595
dds::sub::AnyDataReaderListener	
The listener to notify status changes for a dds::sub::DataReader (p. 756) of a generic type	600

dds::pub::AnyDataWriter	
<< <i>reference-type</i> >> (p. 153) This class provides a non-template holder for representing a DataWriter (p. 908) of any type	603
dds::pub::AnyDataWriterListener	
The listener to notify status changes for a dds::pub::DataWriter (p. 908) of a generic type	608
dds::topic::AnyTopic	
<< <i>reference-type</i> >> (p. 153) This class provides a non-template holder for representing a Topic (p. 2178) of any type	612
dds::core::xtypes::ArrayType	
<< <i>value-type</i> >> (p. 152) Represents an IDL array type	616
rti::core::policy::AsynchronousPublisher	
<< <i>extension</i> >> (p. 156) Configures the mechanism to publish data using a separate thread	620
rti::core::cond::AsyncWaitSet	
<< <i>extension</i> >> (p. 156) Dispatches dds::core::cond::Condition (p. 729) objects using separate threads of execution. Unlike a normal dds::core::cond::WaitSet (p. 2318), which operates on the current thread, an AsyncWaitSet (p. 627) uses a thread pool	627
rti::core::cond::AsyncWaitSetCompletionToken	
Implementation of the completion token role element of the asynchronous completion token pattern that is part of the AsyncWaitSet (p. 627) behavior	640
rti::core::cond::AsyncWaitSetListener	
Listener (p. 1381) for receiving event notifications related to the thread pool of the AsyncWaitSet (p. 627)	643
rti::core::cond::AsyncWaitSetProperty	
Specifies the rti::core::cond::AsyncWaitSet (p. 627) behavior	644
rti::config::activity_context::AttributeKindMask	
The attributes used in the string representation of the Activity Context can be configured through this mask	649
rti::core::policy::Availability	
<< <i>extension</i> >> (p. 156) Configures data availability in the context of Collaborative DataWriters and Required Subscriptions	654
dds::core::basic_string< CharType, Allocator >	
<< <i>value-type</i> >> (p. 152) A string convertible to std::string and with similar functionality	660
rti::core::policy::Batch	
<< <i>extension</i> >> (p. 156) Allows a dds::pub::DataWriter (p. 908) to batch multiple samples into a single network packet to increase throughput	665
rti::core::bounded_sequence< T, MaxLength >	
<< <i>value-type</i> >> (p. 152) A bounded sequence of elements	671
dds::topic::BuiltinTopicKey	
The key of the built-in topics	690
rti::core::policy::BuiltinTopicReaderResourceLimits	
<< <i>extension</i> >> (p. 156) Configures several resource management aspects of the built-in topic DataReaders	691
dds::core::BytesTopicType	
Built-in type consisting of a variable-length array of opaque bytes	700
rti::core::policy::CdrPaddingKind_def	
<< <i>extension</i> >> (p. 156) The definition of the dds::core::safe_enum (p. 1972) CdrPaddingKind	703
rti::core::ChannelSettings	
<< <i>extension</i> >> (p. 156) Configures the properties of a channel in rti::core::policy::MultiChannel (p. 1483)	703
dds::rpc::ClientEndpoint< Request, Reply >	
<< <i>reference-type</i> >> (p. 153) Manages the DDS entities required to make remote function calls	707
dds::rpc::ClientParams	
<< <i>value-type</i> >> (p. 152) The parameters used to configure a ClientEndpoint (p. 707)	710

dds::sub::CoherentAccess	
<< <i>value-type</i> >> (p. 152) Controls whether RTI Connexx will preserve the groupings of changes made by the publishing application by means of <code>begin_coherent_changes</code> and <code>end_coherent_changes</code>	712
dds::pub::CoherentSet	
<< <i>value-type</i> >> (p. 152) A publishing application can request that a set of DDS data-sample changes be propagated in such a way that they are interpreted at the receivers' side as a cohesive set of modifications	714
rti::core::CoherentSetInfo	
<< <i>extension</i> >> (p. 156) << <i>value-type</i> >> (p. 152) A <code>CoherentSampleInfo</code> provides information about the coherent set associated with a sample	716
dds::core::xtypes::CollectionType	
<< <i>value-type</i> >> (p. 152) The base class of all collection types	721
rti::core::CompressionIdMask	
<< <i>extension</i> >> (p. 156) Mask that specifies which built-in compression method to used	722
rti::core::CompressionSettings	
<< <i>extension</i> >> (p. 156) Compression Settings	725
dds::core::cond::Condition	
<< <i>reference-type</i> >> (p. 153) Abstract base class of all the conditions	729
rti::queuing::ConsumerAvailabilityParams	
Definition of the availability feedback information that can be provided by consumers to Queuing Service	731
rti::topic::ContentFilter< T, CompileData >	
<< <i>extension</i> >> (p. 156) A class to inherit from when implementing a custom content filter	732
dds::topic::ContentFilteredTopic< T >	
<< <i>reference-type</i> >> (p. 153) Specialization of <code>TopicDescription</code> (p. 2207) that allows for content-based subscriptions	735
rti::core::ContentFilterProperty	
<< <i>extension</i> >> (p. 156) << <i>value-type</i> >> (p. 152) Provides all the required information to enable content filtering	741
rti::util::network_capture::ContentKindMask	
<< <i>extension</i> >> (p. 156) Mask indicating the types of contents to remove from RTPS frames before saving them to the capture file	743
rti::core::Cookie	
Unique identifier for a written data sample in the form of a sequence of bytes	746
rti::topic::CustomFilter< T >	
<< <i>extension</i> >> (p. 156) << <i>reference-type</i> >> (p. 153) A wrapper class for the user-defined implementation of a <code>ContentFilter</code> (p. 732)	749
rti::core::policy::Database	
<< <i>extension</i> >> (p. 156) Configures threads and resource limits that RTI Connexx uses to control its internal database	751
dds::sub::DataReader< T >	
<< <i>reference-type</i> >> (p. 153) Allows the application to: (1) declare the data it wishes to receive (i.e. make a subscription) and (2) access the data received by the attached <code>dds::sub::Subscriber</code> (p. 2116)	756
rti::core::status::DataReaderCacheStatus	
<< <i>extension</i> >> (p. 156) Information about the status <code>dds::core::status::StatusMask</code> << <code>datareader_cache()</code> (p. 2093)	823
rti::core::policy::DataReaderInstanceRemovalKind_def	
Sets the kinds of instances that can be replaced when instance resource limits (<code>dds::core::policy::ResourceLimits::max_instances</code> (p. 1924)) are reached	830
dds::sub::DataReaderListener< T >	
The <code>Listener</code> (p. 1381) to notify status changes for a <code>dds::sub::DataReader</code> (p. 756)	832

rti::core::policy::DataReaderProtocol	
<< <i>extension</i> >> (p. 156) Configures DataReader-specific aspects of the RTPS protocol	836
rti::core::status::DataReaderProtocolStatus	
<< <i>extension</i> >> (p. 156) Information about the status dds::core::status::StatusMask ←	
::datareader_protocol() (p. 2094)	841
dds::sub::qos::DataReaderQos	
<< <i>value-type</i> >> (p. 152) Container of the QoS policies that a dds::sub::DataReader (p. 756) supports	848
rti::core::policy::DataReaderResourceLimits	
<< <i>extension</i> >> (p. 156) Configures the memory usage of a dds::pub::DataReader	856
rti::core::DataReaderResourceLimitsInstanceReplacementSettings	
<< <i>extension</i> >> (p. 156) How instances are replaced in the DataReader queue when resource limits are reached	878
rti::sub::cond::DataReaderStatusConditionHandler< T >	
Realization of a functor handler (p. 1859) that handles the status of a dds::sub::DataReader (p. 756)	881
dds::core::policy::DataRepresentation	
Contains the data representations supported by entities	883
dds::sub::status::DataState	
Describes the state of a sample and includes the information about the sample's InstanceState (p. 1359), ViewState (p. 2315), and SampleState (p. 2023)	888
rti::sub::status::DataStateEx	
<< <i>extension</i> >> (p. 156) << <i>value-type</i> >> (p. 152) An extended version of dds::sub::status ←	
::DataState (p. 888) that also contains StreamKind (p. 2097)	896
dds::core::policy::DataTag	
Stores name-value (string) pairs that can be used to determine access permissions	902
dds::pub::DataWriter< T >	
<< <i>reference-type</i> >> (p. 153) Allows an application to publish data for a dds::topic::Topic (p. 2178)	908
rti::core::status::DataWriterCacheStatus	
<< <i>extension</i> >> (p. 156) Information about the status dds::core::status::StatusMask ←	
::datawriter_cache() (p. 2093)	969
dds::pub::DataWriterListener< T >	
The Listener (p. 1381) to notify status changes for a dds::pub::DataWriter (p. 908)	972
rti::core::policy::DataWriterProtocol	
<< <i>extension</i> >> (p. 156) Configures aspects of an the RTPS protocol related to a dds::pub:: ←	
DataWriter (p. 908)	979
rti::core::status::DataWriterProtocolStatus	
<< <i>extension</i> >> (p. 156) Information about the status dds::core::status::StatusMask ←	
::datawriter_protocol() (p. 2093)	986
dds::pub::qos::DataWriterQos	
<< <i>value-type</i> >> (p. 152) Container of the QoS policies that a dds::pub::DataWriter (p. 908) supports	994
rti::core::policy::DataWriterResourceLimits	
<< <i>extension</i> >> (p. 156) Configures the memory usage of a dds::pub::DataWriter (p. 908)	1002
rti::core::policy::DataWriterResourceLimitsInstanceReplacementKind_def	
<< <i>extension</i> >> (p. 156) The enumeration for DataWriter Resource Limits	1014
rti::core::DataWriterShmemRefTransferModeSettings	
<< <i>extension</i> >> (p. 156) Configures aspects of the shared memory reference transfer mode related to a DataWriter	1016
rti::core::policy::DataWriterTransferMode	
<< <i>extension</i> >> (p. 156) Configures the transfer mode of a dds::pub::DataWriter (p. 908)	1017
dds::core::policy::Deadline	
Expresses the maximum duration (deadline) within which an instance is expected to be updated . .	1020

dds::core::policy::DestinationOrder	Controls the logical order of updates to the same instance by a dds::pub::Publisher (p. 1719) . . .	1022
dds::core::policy::DestinationOrderKind_def	The definition of the dds::core::safe_enum (p. 1972) DestinationOrderKind	1027
rti::core::policy::DestinationOrderScopeKind_def	<<extension>> (p. 156) The definition of the dds::core::safe_enum (p. 1972) DestinationOrder← ScopeKind	1028
rti::core::policy::Discovery	<<extension>> (p. 156) Configures entity discovery	1029
rti::core::policy::DiscoveryConfig	<<extension>> (p. 156) Configures the discovery mechanism	1035
rti::core::policy::DiscoveryConfigBuiltinChannelKindMask	<<extension>> (p. 156) A mask that selects the built-in channels to be used	1073
rti::core::policy::DiscoveryConfigBuiltinPluginKindMask	<<extension>> (p. 156) A mask that selects the built-in discovery plugins to be used	1075
dds::domain::DomainParticipant	<<reference-type>> (p. 153) Container for all dds::core::Entity (p. 1265) objects . .	1079
rti::domain::DomainParticipantConfigParams	<<extension>> (p. 156) <<value-type>> (p. 152) Input paramaters for creating a participant from xml configuration. It allows modification of some of the properties of the entities defined in the configuration	1123
dds::domain::qos::DomainParticipantFactoryQos	<<value-type>> (p. 152) Container of the QoS policies that do not apply to a specific entity 1130	
dds::domain::DomainParticipantListener	The listener class for a DomainParticipant (p. 1079)	1134
rti::core::status::DomainParticipantProtocolStatus	1135
dds::domain::qos::DomainParticipantQos	<<value-type>> (p. 152) Container of the QoS policies that a dds::domain::DomainParticipant (p. 1079) supports	1136
rti::core::policy::DomainParticipantResourceLimits	<<extension>> (p. 156) Configures the memory usage of certain dds::domain::Domain← Participant (p. 1079) resources	1143
dds::core::policy::Durability	Specifies whether a dds::pub::DataWriter (p. 908) will store and deliver previously published data samples to late-joining dds::sub::DataReader (p. 756) entities	1181
dds::core::policy::DurabilityKind_def	The definition of the dds::core::safe_enum (p. 1972) DurabilityKind	1188
dds::core::policy::DurabilityService	Configures the external RTI Persistence Service used by persistent and transient DataWriters . . .	1190
dds::core::Duration	<<value-type>> (p. 152) Represents a time interval	1194
rti::topic::dynamic_type< TopicType >	Provides a DynamicType that represents an IDL-generated type	1208
dds::core::xtypes::DynamicData	<<value-type>> (p. 152) A data sample of any complex data type, which can be inspected and manipulated reflectively	1208
rti::core::xtypes::DynamicDataInfo	Contains information about a DynamicData sample	1239
rti::core::xtypes::DynamicDataMemberInfo	Contains information about a DynamicData member	1240
rti::core::xtypes::DynamicDataProperty	<<extension>> (p. 156) <<value-type>> (p. 152) Specifies the properties of a DynamicData object	1242

rti::core::xtypes::DynamicDataTypeSerializationProperty	
<< <i>extension</i> >> (p. 156) << <i>value-type</i> >> (p. 152) Configures aspects of the memory management in the serialization of dds::core::xtypes::DynamicData (p. 1208) samples	1245
dds::core::xtypes::DynamicType	
<< <i>value-type</i> >> (p. 152) Represents a runtime type	1249
rti::core::xtypes::DynamicTypePrintFormatProperty	
<< <i>extension</i> >> (p. 156) << <i>value-type</i> >> (p. 152) A collection of attributes used to configure how DynamicTypes will be formatted when converted to strings	1253
rti::core::EndpointGroup	
<< <i>extension</i> >> (p. 156) Specifies a group of endpoints that can be collectively identified by a name and satisfied by a quorum	1259
rti::topic::trust::EndpointTrustAlgorithmInfo	
<< <i>extension</i> >> (p. 156) << <i>value-type</i> >> (p. 152) Trust Plugins algorithm information associated with the discovered endpoint	1261
rti::topic::trust::EndpointTrustInterceptorAlgorithmInfo	
<< <i>extension</i> >> (p. 156) << <i>value-type</i> >> (p. 152) Trust Plugins interception algorithm information associated with the discovered endpoint	1262
rti::topic::trust::EndpointTrustProtectionInfo	
<< <i>extension</i> >> (p. 156) << <i>value-type</i> >> (p. 152) Trust Plugins Protection information associated with the discovered endpoint	1263
dds::core::Entity	
<< <i>reference-type</i> >> (p. 153) This is the abstract base class for all the DDS objects that support QoS policies, a listener and a status condition	1265
dds::core::policy::EntityFactory	
Configures a dds::core::Entity (p. 1265) that acts as factory of other entities	1272
rti::core::policy::EntityName	
<< <i>extension</i> >> (p. 156) Assigns a name to a DomainParticipant, Publisher, Subscriber, DataWriter or DataReader	1275
dds::core::xtypes::EnumMember	
<< <i>value-type</i> >> (p. 152) Represents a EnumType (p. 1280) member	1278
dds::core::xtypes::EnumType	
<< <i>value-type</i> >> (p. 152) Represents and IDL <code>enum</code> type	1280
rti::test::EnvVarToken	1284
dds::core::Error	
A generic, unspecified Error (p. 1284)	1284
rti::core::policy::Event	
<< <i>extension</i> >> (p. 156) Configures the thread in a DomainParticipant that handles timed events	1285
rti::core::status::EventCount< IntegerType >	
<< <i>extension</i> >> (p. 156) << <i>value-type</i> >> (p. 152) Encapsulates an event count containing a total count and an incremental count since the last time a status was read	1289
dds::core::Exception	
The abstract base class for all of the DDS exceptions which may be thrown by the API	1291
rti::topic::ExpressionProperty	
<< <i>extension</i> >> (p. 156) << <i>value-type</i> >> (p. 152) Provides additional information about the filter expression passed to the <code>writer_compile</code> method of rti::topic::WriterContentFilter (p. 2351)	1292
rti::topic::extensibility< TopicType >	
<< <i>extension</i> >> (p. 156) Indicates the extensibility kind of a topic-type	1295
dds::core::xtypes::ExtensibilityKind_def	
The definition of the dds::core::safe_enum (p. 1972) <code>ExtensibilityKind</code>	1295
dds::core::external< T >	
A managed reference to an object	1296
dds::topic::Filter	
Defines the filter to create a ContentFilteredTopic (p. 735)	1303

rti::topic::FilterSampleInfo	
<<extension>> (p. 156) <<value-type>> (p. 152) Provides meta information associated with the sample	1307
rti::flat::FinalAlignedArrayOffset< ElementOffset, N >	
Offset to an array of final elements	1309
rti::flat::FinalArrayOffset< ElementOffset, N >	
Offset to an array of final elements	1310
rti::flat::FinalOffset< T >	
The base class of all Offsets to a final struct type	1312
rti::flat::FinalSequenceBuilder< ElementOffset >	
Builds a sequence member of fixed-size elements	1313
rti::flat::flat_type_traits< T >	
Given a Sample (p. 1981), an Offset or a Builder , it allows obtaining the other types	1315
rti::pub::FlowController	
<<extension>> (p. 156) <<reference-type>> (p. 153) A flow controller is the object responsible for shaping the network traffic by determining when attached asynchronous dds::pub::DataWriter (p. 908) instances are allowed to write data	1316
rti::pub::FlowControllerProperty	
<<extension>> (p. 156) <<value-type>> (p. 152) Configures a FlowController (p. 1316)	1321
rti::pub::FlowControllerSchedulingPolicy_def	
<<extension>> (p. 156) Kinds of flow controller shceduling policy	1325
rti::pub::FlowControllerTokenBucketProperty	
<<extension>> (p. 156) <<value-type>> (p. 152) Configures a FlowController (p. 1316) based on a token-bucket mechanism	1327
Foo	
An example topic-type	1332
dds::sub::GenerationCount	
<<value-type>> (p. 152)	1333
dds::core::policy::GroupData	1335
dds::core::cond::GuardCondition	
<<reference-type>> (p. 153) A condition whose trigger value is under the control of the application	1338
rti::core::Guid	
<<extension>> (p. 156) <<value-type>> (p. 152) Class for GUID (Global Unique Identifier) representation	1340
rti::util::heap_monitoring::HeapMonitoringParams	
Input parameters for enabling heap monitoring. They will be used for configuring the format of the snapshot	1343
dds::core::policy::History	
Specifies how much historical data a dds::pub::DataWriter (p. 908) and a dds::sub::DataReader (p. 756) can store	1346
dds::core::policy::HistoryKind_def	
The definition of the dds::core::safe_enum (p. 1972) HistoryKind	1350
rti::core::policy::IgnoredEntityReplacementKind_def	
<<extension>> (p. 156) The enumeration for DomainParticipantResourceLimits (p. 1143) ignored entity replacement kinds	1351
dds::core::IllegalOperationError	
Indicates that an operation was called under improper circumstances	1352
dds::core::ImmutablePolicyError	
Indicates that the application attempted to modify an immutable QoS policy	1353
dds::core::InconsistentPolicyError	
Indicates that the application specified a set of QoS policies that are not consistent with each other	1354
dds::core::status::InconsistentTopicStatus	
Information about the status dds::core::status::StatusMask::inconsistent_topic() (p. 2086)	1355

dds::core::InstanceHandle	
<< <i>value-type</i> >> (p. 152) Handle to identify different instances of the same dds::topic::Topic (p. 2178) of a certain type	1356
dds::sub::status::InstanceState	
Indicates if the samples are from a live dds::pub::DataWriter (p. 908) or not	1359
dds::core::InvalidArgumentError	
Indicates that the application passed an illegal parameter value into an operation	1363
dds::core::InvalidDowncastError	
Indicates that a downcast was incorrect	1364
rti::core::status::InvalidLocalIdentityAdvanceNoticeStatus	
<< <i>extension</i> >> (p. 156) Information about the status dds::core::status::StatusMask::invalid ← _local_identity_advance_notice() (p. 2095)	1365
dds::topic::is_topic_type< T >	
Trait that indicates if a type is suitable to be the type of a dds::topic::Topic (p. 2178)	1365
rti::request::IsReplyRelatedPredicate< T >	
Functor to match replies by their related request	1366
rti::sub::IsValidData< T >	
<< <i>extension</i> >> (p. 156) A functor that returns true when a sample has valid data	1368
dds::core::KeyedBytesTopicType	
Built-in type consisting of a variable-length array of opaque bytes and a string that is the key	1369
dds::core::KeyedStringTopicType	
Built-in type consisting of a string payload and a second string that is the key	1373
dds::core::policy::LatencyBudget	
Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications	1375
rti::config::LibraryVersion	
<< <i>extension</i> >> (p. 156) << <i>value-type</i> >> (p. 152) The version of a single library shipped as part of an RTI Connext distribution	1377
dds::core::policy::Lifespan	
Specifies how long the data written by a dds::pub::DataWriter (p. 908) is considered valid	1379
Listener	
Entity listeners	1381
rti::core::ListenerBinder< Entity, Listener >	
<< <i>reference-type</i> >> (p. 153) Automatically manages the association of an Entity and a Listener (p. 1381)	1384
dds::core::policy::Liveliness	
Specifies and configures the mechanism that allows dds::sub::DataReader (p. 756)'s to detect when dds::pub::DataWriter (p. 908)'s become disconnected	1389
dds::core::status::LivelinessChangedStatus	
Information about the status dds::core::status::StatusMask::liveliness_changed() (p. 2090)	1395
dds::core::policy::LivelinessKind_def	
The definition of the dds::core::safe_enum (p. 1972) LivelinessKind	1397
dds::core::status::LivelinessLostStatus	
Information about the status dds::core::status::StatusMask::liveliness_lost() (p. 2090)	1398
rti::core::xtypes::LoanedDynamicData	
<< <i>move-only-type</i> >> (p. 155) Gives temporary access to a member of another DynamicData object	1399
rti::sub::LoanedSample< T >	
The element type of a dds::sub::LoanedSamples (p. 1406) collection	1402
dds::sub::LoanedSamples< T >	
<< <i>move-only-type</i> >> (p. 155) Provides temporary access to a collection of samples (data and info) from a DataReader (p. 756)	1406

rti::core::Locator	
<<extension>> (p. 156) <<value-type>> (p. 152) Type used to represent the addressing information needed to send a message to an RTPS Endpoint using one of the supported transports . . .	1416
rti::core::policy::LocatorFilter	
<<extension>> (p. 156) Configures how the dds::topic::PublicationBuiltinTopicData (p. 1703) reports the configuration of a MultiChannel (p. 1483) DataWriter	1419
rti::core::LocatorFilterElement	
<<extension>> (p. 156) <<value-type>> (p. 152) Specifies the configuration of an individual channel within a MultiChannel DataWriter	1421
rti::core::LocatorKind_def	
The definition of the dds::core::safe_enum (p. 1972) LocatorKind	1424
rti::config::LogCategory_def	
The definition of the dds::core::safe_enum (p. 1972) LogCategory	1425
rti::config::Logger	
The singleton type used to configure RTI Connex logging	1426
rti::config::LogLevel_def	
The definition of the dds::core::safe_enum (p. 1972) LogLevel;	1435
rti::config::LogMessage	
A log message, including the text and additional information	1436
rti::core::LongDouble	
<<extension>> (p. 156) <<value-type>> (p. 152) Encapsulates an IDL long double	1439
dds::sub::DataReader< T >::ManipulatorSelector	
A Selector (p. 2027) class enabling the streaming API	1440
rti::sub::ManipulatorSelector< T >	1443
dds::core::xtypes::Member	
<<value-type>> (p. 152) Represents a StructType (p. 2107) member	1443
rti::core::policy::Monitoring	
<<extension>> (p. 156) Configures the use of the RTI Monitoring (p. 1448) Library 2.0 to collect and distribute RTI Connex telemetry data	1448
rti::core::MonitoringDedicatedParticipantSettings	
<<extension>> (p. 156) Configures the usage of a dedicated dds::domain::DomainParticipant (p. 1079) to distribute the RTI Connex application telemetry data	1453
rti::core::MonitoringDistributionSettings	
<<extension>> (p. 156) Configures the distribution of telemetry data	1457
rti::core::MonitoringEventDistributionSettings	
<<extension>> (p. 156) Configures the distribution of event metrics	1462
rti::core::MonitoringLoggingDistributionSettings	
<<extension>> (p. 156) Configures the distribution of log messages	1466
rti::core::MonitoringLoggingForwardingSettings	
<<extension>> (p. 156) Configures the forwarding levels of log messages for the different rti::config::LogFacility (p. 255)	1471
rti::core::MonitoringMetricSelection	
<<extension>> (p. 156) Configures event and periodic metrics collection and distribution for a specific set of observable resources	1475
rti::core::MonitoringPeriodicDistributionSettings	
<<extension>> (p. 156) Configures the distribution of periodic metrics	1478
rti::core::MonitoringTelemetryData	
<<extension>> (p. 156) Configures the telemetry data that will be distributed	1481
rti::core::policy::MultiChannel	
<<extension>> (p. 156) Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data	1483
rti::flat::MutableArrayBuilder< ElementBuilder, N >	
Builds an array member of variable-size elements	1487

rti::flat::MutableArrayOffset < ElementOffset , N >	Offset to an array of variable-size elements	1489
rti::flat::MutableOffset	The base class of all Offsets to a final struct type	1490
rti::flat::MutableSequenceBuilder < ElementBuilder >	Builds a sequence member of variable-size elements	1491
MyFlatFinalOffset	Represents the Offset to an arbitrary user-defined FlatData final IDL struct	1493
MyFlatMutableBuilder	Represents the Builder for an arbitrary user-defined mutable type	1497
MyFlatMutableOffset	Represents the Offset to an arbitrary user-defined FlatData mutable IDL struct	1504
MyFlatUnionBuilder	Represents the Builder for an arbitrary user-defined mutable IDL union	1511
MyFlatUnionOffset	Represents the Offset to an arbitrary user-defined FlatData mutable IDL union	1514
NDDS_Transport_Address_t	Addresses are stored individually as network-ordered bytes	1518
NDDS_Transport_Interface_t	Storage for the description of a network interface used by a Transport Plugin	1519
NDDS_Transport_Property_t	Base configuration structure that must be inherited by derived Transport Plugin classes	1520
NDDS_Transport_Shmem_Property_t	Subclass of NDDS_Transport_Property_t (p. 1520) allowing specification of parameters that are specific to the shared-memory transport	1528
NDDS_Transport_UDP_WAN_CommPortsMappingInfo	Type for storing UDP WAN communication ports	1531
NDDS_Transport_UDPv4_Property_t	Configurable IPv4/UDP Transport-Plugin properties	1532
NDDS_Transport_UDPv4_WAN_Property_t	Configurable IPv4/UDP WAN Transport-Plugin properties	1542
NDDS_Transport_UDPv6_Property_t	Configurable IPv6/UDP Transport-Plugin properties	1552
NDDS_Transport_UUID	Univocally identifies a transport plugin instance	1561
rti::util::network_capture::NetworkCaptureParams	<< <i>extension</i> >> (p. 156) Input parameters for starting Network Capture	1561
rti::topic::no_compile_data_t	The type to specify as the CompileData template parameter to your ContentFilter (p. 732) if your compile function does not return any data	1567
rti::queuing::NoMatchingQueueException	The entity lost matching with all the Queuing Service	1567
rti::core::cond::NoOpAsyncWaitSetListener	A convenience implementation of AsyncWaitSetListener (p. 643) where all methods are overridden to do nothing	1568
dds::sub::NoOpDataReaderListener < T >	A convenience implementation of DataReaderListener (p. 832) where all methods are overridden to do nothing	1570
dds::pub::NoOpDataWriterListener < T >	A convenience implementation of DataWriterListener (p. 972) where all methods are overridden to do nothing	1573
dds::domain::NoOpDomainParticipantListener	A convenience implementation of DomainParticipantListener (p. 1134) where all methods are overridden to do nothing	1577

dds::pub::NoOpPublisherListener	
A convenience implementation of PublisherListener (p. 1732) where all methods are overridden to do nothing	1584
rti::queuing::NoOpQueueConsumerListener< T >	
A listener with an empty implementation of all methods	1588
rti::queuing::NoOpQueueProducerListener< T >	
A listener with an empty implementation of all methods	1590
rti::queuing::NoOpQueueReplierListener< TReq, TRep >	
A listener with an empty implementation of all methods	1591
rti::queuing::NoOpQueueRequesterListener< TReq, TRep >	
A listener with an empty implementation of all methods	1593
dds::sub::NoOpSubscriberListener	
A convenience implementation of SubscriberListener (p. 2128) where all methods are overridden to do nothing	1596
dds::topic::NoOpTopicListener< T >	
A convenience implementation of TopicListener (p. 2212) where all methods are overridden to do nothing	1599
dds::core::NotAllowedBySecurityError	
Indicates that an operation on the DDS API fails because the security plugins do not allow it	1600
dds::core::NotEnabledError	
A NotEnabledError (p. 1601) is thrown when an operation is invoked on a dds::core::Entity (p. 1265) that is not yet enabled	1601
dds::core::NullReferenceError	
Indicates an attempt to access a null object	1602
dds::core::status::OfferedDeadlineMissedStatus	
Information about the status dds::core::status::StatusMask::offered_deadline_missed() (p. 2086)	1603
dds::core::status::OfferedIncompatibleQosStatus	
Information about the status dds::core::status::StatusMask::offered_incompatible_qos() (p. 2087)	1604
rti::flat::OffsetBase	
Base class of all Offset types	1606
dds::core::optional< T >	
<< value-type >> (p. 152) Represents an object that may not contain a valid value	1610
rti::core::optional_value< T >	
<< extension >> (p. 156) Represents a value that can be initialized or not	1623
dds::core::OutOfResourcesError	
Indicates that RTI Connexant ran out of the resources needed to complete the operation	1629
dds::core::policy::Ownership	
Specifies whether it is allowed for multiple dds::pub::DataWriter (p. 908)'s to write the same instance of the data and if so, how these modifications should be arbitrated	1630
dds::core::policy::OwnershipKind_def	
The definition of the dds::core::safe_enum (p. 1972) OwnershipKind	1636
dds::core::policy::OwnershipStrength	
Specifies the value of the strength used to arbitrate among multiple dds::pub::DataWriter (p. 908) objects that attempt to modify the same instance of a data type (identified by its dds::topic::Topic (p. 2178) and key)	1637
dds::topic::ParticipantBuiltinTopicData	
Entry created when a dds::domain::DomainParticipant (p. 1079) is discovered	1639
rti::topic::trust::ParticipantTrustAlgorithmInfo	
<< extension >> (p. 156) << value-type >> (p. 152) Trust Plugins algorithm information associated with the discovered DomainParticipant	1645

rti::topic::trust::ParticipantTrustInterceptorAlgorithmInfo	
<< <i>extension</i> >> (p. 156) << <i>value-type</i> >> (p. 152) Trust Plugins interception algorithm information associated with the discovered DomainParticipant	1647
rti::topic::trust::ParticipantTrustKeyEstablishmentAlgorithmInfo	
<< <i>extension</i> >> (p. 156) << <i>value-type</i> >> (p. 152) Trust Plugins key establishment algorithm information associated with the discovered DomainParticipant	1648
rti::topic::trust::ParticipantTrustProtectionInfo	
<< <i>extension</i> >> (p. 156) << <i>value-type</i> >> (p. 152) Trust Plugins Protection information associated with the discovered DomainParticipant	1650
rti::topic::trust::ParticipantTrustSignatureAlgorithmInfo	
<< <i>extension</i> >> (p. 156) << <i>value-type</i> >> (p. 152) Trust Plugins signature algorithm information associated with the discovered DomainParticipant	1651
dds::core::policy::Partition	
Set of strings that introduces logical partitions in dds::domain::DomainParticipant (p. 1079), dds::pub::Publisher (p. 1719), or dds::sub::Subscriber (p. 2116) entities	1652
rti::core::PersistentStorageSettings	
<< <i>extension</i> >> (p. 156) Configures the persistent storage settings for durable writer history and durable reader state	1656
rti::core::pointer< T >	1666
dds::core::policy::policy_id< Policy >	
Obtains the QoSPolicyId of a QoS Policy	1668
dds::core::policy::policy_name< Policy >	
Obtains the policy name	1668
dds::core::PreconditionNotMetError	
A PreconditionNotMetError (p. 1669) is thrown when a pre-condition for the operation was not met	1669
dds::core::policy::Presentation	
Specifies how the samples representing changes to data instances are presented to a subscribing application	1670
dds::core::policy::PresentationAccessScopeKind_def	
The definition of the dds::core::safe_enum (p. 1972) PresentationAccessScopeKind	1677
rti::flat::PrimitiveArrayOffset< T, N >	
Offset to an array of primitive elements	1678
rti::flat::PrimitiveConstOffset< T >	
A const Offset to an optional primitive member	1679
rti::flat::PrimitiveOffset< T >	
An Offset to an optional primitive member	1680
rti::flat::PrimitiveSequenceBuilder< T >	
Builds a sequence of primitive members	1681
rti::flat::PrimitiveSequenceOffset< T >	
Offset to a sequence of primitive elements	1684
dds::core::xtypes::PrimitiveType	
<< <i>value-type</i> >> (p. 152) Represents and IDL primitive type	1685
rti::config::PrintFormat_def	
The definition of the dds::core::safe_enum (p. 1972) PrintFormat	1686
rti::topic::PrintFormatKind_def	
The definition of the dds::core::safe_enum (p. 1972) PrintFormatKind	1687
rti::topic::PrintFormatProperty	
<< <i>extension</i> >> (p. 156) << <i>value-type</i> >> (p. 152) A collection of attributes used to configure how data samples will be formatted when converted to a string	1688
rti::core::ProductVersion	
<< <i>extension</i> >> (p. 156) << <i>value-type</i> >> (p. 152) Represents the current version of RTI Connext	1693

rti::core::policy::Property	
<< <i>extension</i> >> (p. 156) Stores key/value string pairs that can configure certain parameters of RTI Connex	
not exposed through QoS policies. It can also store and propagate through the discovery mechanism application-specific information associated to a dds::core::Entity (p. 1265)	1695
rti::core::ProtocolVersion	
<< <i>extension</i> >> (p. 156) Represents the current version of RTI Connex	1702
dds::topic::PublicationBuiltinTopicData	
Entry created when a dds::pub::DataWriter (p. 908) is discovered in association with its dds::pub::Publisher (p. 1719)	1703
dds::core::status::PublicationMatchedStatus	
Information about the status dds::core::status::StatusMask::publication_matched() (p. 2091)	1717
dds::pub::Publisher	
<< <i>reference-type</i> >> (p. 153) A publisher is the object responsible for the actual dissemination of publications	1719
dds::pub::PublisherListener	
The listener to notify status changes for a dds::pub::Publisher (p. 1719)	1732
dds::pub::qos::PublisherQos	
<< <i>value-type</i> >> (p. 152) Container of the QoS policies that a dds::pub::Publisher (p. 1719) supports	1733
rti::core::policy::PublishMode	
<< <i>extension</i> >> (p. 156) Specifies whether a dds::pub::DataWriter (p. 908) sends data synchronously or asynchronously	1739
rti::core::policy::PublishModeKind_def	
<< <i>extension</i> >> (p. 156) The enumeration for PublishMode (p. 1739) kinds	1744
rti::core::qos_print_all_t	
A tag type that selects the <code>to_string</code> overload that prints all the values of a Qos object	1746
dds::core::policy::QosPolicyCount	
<< <i>value-type</i> >> (p. 152) Holds a counter for a QosPolicyId	1746
rti::core::QosPrintFormat	
<< <i>extension</i> >> (p. 156) << <i>value-type</i> >> (p. 152) A collection of attributes used to configure how QoS will be formatted when converted to strings	1747
dds::core::QosProvider	
<< <i>reference-type</i> >> (p. 153) The QosProvider (p. 1752) class provides a way for a user to control and access the XML QoS profiles that are loaded by RTI Connex	1752
rti::core::QosProviderParams	
<< <i>extension</i> >> (p. 156) << <i>value-type</i> >> (p. 152) Configure options that control the way that XML documents containing QoS profiles are loaded by a dds::core::QosProvider (p. 1752)	1773
dds::sub::Query	
<< <i>value-type</i> >> (p. 152) Encapsulates a query for a dds::sub::cond::QueryCondition (p. 1784)	1778
dds::sub::cond::QueryCondition	
<< <i>reference-type</i> >> (p. 153) Specialized ReadCondition (p. 1858) that allows applications to also specify a filter on the data available in a dds::sub::DataReader (p. 756)	1784
rti::queuing::QueueConsumer< T >	
Allows you to receive samples from a SharedReaderQueue	1787
rti::queuing::QueueConsumerListener< T >	
Called when certain events occur in a QueueConsumer (p. 1787)	1800
rti::queuing::QueueConsumerParams	
Contains the parameters for creating a QueueConsumer (p. 1787)	1802
rti::queuing::QueueEntityParams< ActualEntity >	
A parent class for all queue parameter classes	1804
rti::queuing::QueueProducer< T >	
Allows you to send samples to a specific SharedReaderQueue hosted by Queuing Service	1805
rti::queuing::QueueProducerListener< T >	
Called when certain events occur in a QueueProducer (p. 1805)	1815

rti::queuing::QueueProducerParams	Contains the parameters for creating a QueueProducer (p. 1805)	1817
rti::queuing::QueueReplier< TReq, TRep >	Allows receiving requests and sending replies	1819
rti::queuing::QueueReplierListener< TReq, TRep >	Called when certain events occur in a QueueReplier (p. 1819)	1832
rti::queuing::QueueReplierParams	Contains the parameters for creating a QueueReplier (p. 1819)	1834
rti::queuing::QueueRequester< TReq, TRep >	Allows sending requests and receiving replies	1836
rti::queuing::QueueRequesterListener< TReq, TRep >	Called when certain events occur in a QueueRequester (p. 1836)	1851
rti::queuing::QueueRequesterParams	Contains the parameters for creating a QueueRequester (p. 1836)	1853
dds::sub::Rank	<< <i>value-type</i> >> (p. 152) Contains the sample and generation ranks of a data-sample	1855
dds::sub::cond::ReadCondition	<< <i>reference-type</i> >> (p. 153) Condition specifically dedicated to read operations and attached to one dds::sub::DataReader (p. 756)	1858
dds::core::policy::ReaderDataLifecycle	Controls how a DataReader manages the lifecycle of the data that it has received	1862
dds::sub::ReadModeDummyType	1868
rti::core::policy::ReceiverPool	<< <i>extension</i> >> (p. 156) Configures threads that RTI Connex uses to receive and process data from the transport modules (such as UDP)	1868
dds::core::Reference< DELEGATE >	Base class for all reference types	1872
dds::core::policy::Reliability	Indicates the level of reliability in sample delivered that a dds::pub::DataWriter (p. 908) offers or a dds::sub::DataReader (p. 756) requests	1873
dds::core::policy::ReliabilityKind_def	The definition of the dds::core::safe_enum (p. 1972) ReliabilityKind	1879
rti::core::status::ReliableReaderActivityChangedStatus	<< <i>extension</i> >> (p. 156) Information about the status dds::core::status::StatusMask::reliable ↔ _reader_activity_changed() (p. 2092)	1881
rti::core::status::ReliableWriterCacheChangedStatus	<< <i>extension</i> >> (p. 156) Information about the status dds::core::status::StatusMask::reliable ↔ _writer_cache_changed() (p. 2092)	1883
rti::core::policy::RemoteParticipantPurgeKind_def	<< <i>extension</i> >> (p. 156) The definition of the dds::core::safe_enum (p. 1972) Remote ↔ ParticipantPurgeKind	1886
dds::rpc::RemoteUnknownOperationError	Thrown when a Client calls an operation that doesn't exist in the Service	1887
rti::request::Replier< RequestType, ReplyType >	<< <i>reference-type</i> >> (p. 153) Allows receiving requests and sending replies	1888
rti::request::ReplierListener< RequestType, ReplyType >	Called when a Replier (p. 1888) has new available requests	1899
rti::request::ReplierParams	Contains the parameters for creating a rti::request::Replier (p. 1888)	1900
dds::core::status::RequestedDeadlineMissedStatus	Information about the status dds::core::status::StatusMask::requested_deadline_missed() (p. 2087)	1904

dds::core::status::RequestedIncompatibleQosStatus	
Information about the status dds::core::status::StatusMask::requested_incompatible_qos() (p. 2088)	1905
rti::request::Requester< RequestType, ReplyType >	
<<reference-type>> (p. 153) Allows sending requests and receiving replies	1907
rti::request::RequesterParams	
Contains the parameters for creating a rti::request::Requester (p. 1907)	1917
dds::core::policy::ResourceLimits	
Controls the memory usage of dds::pub::DataWriter (p. 908) or a dds::sub::DataReader (p. 756)	1921
rti::core::Result< T >	
A result from an operation that doesn't throw exceptions containing a return code and (if successful) a value	1927
rpc_example::RobotControl	
The synchronous interface generated from the RobotControl (p. 95) IDL service	1931
rpc_example::RobotControlAsync	
The asynchronous interface derived from the RobotControl (p. 1931) service	1933
rpc_example::RobotControlClient	
<<reference-type>> (p. 153) Allows client applications to make remote function calls	1934
rti::core::RtpsReliableReaderProtocol	
<<extension>> (p. 156) Configures aspects of the RTPS protocol related to a reliable DataReader	1934
rti::core::policy::RtpsReliableWriterProtocol	
<<extension>> (p. 156) Configures aspects of an RTPS reliable writer	1940
rti::core::policy::RtpsReservedPortKindMask	
<<extension>> (p. 156) Mask of reserved ports	1963
rti::core::RtpsWellKnownPorts	
<<extension>> (p. 156) Configures the mapping of the RTPS well-known ports	1965
dds::core::safe_enum< def, inner >	
<<value-type>> (p. 152) Provides a safe, scoped enumeration based on def::type	1972
dds::sub::Sample< T >	
<<value-type>> (p. 152) This class encapsulate the data and meta-data associated with DDS samples	1977
rti::flat::Sample< OffsetType >	
The generic definition of FlatData topic-types	1981
rti::core::SampleFlag	
<<extension>> (p. 156) A set of flags that can be associated with a sample	1985
rti::core::SampleIdentity	
<<extension>> (p. 156) <<value-type>> (p. 152) A SampleIdentity (p. 1989) defines a pair (Virtual Writer Guid (p. 1340), SequenceNumber (p. 2042)) that uniquely identifies a sample within a DDS domain and a Topic	1989
dds::sub::SampleInfo	
<<value-type>> (p. 152) Information that accompanies each sample received by a DataReader (p. 756)	1992
rti::sub::SampleIterator< T >	
A random-access iterator of LoanedSample (p. 1402)	2003
rti::core::status::SampleLostState	
<<extension>> (p. 156) Reasons why a sample was lost	2003
dds::core::status::SampleLostStatus	
Information about the status dds::core::status::StatusMask::sample_lost() (p. 2088)	2010
rti::sub::SampleProcessor	
<<extension>> (p. 156) <<reference-type>> (p. 153) Utility to read and process the data samples that one or more DataReaders receive using a sample handler	2012
dds::core::status::SampleRejectedState	
Reasons why a sample was rejected	2017

dds::core::status::SampleRejectedStatus	Information about the status dds::core::status::StatusMask::sample_rejected() (p. 2089)	2022
dds::sub::status::SampleState	Indicates whether or not a sample has ever been read	2023
rti::config::ScopedLoggerVerbosity	Changes the logger verbosity temporarily during the scope of a variable	2026
dds::sub::DataReader< T >::Selector	Used by the DataReader (p. 756) to compose read and take operations	2027
rti::flat::SequenceIterator< E, OffsetKind >	Iterator for collections of Offsets	2035
rti::core::SequenceNumber	<< <i>extension</i> >> (p. 156) << <i>value-type</i> >> (p. 152) A class representing the DDS 64-bit Sequence Number	2042
rti::flat::SequenceOffset< ElementOffset >	Offset to a sequence of non-primitive elements	2050
dds::core::xtypes::SequenceType	<< <i>value-type</i> >> (p. 152) Represents an IDL <i>sequence</i> type	2051
dds::rpc::Server	<< <i>reference-type</i> >> (p. 153) Provides the execution environment for one or more Service ↔ Endpoint (p. 2061)	2053
dds::rpc::ServerParams	<< <i>value-type</i> >> (p. 152) The parameters used to configure a Server (p. 2053)	2055
rti::core::policy::Service	<< <i>extension</i> >> (p. 156) Indicates if an Entity is associated with a service and if so, which one	2057
dds::rpc::ServiceEndpoint< Dispatcher >	Manages the DDS entities required to receive function calls and send the return values	2061
rti::core::policy::ServiceKind_def	<< <i>extension</i> >> (p. 156) The definition of the dds::core::safe_enum (p. 1972) <i>ServiceKind</i>	2064
rti::topic::ServiceRequest	<< <i>extension</i> >> (p. 156) << <i>value-type</i> >> (p. 152) A request coming from one of the built-in services	2065
rti::core::status::ServiceRequestAcceptedStatus	<< <i>extension</i> >> (p. 156) Information about the status dds::core::status::StatusMask::service_request_accepted() (p. 2095)	2067
rti::core::ServiceRequestId_def	The definition of the rti::core::safe_enum <i>ServiceRequestId</i>	2068
dds::sub::SharedSamples< T, DELEGATE >	<< <i>reference-type</i> >> (p. 153) A sharable and container-safe version of LoanedSamples (p. 1406)	2069
rti::sub::SharedSamples< T >	Provides access to a collection of middleware-loaned samples	2074
rti::request::SimpleReplier< RequestType, ReplyType >	<< <i>reference-type</i> >> (p. 153) A callback-based replier	2075
rti::util::heap_monitoring::SnapshotContentFormat_def	Bitmap used to decide which information of the snapshot will be displayed	2077
rti::util::heap_monitoring::SnapshotOutputFormat_def	Specify the format of the output of the snapshot. RTI Connext	2078
dds::core::cond::StatusCondition	<< <i>reference-type</i> >> (p. 153) A condition associated with each dds::core::Entity (p. 1265)	2079
dds::core::status::StatusMask	A std::bitset (list) of statuses	2082
rti::util::StreamFlagSaver	2097
rti::sub::status::StreamKind	<< <i>extension</i> >> (p. 156) Indicates which stream to read from: live stream, topic-query stream or both	2097

rti::flat::StringBuilder	Builds a string	2099
rti::flat::StringOffset	Offset to a string	2101
dds::core::StringTopicType	Built-in type consisting of a single character string	2102
dds::core::xtypes::StringType	<< <i>value-type</i> >> (p. 152) Represents an IDL <code>string</code> type	2106
dds::core::xtypes::StructType	<< <i>value-type</i> >> (p. 152) Represents and IDL <code>struct</code> type	2107
dds::sub::Subscriber	<< <i>reference-type</i> >> (p. 153) A subscriber is the object responsible for actually receiving data from a subscription	2116
dds::sub::SubscriberListener	The listener to notify status changes for a dds::sub::Subscriber (p.2116)	2128
dds::sub::qos::SubscriberQos	<< <i>value-type</i> >> (p. 152) Container of the QoS policies that a dds::sub::Subscriber (p.2116) supports	2129
dds::topic::SubscriptionBuiltinTopicData	Entry created when a dds::sub::DataReader (p.756) is discovered in association with its dds::sub::Subscriber (p.2116)	2133
dds::core::status::SubscriptionMatchedStatus	Information about the status dds::core::status::StatusMask::subscription_matched() (p.2091)	2144
dds::pub::SuspendedPublication	<< <i>value-type</i> >> (p. 152) Indicates that the application is about to make multiple modifications using several dds::pub::DataWriter (p.908)'s belonging to the same dds::pub::Publisher (p.1719)	2147
rti::core::policy::SystemResourceLimits	<< <i>extension</i> >> (p. 156) Configures resources that RTI Connex uses	2149
dds::core::TEntityQos< DELEGATE >	Acts as a container for Qos policies allowing to set and retrieve all the policies of an entity as a unit	2152
rti::core::ThreadSettings	<< <i>extension</i> >> (p. 156) The properties of a thread of execution	2154
rti::core::ThreadSettingsCpuRotationKind_def	Determines how rti::core::ThreadSettings::cpu_list (p.2156) affects processor affinity for thread-related QoS policies that apply to multiple threads	2158
rti::core::ThreadSettingsKindMask	<< <i>extension</i> >> (p. 156) A collection of flags used to configure threads of execution	2159
dds::core::Time	<< <i>extension</i> >> (p. 156) Represents a point in time	2162
dds::core::policy::TimeBasedFilter	Allows a dds::sub::DataReader (p.756) to indicate that it is not interested in all the sample updates that occur within a time period	2174
dds::core::TimeoutError	Indicates that an operation has timed out	2177
dds::topic::Topic< T >	<< <i>reference-type</i> >> (p. 153) Topic (p.2178) is the most basic description of the data to be published and subscribed	2178
rti::topic::topic_type_disabled_copy< TopicType >	<< <i>extension</i> >> (p. 156) Indicates whether a <code>TopicType</code> is uncopyable	2195
rti::topic::topic_type_has_external_members< TopicType >	<< <i>extension</i> >> (p. 156) Indicates if a topic type contains directly or indirectly IDL external members	2196
dds::topic::topic_type_name< T >	Provides the name of a topic-type	2196

dds::topic::topic_type_support < T >	Provides convenience operations for a topic-type	2197
dds::topic::TopicBuiltinTopicData	Entry created when a dds::topic::Topic (p. 2178) object is discovered	2197
dds::core::policy::TopicData	2204
dds::topic::TopicDescription < T >	Abstract base class of Topic (p. 2178) and ContentFilteredTopic (p. 735)	2207
dds::topic::TopicInstance < T >	Encapsulates a sample and its associated instance handle	2209
dds::topic::TopicListener < T >	The listener to notify status changes for a dds::topic::Topic (p. 2178)	2212
dds::topic::qos::TopicQos	<< <i>value-type</i> >> (p. 152) Container of the QoS policies that a dds::topic::Topic (p. 2178) supports	2213
rti::sub::TopicQuery	<< <i>extension</i> >> (p. 156) << <i>reference-type</i> >> (p. 153) Allows a dds::sub::DataReader (p. 756) to query the sample cache of its matching dds::pub::DataWriters	2220
rti::sub::TopicQueryData	<< <i>extension</i> >> (p. 156) << <i>value-type</i> >> (p. 152) Provides information about a TopicQuery (p. 2220)	2224
rti::core::policy::TopicQueryDispatch	<< <i>extension</i> >> (p. 156) Configures the ability of a dds::pub::DataWriter (p. 908) to publish samples in response to a rti::sub::TopicQuery (p. 2220)	2226
rti::sub::TopicQuerySelection	<< <i>extension</i> >> (p. 156) << <i>value-type</i> >> (p. 152) Specifies the data query that defines a TopicQuery (p. 2220)	2229
rti::sub::TopicQuerySelectionKind_def	The definition of the dds::core::safe_enum (p. 1972) rti::sub::TopicQuerySelectionKind (p. 69)	2232
rti::util::network_capture::TrafficKindMask	<< <i>extension</i> >> (p. 156) Mask indicating the traffic direction to capture	2233
TransportAllocationSettings_t	Allocation settings used by various internal buffers	2236
rti::core::policy::TransportBuiltin	<< <i>extension</i> >> (p. 156) Specifies which built-in transports to use	2237
rti::core::policy::TransportBuiltinMask	<< <i>extension</i> >> (p. 156) Mask that specifies which built-in transports are used	2241
rti::core::TransportClassId_def	The definition of the dds::core::safe_enum (p. 1972) TransportClassId	2244
rti::core::TransportInfo	<< <i>extension</i> >> (p. 156) << <i>value-type</i> >> (p. 152) Contains the class id and message max size of an installed transport	2245
rti::core::policy::TransportMulticast	<< <i>extension</i> >> (p. 156) Specifies the multicast address on which a dds::sub::DataReader (p. 756) wants to receive its data and other settings	2247
rti::core::policy::TransportMulticastKind_def	<< <i>extension</i> >> (p. 156) The definition of the dds::core::safe_enum (p. 1972) TransportMulticastKind	2249
rti::core::policy::TransportMulticastMapping	Specifies a list of topic_expressions and multicast addresses that can be used by an Entity with a specific topic name to receive data	2250
rti::core::TransportMulticastSettings	<< <i>extension</i> >> (p. 156) Represents a list of multicast locators	2252
dds::core::policy::TransportPriority	Allows applications to take advantage of transports capable of sending messages with different priorities	2255

rti::core::policy::TransportSelection	
<< <i>extension</i> >> (p. 156) Specifies the transports that a dds::pub::DataWriter (p. 908) or a dds::sub::DataReader (p. 756) may use to send or receive data	2257
rti::core::policy::TransportUnicast	
<< <i>extension</i> >> (p. 156) Specifies a subset of transports and a port number that can be used by a dds::core::Entity (p. 1265) to receive data	2259
rti::core::TransportUnicastSettings	
<< <i>extension</i> >> (p. 156) Represents a list of unicast locators	2262
rti::topic::trust::TrustAlgorithmRequirements	
<< <i>extension</i> >> (p. 156) << <i>value-type</i> >> (p. 152) Type to describe Trust Plugins algorithm requirements	2264
dds::core::policy::TypeConsistencyEnforcement	
Defines the rules for determining whether the type used to publish a given topic is consistent with that used to subscribe to it	2265
dds::core::policy::TypeConsistencyEnforcementKind_def	
The definition of the dds::core::safe_enum (p. 1972) <code>TypeConsistencyEnforcementKind</code>	2272
dds::core::xtypes::TypeKind_def	
The definition of <code>TypeKind</code>	2273
rti::core::policy::TypeSupport	
<< <i>extension</i> >> (p. 156) Allows attaching application-specific information to a dds::pub::DataWriter (p. 908) or dds::sub::DataReader (p. 756) that is passed to the serialization and deserialization routines	2275
dds::core::xtypes::UnidimensionalCollectionType	
<< <i>value-type</i> >> (p. 152) The base class of collection types with only one dimension	2278
rti::flat::UnionBuilder< Discriminator >	
Base class of builders for user-defined mutable unions	2279
dds::core::xtypes::UnionMember	
<< <i>value-type</i> >> (p. 152) Represents a UnionType (p. 2285) member	2279
dds::core::xtypes::UnionType	
<< <i>value-type</i> >> (p. 152) Represents and IDL <code>union</code> type	2285
rti::core::UnregisterThreadOnExit	
<< <i>extension</i> >> (p. 156) Utility that calls rti::core::unregister_thread (p. 237) when leaving scope	2291
dds::core::UnsupportedError	
Indicates that the application used an unsupported operation	2291
dds::core::policy::UserData	
Attaches a buffer of opaque data that is distributed by Built-in Topics (p. 44) during discovery	2292
rti::sub::ValidLoanedSamples< T >	
<< <i>extension</i> >> (p. 156) << <i>C++11</i> >> (p. 155) << <i>move-only-type</i> >> (p. 155) Provides access to only those samples that contain valid data	2296
rti::sub::ValidSampleIterator< T >	
A forward iterator adapter that skips invalid samples	2302
dds::core::Value< D >	2302
dds::core::vector< T >	
<< <i>value-type</i> >> (p. 152) A vector convertible to <code>std::vector</code> and with similar functionality	2304
rti::core::VendorId	
<< <i>extension</i> >> (p. 156) Represents the vendor of the service implementing the RTPS protocol	2313
rti::config::Verbosity_def	
The definition of the dds::core::safe_enum (p. 1972) <code>Verbosity</code>	2314
dds::sub::status::ViewState	
Indicates whether or not an instance is new	2315
dds::core::cond::WaitSet	
<< <i>reference-type</i> >> (p. 153) Allows an application to wait until one or more of the attached Condition (p. 729) objects have a <code>trigger_value</code> of true or else until the timeout expires	2318

rti::core::cond::WaitSetProperty	
<< <i>extension</i> >> (p. 156) << <i>value-type</i> >> (p. 152) Specifies the dds::core::cond::WaitSet (p. 2318) behavior for multiple trigger events	2328
dds::core::WeakReference< T >	2331
rti::core::policy::WireProtocol	
<< <i>extension</i> >> (p. 156) Configures the write protocol of a dds::domain::DomainParticipant (p. 1079)	2331
rti::core::policy::WireProtocolAutoKind_def	
<< <i>extension</i> >> (p. 156) The definition of the dds::core::safe_enum (p. 1972) WireProtocol ↔ AutoKind	2341
rti::pub::WriteParams	
<< <i>extension</i> >> (p. 156) << <i>value-type</i> >> (p. 152) Advanced parameters for writing with a DataWriter	2342
rti::topic::WriterContentFilter< T, CompileData, WriterFilterData >	
<< <i>extension</i> >> (p. 156) A class to inherit from when implementing a writer-side custom content filter	2351
rti::topic::WriterContentFilterHelper< T, CompileData, WriterFilterData >	
<< <i>extension</i> >> (p. 156) A class to inherit from when implementing a writer-side custom content filter	2356
dds::core::policy::WriterDataLifecycle	
Controls how a dds::pub::DataWriter (p. 908) handles the lifecycle of the instances (keys) that it writes	2359
dds::core::xtypes::WStringType	
<< <i>value-type</i> >> (p. 152) Represents an IDL <code>wstring</code> type	2363
rti::config::compliance::XTypesMask	
This mask configures different aspects of the Extended CDR encoding (XCDR and XCDR2)	2364

Chapter 6

Module Documentation

6.1 Clock Selection

APIs related to clock selection.

APIs related to clock selection.

RTI Connext uses clocks to measure time and generate timestamps.

The middleware uses two clocks, an internal clock and an external clock. The internal clock is used to measure time and handles all timing in the middleware. The external clock is used solely to generate timestamps, such as the source timestamp and the reception timestamp, in addition to providing the time given by `dds::domain::DomainParticipant←→::get_current_time`.

6.1.1 Available Clocks

Two clock implementations are generally available, the monotonic clock and the realtime clock.

The monotonic clock provides times that are monotonic from a clock that is not adjustable. This clock is useful to use in order to not be subject to changes in the system or realtime clock, which may be adjusted by the user or via time synchronization protocols. However, this time generally starts from an arbitrary point in time, such as system startup. Note that this clock is not available for all architectures. Please see the `Platform Notes` for the architectures on which it is supported. For the purposes of clock selection, this clock can be referenced by the name "monotonic".

The realtime clock provides the realtime of the system. This clock may generally be monotonic but may not be guaranteed to be so. It is adjustable and may be subject to small and large changes in time. The time obtained from this clock is generally a meaningful time in that it is the amount of time from a known epoch. For the purposes of clock selection, this clock can be referenced by the names "realtime" or "system".

6.1.2 Clock Selection Strategy

By default, both the internal and external clocks use the real-time clock. If you want your application to be robust to changes in the system time, you may use the monotonic clock as the internal clock, and leave the system clock as the external clock. Note, however, that this may slightly diminish performance in that both the send and receive paths may need to obtain times from both clocks. Since the monotonic clock is not available on all architectures, you may want to specify "monotonic,realtime" for the `internal_clock` (see the table below). By doing so, the middleware will attempt to use the monotonic clock if available, and will fall back to the realtime clock if the monotonic clock is not available.

If you want your application to be robust to changes in the system time, you are not relying on source timestamps, and you want to avoid obtaining times from both clocks, you may use the monotonic clock for both the internal and external clocks.

6.1.3 Configuring Clock Selection

To configure the clock selection, use the **PROPERTY** (p. 332) QoS policy associated with the `dds::domain::Domain`↔ **Participant** (p. 1079).

See also

`rti::core::policy::Property` (p. 1695)

The following table lists the supported clock selection properties.

Table 6.1 Clock Selection Properties

Property	Description
<code>dds.clock.external_clock</code>	Comma-delimited list of clocks to use for the external clock, in the order of preference. Valid clock names are "realtime", "system", and "monotonic". Default: "realtime"
<code>dds.clock.internal_clock</code>	Comma-delimited list of clocks to use for the internal clock, in the order of preference. Valid clock names are "realtime", "system", and "monotonic". Default: "realtime"

6.2 Domain Module

Contains the `dds::domain::DomainParticipant` (p. 1079) class that acts as an entrypoint of RTI Connex and acts as a factory for many of the classes. The `dds::domain::DomainParticipant` (p. 1079) also acts as a container for the other objects that make up RTI Connex.

Modules

- **DomainParticipants**
dds::domain::DomainParticipant (p. 1079) entity and associated elements
- **Built-in Topics**
Built-in objects created by RTI Connex but accessible to the application.

6.2.1 Detailed Description

Contains the **dds::domain::DomainParticipant** (p. 1079) class that acts as an endpoint of RTI Connex and acts as a factory for many of the classes. The **dds::domain::DomainParticipant** (p. 1079) also acts as a container for the other objects that make up RTI Connex.

6.3 DomainParticipants

dds::domain::DomainParticipant (p. 1079) entity and associated elements

Classes

- class **dds::domain::DomainParticipantListener**
*The listener class for a **DomainParticipant** (p. 1079).*
- class **dds::domain::NoOpDomainParticipantListener**
*A convenience implementation of **DomainParticipantListener** (p. 1134) where all methods are overridden to do nothing.*
- class **dds::domain::DomainParticipant**
*<<reference-type>> (p. 153) Container for all **dds::core::Entity** (p. 1265) objects.*
- class **rti::core::status::DomainParticipantProtocolStatus**
- class **rti::core::status::InvalidLocalIdentityAdvanceNoticeStatus**
*<<extension>> (p. 156) Information about the status **dds::core::status::StatusMask::invalid_local_identity_↔advance_notice()** (p. 2095)*
- class **rti::domain::DomainParticipantConfigParams**
<<extension>> (p. 156) <<value-type>> (p. 152) Input parameters for creating a participant from xml configuration. It allows modification of some of the properties of the entities defined in the configuration.
- class **dds::domain::qos::DomainParticipantFactoryQos**
<<value-type>> (p. 152) Container of the QoS policies that do not apply to a specific entity
- class **dds::domain::qos::DomainParticipantQos**
*<<value-type>> (p. 152) Container of the QoS policies that a **dds::domain::DomainParticipant** (p. 1079) supports*

6.3.1 Detailed Description

dds::domain::DomainParticipant (p. 1079) entity and associated elements

6.4 Built-in Topics

Built-in objects created by RTI Connex but accessible to the application.

Modules

- **Participant Built-in Topics**

Builtin topic for accessing information about the DomainParticipants discovered by RTI Connex.

- **Topic Built-in Topics**

Builtin topic for accessing information about the Topics discovered by RTI Connex.

- **Publication Built-in Topics**

Builtin topic for accessing information about the Publications discovered by RTI Connex.

- **Subscription Built-in Topics**

Builtin topic for accessing information about the Subscriptions discovered by RTI Connex.

- **ServiceRequest Built-in Topic**

Builtin topic for accessing requests from different services within RTI Connex.

6.4.1 Detailed Description

Built-in objects created by RTI Connex but accessible to the application.

RTI Connex must discover and keep track of the remote entities, such as new participants in the domain. This information may also be important to the application, which may want to react to this discovery, or else access it on demand.

A set of built-in topics and corresponding **dds::sub::DataReader** (p.756) objects are introduced to be used by the application to access this discovery information.

The information can be accessed as if it were normal application data. This allows the application to know when there are any changes in those values by means of the **Listener** (p.1381) or the **dds::core::cond::Condition** (p.729) mechanisms.

The built-in data-readers all belong to a built-in **dds::sub::Subscriber** (p.2116), which can be retrieved by using the method **dds::sub::builtin_subscriber** (p.459). The built-in **dds::sub::DataReader** (p.756) objects can be retrieved by using the operation **dds::sub::find** (p.460), with the topic name as a parameter.

Built-in entities have default listener settings as well. The built-in **dds::sub::Subscriber** (p.2116) and all of its built-in topics have 'nil' listeners with all statuses appearing in their listener masks (acting as a NO-OP listener that does not reset communication status). The built-in DataReaders have null listeners with no statuses in their masks.

The information that is accessible about the remote entities by means of the built-in topics includes all the QoS policies that apply to the corresponding remote Entity. These QoS policies appear as normal 'data' fields inside the data read by means of the built-in Topic. Additional information is provided to identify the Entity and facilitate the application logic.

The built-in **dds::sub::DataReader** (p.756) will not provide data pertaining to entities created from the same **dds::domain::DomainParticipant** (p.1079) under the assumption that such entities are already known to the application that created them.

The discovery information provided by each built-in reader won't be received until it is first looked up. And if the DomainParticipant was created in a disabled state (see `dds::core::policy::EntityFactory` (p. 1272)), the built-in subscriber and readers will need to be enabled explicitly (by the `dds::core::Entity::enable` (p. 1269) operation).

Refer to `dds::topic::ParticipantBuiltinTopicData` (p. 1639), `dds::topic::TopicBuiltinTopicData` (p. 2197), `dds::topic::SubscriptionBuiltinTopicData` (p. 2133) and `dds::topic::PublicationBuiltinTopicData` (p. 1703) for a description of all the built-in topics and their contents.

The QoS of the built-in `dds::sub::Subscriber` (p. 2116) and `dds::sub::DataReader` (p. 756) objects is given by the following table:

Table 6.2 QoS of built-in `dds::sub::Subscriber` (p. 2116) and `dds::sub::DataReader` (p. 756)

QoS	Value
<code>dds::core::policy::UserData</code> (p. 2292)	0-length sequence
<code>dds::core::policy::TopicData</code> (p. 2204)	0-length sequence
<code>dds::core::policy::GroupData</code> (p. 1335)	0-length sequence
<code>dds::core::policy::Durability</code> (p. 1181)	<code>dds::core::policy::DurabilityKind::TRANSIENT_LOCAL</code>
<code>dds::core::policy::DurabilityService</code> (p. 1190)	Does not apply as <code>dds::core::policy::DurabilityKind</code> (p. 321) is <code>dds::core::policy::DurabilityKind::TRANSIENT_LOCAL</code>
<code>dds::core::policy::Presentation</code> (p. 1670)	<code>access_scope = dds::core::policy::PresentationAccessScopeKind_def::TOPIC</code> (p. 1677) <code>coherent_access = false</code> <code>ordered_access = false</code>
<code>dds::core::policy::Deadline</code> (p. 1020)	<code>Period = infinite</code>
<code>dds::core::policy::LatencyBudget</code> (p. 1375)	<code>duration = 0</code>
<code>dds::core::policy::Ownership</code> (p. 1630)	<code>dds::core::policy::OwnershipKind_def::SHARED</code> (p. 1637)
<code>dds::core::policy::OwnershipStrength</code> (p. 1637)	<code>value = 0</code>
<code>dds::core::policy::Liveliness</code> (p. 1389)	<code>kind = dds::core::policy::LivelinessKind::AUTOMATIC</code> <code>lease_duration = 0</code>
<code>dds::core::policy::TimeBasedFilter</code> (p. 2174)	<code>minimum_separation = 0</code>
<code>dds::core::policy::Partition</code> (p. 1652)	0-length sequence
<code>dds::core::policy::Reliability</code> (p. 1873)	<code>kind = dds::core::policy::ReliabilityKind_def::RELIABLE</code> (p. 1881) <code>max_blocking_time = 100 milliseconds</code>
<code>dds::core::policy::DestinationOrder</code> (p. 1022)	<code>dds::core::policy::DestinationOrderKind::BY_RECEPTION_TIMESTAMP</code>
<code>dds::core::policy::History</code> (p. 1346)	<code>kind = dds::core::policy::HistoryKind::KEEP_LAST</code> <code>depth = 1</code>
<code>dds::core::policy::ResourceLimits</code> (p. 1921)	<code>max_samples = dds::core::LENGTH_UNLIMITED</code> (p. 238) <code>max_instances = dds::core::LENGTH_UNLIMITED</code> (p. 238) <code>max_samples_per_instance = dds::core::LENGTH_UNLIMITED</code> (p. 238)
<code>dds::core::policy::ReaderDataLifecycle</code> (p. 1862)	<code>autopurge_nowriter_samples_delay = infinite</code> <code>autopurge_disposed_samples_delay = infinite</code>
<code>dds::core::policy::EntityFactory</code> (p. 1272)	<code>autoenable_created_entities = true</code>

6.5 Topic Module

Contains the `dds::topic::Topic` (p.2178), `dds::topic::ContentFilteredTopic` (p.735), and `MultiTopic` classes, the `TopicListener` interface, and more generally, all that is needed by an application to define `dds::topic::Topic` (p.2178) objects and attach QoS policies to them.

Modules

- **Topics**
dds::topic::Topic (p. 2178) entity and associated elements
- **Zero Copy Transfer Over Shared Memory**
<<extension>> (p. 156) *Zero Copy transfer over shared memory*
- **Built-in Types**
RTI Connext provides a set of very simple data types for you to use with the topics in your application.
- **Built-in Topic's Trust Types**
Types used as part of dds::topic::ParticipantBuiltinTopicData (p. 1639), *dds::topic::PublicationBuiltinTopicData* (p. 1703), *dds::topic::SubscriptionBuiltinTopicData* (p. 2133) to describe Trust Plugins configuration.
- **FlatData Topic-Types**
<<extension>> (p. 156) *FlatData Language Binding for IDL topic-types*
- **DynamicType and DynamicData**
Describes dds::core::xtypes::DynamicType (p. 1249), *dds::core::xtypes::DynamicData* (p. 1208) and related types and functions.
- **Topic traits and data-type support**
Traits and operations associated to topic-types.
- **Custom Content Filters**
Classes and associated types used to implement custom content filters.

6.5.1 Detailed Description

Contains the **dds::topic::Topic** (p.2178), **dds::topic::ContentFilteredTopic** (p.735), and MultiTopic classes, the TopicListener interface, and more generally, all that is needed by an application to define **dds::topic::Topic** (p.2178) objects and attach QoS policies to them.

6.6 Topics

dds::topic::Topic (p. 2178) entity and associated elements

Classes

- class **dds::core::status::InconsistentTopicStatus**
Information about the status dds::core::status::StatusMask::inconsistent_topic() (p. 2086)
- class **dds::topic::AnyTopic**
<<reference-type>> (p. 153) *This class provides an non-template holder for representing a Topic* (p. 2178) of any type
- class **dds::topic::ContentFilteredTopic< T >**
<<reference-type>> (p. 153) *Specialization of TopicDescription* (p. 2207) that allows for content-based subscriptions.
- class **dds::topic::Filter**
Defines the filter to create a ContentFilteredTopic (p. 735).
- class **dds::topic::TopicInstance< T >**
Encapsulates a sample and its associated instance handle.
- class **dds::topic::TopicListener< T >**

The listener to notify status changes for a `dds::topic::Topic` (p. 2178).

- class `dds::topic::NoOpTopicListener< T >`
A convenience implementation of `TopicListener` (p. 2212) where all methods are overridden to do nothing.
- class `dds::topic::Topic< T >`
<<*reference-type*>> (p. 153) `Topic` (p. 2178) is the most basic description of the data to be published and subscribed.
- class `dds::topic::TopicDescription< T >`
Abstract base class of `Topic` (p. 2178) and `ContentFilteredTopic` (p. 735).
- class `rti::topic::ExpressionProperty`
<<*extension*>> (p. 156) <<*value-type*>> (p. 152) Provides additional information about the filter expression passed to the `writer_compile` method of `rti::topic::WriterContentFilter` (p. 2351)
- class `rti::topic::FilterSampleInfo`
<<*extension*>> (p. 156) <<*value-type*>> (p. 152) Provides meta information associated with the sample.
- class `rti::topic::PrintFormatProperty`
<<*extension*>> (p. 156) <<*value-type*>> (p. 152) A collection of attributes used to configure how data samples will be formatted when converted to a string.
- class `dds::topic::qos::TopicQos`
<<*value-type*>> (p. 152) Container of the QoS policies that a `dds::topic::Topic` (p. 2178) supports

Functions

- `std::string rti::topic::sql_filter_name ()`
<<*extension*>> (p. 156) The name of the built-in SQL filter
- `std::string rti::topic::stringmatch_filter_name ()`
<<*extension*>> (p. 156) The name of the built-in StringMatch filter

6.6.1 Detailed Description

`dds::topic::Topic` (p. 2178) entity and associated elements

6.6.2 Function Documentation

6.6.2.1 `sql_filter_name()`

```
std::string rti::topic::sql_filter_name ( )
```

<<*extension*>> (p. 156) The name of the built-in SQL filter

This filter can be used with a `dds::topic::ContentFilteredTopic` (p. 735) and a `rti::core::policy::MultiChannel` (p. 1483)-enabled `dds::pub::DataWriter` (p. 908).

See also

- `dds::topic::Filter::name()` (p. 1307)
- `rti::core::policy::MultiChannel::filter_name()` (p. 1486)

6.6.2.2 stringmatch_filter_name()

```
std::string rti::topic::stringmatch_filter_name ( )
```

<<*extension*>> (p. 156) The name of the built-in StringMatch filter

This filter can be used with a **dds::topic::ContentFilteredTopic** (p. 735) and a **rti::core::policy::MultiChannel** (p. 1483)-enabled **dds::pub::DataWriter** (p. 908).

The StringMatch Filter is a subset of the SQL filter; it only supports the MATCH relational operator on a single string field.

See also

dds::topic::Filter::name() (p. 1307)

rti::core::policy::MultiChannel::filter_name() (p. 1486)

Referenced by **rti::core::policy::LocatorFilter::filter_name()**.

6.7 Zero Copy Transfer Over Shared Memory

<<*extension*>> (p. 156) Zero Copy transfer over shared memory

<<*extension*>> (p. 156) Zero Copy transfer over shared memory

Note

For a description of Zero Copy transfer over shared memory and its benefits, and a tutorial, see the "Sending Large Data" chapter in the **RTI Connex User's Manual**.

For buildable **code examples**, see <https://community.rti.com/kb/flatdata-and-zerocopy-examples>.

Zero Copy transfer over shared memory is available in the C API, in the Traditional C++ API, and in the Modern C++ API.

6.8 Built-in Types

RTI Connex provides a set of very simple data types for you to use with the topics in your application.

Classes

- class **dds::core::BytesTopicType**
Built-in type consisting of a variable-length array of opaque bytes.
- class **dds::core::StringTopicType**
Built-in type consisting of a single character string.
- class **dds::core::KeyedStringTopicType**
Built-in type consisting of a string payload and a second string that is the key.
- class **dds::core::KeyedBytesTopicType**
Built-in type consisting of a variable-length array of opaque bytes and a string that is the key.

6.8.1 Detailed Description

RTI Connexnt provides a set of very simple data types for you to use with the topics in your application.

The middleware provides four built-in types:

- **String**: A payload consisting of a single string of characters. This type has no key.
- **KeyedString**: A payload consisting of a single string of characters and a second string, the key, that identifies the instance to which the sample belongs.
- **Octets**: A payload consisting of an opaque variable-length array of bytes. This type has no key.
- **KeyedOctets**: A payload consisting of an opaque variable-length array of bytes and a string, the key, that identifies the instance to which the sample belongs.

The **String** and **KeyedString** types are appropriate for simple text-based applications. The **Octets** and **KeyedOctets** types are appropriate for applications that perform their own custom data serialization, such as legacy applications still in the process of migrating to RTI Connexnt. In most cases, string-based or structured data is preferable to opaque data, because the latter cannot be easily visualized in tools or used with content-based filters (see **dds::topic::Content**↔**FilteredTopic** (p. 735)).

The built-in types are very simple in order to get you up and running as quickly as possible. If you need a structured data type you can define your own type with exactly the fields you need in one of two ways:

- At compile time, by generating code from an IDL or XML file using the `rtiddsgen` utility
- At runtime, by using **dds::core::xtypes::DynamicData** (p. 1208)

6.8.2 Managing Memory for Builtin Types

When a sample is written, the `DataWriter` serializes it and stores the result in a buffer obtained from a pool of preallocated buffers. In the same way, when a sample is received, the `DataReader` deserializes it and stores the result in a sample coming from a pool of preallocated samples.

For builtin types, the maximum size of the buffers/samples and depends on the nature of the application using the builtin type.

You can configure the maximum size of the builtin types on a per-`DataWriter` and per-`DataReader` basis using the **rti::core::policy::Property** (p. 1695) in `DataWriters`, `DataReaders` or `Participants`.

The following table lists the supported builtin type properties to configure memory allocation. When the properties are defined in the `DomainParticipant`, they are applicable to all `DataWriters` and `DataReaders` belonging to the `Domain`↔`Participant` unless they are overwritten in the `DataWriters` and `DataReaders`.

Table 6.3 *Builtin Types Allocation Properties*

Property	Description
dds.builtin_type.string.alloc_size	Maximum size of the strings published by the StringDataWriter or received the StringDataReader (includes the NULL-terminated character). Default: dds.builtin_type.string.max_size if defined. Otherwise, 1024.
dds.builtin_type.keyed_string.alloc_key_size	Maximum size of the keys used by the KeyedStringDataWriter or KeyedStringDataReader (includes the NULL-terminated character). Default: dds.builtin_type.keyed_string.max_key_size if defined. Otherwise, 1024.
dds.builtin_type.keyed_string.alloc_size	Maximum size of the strings published by the KeyedStringDataWriter or received by the KeyedStringDataReader (includes the NULL-terminated character). Default: dds.builtin_type.keyed_string.max_size if defined. Otherwise, 1024.
dds.builtin_type.octets.alloc_size	Maximum size of the octet sequences published the OctetsDataWriter or received by the OctetsDataReader. Default: dds.builtin_type.octets.max_size if defined. Otherwise, 2048.
dds.builtin_type.keyed_octets.alloc_key_size	Maximum size of the key published by the KeyedOctetsDataWriter or received by the KeyedOctetsDataReader (includes the NULL-terminated character). Default: dds.builtin_type.keyed_octets.max_key_size if defined. Otherwise, 1024.
dds.builtin_type.keyed_octets.alloc_size	Maximum size of the octets sequences published by a KeyedOctetsDataWriter or received by a KeyedOctetsDataReader. Default: dds.builtin_type.keyed_octets.max_size if defined. Otherwise, 2048.

The previous properties must be set consistently with respect to the corresponding `*.max_size` properties that set the maximum size of the builtin types in the typecode.

6.8.3 Typecodes for Builtin Types

The typecodes associated with the builtin types are generated from the following IDL type definitions:

```
module DDS {
    struct String {
        string value;
    };

    struct KeyedString {
        string key;
        string value;
    };
};
```

```

struct Octets {
    sequence<octet> value;
};

struct KeyedOctets {
    string key;
    sequence<octet> value;
};
};

```

The maximum size of the strings and sequences that will be included in the type code definitions can be configured on a per-DomainParticipant-basis by using the properties in following table.

Table 6.4 Properties for Allocating Size of Builtin Types, per DomainParticipant

Property	Description
dds.builtin_type.string.max_size	Maximum size of the strings published by the StringDataWriters and received by the StringDataReaders belonging to a DomainParticipant (includes the NULL-terminated character). Default: 1024.
dds.builtin_type.keyed_string.max_key_size	Maximum size of the keys used by the KeyedStringDataWriters and KeyedStringDataReaders belonging to a DomainParticipant (includes the NULL-terminated character). Default: 1024.
dds.builtin_type.keyed_string.max_size	Maximum size of the strings published by the KeyedStringDataWriters and received by the KeyedStringDataReaders belonging to a DomainParticipant using the builtin type (includes the NULL-terminated character). Default: 1024
dds.builtin_type.octets.max_size	Maximum size of the octet sequences published by the OctetsDataWriters and received by the OctetsDataReader belonging to a DomainParticipant. Default: 2048
dds.builtin_type.keyed_octets.max_key_size	Maximum size of the keys used by the KeyedOctetsStringDataWriters and KeyedOctetsStringDataReaders belonging to a DomainParticipant (includes the NULL-terminated character). Default: 1024.
dds.builtin_type.keyed_octets.max_size	Maximum size of the octet sequences published by the KeyedOctetsDataWriters and received by the KeyedOctetsDataReaders belonging to a DomainParticipant. Default: 2048

For more information about the built-in types, including how to control memory usage and maximum lengths, please see the "Data Types and DDS Data Samples" chapter in the `User's Manual`.

6.9 Built-in Topic's Trust Types

Types used as part of `dds::topic::ParticipantBuiltinTopicData` (p. 1639), `dds::topic::PublicationBuiltinTopicData` (p. 1703), `dds::topic::SubscriptionBuiltinTopicData` (p. 2133) to describe Trust Plugins configuration.

Classes

- class `rti::topic::trust::EndpointTrustAlgorithmInfo`
<<extension>> (p. 156) *<<value-type>>* (p. 152) *Trust Plugins algorithm information associated with the discovered endpoint.*
- class `rti::topic::trust::EndpointTrustInterceptorAlgorithmInfo`
<<extension>> (p. 156) *<<value-type>>* (p. 152) *Trust Plugins interception algorithm information associated with the discovered endpoint.*
- class `rti::topic::trust::EndpointTrustProtectionInfo`
<<extension>> (p. 156) *<<value-type>>* (p. 152) *Trust Plugins Protection information associated with the discovered endpoint.*
- class `rti::topic::trust::ParticipantTrustAlgorithmInfo`
<<extension>> (p. 156) *<<value-type>>* (p. 152) *Trust Plugins algorithm information associated with the discovered DomainParticipant.*
- class `rti::topic::trust::ParticipantTrustInterceptorAlgorithmInfo`
<<extension>> (p. 156) *<<value-type>>* (p. 152) *Trust Plugins interception algorithm information associated with the discovered DomainParticipant.*
- class `rti::topic::trust::ParticipantTrustKeyEstablishmentAlgorithmInfo`
<<extension>> (p. 156) *<<value-type>>* (p. 152) *Trust Plugins key establishment algorithm information associated with the discovered DomainParticipant.*
- class `rti::topic::trust::ParticipantTrustProtectionInfo`
<<extension>> (p. 156) *<<value-type>>* (p. 152) *Trust Plugins Protection information associated with the discovered DomainParticipant.*
- class `rti::topic::trust::ParticipantTrustSignatureAlgorithmInfo`
<<extension>> (p. 156) *<<value-type>>* (p. 152) *Trust Plugins signature algorithm information associated with the discovered DomainParticipant.*
- class `rti::topic::trust::TrustAlgorithmRequirements`
<<extension>> (p. 156) *<<value-type>>* (p. 152) *Type to describe Trust Plugins algorithm requirements.*

6.9.1 Detailed Description

Types used as part of `dds::topic::ParticipantBuiltinTopicData` (p. 1639), `dds::topic::PublicationBuiltinTopicData` (p. 1703), `dds::topic::SubscriptionBuiltinTopicData` (p. 2133) to describe Trust Plugins configuration.

These types are used to describe how RTPS wire serialization, discovery, and liveliness interact with the loaded Trust Plugins.

The meaning of the contents of these types may vary depending on what Trust Plugins the DomainParticipant is using. For information about how these types interact with the RTI Security Plugins, please refer to the [RTI Security Plugins User's Manual](#).

6.10 Publication Module

Contains the `rti::pub::FlowController` (p. 1316), `dds::pub::Publisher` (p. 1719), and `dds::pub::DataWriter` (p. 908) classes as well as the `PublisherListener` and `dds::pub::DataWriterListener` (p. 972) interfaces, and more generally, all that is needed on the publication side.

Modules

- **Publishers**
dds::pub::Publisher (p. 1719) entity and associated elements
- **Data Writers**
dds::pub::DataWriter (p. 908) entity and associated elements
- **Flow Controllers**
<<extension>> (p. 156) *rti::pub::FlowController* (p. 1316) and associated elements
- **Multi-channel DataWriters**
APIs related to Multi-channel DataWriters.

6.10.1 Detailed Description

Contains the `rti::pub::FlowController` (p. 1316), `dds::pub::Publisher` (p. 1719), and `dds::pub::DataWriter` (p. 908) classes as well as the `PublisherListener` and `dds::pub::DataWriterListener` (p. 972) interfaces, and more generally, all that is needed on the publication side.

"DCPS Publication package"

6.11 Publishers

`dds::pub::Publisher` (p. 1719) entity and associated elements

Classes

- class `dds::pub::PublisherListener`
The listener to notify status changes for a `dds::pub::Publisher` (p. 1719).
- class `dds::pub::NoOpPublisherListener`
A convenience implementation of `PublisherListener` (p. 1732) where all methods are overridden to do nothing.
- class `dds::pub::CoherentSet`
<<value-type>> (p. 152) *A publishing application can request that a set of DDS data-sample changes be propagated in such a way that they are interpreted at the receivers' side as a cohesive set of modifications.*
- class `dds::pub::Publisher`
<<reference-type>> (p. 153) *A publisher is the object responsible for the actual dissemination of publications.*
- class `dds::pub::SuspendedPublication`
<<value-type>> (p. 152) *Indicates that the application is about to make multiple modifications using several `dds::pub::DataWriter` (p. 908)'s belonging to the same `dds::pub::Publisher` (p. 1719)*
- class `dds::pub::qos::PublisherQos`
<<value-type>> (p. 152) *Container of the QoS policies that a `dds::pub::Publisher` (p. 1719) supports*

6.11.1 Detailed Description

dds::pub::Publisher (p. 1719) entity and associated elements

6.12 Data Writers

dds::pub::DataWriter (p. 908) entity and associated elements

Classes

- class **dds::core::status::LivelinessLostStatus**
Information about the status `dds::core::status::StatusMask::liveliness_lost()` (p. 2090)
- class **dds::core::status::OfferedDeadlineMissedStatus**
Information about the status `dds::core::status::StatusMask::offered_deadline_missed()` (p. 2086)
- class **dds::core::status::OfferedIncompatibleQosStatus**
Information about the status `dds::core::status::StatusMask::offered_incompatible_qos()` (p. 2087)
- class **dds::core::status::PublicationMatchedStatus**
Information about the status `dds::core::status::StatusMask::publication_matched()` (p. 2091)
- class **dds::pub::AnyDataWriter**
*<<reference-type>> (p. 153) This class provides a non-template holder for representing a **DataWriter** (p. 908) of any type*
- class **dds::pub::AnyDataWriterListener**
*The listener to notify status changes for a **dds::pub::DataWriter** (p. 908) of a generic type.*
- class **dds::pub::DataWriterListener**< T >
*The **Listener** (p. 1381) to notify status changes for a **dds::pub::DataWriter** (p. 908).*
- class **dds::pub::NoOpDataWriterListener**< T >
*A convenience implementation of **DataWriterListener** (p. 972) where all methods are overridden to do nothing.*
- class **dds::pub::DataWriter**< T >
*<<reference-type>> (p. 153) Allows an application to publish data for a **dds::topic::Topic** (p. 2178)*
- class **rti::core::status::DataWriterCacheStatus**
<<extension>> (p. 156) Information about the status `dds::core::status::StatusMask::datawriter_cache()` (p. 2093)
- class **rti::core::status::ReliableWriterCacheChangedStatus**
<<extension>> (p. 156) Information about the status `dds::core::status::StatusMask::reliable_writer_cache_↔changed()` (p. 2092)
- class **rti::core::status::ReliableReaderActivityChangedStatus**
<<extension>> (p. 156) Information about the status `dds::core::status::StatusMask::reliable_reader_activity_↔changed()` (p. 2092)
- class **rti::core::status::DataWriterProtocolStatus**
<<extension>> (p. 156) Information about the status `dds::core::status::StatusMask::datawriter_protocol()` (p. 2093)
- class **rti::core::status::ServiceRequestAcceptedStatus**
<<extension>> (p. 156) Information about the status `dds::core::status::StatusMask::service_request_accepted()` (p. 2095)
- class **rti::pub::AcknowledgmentInfo**
<<extension>> (p. 156) <<value-type>> (p. 152) Information about an application-acknowledged sample
- class **dds::pub::qos::DataWriterQos**
*<<value-type>> (p. 152) Container of the QoS policies that a **dds::pub::DataWriter** (p. 908) supports*
- class **rti::pub::WriteParams**
*<<extension>> (p. 156) <<value-type>> (p. 152) Advanced parameters for writing with a **DataWriter***

6.12.1 Detailed Description

dds::pub::DataWriter (p. 908) entity and associated elements

6.13 Flow Controllers

<<*extension*>> (p. 156) **rti::pub::FlowController** (p. 1316) and associated elements

Classes

- struct **rti::pub::FlowControllerSchedulingPolicy_def**
 <<*extension*>> (p. 156) *Kinds of flow controller scheduling policy*
- class **rti::pub::FlowControllerTokenBucketProperty**
 <<*extension*>> (p. 156) <<*value-type*>> (p. 152) *Configures a **FlowController** (p. 1316) based on a token-bucket mechanism*
- class **rti::pub::FlowControllerProperty**
 <<*extension*>> (p. 156) <<*value-type*>> (p. 152) *Configures a **FlowController** (p. 1316)*
- class **rti::pub::FlowController**
 <<*extension*>> (p. 156) <<*reference-type*>> (p. 153) *A flow controller is the object responsible for shaping the network traffic by determining when attached asynchronous **dds::pub::DataWriter** (p. 908) instances are allowed to write data.*

Typedefs

- typedef **dds::core::safe_enum< FlowControllerSchedulingPolicy_def > rti::pub::FlowController↔ SchedulingPolicy**
 <<*extension*>> (p. 156) *The safe enumeration for **FlowControllerSchedulingPolicy_def::type** (p. 1325)*

Variables

- static OMG_DDS_API_CLASS_VARIABLE const std::string **rti::pub::FlowController::DEFAULT_NAME**
*Name that identifies the built-in default **FlowController** (p. 1316).*
- static OMG_DDS_API_CLASS_VARIABLE const std::string **rti::pub::FlowController::FIXED_RATE_NAME**
*Name that identifies the built-in fixed-rate **FlowController** (p. 1316).*
- static OMG_DDS_API_CLASS_VARIABLE const std::string **rti::pub::FlowController::ON_DEMAND_NAME**
*Name that identifies the built-in on-demand **FlowController** (p. 1316).*

6.13.1 Detailed Description

<<*extension*>> (p. 156) **rti::pub::FlowController** (p. 1316) and associated elements

rti::pub::FlowController (p. 1316) provides the network traffic shaping capability to asynchronous **dds::pub::DataWriter** (p.908) instances. For use cases and advantages of publishing asynchronously, please refer to **rti::core::policy::PublishMode** (p. 1739) of **dds::pub::qos::DataWriterQos** (p. 994).

FlowControllerSchedulingPolicy_def (p. 1325)

6.13.3 Variable Documentation

6.13.3.1 DEFAULT_NAME

```
OMG_DDS_API_CLASS_VARIABLE const std::string rti::pub::FlowController::DEFAULT_NAME [static]
```

Name that identifies the built-in default **FlowController** (p. 1316).

RTI Connext provides several built-in **rti::pub::FlowController** (p. 1316) for use with an asynchronous **dds::pub::DataWriter** (p. 908). The user can choose to use the built-in flow controllers and optionally modify their properties or can create a custom flow controller.

By default, flow control is disabled. That is, the built-in **rti::pub::FlowController::DEFAULT_NAME** (p. 57) flow controller does not apply any flow control. Instead, it allows data to be sent asynchronously as soon as it is written by the **dds::pub::DataWriter** (p. 908).

Essentially, this is equivalent to a user-created **rti::pub::FlowController** (p. 1316) with the following **rti::pub::FlowControllerProperty** (p. 1321) settings:

- **rti::pub::FlowControllerProperty::scheduling_policy** (p. 1323) = **FlowControllerSchedulingPolicy_def::↔** **EARLIEST_DEADLINE_FIRST** (p. 1326)
- **rti::pub::FlowControllerProperty::token_bucket** (p. 1323) **max_tokens** = **dds::core::LENGTH_UNLIMITED** (p. 238)
- **rti::pub::FlowControllerProperty::token_bucket** (p. 1323) **tokens_added_per_period** = **dds::core::↔** **LENGTH_UNLIMITED** (p. 238)
- **rti::pub::FlowControllerProperty::token_bucket** (p. 1323) **tokens_leaked_per_period** = 0
- **rti::pub::FlowControllerProperty::token_bucket** (p. 1323) **period** = 60 seconds
- **rti::pub::FlowControllerProperty::token_bucket** (p. 1323) **bytes_per_token** = **dds::core::LENGTH_↔** **UNLIMITED** (p. 238)

See also

- dds::pub::DataWriter** (p. 908) constructors
- rti::pub::find_flow_controller** (p. 537)
- rti::pub::FlowController::property** (p. 1318)
- rti::core::policy::PublishMode** (p. 1739)
- rti::core::policy::AsynchronousPublisher** (p. 620)

6.13.3.2 FIXED_RATE_NAME

```
OMG_DDS_API_CLASS_VARIABLE const std::string rti::pub::FlowController::FIXED_RATE_NAME [static]
```

Name that identifies the built-in fixed-rate **FlowController** (p. 1316).

RTI Connext provides several builtin **rti::pub::FlowController** (p. 1316) for use with an asynchronous **dds::pub::↔** **DataWriter** (p. 908). The user can choose to use the built-in flow controllers and optionally modify their properties or can create a custom flow controller.

The built-in **rti::pub::FlowController::FIXED_RATE_NAME** (p. 58) flow controller shapes the network traffic by allowing data to be sent only once every second. Any accumulated samples destined for the same destination are coalesced into as few network packets as possible.

Essentially, this is equivalent to a user-created **rti::pub::FlowController** (p. 1316) with the following **rti::pub::Flow↔** **ControllerProperty** (p. 1321) settings:

- **rti::pub::FlowControllerProperty::scheduling_policy** (p. 1323) = **FlowControllerSchedulingPolicy_def::↔** **EARLIEST_DEADLINE_FIRST** (p. 1326)

- **rti::pub::FlowControllerProperty::token_bucket** (p. 1323) `max_tokens = dds::core::LENGTH_UNLIMITED` (p. 238)
- **rti::pub::FlowControllerProperty::token_bucket** (p. 1323) `tokens_added_per_period = dds::core::LENGTH_UNLIMITED` (p. 238)
- **rti::pub::FlowControllerProperty::token_bucket** (p. 1323) `tokens_leaked_per_period = dds::core::LENGTH_UNLIMITED` (p. 238)
- **rti::pub::FlowControllerProperty::token_bucket** (p. 1323) `period = 1 second`
- **rti::pub::FlowControllerProperty::token_bucket** (p. 1323) `bytes_per_token = dds::core::LENGTH_UNLIMITED` (p. 238)

See also

- dds::pub::DataWriter** (p. 908) constructors
- rti::pub::find_flow_controller** (p. 537)
- rti::pub::FlowController::property** (p. 1318)
- rti::core::policy::PublishMode** (p. 1739)
- rti::core::policy::AsynchronousPublisher** (p. 620)

6.13.3.3 ON_DEMAND_NAME

```
OMG_DDS_API_CLASS_VARIABLE const std::string rti::pub::FlowController::ON_DEMAND_NAME [static]
```

Name that identifies the built-in on-demand **FlowController** (p. 1316).

RTI Connexnt provides several builtin **rti::pub::FlowController** (p. 1316) for use with an asynchronous **dds::pub::DataWriter** (p. 908). The user can choose to use the built-in flow controllers and optionally modify their properties or can create a custom flow controller.

The built-in **rti::pub::FlowController::ON_DEMAND_NAME** (p. 59) allows data to be sent only when the user calls **rti::pub::FlowController::trigger_flow** (p. 1319). With each trigger, all accumulated data since the previous trigger is sent (across all **dds::pub::Publisher** (p. 1719) or **dds::pub::DataWriter** (p. 908) instances). In other words, the network traffic shape is fully controlled by the user. Any accumulated samples destined for the same destination are coalesced into as few network packets as possible.

This external trigger source is ideal for users who want to implement some form of closed-loop flow control or who want to only put data on the wire every so many samples (e.g. with the number of samples based on **NDDS_Transport_Property_t::gather_send_buffer_count_max** (p. 1523)).

Essentially, this is equivalent to a user-created **rti::pub::FlowController** (p. 1316) with the following **rti::pub::FlowControllerProperty** (p. 1321) settings:

- `rti::pub::FlowControllerProperty::scheduling_policy` (p. 1323) = `FlowControllerSchedulingPolicy_def::← EARLIEST_DEADLINE_FIRST` (p. 1326)
- `rti::pub::FlowControllerProperty::token_bucket` (p. 1323) `max_tokens` = `dds::core::LENGTH_UNLIMITED` (p. 238)
- `rti::pub::FlowControllerProperty::token_bucket` (p. 1323) `tokens_added_per_period` = `dds::core::← LENGTH_UNLIMITED` (p. 238)
- `rti::pub::FlowControllerProperty::token_bucket` (p. 1323) `tokens_leaked_per_period` = `dds::core← ::LENGTH_UNLIMITED` (p. 238)
- `rti::pub::FlowControllerProperty::token_bucket` (p. 1323) `period` = `dds::core::Duration::infinite()` (p. 1197)
- `rti::pub::FlowControllerProperty::token_bucket` (p. 1323) `bytes_per_token` = `dds::core::LENGTH_← UNLIMITED` (p. 238)

6.14 Subscription Module

Contains the `dds::sub::Subscriber` (p. 2116), `dds::sub::DataReader` (p. 756), `dds::sub::cond::ReadCondition` (p. 1858), `dds::sub::cond::QueryCondition` (p. 1784), and `rti::sub::TopicQuery` (p. 2220) classes, as well as the `dds::sub::SubscriberListener` (p. 2128) and `dds::sub::DataReaderListener` (p. 832) interfaces, and more generally, all that is needed on the subscription side.

Modules

- **Subscribers**
 - `dds::sub::Subscriber` (p. 2116) *entity and associated elements*
- **DataReaders**
 - `dds::sub::DataReader` (p. 756) *entity and associated elements*
- **Data Samples**
 - `dds::sub::SampleInfo` (p. 1992), `dds::sub::status::SampleState` (p. 2023), `dds::sub::status::ViewState` (p. 2315), `dds::sub::status::InstanceState` (p. 1359) *and associated elements*
- **SampleProcessor**
 - `<<experimental>>` (p. 157) `<<extension>>` (p. 156) *Utility to concurrently read and process the data samples received by `dds::sub::DataReader` (p. 756).*

6.14.1 Detailed Description

Contains the `dds::sub::Subscriber` (p.2116), `dds::sub::DataReader` (p.756), `dds::sub::cond::ReadCondition` (p.1858), `dds::sub::cond::QueryCondition` (p.1784), and `rti::sub::TopicQuery` (p.2220) classes, as well as the `dds::sub::SubscriberListener` (p.2128) and `dds::sub::DataReaderListener` (p.832) interfaces, and more generally, all that is needed on the subscription side.

"DCPS Subscription package"

6.14.2 Access to data samples

Data is made available to the application by the following operations on `dds::sub::DataReader` (p.756) objects: `dds::sub::DataReader::read` (p.773), `dds::sub::DataReader::take` (p.774), `dds::sub::DataReader::select` (p.780), and the other variants of `read()` (p.801) and `take()` (p.801).

The general semantics of the `read()` (p.801) operation is that the application only gets access to the corresponding data (i.e. a precise instance value); the data remains the responsibility of RTI Connext and can be read again.

The semantics of the `take()` (p.801) operations is that the application takes full responsibility for the data; that data will no longer be available locally to RTI Connext. Consequently, it is possible to access the same information multiple times only if all previous accesses were `read()` (p.801) operations, not `take()` (p.801).

The `select()` operation allows specifying which samples to read or take depending on several parameters.

Each of these operations returns a collection of `Data` values and associated `dds::sub::SampleInfo` (p.1992) objects. Each data value represents an atom of data information (i.e., a value for one instance). This collection may contain samples related to the same or different instances (identified by the key). Multiple samples can refer to the same instance if the settings of the `HISTORY` (p.324) QoS allow for it.

These operations reset the read communication statuses; see **Changes in read communication status** (p.232).

See also

Interpretation of the SampleInfo (p.1993)

6.14.2.1 Data access patterns

Applications access data using the following `dds::sub::DataReader` (p.756) operations and their variants: `dds::sub::DataReader::read()` (p.773), `dds::sub::DataReader::take()` (p.774), and `dds::sub::DataReader::select()` (p.780).

These operations return a collection, `dds::sub::LoanedSamples` (p.1406), consisting of which contain the actual data and `dds::sub::SampleInfo` (p.1992) objects.

The way RTI Connext builds the collection depends on QoS policies set on the `dds::sub::DataReader` (p.756) and `dds::sub::Subscriber` (p.2116), the `source_timestamp` of the samples, and, when using `dds::sub::DataReader::select()` (p.780), the parameters used to build the `dds::sub::Selector`.

These operations are non-blocking and just deliver what is currently available.

Once the data samples are available to the `DataReader`, the application can read or take them.

To access data coherently, or in order, the **PRESENTATION** (p.331) QoS must be set properly.

6.15 Subscribers

dds::sub::Subscriber (p. 2116) entity and associated elements

Classes

- class **dds::sub::SubscriberListener**
*The listener to notify status changes for a **dds::sub::Subscriber** (p. 2116).*
- class **dds::sub::NoOpSubscriberListener**
*A convenience implementation of **SubscriberListener** (p. 2128) where all methods are overridden to do nothing.*
- class **dds::sub::CoherentAccess**
<<value-type>> (p. 152) Controls whether RTI Connext will preserve the groupings of changes made by the publishing application by means of `begin_coherent_changes` and `end_coherent_changes`.
- class **dds::sub::Subscriber**
<<reference-type>> (p. 153) A subscriber is the object responsible for actually receiving data from a subscription.
- class **dds::sub::qos::SubscriberQos**
*<<value-type>> (p. 152) Container of the QoS policies that a **dds::sub::Subscriber** (p. 2116) supports*

6.15.1 Detailed Description

dds::sub::Subscriber (p. 2116) entity and associated elements

6.16 DataReaders

dds::sub::DataReader (p. 756) entity and associated elements

Modules

- **Read Conditions**

- **Topic Queries**
***rti::sub::TopicQuery** (p. 2220) and associated elements.*

Classes

- class **dds::core::status::SampleRejectedState**
Reasons why a sample was rejected.
- class **dds::core::status::SampleLostStatus**
Information about the status `dds::core::status::StatusMask::sample_lost()` (p. 2088)
- class **dds::core::status::SampleRejectedStatus**
Information about the status `dds::core::status::StatusMask::sample_rejected()` (p. 2089)
- class **dds::core::status::LivelinessChangedStatus**
Information about the status `dds::core::status::StatusMask::liveliness_changed()` (p. 2090)
- class **dds::core::status::RequestedDeadlineMissedStatus**
Information about the status `dds::core::status::StatusMask::requested_deadline_missed()` (p. 2087)
- class **dds::core::status::RequestedIncompatibleQosStatus**
Information about the status `dds::core::status::StatusMask::requested_incompatible_qos()` (p. 2088)
- class **dds::core::status::SubscriptionMatchedStatus**
Information about the status `dds::core::status::StatusMask::subscription_matched()` (p. 2091)
- class **dds::sub::AnyDataReader**
*<<reference-type>> (p. 153) This class provides a non-template holder for representing a **DataReader** (p. 756) of any type*
- class **dds::sub::AnyDataReaderListener**
The listener to notify status changes for a `dds::sub::DataReader` (p. 756) of a generic type.
- class **dds::sub::DataReaderListener< T >**
*The **Listener** (p. 1381) to notify status changes for a `dds::sub::DataReader` (p. 756).*
- class **dds::sub::NoOpDataReaderListener< T >**
*A convenience implementation of **DataReaderListener** (p. 832) where all methods are overridden to do nothing.*
- class **dds::sub::DataReader< T >**
<<reference-type>> (p. 153) Allows the application to: (1) declare the data it wishes to receive (i.e. make a subscription) and (2) access the data received by the attached `dds::sub::Subscriber` (p. 2116).
- class **dds::sub::DataReader< T >::Selector**
*The **Selector** (p. 2027) class is used by the **DataReader** (p. 756) to compose read and take operations.*
- class **dds::sub::DataReader< T >::ManipulatorSelector**
*A **Selector** (p. 2027) class enabling the streaming API.*
- class **rti::core::status::SampleLostState**
<<extension>> (p. 156) Reasons why a sample was lost
- class **rti::core::status::DataReaderCacheStatus**
<<extension>> (p. 156) Information about the status `dds::core::status::StatusMask::datareader_cache()` (p. 2093)
- class **rti::core::status::DataReaderProtocolStatus**
<<extension>> (p. 156) Information about the status `dds::core::status::StatusMask::datareader_protocol()` (p. 2094)
- class **dds::sub::qos::DataReaderQos**
<<value-type>> (p. 152) Container of the QoS policies that a `dds::sub::DataReader` (p. 756) supports

6.16.1 Detailed Description

dds::sub::DataReader (p. 756) entity and associated elements

6.17 Read Conditions

`dds::sub::cond::ReadCondition` (p. 1858) and associated elements

Classes

- class `dds::sub::cond::ReadCondition`
 <<*reference-type*>> (p. 153) Condition specifically dedicated to read operations and attached to one `dds::sub::DataReader` (p. 756).

6.17.1 Detailed Description

`dds::sub::cond::ReadCondition` (p. 1858) and associated elements

6.18 Query Conditions

`dds::sub::cond::QueryCondition` (p. 1784) and associated elements

Classes

- class `dds::sub::cond::QueryCondition`
 <<*reference-type*>> (p. 153) Specialized `ReadCondition` (p. 1858) that allows applications to also specify a filter on the data available in a `dds::sub::DataReader` (p. 756)
- class `dds::sub::Query`
 <<*value-type*>> (p. 152) Encapsulates a query for a `dds::sub::cond::QueryCondition` (p. 1784).

Functions

- `dds::sub::cond::detail::QueryCondition rti::sub::cond::create_query_condition_ex` (const `dds::sub::Query` &query, const `::rti::sub::status::DataStateEx` &status)
 <<*extension*>> (p. 156) Creates a `QueryCondition` with the extended `DataStateEx`.
- `template<typename Functor >`
`dds::sub::cond::detail::QueryCondition rti::sub::cond::create_query_condition_ex` (const `dds::sub::Query` &query, const `::rti::sub::status::DataStateEx` &status, const `Functor` &handler)
 <<*extension*>> (p. 156) Creates a `QueryCondition` with the extended `DataStateEx` and a handler.

6.18.1 Detailed Description

`dds::sub::cond::QueryCondition` (p. 1784) and associated elements

6.18.2 Function Documentation

6.18.2.1 create_query_condition_ex() [1/2]

```
dds::sub::cond::detail::QueryCondition rti::sub::cond::create_query_condition_ex (
    const dds::sub::Query & query,
    const ::rti::sub::status::DataStateEx & status ) [inline]
```

<<**extension**>> (p. 156) Creates a QueryCondition with the extended DataStateEx.

Note

This is a standalone function in the namespace rti::sub::cond

The usual way to create a **dds::sub::cond::QueryCondition** (p. 1784) is the constructor that receives a **dds::sub::status::DataState** (p. 888). This extension function allows using **rti::sub::status::DataStateEx** (p. 896), which includes additional state masks.

6.18.2.2 create_query_condition_ex() [2/2]

```
template<typename Functor >
dds::sub::cond::detail::QueryCondition rti::sub::cond::create_query_condition_ex (
    const dds::sub::Query & query,
    const ::rti::sub::status::DataStateEx & status,
    const Functor & handler )
```

<<**extension**>> (p. 156) Creates a QueryCondition with the extended DataStateEx and a handler.

Note

This is a standalone function in the namespace rti::sub::cond

The usual way to create a **dds::sub::cond::QueryCondition** (p. 1784) is the constructor that receives a **dds::sub::status::DataState** (p. 888). This extension function allows using **rti::sub::status::DataStateEx** (p. 896), which includes additional state masks.

6.19 Data Samples

dds::sub::SampleInfo (p. 1992), **dds::sub::status::SampleState** (p. 2023), **dds::sub::status::ViewState** (p. 2315), **dds::sub::status::InstanceState** (p. 1359) and associated elements

Modules

- **Sample Information**
- **Data State**

Describes DataState, which includes SampleState, ViewState and InstanceState. .

Classes

- class **dds::sub::SharedSamples**< T, DELEGATE >
 <<reference-type>> (p. 153) A sharable and container-safe version of **LoanedSamples** (p. 1406).
- class **dds::sub::Sample**< T >
 <<value-type>> (p. 152) This class encapsulate the data and meta-data associated with DDS samples.
- class **dds::sub::SampleInfo**
 <<value-type>> (p. 152) Information that accompanies each sample received by a **DataReader** (p. 756)
- class **rti::core::CoherentSetInfo**
 <<extension>> (p. 156) <<value-type>> (p. 152) A **CoherentSampleInfo** provides information about the coherent set associated with a sample.
- class **rti::sub::LoanedSample**< T >
 The element type of a **dds::sub::LoanedSamples** (p. 1406) collection.
- class **dds::sub::LoanedSamples**< T >
 <<move-only-type>> (p. 155) Provides temporary access to a collection of samples (data and info) from a **DataReader** (p. 756).
- struct **rti::sub::IsValidData**< T >
 <<extension>> (p. 156) A functor that returns true when a sample has valid data.
- class **rti::sub::ValidLoanedSamples**< T >
 <<extension>> (p. 156) <<C++11>> (p. 155) <<move-only-type>> (p. 155) Provides access to only those samples that contain valid data
- class **rti::sub::SampleIterator**< T >
 A random-access iterator of **LoanedSample** (p. 1402).
- class **rti::sub::ValidSampleIterator**< T >
 A forward iterator adapter that skips invalid samples.

6.19.1 Detailed Description

dds::sub::SampleInfo (p. 1992), **dds::sub::status::SampleState** (p. 2023), **dds::sub::status::ViewState** (p. 2315), **dds::sub::status::InstanceState** (p. 1359) and associated elements

6.20 Topic Queries

rti::sub::TopicQuery (p. 2220) and associated elements.

Classes

- struct **rti::sub::TopicQuerySelectionKind_def**
*The definition of the **dds::core::safe_enum** (p. 1972) **rti::sub::TopicQuerySelectionKind** (p. 69).*
- class **rti::sub::TopicQuerySelection**
*<<extension>> (p. 156) <<value-type>> (p. 152) Specifies the data query that defines a **TopicQuery** (p. 2220).*
- class **rti::sub::TopicQueryData**
*<<extension>> (p. 156) <<value-type>> (p. 152) Provides information about a **TopicQuery** (p. 2220)*
- class **rti::sub::TopicQuery**
*<<extension>> (p. 156) <<reference-type>> (p. 153) Allows a **dds::sub::DataReader** (p. 756) to query the sample cache of its matching **dds::pub::DataWriters**.*

Typedefs

- typedef **dds::core::safe_enum**< **TopicQuerySelectionKind_def** > **rti::sub::TopicQuerySelectionKind**
*Safe Enumeration (p. 229) of **TopicQuerySelectionKind_def** (p. 2232)*

6.20.1 Detailed Description

rti::sub::TopicQuery (p. 2220) and associated elements.

TopicQueries allow a **dds::sub::DataReader** (p. 756) to query the sample cache of its matching **dds::pub::DataWriter** (p. 908). When the application creates a TopicQuery, DDS will propagate it to other DomainParticipants and their DataWriters. When a DataWriter matching with the DataReader that created the TopicQuery receives it, it will send the cached samples that pass the TopicQuery's filter.

To configure how to dispatch a TopicQuery, the **dds::pub::qos::DataWriterQos** (p. 994) includes the **rti::core::policy::TopicQueryDispatch** (p. 2226) policy. By default, a DataWriter ignores TopicQueries unless they are explicitly enabled using this policy.

The delivery of TopicQuery samples occurs in a separate RTPS channel. This allows DataReaders to receive TopicQuery samples and live samples in parallel. This is a key difference with respect to the Durability QoS policy.

Late-joining DataWriters will also discover existing TopicQueries.

After deleting a TopicQuery, new DataWriters won't discover it and existing DataWriters currently publishing cached samples may stop before delivering all of them. See **rti::sub::TopicQuery::close()** (p. 2222).

By default, a TopicQuery queries the samples that were in the DataWriter cache at the time the DataWriter receives the TopicQuery. However a TopicQuery can be created in a "continuous" mode. A DataWriter will continue delivering samples that pass a continuous TopicQuery filter until the DataReader application explicitly deletes it.

The samples received in response to a TopicQuery are stored in the associated DataReader's cache. Any of the read/take operations can retrieve TopicQuery samples. The field **dds::sub::SampleInfo::topic_query_guid** (p. 2001) associates each sample to its TopicQuery. If the read sample is not in response to a TopicQuery then this field will be **rti::core::Guid::unknown()** (p. 1341). Note that the same data may be received several times, depending on how many TopicQueries the DataReader creates and their TopicQuerySelection.

You can choose to read or take only TopicQuery samples, only live samples, or both. To support this ReadConditions and QueryConditions provide the **rti::sub::cond::create_query_condition_ex** and **rti::sub::cond::create_read_condition_ex** APIs.

Each TopicQuery is identified by a GUID that can be accessed using the **rti::sub::TopicQuery::guid** (p. 2222) method.

6.20.2 Debugging Topic Queries

There are a number of ways in which to gain more insight into what is happening in an application that is creating Topic Queries.

6.20.2.1 The Built-in ServiceRequest DataReader

TopicQueries are communicated to publishing applications through a built-in `rti::topic::ServiceRequest` (p. 2065) channel. The ServiceRequest channel is designed to be generic so that it can be used for many different purposes, one of which is TopicQueries.

When a DataReader creates a TopicQuery, a `rti::topic::ServiceRequest` (p. 2065) message is sent containing the TopicQuery information. Just as there are built-in DataReaders for `dds::topic::ParticipantBuiltinTopicData` (p. 1639), `dds::topic::SubscriptionBuiltinTopicData` (p. 2133), and `dds::topic::PublicationBuiltinTopicData` (p. 1703), there is a fourth built-in DataReader for ServiceRequests.

The new built-in DataReader can be retrieved using the built-in subscriber and `dds::sub::find` (p. 460). The topic name is `rti::topic::service_request_topic_name()` (p. 358). Installing a listener with the `dds::sub::DataReaderListener::on_data_available` (p. 835) callback implemented will allow a publishing application to be notified whenever a TopicQuery has been received from a subscribing application.

The `rti::topic::ServiceRequest::service_id` (p. 2066) of a `rti::topic::ServiceRequest` (p. 2065) corresponding to a `rti::sub::TopicQuery` (p. 2220) will be `rti::core::ServiceRequestId_def::TOPIC_QUERY` (p. 2069) and the `rti::topic::ServiceRequest::instance_id` (p. 2066) will be equal to the GUID of the `rti::sub::TopicQuery` (p. 2220) (see `rti::sub::TopicQuery::guid` (p. 2222)).

The `rti::topic::ServiceRequest::request_body` (p. 2066) is a sequence of bytes containing more information about the TopicQuery. This information can be retrieved using the `rti::sub::create_topic_query_data_from_service_request()` (p. 555) function. The resulting `rti::sub::TopicQueryData` (p. 2224) contains the `rti::sub::TopicQuerySelection` (p. 2229) that the `rti::sub::TopicQuery` (p. 2220) was created with, the GUID of the original DataReader that created the TopicQuery, and the topic name of that DataReader. Note: When TopicQueries are propagated through one or more Routing Services, the last DataReader that issued the TopicQuery will be a Routing Service DataReader. The `rti::sub::TopicQueryData::original_related_reader_guid` (p. 2225), however, will be that of the first DataReader to have created the TopicQuery.

6.20.2.2 The on_service_request_accepted DataWriter Listener Callback

It is possible that a `rti::topic::ServiceRequest` (p. 2065) for a `rti::sub::TopicQuery` (p. 2220) is received but is not immediately dispatched to a DataWriter. This can happen, for example, if a DataWriter was not matching with a DataReader at the time that the TopicQuery was received by the publishing application. The `dds::pub::DataWriterListener::on_service_request_accepted` (p. 978) callback notifies a DataWriter when a ServiceRequest has been dispatched to that DataWriter. The `rti::core::status::ServiceRequestAcceptedStatus` (p. 2067) provides information about how many ServiceRequests have been accepted by the DataWriter since the last time that the status was read. The status also includes the `rti::core::status::ServiceRequestAcceptedStatus::last_request_handle` (p. 2068), which is the `dds::core::InstanceHandle` (p. 1356) of the last ServiceRequest that was accepted. This instance handle can be used to read samples per instance from the built-in ServiceRequest DataReader and correlate which ServiceRequests have been dispatched to which DataWriters.

6.20.2.3 Reading TopicQuery Samples

Data samples that are received by a `DataReader` in response to a `TopicQuery` can be identified with two pieces of information from the corresponding `dds::sub::SampleInfo` (p. 1992) to the sample. First, if the `dds::sub::SampleInfo::topic_query_guid` (p. 2001) is not equal to `rti::core::Guid::unknown()` (p. 1341) then the sample is in response to the `TopicQuery` with that GUID (see `rti::sub::TopicQuery::guid` (p. 2222)). Second, if the sample is in response to a `TopicQuery` and the `dds::sub::SampleInfo::flag` (p. 2000) `rti::core::SampleFlag::intermediate_topic_query_sample` (p. 1988) flag is set then this is not the last sample in response to the `TopicQuery` for a `DataWriter` identified by `dds::sub::SampleInfo::original_publication_virtual_guid` (p. 1998). If that flag is not set then there will be no more samples corresponding to that `TopicQuery` coming from the `DataWriter`.

6.20.3 Typedef Documentation

6.20.3.1 TopicQuerySelectionKind

```
typedef dds::core::safe_enum< TopicQuerySelectionKind_def> rti::sub::TopicQuerySelectionKind
```

Safe Enumeration (p. 229) of `TopicQuerySelectionKind_def` (p. 2232)

See also

`TopicQuerySelectionKind_def` (p. 2232) for the enumerated values

6.21 Sample Information

Classes

- class `dds::sub::GenerationCount`
 << *value-type* >> (p. 152)
- class `dds::sub::Rank`
 << *value-type* >> (p. 152) *Contains the sample and generation ranks of a data-sample*
- class `dds::sub::SampleInfo`
 << *value-type* >> (p. 152) *Information that accompanies each sample received by a **DataReader** (p. 756)*

6.21.1 Detailed Description

6.22 Data State

Describes `DataState`, which includes `SampleState`, `ViewState` and `InstanceState`. .

Classes

- class **dds::sub::status::SampleState**
Indicates whether or not a sample has ever been read.
- class **dds::sub::status::ViewState**
Indicates whether or not an instance is new.
- class **dds::sub::status::InstanceState**
*Indicates if the samples are from a live **dds::pub::DataWriter** (p. 908) or not.*
- class **dds::sub::status::DataState**
*The **DataState** (p. 888) class describes the state of a sample and includes the information about the sample's **InstanceState** (p. 1359), **ViewState** (p. 2315), and **SampleState** (p. 2023).*
- class **rti::sub::status::StreamKind**
<<extension>> (p. 156) Indicates which stream to read from: live stream, topic-query stream or both
- class **rti::sub::status::DataStateEx**
*<<extension>> (p. 156) <<value-type>> (p. 152) An extended version of **dds::sub::status::DataState** (p. 888) that also contains **StreamKind** (p. 2097)*

6.22.1 Detailed Description

Describes DataState, which includes SampleState, ViewState and InstanceState. .

6.23 Infrastructure Module

Defines the abstract classes and the interfaces that are refined by the other modules. Contains common definitions such as return codes, status values, and QoS policies.

Modules

- **Clock Selection**
APIs related to clock selection.
- **Conditions and WaitSets**
***dds::core::cond::Condition** (p. 729) and **dds::core::cond::WaitSet** (p. 2318).*
- **Time Support**
Time and duration types.
- **Exceptions**
- **Safe Enumeration**
*Describes the **safe_enum** (p. 1972) class.*
- **Status Kinds**
Kinds of communication status.
- **Supporting Types and Constants**
Miscellaneous, general-purpose types and constants.
- **Builtin Qos Profiles**
<<extension>> (p. 156) QoS libraries and profiles that are automatically built into RTI Connext.
- **QoS Policies**
Quality of Service (QoS) policies.

Classes

- class **dds::core::Entity**
 <<**reference-type**>> (p. 153) *This is the abstract base class for all the DDS objects that support QoS policies, a listener and a status condition.*
- class **rti::core::Cookie**
Unique identifier for a written data sample in the form of a sequence of bytes.
- class **rti::core::Guid**
 <<**extension**>> (p. 156) <<**value-type**>> (p. 152) *Class for GUID (Global Unique Identifier) representation*
- class **rti::core::QosPrintFormat**
 <<**extension**>> (p. 156) <<**value-type**>> (p. 152) *A collection of attributes used to configure how QoS will be formatted when converted to strings.*
- class **rti::core::SampleFlag**
 <<**extension**>> (p. 156) *A set of flags that can be associated with a sample.*
- class **rti::core::SampleIdentity**
 <<**extension**>> (p. 156) <<**value-type**>> (p. 152) *A **SampleIdentity** (p. 1989) defines a pair (Virtual Writer **Guid** (p. 1340), **SequenceNumber** (p. 2042)) that uniquely identifies a sample within a DDS domain and a Topic.*
- class **rti::core::SequenceNumber**
 <<**extension**>> (p. 156) <<**value-type**>> (p. 152) *A class representing the DDS 64-bit Sequence Number*

6.23.1 Detailed Description

Defines the abstract classes and the interfaces that are refined by the other modules. Contains common definitions such as return codes, status values, and QoS policies.

6.24 Multi-channel DataWriters

APIs related to Multi-channel DataWriters.

APIs related to Multi-channel DataWriters.

6.24.1 What is a Multi-channel DataWriter?

A Multi-channel **dds::pub::DataWriter** (p. 908) is a **dds::pub::DataWriter** (p. 908) that is configured to send data over multiple multicast addresses, according to some filtering criteria applied to the data.

To determine which multicast addresses will be used to send the data, the middleware evaluates a set of filters that are configured for the **dds::pub::DataWriter** (p. 908). Each filter "guards" a channel (a set of multicast addresses). Each time a multi-channel **dds::pub::DataWriter** (p. 908) writes data, the filters are applied. If a filter evaluates to true, the data is sent over that filter's associated channel (set of multicast addresses). We refer to this type of filter as a Channel Guard filter.

6.24.2 Configuration on the Writer Side

To configure a multi-channel `dds::pub::DataWriter` (p.908), simply define a list of all its channels in the `rti::core::policy::MultiChannel` (p. 1483).

The `rti::core::policy::MultiChannel` (p. 1483) is propagated along with discovery traffic. The value of this policy is available in `dds::topic::PublicationBuiltinTopicData::locator_filter` (p. 1715).

6.24.3 Configuration on the Reader Side

No special changes are required in a subscribing application to get data from a multichannel `dds::pub::DataWriter` (p.908). If you want the `dds::sub::DataReader` (p.756) to subscribe to only a subset of the channels, use a `dds::topic::ContentFilteredTopic` (p. 735).

For more information on Multi-channel DataWriters, refer to the `User's Manual`.

6.24.4 Reliability with Multi-Channel DataWriters

6.24.4.1 Reliable Delivery

Reliable delivery is only guaranteed when the `dds::core::policy::Presentation::access_scope` (p.1674) is set to `dds::core::policy::PresentationAccessScopeKind_def::INSTANCE` (p.1677) and the filters in `rti::core::policy::MultiChannel` (p. 1483) are keyed-only based.

If any of the guard filters are based on non-key fields, RTI Connext only guarantees reception of the most recent data from the MultiChannel DataWriter.

6.24.4.2 Reliable Protocol Considerations

Reliability is maintained on a per-channel basis. Each channel has its own reliability channel send queue. The size of that queue is limited by `dds::core::policy::ResourceLimits::max_samples` (p. 1924) and/or `rti::core::policy::DataWriterResourceLimits::max_batches` (p. 1007).

The protocol parameters described in `rti::core::policy::DataWriterProtocol` (p. 979) are applied per channel, with the following exceptions:

`rti::core::RtpsReliableWriterProtocol::low_watermark` and `rti::core::RtpsReliableWriterProtocol::high_watermark`: The low watermark and high watermark control the queue levels (in number of samples) that determine when to switch between regular and fast heartbeat rates. With MultiChannel DataWriters, `high_watermark` and `low_watermark` refer to the DataWriter's queue (not the reliability channel queue). Therefore, periodic heartbeating cannot be controlled on a per-channel basis.

Important: With MultiChannel DataWriters, `low_watermark` and `high_watermark` refer to application samples even if batching is enabled. This behavior differs from the one without MultiChannel DataWriters (where `low_watermark` and `high_watermark` refer to batches).

`rti::core::RtpsReliableWriterProtocol::heartbeats_per_max_samples`: This field defines the number of heartbeats per send queue. For MultiChannel DataWriters, the value is applied per channel. However, the send queue size that is used

to calculate the a piggyback heartbeat rate is defined per DataWriter (see `dds::core::policy::ResourceLimits::max_heartbeat_per_max_samples` (p. 1924))

Important: With MultiChannel DataWriters, `heartbeats_per_max_samples` refers to samples even if batching is enabled. This behavior differs from the one without MultiChannels DataWriters (where `heartbeats_per_max_samples` refers to batches).

With batching and MultiChannel DataWriters, the size of the DataWriter's send queue should be configured using `dds::core::policy::ResourceLimits::max_samples` (p. 1924) instead of `max_batches` `rti::core::policy::DataWriterResourceLimits::max_batches` (p. 1007) in order to take advantage of `heartbeats_per_max_samples`.

6.25 Transports

APIs related to RTI Connexth pluggable transports.

Modules

- **Installing Transport Plugins**
Installing and configuring transports used by RTI Connexth.
- **Built-in Transport Plugins**
Transport plugins delivered with RTI Connexth.
- **Creating New Transport Plugins**
Developing new transport plugins for RTI Connexth.
- **Transport Plugins Configuration**
Transport plugins configuration with RTI Connexth.
- **Transport Address**
Transport-independent addressing scheme using IPv6 presentation strings and numerically stored in network-ordered format.

6.25.1 Detailed Description

APIs related to RTI Connexth pluggable transports.

6.25.2 Overview

RTI Connexth has a pluggable transports architecture. The core of RTI Connexth is transport agnostic; it does not make any assumptions about the actual transports used to send and receive messages. Instead, the RTI Connexth core uses an abstract "transport API" to interact with the **transport plugins** which implement that API.

A transport plugin implements the abstract transport API and performs the actual work of sending and receiving messages over a physical transport. A collection of **builtin plugins** (see **Built-in Transport Plugins** (p. 81)) is delivered with RTI Connexth for commonly used transports. New transport plugins can easily be created, thus enabling RTI Connexth applications to run over transports that may not even be conceived yet. This is a powerful capability and that distinguishes RTI Connexth from competing middleware approaches.

RTI Connexth also provides a set of APIs for installing and configuring transport plugins to be used in an application. So that RTI Connexth applications work out of the box, a subset of the builtin transport plugins is preconfigured by default (see `rti::core::policy::TransportBuiltin` (p. 2237)). You can "turn-off" some or all of the builtin transport plugins. In addition, you can configure other transport plugins for use by the application.

6.25.3 Transport Aliases

In order to use a transport plugin instance in an RTI Connex application, it must be registered with a `dds::domain::DomainParticipant` (p. 1079). When you register a transport, you specify a sequence of "alias" strings to symbolically refer to the transport plugin. The same alias strings can be used to register more than one transport plugin.

You can register multiple transport plugins with a `dds::domain::DomainParticipant` (p. 1079). An `alias` symbolically refers to one or more transport plugins registered with the `dds::domain::DomainParticipant` (p. 1079). Builtin transport plugin instances can be referred to using preconfigured aliases (see `TRANSPORT_BUILTIN` (p. 339)).

A transport plugin's class name is automatically used as an implicit alias. It can be used to refer to all the transport plugin instances of that class.

You can use aliases to refer to transport plugins, in order to specify:

- the transport plugins to use for `discovery` (see `rti::core::policy::Discovery::enabled_transports` (p. 1031)), and for `dds::pub::DataWriter` (p. 908) and `dds::sub::DataReader` (p. 756) entities (see `rti::core::policy::TransportSelection` (p. 2257)).
- the `multicast` addresses on which to receive discovery messages (see `rti::core::policy::Discovery::multicast_receive_addresses` (p. 1032)), and the multicast addresses and ports on which to receive user data (see `rti::core::policy::TransportMulticast` (p. 2247)).
- the `unicast ports` used for user data (see `rti::core::policy::TransportUnicast` (p. 2259)) on both `dds::pub::DataWriter` (p. 908) and `dds::sub::DataReader` (p. 756) entities.
- the transport plugins used to parse an address string in a locator (`Locator Format` (p. 351) and `NDDS_DISCOVERY_PEERS` (p. 349)).

A `dds::domain::DomainParticipant` (p. 1079) (and contained its entities) start using a transport plugin after the `dds::domain::DomainParticipant` (p. 1079) is enabled (see `dds::core::Entity::enable` (p. 1269)). An entity will use *all* the transport plugins that match the specified transport QoS policy. All transport plugins are treated uniformly, regardless of how they were created or registered; there is no notion of some transports being more "special" than others.

6.25.4 Transport Lifecycle

A transport plugin is owned by whomever creates it. Thus, if you create and register a transport plugin with a `dds::domain::DomainParticipant` (p. 1079), you are responsible for deleting it by calling its destructor. Note that builtin transport plugins (`TRANSPORT_BUILTIN` (p. 339)) and transport plugins that are loaded through the `PROPERTY` (p. 332) QoS policy (see `Loading Transport Plugins through Property QoS Policy of Domain Participant` (p. 79)) are automatically managed by RTI Connex.

A user-created transport plugin must not be deleted while it is still in use by a `dds::domain::DomainParticipant` (p. 1079). This generally means that a user-created transport plugin instance can only be deleted after the `dds::domain::DomainParticipant` (p. 1079) with which it was registered is deleted (see `DomainParticipantFactory::delete_participant`). Note that a transport plugin *cannot* be "unregistered" from a `dds::domain::DomainParticipant` (p. 1079).

A transport plugin instance cannot be registered with more than one `dds::domain::DomainParticipant` (p. 1079) at a time. This requirement is necessary to guarantee the multi-threaded safety of the transport API.

If the same physical transport resources are to be used with more than one `dds::domain::DomainParticipant` (p. 1079) in the same address space, the transport plugin should be written in such a way so that it can be instantiated multiple times—once for each `dds::domain::DomainParticipant` (p. 1079) in the address space. Note that it is always possible to write the transport plugin so that multiple transport plugin instances share the same underlying resources; however the burden (if any) of guaranteeing multi-threaded safety to access shared resource shifts to the transport plugin developer.

6.25.5 Transport Class Attributes

A transport plugin instance is associated with two kinds of attributes:

- the *class* attributes that are decided by the plugin writer; these are invariant across all instances of the transport plugin class, and
- the *instance* attributes that can be set on a per instance basis by the transport plugin user.

Every transport plugin must specify the following class attributes.

transport class id (see `NDDS_Transport_Property_t::classid` (p. 1521)) Identifies a transport plugin implementation class. It denotes a unique "class" to which the transport plugin instance belongs. The class is used to distinguish between different transport plugin implementations. Thus, a transport plugin vendor should ensure that its transport plugin implementation has a unique class.

Two transport plugin instances report the same class *iff* they have compatible implementations. Transport plugin instances with mismatching classes are not allowed (by the RTI Connex Core) to communicate with one another.

Multiple implementations (possibly from different vendors) for a physical transport mechanism can co-exist in an RTI Connex application, provided they use different transport class IDs.

The class ID can also be used to distinguish between different transport protocols over the same physical transport network (e.g., UDP vs. TCP over the IP routing infrastructure).

transport significant address bit count (see `NDDS_Transport_Property_t::address_bit_count` (p. 1522)) RTI Connex's addressing is modeled after the IPv6 and uses 128-bit addresses (**Transport Address** (p. 173)) to route messages.

A transport plugin is expected to map the transport's internal addressing scheme to 128-bit addresses. Depending on the sign of this attribute, this mapping uses only *N* least significant bits (LSB) if positive or *N* most significant bits (MSB) if negative; these bits are specified by this attribute.

```

>----- netmask -----<

+-----+-----+
|           Network Address           | Transport Local Address |
+-----+-----+

                                     >----- N -----<
                                     address_bits_count

                                     Only these bits are used
                                     by the transport plugin
                                     if sign is positive.

                                     >----- netmask -----<

+-----+-----+
| Transport Local Address |           Network Address           |
+-----+-----+

```

```

>----- N -----<
        address_bits_count

    Only these bits are used
    by the transport plugin
    if sign is negative.

```

The remaining bits of an address using the $128 - \text{abs}(\text{bit address})$ representation will be considered as part of the "network address" (see **Transport Network Address** (p. 77)) and thus ignored by the transport plugin's internal addressing scheme.

For *unicast* addresses, the transport plugin is expected to ignore the higher ($128 - \text{NDDS_Transport_Property_t::address_bit_count}$ (p. 1522)) bits. RTI Connex is free to manipulate those bits freely in the addresses passed in/out to the transport plugin APIs.

Theoretically, the significant address bits count, *N* is related to the size of the underlying transport network as follows:

$$\text{address_bits_count} \geq \text{ceil}(\log_2(\text{total_addressable_transport_unicast_interfaces}))$$

The equality holds when the most compact (theoretical) internal address mapping scheme is used. A practical address mapping scheme may waste some bits.

6.25.6 Transport Instance Attributes

The *per instance* attributes to configure the plugin instance are generally passed in to the plugin constructor. These are defined by the transport plugin writer, and can be used to:

- customize the behavior of an instance of a transport plugin, including the send and the receiver buffer sizes, the maximum message size, various transport level classes of service (CoS), and so on.
- specify the resource values, network interfaces to use, various transport level policies, and so on.

RTI Connex requires that every transport plugin instance must specify the **NDDS_Transport_Property_t::message_size_max** (p. 1523) and **NDDS_Transport_Property_t::gather_send_buffer_count_max** (p. 1523).

It is up to the transport plugin developer to make these available for configuration to transport plugin user.

Note that it is important that the instance attributes are "compatible" between the sending side and the receiving side of communicating applications using different instances of a transport plugin class. For example, if one side is configured to send messages larger than can be received by the other side, then communications via the plugin may fail.

6.25.7 Transport Network Address

The address bits not used by the transport plugin for its internal addressing constitute its network address bits.

In order for RTI Connex to properly route the messages, each unicast interface in the RTI Connex *domain* must have a unique address. RTI Connex allows the user to specify the value of the network address when installing a transport plugin via the `Transport_Support::register_transport()` API.

The network address for a transport plugin should be chosen such that the resulting fully qualified 128-bit address will be unique in the RTI Connex domain. Thus, if two instances of a transport plugin are registered with a `dds::domain` ↔ `::DomainParticipant` (p. 1079), they will be at different network addresses in order for their unicast interfaces to have unique fully qualified 128-bit addresses. It is also possible to create multiple transports with the same network address, as it can be useful for certain use cases; note that this will require special entity configuration for most transports to avoid clashes in resource use (e.g. sockets for UDPv4 transport).

6.25.8 Transport Send Route

By default, a transport plugin is configured to send outgoing messages destined to addresses in the network address range at which the plugin was registered.

RTI Connex allows the user to configure the routing of outgoing messages via the `Transport_Support::add_send` ↔ `route()` API, so that a transport plugin will be used to send messages only to certain ranges of destination addresses. The method can be called multiple times for a transport plugin, with different address ranges.

The user can set up a routing table to restrict the use of a transport plugin to send messages to selected addresses ranges.

6.25.9 Transport Receive Route

By default, a transport plugin is configured to receive incoming messages destined to addresses in the network address range at which the plugin was registered.

RTI Connex allows the user to configure the routing of incoming messages via the `Transport_Support::add_receive` ↔ `_route()` API, so that a transport plugin will be used to receive messages only on certain ranges of addresses. The method can be called multiple times for a transport plugin, with different address ranges.

```

+-----+
|      Transport Plugin      <- Incoming Address Range 1 |
+-----+
|          :                  <-          :                |
+-----+
|      Transport Plugin      <- Incoming Address Range M |
+-----+

```

The user can set up a routing table to restrict the use of a transport plugin to receive messages from selected ranges. For example, the user may restrict a transport plugin to

- receive messages from a certain multicast address range.
- receive messages only on certain unicast interfaces (when multiple unicast interfaces are available on the transport plugin).

6.26 Installing Transport Plugins

Installing and configuring transports used by RTI Connex.

Installing and configuring transports used by RTI Connex.

There is more than one way to install a transport plugin for use with RTI Connex:

- If it is a builtin transport plugin, by specifying a bitmask in **rti::core::policy::TransportBuiltin** (p. 2237) (see **Built-in Transport Plugins** (p. 81))
- For all other non-builtin transport plugins, by dynamically loading the plugin through **PROPERTY** (p. 332) QoS policy settings of **dds::domain::DomainParticipant** (p. 1079) (only supported on architectures that support dynamic libraries, see **Loading Transport Plugins through Property QoS Policy of Domain Participant** (p. 79))

The lifecycle of the transport plugin is automatically managed by RTI Connex. See **Transport Lifecycle** (p. 74) for details.

6.26.1 Loading Transport Plugins through Property QoS Policy of Domain Participant

On architectures that support dynamic libraries, a non-builtin transport plugin written in C/C++ and built as a dynamic-link library (*.dll/*.so) can be loaded by RTI Connex through the **PROPERTY** (p. 332) QoS policy settings of the **dds::domain::DomainParticipant** (p. 1079).

Dynamic libraries are supported on all architectures except INTEGRITY and certain VxWorks platforms. For VxWorks, dynamic libraries are only supported for architectures that are on Pentium/Arm CPUs AND use kernel mode.

The dynamic-link library (and all the dependent libraries) need to be in the library search path during runtime (in the **LD_LIBRARY_PATH** environment variable on Linux systems, **DYLD_LIBRARY_PATH** on macOS systems, or **Path** on Windows systems).

To allow dynamic loading of the transport plugin, the transport plugin must implement the RTI Connex abstract transport API and must provide a function with the signature `Transport_create_plugin` that can be called by RTI Connex to create an instance of the transport plugin. The name of the dynamic library that contains the transport plugin implementation, the name of the function and properties that can be used to create the plugin, and the aliases and network address that are used to register the plugin can all be specified through the **PROPERTY** (p. 332) QoS policy of the **dds::domain::DomainParticipant** (p. 1079).

The following table lists the property names that are used to load the transport plugins dynamically:

Table 6.5 Properties for dynamically loading and registering transport plugins

Property Name	Description	Required?
<code>dds.transport.load_plugins</code>	Comma-separated strings indicating the prefix names of all plugins that will be loaded by RTI Connex. Up to 8 plugins may be specified. For example, "dds.transport.TCPv4.tcp1, dds.transport.TCPv4.tcp2", In the following examples, <TRANSPORT_PREFIX> is used to indicate one element of this string that is used as a prefix in the property names for all the settings that are related to the plugin. <TRANSPORT_PREFIX> must begin with "dds.transport." (such as "dds.transport.mytransport").	YES
<code><TRANSPORT_PREFIX>.library</code>	Should be set to the name of the dynamic library (*.so for Linux systems, *.dylib for macOS systems, and *.dll for Windows systems) that contains the transport plugin implementation. This library (and all the other dependent dynamic libraries) needs to be in the library search path used by RTI Connex during run time (pointed to by the environment variable LD_LIBRARY_PATH on Linux systems, DYLD_LIBRARY_PATH on macOS systems, or Path on Windows systems).	YES
<code><TRANSPORT_PREFIX>.create_function</code>	Should be set to the name of the function with the prototype of <code>Transport_create_plugin</code> that can be called by RTI Connex to create an instance of the plugin. The resulting transport plugin will then be registered by RTI Connex through <code>Transport_Support::register_transport</code>	YES

Property Name	Description	Required?
<TRANSPORT_PREFIX>.aliases	Used to register the transport plugin returned by <code>Transport_create_plugin</code> (as specified by <TRANSPORT_PREFIX>.create_function) to the <code>dds::domain::DomainParticipant</code> (p. 1079). Refer to <code>aliases_in</code> parameter in <code>Transport_Support::register_transport</code> for details. Aliases should be specified as a comma-separated string, with each comma delimiting an alias. If it is not specified, <TRANSPORT_PREFIX> – without the leading "dds.transport" – is used as the default alias for the plugin.	NO
<TRANSPORT_PREFIX>.network_address	Used to register the transport plugin returned by <code>Transport_create_plugin</code> (as specified by <TRANSPORT_PREFIX>.create_function) to the <code>dds::domain::DomainParticipant</code> (p. 1079). Refer to <code>network_address_in</code> parameter in <code>Transport_Support::register_transport</code> for details. If it is not specified, the <code>network_address_out</code> output parameter from <code>Transport_create_plugin</code> is used. The default value is a zeroed out network address.	NO
<TRANSPORT_PREFIX>.<property_name>	Property that is passed into <code>Transport_create_plugin</code> (as specified by <TRANSPORT_PREFIX>.create_function) for creating the transport plugin. This property name-value pair will be passed to <code>Transport_create_plugin</code> after stripping out <TRANSPORT_PREFIX> from the property name. The parsing of this property and configuring the transport using this property should be handled by the implementation of each transport plugin. Multiple <TRANSPORT_PREFIX>.<property_name> can be specified. Note: "library", "create_function", "aliases" and "network_address" cannot be used as the <property_name> due to conflicts with other builtin property names.	NO

A transport plugin is dynamically created and registered to the `dds::domain::DomainParticipant` (p. 1079) by RTI Connext when:

- the `dds::domain::DomainParticipant` (p. 1079) is enabled,
- the first `DataWriter/DataReader` is created, or
- you lookup a builtin `DataReader` (`dds::sub::find` (p. 460)),

whichever happens first.

Any changes to the transport plugin related properties in the **PROPERTY** (p. 332) QoS policy after the transport plugin has been registered with the `dds::domain::DomainParticipant` (p. 1079) will have no effect.

6.27 Built-in Transport Plugins

Transport plugins delivered with RTI Connext.

Modules

- **UDP Transport Plugin definitions**
UDP Transport Plugin definitions.
- **Shared Memory Transport**
Built-in transport plug-in for inter-process communications using shared memory.
- **UDPv4 Transport**
Transport plug-in using UDP/IPv4.
- **Real-Time WAN Transport**
Transport plug-in using UDP/IPv4 for WAN communications..
- **UDPv6 Transport**
Transport plug-in using UDP/IPv6.

6.27.1 Detailed Description

Transport plugins delivered with RTI Connext.

The **TRANSPORT_BUILTIN** (p. 339) specifies the collection of transport plugins that can be automatically configured and managed by RTI Connext as a convenience to the user.

These transport plugins can simply be turned "on" or "off" by a specifying a bitmask in **rti::core::policy::TransportBuiltin** (p. 2237), thus bypassing the steps for setting up a transport plugin. RTI Connext preconfigures the transport plugin properties, the network address, and the aliases to "factory defined" values.

If a builtin transport plugin is turned "on" in **rti::core::policy::TransportBuiltin** (p. 2237), the plugin is implicitly created and registered to the corresponding **dds::domain::DomainParticipant** (p. 1079) by RTI Connext when:

- the **dds::domain::DomainParticipant** (p. 1079) is enabled,
- the first DataWriter/DataReader is created, or
- you lookup a builtin DataReader (**dds::sub::find** (p. 460)),

whichever happens first.

Each builtin transport contains its own set of properties. For example, the UDPv4Transport allows the application to specify whether or not multicast is supported, the maximum size of the message, and provides a mechanism for the application to filter out network interfaces.

The builtin transport plugin properties can be changed by the method **Transport_Support::set_builtin_transport_↔property()** or by using the **PROPERTY** (p. 332) QoS policy associated with the **dds::domain::DomainParticipant** (p. 1079). Builtin transport plugin properties specified in **rti::core::policy::Property** (p. 1695) always overwrite the ones specified through **Transport_Support::set_builtin_transport_property()**. Refer to the specific builtin transport for the list of property names that can be specified through **PROPERTY** (p. 332) QoS policy.

Any changes to the builtin transport properties after the builtin transports have been registered with will have no effect.

Transport_Support::set_builtin_transport_property() **rti::core::policy::Property** (p. 1695)

6.28 Creating New Transport Plugins

Developing new transport plugins for RTI Connex.

Developing new transport plugins for RTI Connex.

RTI Connex provides an abstract "C" language API for creating new transport plugins. If you are interested in creating a new transport plugin for RTI Connex, please contact your RTI representative or email sales@rti.com.

6.29 Queries and Filters Syntax

6.29.1 Syntax for DDS Queries and Filters

A subset of the WHERE clause in SQL is used in several parts of the specification:

- The `filter_expression` in the `dds::topic::ContentFilteredTopic` (p. 735)
- The `query_expression` in the `dds::sub::cond::QueryCondition` (p. 1784)
- `<<extension>>` (p. 156) The `filter_expression` in the `rti::sub::TopicQuerySelection` (p. 2229)
- `<<extension>>` (p. 156) The `filter_expression` in the `rti::core::ChannelSettings` (p. 703)

Those expressions may use a subset of SQL, extended with the possibility to use program variables in the SQL expression. The allowed SQL expressions are defined with the BNF-grammar below.

The following notational conventions are made:

- *NonTerminals* are typeset in italics.
- 'Terminals' are quoted and typeset in a fixed width font. They are written in upper case in most cases in the BNF-grammar below, but should be case insensitive.
- **TOKENS** are typeset in bold.
- The notation (*element* // ',') represents a non-empty comma-separated list of *elements*.

6.29.2 SQL grammar in BNF

```

FilterExpression ::= Condition
Condition       ::= Predicate
                | Condition 'AND' Condition
                | Condition 'OR' Condition
                | 'NOT' Condition
                | '(' Condition ')'
Predicate      ::= ComparisonPredicate
                | BetweenPredicate
ComparisonPredicate ::= ComparisonTerm RelOp ComparisonTerm
ComparisonTerm    ::= FieldIdentifier
                | Parameter
BetweenPredicate  ::= FieldIdentifier 'BETWEEN' Range
                | FieldIdentifier 'NOT BETWEEN' Range
FieldIdentifier   ::= FIELDNAME
                | IDENTIFIER
RelOp             ::= '=' | '>' | '>=' | '<' | '<=' | '<>' | 'LIKE' | 'MATCH'
Range             ::= Parameter 'AND' Parameter
Parameter        ::= INTEGERVALUE
                | CHARVALUE
                | FLOATVALUE
                | STRING
                | ENUMERATEDVALUE
                | BOOLEANVALUE
                | NULLVALUE
                | PARAMETER

```

6.29.3 Token expression

The syntax and meaning of the tokens used in the SQL grammar is described as follows:

- **IDENTIFIER** - An identifier for a FIELDNAME, and is defined as any series of characters 'a', ..., 'z', 'A', ..., 'Z', '0', ..., '9', '_' but may not start with a digit.

Formal notation:

```

IDENTIFIER: LETTER ( PART_LETTER)*
where LETTER: [ "A"-"Z", "_", "a"-"z" ]
PART_LETTER: [ "A"-"Z", "_", "a"-"z", "0"-"9" ]

```

- **FIELDNAME** - A fieldname is a reference to a field in the data structure. The dot '.' is used to navigate through nested structures. The number of dots that may be used in a FIELDNAME is unlimited. The FIELDNAME can refer to fields at any depth in the data structure. The names of the field are those specified in the IDL definition of the corresponding structure, which may or may not match the fieldnames that appear on the language-specific (e.g., C/C++, Java) mapping of the structure. To reference to the $n+1$ element in an array or sequence, use the notation '[n]', where n is a natural number (zero included). FIELDNAME must resolve to a primitive IDL type; that is either boolean, octet, (unsigned) short, (unsigned) long, (unsigned) long long, float double, char, wchar, string, wstring, or enum.

Formal notation:

```

FIELDNAME: FieldNamePart ( "." FieldNamePart )*
where FieldNamePart : IDENTIFIER ( "[" Index "]" )*
      Index> : (["0"- "9"])+
              | ["0x", "0X"] (["0"- "9", "A"- "F", "a"- "f"])+

```

Primitive IDL types referenced by FIELDNAME are treated as different types in *Predicate* according to the following table:

Predicate Data Type	IDL Type
BOOLEANVALUE	boolean
INTEGERVALUE	octet, (unsigned) short, (unsigned) long, (unsigned) long long
FLOATVALUE	float, double
CHARVALUE	char, wchar
STRING	string, wstring
ENUMERATEDVALUE	enum

- **TOPICNAME** - A topic name is an identifier for a topic, and is defined as any series of characters 'a', ..., 'z', 'A', ..., 'Z', '0', ..., '9', '_' but may not start with a digit.

Formal notation:

```

TOPICNAME : IDENTIFIER

```

- **INTEGERVALUE** - Any series of digits, optionally preceded by a plus or minus sign, representing a decimal integer value within the range of the system. 64-bit integers (int64 and uint64) must be followed by either I or L, otherwise the value is treated as a 32-bit integer. A hexadecimal number is preceded by 0x and must be a valid hexadecimal expression.

Formal notation:

```

INTEGERVALUE : (["+", "-"])? (["0"- "9"])+ [ ("L", "l") ]?
              | (["+", "-"])? ["0x", "0X"] (["0"- "9", "A"- "F", "a"- "f"])+ [ ("L", "l") ]?

```

- **CHARVALUE** - A single character enclosed between single quotes.

Formal notation:

```

CHARVALUE : "'" (~["'"]) "'"

```

- **FLOATVALUE** - Any series of digits, optionally preceded by a plus or minus sign and optionally including a floating point ('.'). A power-of-ten expression may be postfixed, which has the syntax en or En , where n is a number, optionally preceded by a plus or minus sign.

Formal notation:

```
FLOATVALUE : ([ "+", "-" ])? ([ "0"-"9" ])* ( "." )? ([ "0"-"9" ])+ ( EXPONENT )?
where EXPONENT: [ "e", "E" ] ([ "+", "-" ])? ([ "0"-"9" ])+
```

- **STRING** - Any series of characters encapsulated in single quotes, except the single quote itself.

Formal notation:

```
STRING : "'" (~["'"]) * "'"
```

- **ENUMERATEDVALUE** - An enumerated value is a reference to a value declared within an enumeration. Enumerated values consist of the name of the enumeration label enclosed in single quotes. The name used for the enumeration label must correspond to the label names specified in the IDL definition of the enumeration.

Formal notation:

```
ENUMERATEDVALUE : "'" [ "A" - "Z", "a" - "z" ] [ "A" - "Z", "a" - "z", "_", "0" - "9" ]* "'"
```

- **BOOLEANVALUE** - Can either be 'TRUE' or 'FALSE', case insensitive.

Formal notation (case insensitive):

```
BOOLEANVALUE : [ "TRUE", "FALSE" ]
```

- **NULLVALUE** - Can be null, and is case insensitive.

Formal notation (case insensitive):

```
NULLVALUE : "null"
```

- **PARAMETER** - A parameter is of the form $\%n$, where n represents a natural number (zero included) smaller than 100. It refers to the $n + 1^{\text{th}}$ argument in the given context. Argument can only in primitive type value format. It cannot be a FIELDNAME.

Formal notation:

```
PARAMETER : "%" ([ "0"-"9" ])+
```

6.29.4 String Parameters

Strings used as parameter values must contain the enclosing quotation marks (') within the parameter value, and not place the quotation marks within the expression statement. For example, the following expression is legal:

```
" symbol MATCH %0 " with parameter 0 = " 'IBM' "
```

whereas the following expression will not compile:

```
" symbol MATCH '%0' " with parameter 0 = " IBM "
```

6.29.5 Type compatability in Predicate

Only certain combination of type comparisons are valid in *Predicate*. The following table marked all the compatible pairs with 'YES':

	BOOLEANVALUE	INTEGERVALUE	FLOATVALUE	CHARVALUE	STRING	ENUMERATEDVALUE
BOOLEAN	YES					
INTEGERVALUE		YES	YES			
FLOATVALUE		YES	YES			
CHARVALUE				YES	YES	YES
STRING				YES	YES(*1)	YES
ENUMERATEDVALUE		YES		YES(*2)	YES(*2)	YES(*3)

- (*1) See **SQL Extension: Regular Expression Matching** (p. 86)
- (*2) Because the formal notation of the Enumeration values, they are compatible with string and char literals, but they are not compatible with string or char variables, i.e., "MyEnum='EnumValue'" would be correct, but "MyEnum=MyString" is not allowed.
- (*3) Only for same type Enums.

6.29.6 SQL Extension: Regular Expression Matching

The relational operator MATCH may only be used with string fields. The right-hand operator is a string *pattern*. A string pattern specifies a template that the left-hand field value must match. The characters `,^?[*]-^!%` have special meanings unless they are escaped by the escape character `\`.

MATCH is case-sensitive.

The pattern allows limited "wild card" matching under the following rules:

Character	Meaning
,	"," separates a list of alternate patterns. The field string is matched if it matches one or more of the patterns.
/	"/" in the pattern string matches a / in the field string. This character is used to separate a sequence of mandatory substrings.
?	"?" in the pattern string matches any single <i>non-special</i> characters in the field string.
*	"*" in the pattern string matches 0 or more <i>non-special</i> characters in field string.
[<i>charlist</i>]	Matches any one of the characters from the list of characters in <i>charlist</i> .
[<i>s-e</i>]	Matches any character any character from <i>s</i> to <i>e</i> , inclusive.
%	"%" is used to designate filter expressions parameters.
[! <i>charlist</i>] or [^ <i>charlist</i>]	Matches any characters not in <i>charlist</i> (not supported).
[! <i>s-e</i>] or [^ <i>s-e</i>]	Matches any characters not in the interval [<i>s-e</i>] (not supported).
\	Escape character for special characters.

The syntax is similar to the POSIX fnmatch syntax (1003.2-1992 section B.6). The MATCH syntax is also similar to the 'subject' strings of TIBCO Rendezvous.

Note: To use special characters as regular characters in regular expressions, you must escape them using the character '\'. For example, 'A]' is considered a malformed expression and the result is undefined.

6.29.7 Character Encoding

The default encoding for IDL strings is UTF-8. RTI Connexx offers ISO 8859-1 as an alternative encoding for IDL strings.

In order to configure ISO 8859-1 as the encoding for filtering of IDL strings, you can set the DomainParticipant property `dds.domain_participant.filtering_character_encoding` to ISO-8859:

The possible values for `dds.domain_participant.filtering_character_encoding` are:

- **UTF-8** (default value)
- **ISO-8859-1**

6.29.8 Unicode Normalization

Unicode supports multiple ways to encode some characters, most notably accented characters. A composed character in Unicode can often have a number of different ways of representing the character. For example:

- Precomposed `é` is represented by `\u1e3c`
- Composed `é` = `L + ^` is represented by `\u004c + \u032d`

The lexical comparison of the two characters above will return false. In order to do the correct comparison the characters need to be normalized, that is, reduced to the same character composition.

When the character encoding for filtering of IDL strings is UTF-8, the Unicode normalization behavior can be controlled using a DomainParticipant property called **dds.domain_participant.filtering_unicode_normalization**.

The possible values of the normalization property are:

- **OFF**: Disables normalization
- **NFD**: Canonical Decomposition
- **NFC (default value)**: Canonical Decomposition, followed by Canonical Composition
- **NFK**: Compatibility Decomposition, followed by Canonical Composition
- **NFKC_Casefold**: Casefold followed by NFKC normalization

Because normalization may affect performance, and it is enabled by default, the property allows disabling the normalization process per DomainParticipant using the value OFF. However, you should be aware that doing this may lead to unexpected behavior.

6.29.9 Examples

Assuming Topic "Location" has as an associated type a structure with fields "flight_id, x, y, z", and Topic "FlightPlan" has as fields "flight_id, source, destination". The following are examples of using these expressions.

Example of a **filter_expression** (for **dds::topic::ContentFilteredTopic** (p. 735)) or a **query_expression** (for **dds::sub::cond::QueryCondition** (p. 1784)):

- "z < 1000 AND x < 23"

Examples of a **filter_expression** using **MATCH** (for **dds::topic::ContentFilteredTopic** (p. 735)) operator:

- "symbol MATCH 'NASDAQ/GOOG' "
- "symbol MATCH 'NASDAQ/[A-M]*' "

6.30 Logging and Version

APIs of troubleshooting utilities and APIs designed to configure the overall behavior of RTI Connext.

Modules

- **Logging**
Configure how much debugging information is reported during runtime and where it is logged.
- **Version**
Retrieve information for the RTI Connext product, the core library, and the C, C++ or Java libraries.

6.30.1 Detailed Description

APIs of troubleshooting utilities and APIs designed to configure the overall behavior of RTI Connex.

6.31 General Utilities and Compliance Configuration

API of general utilities used in the RTI Connex distribution.

Modules

- **Compliance Configuration**
APIs to configure compliance with certain standard specifications.
- **Discovery Snapshot**
Utilities to print discovery snapshots of DDS entities.
- **Network Capture**
Save network traffic into a capture file for further analysis.
- **Heap Monitoring**
Monitor memory allocations done by the middleware on the native heap.
- **Other Utilities**
Other Utilities, such as `rti::util::spin()` (p. 388)

6.31.1 Detailed Description

API of general utilities used in the RTI Connex distribution.

6.32 Observability

API of RTI Connex Observability Framework.

Modules

- **Observability Library**
RTI Monitoring Library 2.0.

6.32.1 Detailed Description

API of RTI Connex Observability Framework.

6.33 Request-Reply Pattern

Support for the request-reply communication pattern.

Modules

- **Requester**
rti::request::Requester (p. 1907) and associated elements
- **Replier**
rti::request::Replier (p. 1888), *SimpleReplier* and associated elements

6.33.1 Detailed Description

Support for the request-reply communication pattern.

There are two basic entities that enable this pattern:

- **rti::request::Requester** (p. 1907)
- **rti::request::Replier** (p. 1888) (and a simpler version *SimpleReplier*)

This functionality is built on top of RTI Connext.

A Requester publishes a request topic and subscribes to a reply topic. A Replier subscribes to the request topic and publishes the reply topic.

You can find more information about this pattern in `Request-Reply`, in the Core Libraries User's Manual.

See also

Request-Reply Examples (p. 145).

6.34 Requester

rti::request::Requester (p. 1907) and associated elements

Classes

- class **rti::request::Requester**< **RequestType**, **ReplyType** >
<<*reference-type*>> (p. 153) *Allows sending requests and receiving replies*
- class **rti::request::RequesterParams**
*Contains the parameters for creating a **rti::request::Requester** (p. 1907).*

6.34.1 Detailed Description

`rti::request::Requester` (p. 1907) and associated elements

6.35 Replier

`rti::request::Replier` (p. 1888), `SimpleReplier` and associated elements

Classes

- class `rti::request::Replier`< `RequestType`, `ReplyType` >
 <<*reference-type*>> (p. 153) Allows receiving requests and sending replies
- class `rti::request::ReplierListener`< `RequestType`, `ReplyType` >
 Called when a *Replier* (p. 1888) has new available requests.
- class `rti::request::ReplierParams`
 Contains the parameters for creating a *rti::request::Replier* (p. 1888).
- class `rti::request::SimpleReplier`< `RequestType`, `ReplyType` >
 <<*reference-type*>> (p. 153) A callback-based replier

6.35.1 Detailed Description

`rti::request::Replier` (p. 1888), `SimpleReplier` and associated elements

6.36 Queuing Pattern

Support for the queuing communication pattern.

Modules

- **QueueProducer**
 QueueProducer and associated elements .
- **QueueConsumer**
 QueueConsumer and associated elements .
- **QueueRequester**
 QueueRequester and associated elements .
- **QueueReplier**
 QueueReplier and associated elements .

6.36.1 Detailed Description

Support for the queuing communication pattern.

The queuing communication patterns provides a load-balancing communication model in which a sample sent by a QueueProducer is received exactly by one QueueConsumer.

This pattern requires running RTI Queuing Service.

If there are no QueueConsumers available when the sample is sent, the sample will be stored in a SharedReaderQueue hosted by RTI Queuing Service until a QueueConsumer is available to process the sample.

If a QueueConsumer receives a sample and does not acknowledge it before a specified amount of time or it acknowledges it negatively, the sample will be redelivered to a different QueueConsumer.

A SharedReaderQueue is the result of the association of a Topic with a SharedSubscriber, where a SharedSubscriber is a container that hosts SharedReaderQueues within RTI Queuing Service.

The queuing API implements four basic entities:

- QueueProducer
- QueueConsumer
- QueueRequester
- QueueReplier

Note

It is possible to include all the Queuing API at once with `#include <rti/queuing/rtiqueuing.hpp>` or by including each header file individually.

A QueueProducer sends samples to a Queuing Service instance, which stores them in a SharedReaderQueue.

A QueueConsumer receives samples from a SharedReaderQueue hosted by a Queuing Service instance.

QueueProducers and QueueConsumers do not communicate directly; they need the mediation of Queuing Service.

QueueProducers and QueueConsumers communicate with Queuing Service using different Topics.

A QueueProducer has an underlying DataWriter that publishes samples on Topic 'aTopicName'. This is the SharedReaderQueue Topic.

A QueueConsumer has an underlying DataReader that receives samples on Topic 'aTopicName@aSharedSubscriberName'.

QueueProducer and QueueConsumer are simple components that provide basic queuing communication in one direction: from QueueProducer to QueueConsumer.

The RTI Connex DDS Queuing API also supports the request-reply use case, in which samples sent by a QueueRequester are expected to generate a reply from the QueueReplier that consumed the request.

The QueueReplier produces a reply for each request that it consumes. Queuing Service correlates and delivers that reply to the QueueRequester that produced the request.

QueueRequester and QueueReplier are the components that provide the request-reply functionality. QueueRequesters and QueueRepliers do not communicate directly. They always require the mediation of Queuing Service:

- A QueueRequester sends requests to a request SharedReaderQueue and receives a reply for each request from a reply SharedReaderQueue.
- A QueueReplier receives requests from a request SharedReaderQueue and sends a reply for each request to a reply SharedReaderQueue.

QueueRequesters and QueueRepliers communicate with Queuing Service through regular SharedReaderQueues. The communication from a QueueRequester to a QueueReplier is identical to the basic queuing use-case for Producers and Consumers. The communication from a QueueReplier to a QueueRequester is also similar, with the key difference that replies from the reply SharedReaderQueue are only delivered to the QueueRequester that originally sent the associated request.

The queuing request-reply pattern can also be implemented by using the simple QueueProducer and QueueConsumer components. In this case, your application must create the necessary QueueProducers and QueueConsumers to communicate with the request and reply SharedReaderQueues, as well as perform the correlation of the request and reply samples.

All the available entities and associated infrastructure are built on top of RTI Connex. You can find detailed information about this pattern and the DDS mapping in the RTI Queuing Service User's Manual.

6.37 QueueProducer

QueueProducer and associated elements .

Classes

- class **rti::queuing::QueueProducerParams**
*Contains the parameters for creating a **QueueProducer** (p. 1805).*
- class **rti::queuing::QueueProducer< T >**
Allows you to send samples to a specific SharedReaderQueue hosted by Queuing Service.
- class **rti::queuing::QueueProducerListener< T >**
*Called when certain events occur in a **QueueProducer** (p. 1805).*
- class **rti::queuing::NoOpQueueProducerListener< T >**
A listener with an empty implementation of all methods.

6.37.1 Detailed Description

QueueProducer and associated elements .

6.38 QueueConsumer

QueueConsumer and associated elements .

Classes

- class **rti::queuing::QueueConsumer**< T >
Allows you to receive samples from a SharedReaderQueue.
- class **rti::queuing::QueueConsumerListener**< T >
*Called when certain events occur in a **QueueConsumer** (p. 1787).*
- class **rti::queuing::NoOpQueueConsumerListener**< T >
A listener with an empty implementation of all methods.
- class **rti::queuing::QueueConsumerParams**
*Contains the parameters for creating a **QueueConsumer** (p. 1787).*
- class **rti::queuing::ConsumerAvailabilityParams**
Definition of the availability feedback information that can be provided by consumers to Queuing Service.

6.38.1 Detailed Description

QueueConsumer and associated elements .

6.39 QueueRequester

QueueRequester and associated elements .

Classes

- class **rti::queuing::QueueRequesterParams**
*Contains the parameters for creating a **QueueRequester** (p. 1836).*
- class **rti::queuing::QueueRequester**< TReq, TRep >
Allows sending requests and receiving replies.
- class **rti::queuing::QueueRequesterListener**< TReq, TRep >
*Called when certain events occur in a **QueueRequester** (p. 1836).*
- class **rti::queuing::NoOpQueueRequesterListener**< TReq, TRep >
A listener with an empty implementation of all methods.

6.39.1 Detailed Description

QueueRequester and associated elements .

6.40 QueueReplier

QueueReplier and associated elements .

Classes

- class **rti::queuing::QueueReplierParams**
*Contains the parameters for creating a **QueueReplier** (p. 1819).*
- class **rti::queuing::QueueReplier**< TReq, TRep >
Allows receiving requests and sending replies.
- class **rti::queuing::QueueReplierListener**< TReq, TRep >
*Called when certain events occur in a **QueueReplier** (p. 1819).*
- class **rti::queuing::NoOpQueueReplierListener**< TReq, TRep >
A listener with an empty implementation of all methods.

6.40.1 Detailed Description

QueueReplier and associated elements .

6.41 Remote Procedure Call

Remote Procedure call (RPC) communication pattern.

Modules

- **Client-side API**
Part of the RPC API that relates to the client.
- **Server-side API**
*Part of the RPC API that relates to the **Server** (p. 2053) and **ServiceEndpoint** (p. 2061).*

Classes

- class **rpc_example::RobotControl**
*The synchronous interface generated from the **RobotControl** (p. 95) IDL service.*
- class **rpc_example::RobotControlAsync**
*The asynchronous interface derived from the **RobotControl** (p. 1931) service.*

6.41.1 Detailed Description

Remote Procedure call (RPC) communication pattern.

With RPC you can write client and service applications that make and process function calls according to interfaces defined in IDL. The clients and the services communicate using DDS topics.

Warning

This feature is experimental and subject to change in future releases. It is included in this release to gather customer interest and feedback. For this reason, do not deploy any applications using Remote Procedure Calls in production. For support, you may contact `support@rti.com`.

Note

To get started follow the **RPC Tutorial** (p. 221).

The classes involved in RPC include types generated by `rtiddsgen` and supporting types in the `dds::rpc` and `rti::rpc` namespaces. This API reference assumes that an example IDL service interface is defined as follows:

```
exception WalkError {
    string<32> message;
};
exception TooFastError {
};
@final
struct Coordinates {
    int32 x;
    int32 y;
};
@service
interface RobotControl {
    Coordinates walk_to(Coordinates destination, float speed)
        raises(WalkError, TooFastError);
    float get_speed();
    attribute string<128> name;
};
```

From this IDL the following types are generated:

- **rpc_example::RobotControl** (p. 1931) (a pure-virtual abstract class)
- **rpc_example::RobotControlAsync** (p. 1933) (a pure-virtual abstract class)
- **rpc_example::RobotControlService** (p. 208) (an instantiation of **dds::rpc::ServiceEndpoint** (p. 2061))
- **rpc_example::RobotControlClient** (p. 1934) (derived from **dds::rpc::ClientEndpoint** (p. 707))

In addition, the class **dds::rpc::Server** (p. 2053) provides the execution context for one or more services.

RPC Tutorial (p. 221)

6.42 Utilities

Utilities for the RTI Connex Messaging module.

Utilities for the RTI Connex Messaging module.

Connex Messaging Utilities

6.43 Durability and Persistence

APIs related to RTI Connex Durability and Persistence.

APIs related to RTI Connex Durability and Persistence.

RTI Connex offers the following mechanisms for achieving durability and persistence:

- **Durable Writer History** (p. 97)
- **Durable Reader State** (p. 98)
- **Data Durability** (p. 98)

To use the first two features, you need a relational database, which is not included with RTI Connex. Supported databases are listed in the [Release Notes](#).

The third feature, provided by RTI Persistence Service, can use the filesystem or a relational database to persist information.

These three features can be used separately or in combination.

6.43.1 Durable Writer History

This feature allows a **dds::pub::DataWriter** (p. 908) to locally persist its local history cache so that it can survive shutdowns, crashes and restarts. When an application restarts, each **dds::pub::DataWriter** (p. 908) that has been configured to have durable writer history automatically loads all the data in its history cache from disk and can carry on sending data as if it had never stopped executing. To the rest of the system, it will appear as if the **dds::pub::DataWriter** (p. 908) had been temporarily disconnected from the network and then reappeared.

See also

Configuring Durable Writer History (p. 99)

6.43.2 Durable Reader State

This feature allows a **dds::sub::DataReader** (p. 756) to locally persist its state and remember the sequence numbers it has already received. When an application restarts, each **dds::sub::DataReader** (p. 756) that has been configured to have durable reader state automatically loads its state from disk and can carry on receiving data as if it had never stopped executing. Data that had already been received by the **dds::sub::DataReader** (p. 756) before the restart will not be provided to the application again.

See also

Configuring Durable Reader State (p. 101)

6.43.3 Data Durability

This feature is a full implementation of the OMG DDS Persistence Profile. The **DURABILITY** (p. 320) QoS lets an application configure a **dds::pub::DataWriter** (p. 908) such that the information written by the **dds::pub::DataWriter** (p. 908) survives beyond the lifetime of the **dds::pub::DataWriter** (p. 908). In this manner, a late-joining **dds::sub::DataReader** (p. 756) can subscribe and receive the information even after the **dds::pub::DataWriter** (p. 908) application is no longer executing. To use this feature, you need RTI Persistence Service – an optional product that can be purchased separately.

6.43.4 Durability and Persistence Based on Virtual GUID

Every modification to the global dataspace made by a **dds::pub::DataWriter** (p. 908) is identified by a pair (virtual GUID, sequence number).

- The virtual GUID (Global Unique Identifier) is a 16-byte character identifier associated with a **dds::pub::DataWriter** (p. 908) or **dds::sub::DataReader** (p. 756); it is used to uniquely identify this entity in the global data space.
- The sequence number is a 64-bit identifier that identifies changes published by a specific **dds::pub::DataWriter** (p. 908).

Several **dds::pub::DataWriter** (p. 908) entities can be configured with the same virtual GUID. If each of these **dds::pub::DataWriter** (p. 908) entities publishes a sample with sequence number '0', the sample will only be received once by the **dds::sub::DataReader** (p. 756) entities subscribing to the content published by the **dds::pub::DataWriter** (p. 908) entities.

RTI Connexant also uses the virtual GUID (Global Unique Identifier) to associate a persisted state (state in permanent storage) to the corresponding DDS entity.

For example, the history of a **dds::pub::DataWriter** (p. 908) will be persisted in a database table with a name generated from the virtual GUID of the **dds::pub::DataWriter** (p. 908). If the **dds::pub::DataWriter** (p. 908) is restarted, it must have associated the same virtual GUID to restore its previous history.

Likewise, the state of a **dds::sub::DataReader** (p. 756) will be persisted in a database table whose name is generated from the **dds::sub::DataReader** (p. 756) virtual GUID

A **dds::pub::DataWriter** (p. 908)'s virtual GUID can be configured using **rti::core::policy::DataWriterProtocol::virtual_guid** (p. 981). Similarly, a **dds::sub::DataReader** (p. 756)'s virtual GUID can be configured using **rti::core::policy::DataReaderProtocol::virtual_guid** (p. 837).

The **dds::topic::PublicationBuiltinTopicData** (p. 1703) and **dds::topic::SubscriptionBuiltinTopicData** (p. 2133) structures include the virtual GUID associated with the discovered publication or subscription.

Refer to the `User's Manual` for additional use cases.

See also

`rti::core::policy::DataWriterProtocol::virtual_guid` (p. 981) `rti::core::policy::DataReaderProtocol::virtual_guid` (p. 837).

6.43.5 Configuring Durable Writer History

To configure a `dds::pub::DataWriter` (p. 908) to have durable writer history, use the **PROPERTY** (p. 332) QoS policy associated with the `dds::pub::DataWriter` (p. 908) or the `dds::domain::DomainParticipant` (p. 1079).

Properties defined for the `dds::domain::DomainParticipant` (p. 1079) will be applied to all the `dds::pub::DataWriter` (p. 908) objects belonging to the `dds::domain::DomainParticipant` (p. 1079), unless the property is overwritten by the `dds::pub::DataWriter` (p. 908).

See also

`rti::core::policy::Property` (p. 1695)

The following table lists the supported durable writer history properties.

Table 6.9 Durable Writer History Properties

Property	Description
<code>dds.data_writer.history.plugin_name</code>	Must be set to "dds.data_writer.history.odbc_plugin.builtin" to enable durable writer history in the DataWriter. This property is required.
<code>dds.data_writer.history.odbc_plugin.builtin.dsn</code>	The ODBC DSN (Data Source Name) associated with the database where the writer history must be persisted. This property is required.
<code>dds.data_writer.history.odbc_plugin.builtin.driver</code>	This property tells RTI Connext which ODBC driver to load. If the property is not specified, RTI Connext will try to use the standard ODBC driver manager library : UnixOdbc (odbc32.dll) on Linux systems; the Windows ODBC driver manager (libodbc.so) on Windows systems.
<code>dds.data_writer.history.odbc_plugin.builtin.username</code>	Configures the username used to connect to the database. This property is not used if it is unspecified. There is no default value.
<code>dds.data_writer.history.odbc_plugin.builtin.password</code>	Configures the password used to connect to the database. This property is not used if it is unspecified. There is no default value.
<code>dds.data_writer.history.odbc_plugin.builtin.shared</code>	If set to 1, RTI Connext creates a single connection per DSN that will be shared across DataWriters within the same Publisher. If set to 0 (the default), a <code>dds::pub::DataWriter</code> (p. 908) will create its own database connection. Default: 0

Property	Description
dds.data_writer.history.odbc_plugin.builtin.instance_cache_max_size	These properties configure the resource limits associated with the ODBC writer history caches. To minimize the number of accesses to the database, RTI Connext uses two caches, one for samples and one for instances. The initial and maximum sizes of these caches are configured using these properties. The resource limits <code>initial_instances</code> , <code>max_instances</code> , <code>initial_samples</code> , <code>max_samples</code> and <code>max_samples_per_instance</code> in the <code>dds::core::policy::ResourceLimits</code> (p. 1921) are used to configure the maximum number of samples and instances that can be stored in the relational database. Default: <code>dds::core::policy::ResourceLimits::max_instances</code> (p. 1924)
dds.data_writer.history.odbc_plugin.builtin.instance_cache_init_size	See description above. Default: <code>dds::core::policy::ResourceLimits::initial_instances</code> (p. 1926)
dds.data_writer.history.odbc_plugin.builtin.sample_cache_max_size	See description above. Default: 32 (the minimum)
dds.data_writer.history.odbc_plugin.builtin.sample_cache_init_size	See description above. Default: 32
dds.data_writer.history.odbc_plugin.builtin.restore	This property indicates whether or not the persisted writer history must be restored once the <code>dds::pub::DataWriter</code> (p. 908) is restarted. If the value is 0, the content of the database associated with the <code>dds::pub::DataWriter</code> (p. 908) being restarted will be deleted. If the value is 1, the <code>dds::pub::DataWriter</code> (p. 908) will restore its previous state from the database content. Default: 1
dds.data_writer.history.odbc_plugin.builtin.in_memory_state	This property determines how much state will be kept in memory by the ODBC writer history in order to avoid accessing the database. When <code>in_memory_state</code> is equal to 1, <code>instance_cache_max_size</code> is always equal to <code>dds::core::policy::ResourceLimits::max_instances</code> (p. 1924) (it cannot be changed). In addition, the ODBC writer history will keep in memory a fixed state overhead of 24 bytes per sample. In this operating mode, the ODBC writer history provides the best performance. However, the restore operation will be slower and the maximum number of samples that the writer history can manage will be limited by the available physical memory. If <code>in_memory_state</code> is equal to 0, all the state will be kept in the underlying database. In this operating mode, the maximum number of samples in the writer history will not be limited by the physical memory available unless the underlying database is an in-memory database (TimesTen). Default: 1

6.43.6 Configuring Durable Reader State

To configure a `dds::sub::DataReader` (p. 756) with durable reader state, use the **PROPERTY** (p. 332) QoS policy associated with the `dds::sub::DataReader` (p. 756) or `dds::domain::DomainParticipant` (p. 1079).

A property defined in the `dds::domain::DomainParticipant` (p. 1079) will be applicable to all the `dds::sub::DataReader` (p. 756) belonging to the `dds::domain::DomainParticipant` (p. 1079) unless it is overwritten by the `dds::sub::DataReader` (p. 756).

See also

`rti::core::policy::Property` (p. 1695)

The following table lists the supported durable reader state properties.

Table 6.10 Durable Reader State Properties

Property	Description
<code>dds.data_reader.state.odbc.dsn</code>	The ODBC DSN (Data Source Name) associated with the database where the <code>dds::sub::DataReader</code> (p. 756) state must be persisted. This property is required.
<code>dds.data_reader.state.filter_redundant_samples</code>	To enable durable reader state, this property must be set to 1. Otherwise, the reader state will not be kept and/or persisted. When the reader state is not maintained, RTI Connext does not filter duplicate samples that may be coming from the same virtual writer. By default, this property is set to 1.
<code>dds.data_reader.state.odbc.driver</code>	This property is used to indicate which ODBC driver to load. If the property is not specified, RTI Connext will try to use the standard ODBC driver manager library : UnixOdbc (odbc32.dll) on Linux systems; the Windows ODBC driver manager (libodbc.so) on Windows systems).
<code>dds.data_reader.state.odbc.username</code>	This property configures the username used to connect to the database. This property is not used if it is unspecified. There is no default value.
<code>dds.data_reader.state.odbc.password</code>	This property configures the password used to connect to the database. This property is not used if it is unspecified. There is no default value.
<code>dds.data_reader.state.restore</code>	This property indicates if the persisted <code>dds::sub::DataReader</code> (p. 756) state must be restored or not once the <code>dds::sub::DataReader</code> (p. 756) is restarted. If this property is 0, the previous state will be deleted from the database. If it is 1, the <code>dds::sub::DataReader</code> (p. 756) will restore its previous state from the database content. Default: 1
<code>dds.data_reader.state.checkpoint_frequency</code>	This property controls how often the reader state is stored in the database. A value of N means to store the state once every N samples. A high value will provide better performance. However, if the reader is restarted it may receive some duplicate samples. These samples will be filtered by the middleware and they will not be propagated to the application. Default: 1
Generated by Doxygen	

Property	Description
<code>dds.data_reader.state.persistence_service.request_↔ depth</code>	This property indicates the number of most recent historical samples that the persisted dds::sub::DataReader (p. 756) wants to receive when it starts up. Default: 0

6.43.7 Configuring Data Durability

RTI Connexx implements `dds::core::policy::DurabilityKind::TRANSIENT` and `dds::core::policy::DurabilityKind::↔PERSISTENT` durability using RTI Persistence Service, available for purchase as a separate RTI product.

For more information on RTI Persistence Service, refer to the `User's Manual`, or the RTI Persistence Service API Reference HTML documentation.

See also

DURABILITY (p. 320)

6.44 System Properties

System Properties.

System Properties.

RTI Connexx uses the `rti::core::policy::Property` (p. 1695) of a `DomainParticipant` to maintain a set of properties that provide system information such as hostname.

Unless the default `dds::domain::qos::DomainParticipantQos` (p. 1136) value is overwritten, the system properties are automatically set in the `dds::domain::qos::DomainParticipantQos` (p. 1136) obtained by calling the method `dds::domain::DomainParticipant::default_participant_qos()` (p. 1094) or using the constant `PARTICIPANT_QOS↔_DEFAULT`.

System properties are also automatically set in the `dds::domain::qos::DomainParticipantQos` (p. 1136) loaded from an XML QoS profile unless you disable property inheritance using the attribute `inherit` in the XML tag `<property>`.

By default, the system properties are propagated to other `DomainParticipants` in the system and can be accessed through `dds::topic::ParticipantBuiltinTopicData::property` (p. 1641).

You can disable the propagation of individual properties by setting the flag `Property_t::propagate` to false or by removing the property using the method `PropertyQosPolicyHelper::remove_property`.

The number of system properties set on the `dds::domain::qos::DomainParticipantQos` (p. 1136) is platform specific.

6.44.1 System Properties List

The following table lists the supported system properties. For more information, see `System Properties`, in the `Core Libraries User's Manual`.

Property Name	Description
dds.sys_info.hostname	Name of the host where the process is running
dds.sys_info.process_id	Process ID
dds.sys_info.username	Name of the user running the process
dds.sys_info.execution_timestamp	Time when the execution started
dds.sys_info.creation_timestamp	Time when the executable was created
dds.sys_info.executable_filepath	Name and full path of the executable
dds.sys_info.target	Architecture for which the library was compiled

6.44.2 System Resource Consideration

System properties are affected by the resource limits `rti::core::policy::DomainParticipantResourceLimits`↔
`::participant_property_list_max_length` (p. 1173) and `rti::core::policy::DomainParticipantResourceLimits`↔
`::participant_property_string_max_length` (p. 1173).

6.45 Configuring QoS Profiles with XML

APIs related to XML QoS Profiles.

Classes

- class `dds::core::QosProvider`
 <<reference-type>> (p. 153) The `QosProvider` (p. 1752) class provides a way for a user to control and access the XML QoS profiles that are loaded by RTI Connex
- class `rti::core::QosProviderParams`
 <<extension>> (p. 156) <<value-type>> (p. 152) Configure options that control the way that XML documents containing QoS profiles are loaded by a `dds::core::QosProvider` (p. 1752).

6.45.1 Detailed Description

APIs related to XML QoS Profiles.

6.45.2 Loading QoS Profiles from XML Resources

A 'QoS profile' is a group of QoS settings, specified in XML format. By using QoS profiles, you can change QoS settings without recompiling the application.

The QoS profiles are loaded the first time any of the following operations are called:

- Whenever a `dds::domain::DomainParticipant` (p. 1079) is created
- `dds::core::QosProvider::participant_qos(const std::string& id)` (p. 1757)
- `dds::domain::DomainParticipant::default_participant_qos()` (p. 1094)
- `dds::core::QosProvider::default_library(const std::string& library_name)` (p. 1766)
- `dds::core::QosProvider::default_profile(const std::string& profile_name)` (p. 1766)
- `dds::core::QosProvider::participant_qos(const std::string& id)` (p. 1757)
- `dds::core::QosProvider::topic_qos(const std::string& id)` (p. 1758)
- `dds::core::QosProvider::topic_qos_w_topic_name(const std::string& topic_name) const` (p. 1763)
- `dds::core::QosProvider::topic_qos_w_topic_name(const std::string& id, const std::string& topic_name) const` (p. 1763)
- `dds::core::QosProvider::publisher_qos(const std::string& id)` (p. 1760)
- `dds::core::QosProvider::subscriber_qos(const std::string& id)` (p. 1759)
- `dds::core::QosProvider::datawriter_qos(const std::string& id)` (p. 1761)
- `dds::core::QosProvider::datawriter_qos_w_topic_name(const std::string& topic_name) const` (p. 1765)
- `dds::core::QosProvider::datawriter_qos_w_topic_name(const std::string& id, const std::string& topic_name) const` (p. 1765)
- `dds::core::QosProvider::datareader_qos(const std::string& id)` (p. 1759)
- `dds::core::QosProvider::datareader_qos_w_topic_name(const std::string& topic_name) const` (p. 1764)
- `dds::core::QosProvider::topic_qos_w_topic_name(const std::string& id, const std::string& topic_name) const` (p. 1763)
- `dds::core::QosProvider::qos_profile_libraries()` (p. 1768)
- `dds::core::QosProvider::qos_profiles()` (p. 1768)
- `dds::core::QosProvider::load_profiles()` (p. 1770)

The QoS profiles are reloaded replacing previously loaded profiles when the following operations are called:

- `dds::domain::DomainParticipant::participant_factory_qos(const dds::domain::qos::DomainParticipantFactoryQos& qos)` (p. 1094)
- `dds::core::QosProvider::reload_profiles()` (p. 1770)

The `dds::core::QosProvider::unload_profiles()` (p. 1770) operation will free the resources associated with the XML QoS profiles.

There are five ways to configure the XML resources (listed by load order):

- The file `NDDS_QOS_PROFILES.xml` in `$NDDSHOME/resource/xml` is loaded if it exists and `rti::core::QosProviderParams::ignore_resource_profile` (p. 1777) in `rti::core::QosProviderParams` (p. 1773) is set to false (first to be loaded). An example file, `NDDS_QOS_PROFILES.example.xml`, is available for reference.
- The URL groups separated by semicolons referenced by the environment variable `NDDS_QOS_PROFILES` are loaded if they exist and `rti::core::QosProviderParams::ignore_environment_profile` (p. 1776) in `rti::core::QosProviderParams` (p. 1773) is set to false.
- The file `USER_QOS_PROFILES.xml` in the working directory will be loaded if it exists and `rti::core::QosProviderParams::ignore_user_profile` (p. 1776) in `rti::core::QosProviderParams` (p. 1773) is set to false.
- The URL groups referenced by `rti::core::QosProviderParams::url_profile` (p. 1775) in `rti::core::QosProviderParams` (p. 1773) will be loaded if specified.
- The sequence of XML strings referenced by `rti::core::QosProviderParams::string_profile` (p. 1775) will be loaded if specified (last to be loaded).

The above methods can be combined together.

6.45.3 URL

The location of the XML resources (only files and strings are supported) is specified using a URL (Uniform Resource Locator) format. For example:

File Specification: `file:///usr/local/default_dds.xml`

String Specification: `str://"<dds><qos_library> . . . lt;/qos_library></dds>"`

If the URL schema name is omitted, RTI Connex will assume a file name. For example:

File Specification: `/usr/local/default_dds.xml`

6.45.3.1 URL groups

To provide redundancy and fault tolerance, you can specify multiple locations for a single XML document via URL groups. The syntax of a URL group is as follows:

`[URL1 | URL2 | URL2 | . . . | URLn]`

For example:

`[file:///usr/local/default_dds.xml | file:///usr/local/alternative_default_dds.xml]`

Only one of the elements in the group will be loaded by RTI Connex, starting from the left.

Brackets are not required for groups with a single URL.

6.45.3.2 NDDS_QOS_PROFILES environment variable

The environment variable NDDS_QOS_PROFILES contains a list of URL groups separated by ','

The URL groups referenced by the environment variable are loaded if they exist and `rti::core::QosProviderParams::ignore_environment_profile` (p. 1776) is set to false

6.45.3.3 Built-In QoS Profiles

There are also a number of built-in QoS profiles that can be used without having to load any configurations from outside XML resources. For more information on these built-in profiles see **Built-in QoS Profiles** (p. 258).

For more information on XML Configuration, refer to the `User's Manual`.

6.46 Publication Example

A data publication example.

A data publication example.

6.46.1 A typical publication example

Prep

- Create user data types using `rtiddsgen`. See the `Code Generator User's Manual`.

Set up

- **Set up participant** (p. 108)
- **Set up publisher** (p. 111)
- **Register user data type(s)** (p. 109)
- **Set up topic(s)** (p. 109)
- **Set up data writer(s)** (p. 112)

Adjust the desired quality of service (QoS)

- **Adjust QoS on entities as necessary** (p. 126)

Send data

- **Send data** (p. 114)

Tear down

- **Tear down all entities** (p. 129)

6.47 Subscription Example

A data subscription example.

A data subscription example.

6.47.1 A typical subscription example

Prep

- Create user data types using `rtiddsgen`. See the `Code Generator User's Manual`.

Set up

- **Set up participant** (p. 108)
- **Set up subscriber** (p. 117)
- **Register user data type(s)** (p. 109)
- **Set up topic(s)** (p. 109)
- **Set up data reader(s)** (p. 118)

- **Set up DataReader** (p. 119) to receive data

Adjust the desired quality of service (QoS)

- **Adjust QoS on entities as necessary** (p. 126)

Receive data

- **Read all samples** (p. 119) or **select which samples** (p. 120) to read from the DataReader queue

Tear down

- **Tear down all entities** (p. 129)

6.48 Participant Use Cases

Working with domain participants.

Working with domain participants.

6.48.1 Turning off auto-enable of newly created participant(s)

- Change the value of the **ENTITY_FACTORY** (p. 323) for the DomainParticipantFactory

The following #includes are needed for the examples on this page

```
#include <dds/domain/ddsdomain.hpp>
```

6.48.2 Setting up a DomainParticipant

- How to create DomainParticipants with each of the available constructors

```
// Creating a DomainParticipants on domain 0, with default Qos, and no
// listener
dds::domain::DomainParticipant participant1(0);
// Creating a DomainParticipants with a non-default QoS values
dds::domain::qos::DomainParticipantQos qos;
// Set the initial peers.
// The peers stored in initial_peers are merely potential peers--there is
// no requirement that the peer DomainParticipants are actually up and
// running or even will eventually exist. The Connex discovery process
// will try to contact all potential peer participants in the list
// periodically using unicast transports.
const char * initial_peers_array[] = {
    "host1",
    "10.10.30.192",
    "1@localhost",
    "2@host2",
    "my://", /* all unicast addr on transport plugins with alias "my" */
    "2@shmem://", /* shared memory */
    "FF00:ABCD::0",
    "1@FF00:0:1234::0",
    "225.1.2.3",
    "3@225.1.0.55",
    "FAA0::0#0/0/R"};
const dds::core::StringSeq initial_peers_list(initial_peers_array, initial_peers_array+11);
// Add the initial peers list to the DiscoveryQosPolicy while modifying
// the participant's qos inline
qos < rti::core::policy::Discovery().initial_peers(initial_peers_list);
// Creating a DomainParticipants on domain 1 with modified QoS
dds::domain::DomainParticipant participant2(1, qos);
// Creating a DomainParticipants on domain 2, with modified QoS, and a
// listener
auto listener = std::make_shared<ExampleParticipantListener>();
dds::domain::DomainParticipant participant3(2, qos, listener);
// Creating a DomainParticipants on domain 3, with modified QoS, a listener
// and a data_available() status mask
dds::domain::DomainParticipant participant4(
    3,
    qos,
    listener,
    dds::core::status::StatusMask::data_available());
```

- Setting the DomainParticipantFactoryQos so that participants are created disabled (optional)

```
dds::domain::qos::DomainParticipantFactoryQos qos;
qos < dds::core::policy::EntityFactory::ManuallyEnable();
dds::domain::DomainParticipant::participant_factory_qos(qos);
```

6.48.3 Looking up DomainParticipants

- Lookup DomainParticipants by domain id

```
// Create and retain two DomainParticipants on domain 0 and one on domain 1
create_and_retain_participant(0);
```

```

create_and_retain_participant(0);
create_and_retain_participant(1);
// We don't have any references to the created DomainParticipants but we
// can look them up using the domain id they were created on
// If there is more than one participant on the same domain then this
// operation will return only one of them. It is unspecified which one it
// will return
dds::domain::DomainParticipant participant1 = dds::domain::find(0);
dds::domain::DomainParticipant participant2 = dds::domain::find(1);

```

6.48.4 Tearing down a Participant

- See [Tearing Down An Entity](#) (p. 129) for examples of the various ways to teardown a Participant

6.48.5 Finalizing the factory

- Finalizing the factory

```

// The DomainParticipantFactory is a singleton that the C++ API uses
// implicitly to create participants. RTI Connext provides
// dds::domain::DomainParticipant::finalize_participant_factory()
// for users who want to release memory used by the participant factory.
dds::domain::DomainParticipant::finalize_participant_factory();

```

6.49 Topic Use Cases

The following #includes are needed for the examples on this page

```

#include <dds/domain/ddsdomain.hpp>
#include <dds/core/ddscore.hpp>
#include <dds/topic/ddstopic.hpp>
#include "Foo.hpp"

```

6.49.1 Registering a user data type

- Types are implicitly registered during Topic construction, see [Setting up a Topic](#) (p. 109)

6.49.2 Setting up a Topic

- [Set up a DomainParticipant](#) (p. 108)
- Create a Topic with each of the available constructors

```

// Create the participant
dds::domain::DomainParticipant participant(0);
// Creating a topic with user-defined type Foo and topic name MyTopic1,
// with default QoS and no listener
dds::topic::Topic<Foo> topic1(participant, "MyTopic1");
// Creating a topic with user-defined type Foo, topic name MyTopic2,
// type name MyTypeName2
dds::topic::Topic<Foo> topic2(participant, "MyTopic2", "MyTypeName2");
// Creating a topic with user-defined type Foo, topic name MyTopic3, and
// modified QoS
dds::topic::qos::TopicQoS qos;
qos << dds::core::policy::Durability::TransientLocal();
dds::topic::Topic<Foo> topic3(participant, "MyTopic3", qos);
// Creating a topic with user-defined type Foo, topic name MyTopic4, type
// name MyTypeName4 and modified QoS

```

```

dds::topic::Topic<Foo> topic4(participant, "MyTopic4", "MyTypeName4", qos);
// Creating a topic with user-defined type Foo, topic name MyTopic5,
// modified QoS, and a listener
auto listener = std::make_shared<ExampleTopicListener>();
dds::topic::Topic<Foo> topic5(participant, "MyTopic5", qos, listener);
// Creating a topic with user-defined type Foo, topic name MyTopic6, type
// name MyTypeName6, modified QoS, and a listener
dds::topic::Topic<Foo> topic6(
    participant, "MyTopic6", "MyTypeName6", qos, listener);
// Creating a topic with user-defined type Foo, topic name MyTopic7,
// modified QoS, a non-NULL listener, and a inconsistent_topic status mask
dds::topic::Topic<Foo> topic7(
    participant, "MyTopic7", qos, listener,
    dds::core::status::StatusMask::inconsistent_topic());
// Creating a topic with user-defined type Foo, topic name MyTopic8, type
// name MyTypeName8, modified QoS, a listener, and
// a inconsistent_topic status mask
dds::topic::Topic<Foo> topic8(
    participant, "MyTopic8", "MyTypeName8", qos, listener,
    dds::core::status::StatusMask::inconsistent_topic());

```

6.49.3 Discovering Topics

- Lookup local Topics by their topic name

```

void howto_lookup_topics()
{
    dds::domain::DomainParticipant participant(0);
    // Create two Topics and retain them
    create_and_retain_topic(participant, "Topic1");
    create_and_retain_topic(participant, "Topic2");
    // We don't have any references to the created Topics but we can look
    // them up using topic name that they were created with
    dds::topic::Topic<Foo> topic1 =
        dds::topic::find<dds::topic::Topic<Foo> >(participant, "Topic1");
    dds::topic::Topic<Foo> topic2 =
        dds::topic::find<dds::topic::Topic<Foo> >(participant, "Topic2");
    // We retained the topics so we must close them now
    topic1.close();
    topic2.close();
}

void create_and_retain_topic(
    dds::domain::DomainParticipant &participant, const std::string& topic_name)
{
    dds::topic::Topic<Foo> topic(participant, topic_name);
    topic.retain();
}

```

- The next two examples assume the following setup

```

// Create two DomainParticipants on the same domain
dds::domain::DomainParticipant participant1(1);
dds::domain::DomainParticipant participant2(1);

// Create some Topics for both of the Participants
dds::topic::Topic<Foo> topic1(participant1, "Topic1");
dds::topic::Topic<Foo> topic2(participant1, "Topic2");
dds::topic::Topic<Foo> topic3(participant2, "Topic3");

```

- Discover all Topics in a domain

```

// Get a list of the InstanceHandles of all of the topics in the
// domain. topic_count will = 3
dds::core::InstanceHandleSeq handles1;
int topic_count = dds::topic::discover_any_topic(
    participant1, std::back_inserter(handles1));
// discover_any_topic also takes a forward iterator and a max number of
// topics to discover. topic_count will = 2. There is no guarantee
// as to which two topics' handles will be retrieved
dds::core::InstanceHandleSeq handles2(10, dds::core::InstanceHandle::nil());
topic_count = dds::topic::discover_any_topic(participant2, handles2.begin(), 2);

```

- Retrieve the TopicBuiltinTopicData for a Topic

```
std::vector<dds::topic::TopicBuiltinTopicData> topic_data1;
// Get the TopicBuiltinTopicData for all of the participant's local topics
// topic_count will = 2 because participant1 has 2 associated Topics
topic_count = dds::topic::discover_topic_data(participant1, std::back_inserter(topic_data1));
std::vector<dds::topic::TopicBuiltinTopicData> topic_data2(10);
// discover_any_topic also takes a forward iterator and a max number of
// topics to get the data for. Because we're using participant2,
// topic_count will = 1
topic_count = dds::topic::discover_topic_data(participant2, topic_data2.begin());
// You can also retrieve data about a specific Topic or Topics with their
// InstanceHandles. Because discover_topic_data will only retrieve data
// about local topics, using an InstanceHandle that refers to a remote
// Topic will cause an UnsupportedError to be thrown in either of the
// following cases
// Retrieve the TopicBuiltinTopicData for topic3
dds::topic::TopicBuiltinTopicData topic_data =
    dds::topic::discover_topic_data(participant2, topic3.instance_handle());
// Pass in a container with multiple handles and retrieve the
// TopicBuiltinTopicData for each of the Topics associated with each of the
// InstanceHandles
std::vector<dds::topic::TopicBuiltinTopicData> topic_data3(10);
dds::core::InstanceHandleSeq local_handles;
local_handles.push_back(topic1.instance_handle());
local_handles.push_back(topic2.instance_handle());
// topic_count will equal 2
topic_count = dds::topic::discover_topic_data(
    participant1, topic_data3.begin(), local_handles);
```

6.49.4 Tearing down a topic

- See [Tearing Down An Entity](#) (p. 129) for examples of the various ways to teardown a Topic

6.50 Publisher Use Cases

The following #includes are needed for the examples on this page

```
#include <dds/pub/ddspub.hpp>
#include <dds/domain/ddsdomain.hpp>
#include <dds/core/ddscore.hpp>
```

6.50.1 Setting up a publisher

- Set up participant (p. 108)
- Create a Publisher with each of the available constructors

```
// Create the participant
dds::domain::DomainParticipant participant(0);
// When not explicitly provided to the constructor, the
// created publisher's QoS is default, has a NULL listener, and a status mask
// dds::core::status::StatusMask::all()
// Creating a publisher
dds::pub::Publisher publisher1(participant);
// Creating a publisher with modified QoS
dds::pub::qos::PublisherQos qos;
qos << rti::core::policy::EntityName("PublisherName");
dds::pub::Publisher publisher2(participant, qos);
// Creating a publisher with modified QoS and a listener
auto listener = std::make_shared<ExamplePublisherListener>();
dds::pub::Publisher publisher3(participant, qos, listener);
// Creating a publisher with modified QoS, a listener, and a
// sample_rejected() status mask
dds::pub::Publisher publisher4(
    participant,
    qos,
    listener,
    dds::core::status::StatusMask::offered_deadline_missed());
```

6.50.2 Looking up Publishers

- **Lookup Publishers**

```

void howto_lookup_publishers()
{
    dds::domain::DomainParticipant participant(0);
    // Create three Publishers and retain them
    create_and_retain_publisher(participant);
    create_and_retain_publisher(participant);
    create_and_retain_publisher(participant);
    // We don't have any references to the created Publishers but we can look
    // them up using the participant that they were created with
    std::vector<dds::pub::Publisher> publishers1;
    // publisher_count will equal 3 and publishers1 will hold a reference to
    // each of the three publishers that were created
    int publisher_count =
        rti::pub::find_publishers(participant, std::back_inserter(publishers1));
    // rti::pub::publishers also takes a forward iterator and a max number of
    // publishers to look up
    std::vector<dds::pub::Publisher> publishers2(2, dds::pub::Publisher(dds::core::null));
    // publisher_count will equal 2 because we're only asking for 2
    publisher_count =
        rti::pub::find_publishers(participant, publishers2.begin(), 2);
    std::cout << "Publisher count: " << publisher_count << std::endl;
    // We retained the publishers so we must close them now
    for (std::vector<dds::pub::Publisher>::iterator it = publishers1.begin();
         it != publishers1.end();
         it++) {
        (*it).close();
    }
}

void create_and_retain_publisher(dds::domain::DomainParticipant &participant)
{
    dds::pub::Publisher publisher(participant);
    publisher.retain();
}

```

6.50.3 Tearing down a publisher

- See **Tearing Down An Entity** (p. 129) for examples of the various ways to teardown a Publisher

6.51 DataWriter Use Cases

The following #includes are needed for the examples on this page

```

#include <dds/pub/ddspub.hpp>
#include <dds/domain/ddsdomain.hpp>
#include <dds/core/ddscore.hpp>
#include <dds/topic/ddstopic.hpp>
#include <dds/sub/ddssub.hpp>
#include "Foo.hpp"

```

6.51.1 Setting up a DataWriter

- **Set up a Publisher** (p. 111)
- **Set up a Topic** (p. 109)

- Create a DataWriter of user-defined type **Foo** (p. 1332) with each of the available constructors

```
// Create the Participant
dds::domain::DomainParticipant participant(0);
// Create a Topic
dds::topic::Topic<Foo> topic(participant, "MyTopicName");
// When not explicitly provided to the constructor, the
// created DataWriter's QoS is default, has a NULL listener, and a status mask
// dds::core::status::StatusMask::all()
// Creating a DataWriter, creating the subscriber inline
dds::pub::DataWriter<Foo> writer1(dds::pub::Publisher(participant), topic);
// Create a Publisher
dds::pub::Publisher publisher(participant);
// Create a DataWriter with modified QoS
dds::pub::qos::DataWriterQos writer_qos =
    dds::core::QosProvider::Default().datawriter_qos();
writer_qos << dds::core::policy::Liveliness::ManualByParticipant();
dds::pub::DataWriter<Foo> writer2(publisher, topic, writer_qos);
// Create a DataWriter with the QoS of a topic
writer_qos = topic.qos(); // Copy the policies in TopicQoS into a DataWriterQoS
dds::pub::DataWriter<Foo> writer3(publisher, topic, writer_qos);
// Create a DataWriter with modified QoS and a listener
auto listener = std::make_shared<ExampleDataWriterListener<Foo>>();
dds::pub::DataWriter<Foo> writer4(
    publisher,
    topic,
    writer_qos,
    listener);
// Create a DataWriter with modified QoS, a listener, and a liveliness_lost()
// status mask
dds::pub::DataWriter<Foo> writer5(
    publisher,
    topic,
    writer_qos,
    listener,
    dds::core::status::StatusMask::liveliness_lost());
```

6.51.2 Managing instances

- The snippets in this section assume the following setup

```
dds::domain::DomainParticipant participant(0);
dds::topic::Topic<Foo> topic(participant, "MyTopic");
dds::pub::DataWriter<Foo> writer(dds::pub::Publisher(participant), topic);
Foo sample;
sample.x(100);
```

- Getting an instance "key" value of user data type **Foo** (p. 1332)

```
// Instead of a sample of type Foo, key_value() could also take a
// TopicInstance<Foo> object. key_value only populates the key field in the
// sample
Foo retrieved_sample_key;
writer.key_value(retrieved_sample_key, handle);
```

- Registering an instance of type **Foo** (p. 1332)

```
dds::core::InstanceHandle handle = writer.register_instance(sample);
```

- Unregistering an instance of type **Foo** (p. 1332)

```
writer.unregister_instance(handle);
```

- Disposing of an instance of type **Foo** (p. 1332)

```
writer.dispose_instance(handle);
```

6.51.3 Sending data

- [Set up a DataWriter](#) (p. 112)
- [Register an instance](#) (p. 113)
- [Write instances of type Foo](#) (p. 1332) (see also [Working with IDL types](#) (p. 395))

```

Foo data;
dds::core::InstanceHandle handle =
    dds::core::InstanceHandle::nil();
dds::core::Time timestamp(123);
// Write a sample
writer.write(data);
// You can also write a sample with a timestamp that will be used as the
// source timestamp for this sample
writer.write(data, timestamp);
// You can also write a sample with an InstanceHandle
writer.write(data, handle);
// The above call to write is equivalent to the following
writer.write(dds::topic::TopicInstance<Foo>(handle, data));
// Or a combination of handle and timestamp
writer.write(data, handle, timestamp);
// The above call to write is equivalent to the following
writer.write(dds::topic::TopicInstance<Foo>(handle, data), timestamp);
// Create a vector of three default-constructed samples
std::vector<Foo> samples(3, Foo());
// You can also write samples that are stored in a container by
// passing in an iterator range to write()
writer.write(samples.begin(), samples.end());
// You can add a timestamp to the above call to write
writer.write(samples.begin(), samples.end(), timestamp);
// Create a vector of three instance handles
std::vector<dds::core::InstanceHandle> handles(
    3, dds::core::InstanceHandle::nil());
// Write 3 samples along with their handles
writer.write(samples.begin(), samples.end(),
             handles.begin(), handles.end());
// You can add a timestamp to the above call to write
writer.write(samples.begin(), samples.end(),
             handles.begin(), handles.end(),
             timestamp);
// You can also use operator « to write samples
writer « Foo(1, 2)
      « std::make_pair(Foo(3, 4), timestamp) // add a timestamp
      « std::make_pair(Foo(5, 6), handle); // add an instance handle

```

6.51.4 DataWriter Listeners

- [Implementing a DataWriterListener class](#)

```

// To create a DataWriterListener, inherit from the NoOpDataWriterListener class
// and then override any of the listener callback functions
template <typename T>
class ExampleDataWriterListener : public dds::pub::NoOpDataWriterListener<T>
{
public:
    ExampleDataWriterListener() {}
public:
    void on_publication_matched(
        dds::pub::DataWriter<T>&,
        const dds::core::status::PublicationMatchedStatus &status)
    {
        std::cout « "on_publication_matched callback" « std::endl;
        // Access information from the status
        std::cout « "total_count = " « status.total_count() « std::endl;
        std::cout « "total_count_change = " « status.total_count_change() « std::endl;
        std::cout « "current_count = " « status.current_count() « std::endl;
        std::cout « "current_count_change = " « status.current_count_change() « std::endl;
        dds::core::InstanceHandle handle = status.last_subscription_handle();
        // Extension
        std::cout « "current_count_peak = "
                  « status.extensions().current_count_peak() « std::endl;
    }
    void on_offered_incompatible_qos(

```

```

    dds::pub::DataWriter<T>&,
    const dds::core::status::OfferedIncompatibleQosStatus &status)
{
    std::cout << "on_offered_incompatible_qos callback" << std::endl;
    // Access information from the status
    std::cout << "total_count = " << status.total_count() << std::endl;
    std::cout << "total_count_change = " << status.total_count_change() << std::endl;
    std::cout << "last_policy_id = " << status.last_policy_id() << std::endl;
    dds::core::policy::QosPolicyCountSeq qos_seq = status.policies();
    if (qos_seq.size() > 0) {
        std::cout << "policy_id of one first incompatible Qos policy = "
            << qos_seq[0].policy_id() << std::endl;
    }
}
}
void on_offered_deadline_missed(
    dds::pub::DataWriter<T>&,
    const dds::core::status::OfferedDeadlineMissedStatus &status)
{
    std::cout << "on_offered_deadline_missed callback" << std::endl;
    // Access information from the status
    std::cout << "total_count = " << status.total_count() << std::endl;
    std::cout << "total_count_change = " << status.total_count_change() << std::endl;
    dds::core::InstanceHandle handle = status.last_instance_handle();
}
}
void on_liveliness_lost(
    dds::pub::DataWriter<T>&,
    const dds::core::status::LivelinessLostStatus &status)
{
    std::cout << "on_liveliness_lost callback" << std::endl;
    // Access information from the status
    std::cout << "total_count = " << status.total_count() << std::endl;
    std::cout << "total_count_change = " << status.total_count_change() << std::endl;
}
}
};

```

- Setting a listener on a DataWriter

```

dds::domain::DomainParticipant participant(0);
dds::topic::Topic<Foo> topic(participant, "Topic1");
auto listener = std::make_shared<ExampleDataWriterListener<Foo>>();
// Create a DataWriter with a listener and default
// dds::core::status::StatusMask::all()
dds::pub::DataWriter<Foo> writer1(
    dds::pub::Publisher(participant),
    topic,
    dds::pub::qos::DataWriterQos(),
    listener);
// Create a DataWriter without a listener
dds::pub::DataWriter<Foo> writer2(dds::pub::Publisher(participant), topic);
// Set the listener after creation, specifying a status mask
writer2.set_listener(
    listener,
    dds::core::status::StatusMask::offered_incompatible_qos());

```

6.51.5 Looking up DataWriters

- Lookup DataWriters by topic name

```

dds::domain::DomainParticipant participant(0);
dds::pub::Publisher publisher(participant);
dds::topic::Topic<Foo> topic1(participant, "Topic1");
dds::topic::Topic<Foo> topic2(participant, "Topic2");
// Create three DataWriters for topic1 and one for topic2 and retain them
create_and_retain_writer(publisher, topic1);
create_and_retain_writer(publisher, topic1);
create_and_retain_writer(publisher, topic2);
// We don't have any references to the created DataWriters but we can look
// them up using the publisher and topic name that they were created with
std::vector<dds::pub::DataWriter<Foo>> writers;
// writer_count will equal 1. If more than one DataWriter belongs to a
// publisher with the same topic name then find may return any one of them
int writer_count =
    dds::pub::find<dds::pub::DataWriter<Foo>>(
        publisher,

```

```

    "Topic1",
    std::back_inserter(writers));
writer_count =
    dds::pub::find<dds::pub::DataWriter<Foo> >(
        publisher,
        "Topic2",
        std::back_inserter(writers));

```

For more examples, see **Looking up DataReaders** (p. 123)

6.51.6 Getting Matched Subscriptions

- Lookup a DataWriter's matched subscriptions

```

dds::domain::DomainParticipant participant(0);
dds::topic::Topic<Foo> topic(participant, "Topic1");
dds::pub::DataWriter<Foo> writer(dds::pub::Publisher(participant), topic);
// Create two readers that will match with the above writer
dds::sub::DataReader<Foo> reader1(dds::sub::Subscriber(participant), topic);
dds::sub::DataReader<Foo> reader2(dds::sub::Subscriber(participant), topic);
// Get a list of the InstanceHandles corresponding to the DataWriter's
// matched subscriptions.
dds::core::InstanceHandleSeq subscription_handles1 =
    dds::pub::matched_subscriptions(writer);
// matched_subscriptions also takes in an iterator range and will return
// an InstanceHandle iterator to the end of the InstanceHandleSeq
dds::core::InstanceHandleSeq subscription_handles2(2, dds::core::null);
dds::core::InstanceHandleSeq::iterator last =
    dds::pub::matched_subscriptions(
        writer,
        subscription_handles2.begin(),
        subscription_handles2.end());
// now last == subscription_handles2.end()

```

- Use the InstanceHandles obtained from **matched_subscriptions()** (p. 957) to get the SubscriptionBuiltinTopicData for the subscriptions

```

dds::topic::SubscriptionBuiltinTopicData subscription_data =
    dds::pub::matched_subscription_data(writer, subscription_handles1[0]);

```

6.51.7 Tearing down a DataWriter

- See **Tearing Down An Entity** (p. 129) for examples of the various ways to teardown a DataWriter

6.52 Subscriber Use Cases

The following #includes are needed for the examples on this page

```

#include <dds/sub/ddssub.hpp>
#include <dds/domain/ddsdomain.hpp>
#include <dds/core/ddscore.hpp>

```

6.52.1 Setting up a subscriber

- Set up participant (p. 108)
- Create a Subscriber with each of the available constructors

```
// Create the participant
dds::domain::DomainParticipant participant(0);
// Creating a Subscriber with default QoS and no listener
dds::sub::Subscriber subscriber1(participant);
// Creating a Subscriber with modified QoS
dds::sub::qos::SubscriberQos qos;
qos « dds::core::policy::Presentation::GroupAccessScope(true, false);
dds::sub::Subscriber subscriber2(participant, qos);
// Creating a Subscriber with modified QoS and a listener
auto listener = std::make_shared<ExampleSubscriberListener>();
dds::sub::Subscriber subscriber3(participant, qos, listener);
// Creating a Subscriber with modified QoS, a listener, and a sample_rejected()
// status mask
dds::sub::Subscriber subscriber4(
    participant,
    qos,
    listener,
    dds::core::status::StatusMask::sample_rejected());
```

6.52.2 Looking up Subscribers

- Lookup Subscribers

```
void howto_lookup_subscribers()
{
    dds::domain::DomainParticipant participant(0);
    // Create three Subscribers and retain them
    create_and_retain_subscriber(participant);
    create_and_retain_subscriber(participant);
    create_and_retain_subscriber(participant);
    // We don't have any references to the created Subscribers but we can look
    // them up using the participant that they were created with
    std::vector<dds::sub::Subscriber> subscribers1;
    // subscriber_count will equal 3 and subscribers1 will hold a reference to
    // each of the three subscribers that were created
    int subscriber_count =
        rti::sub::find_subscribers(participant, std::back_inserter(subscribers1));
    std::cout « "Subscriber count: " « subscriber_count « std::endl;
    // rti::sub::subscribers also takes a forward iterator and a max number of
    // subscribers to look up
    std::vector<dds::sub::Subscriber> subscribers2(2, dds::sub::Subscriber(dds::core::null));
    // subscriber_count will equal 2 because we're only asking for 2
    subscriber_count =
        rti::sub::find_subscribers(participant, subscribers2.begin(), 2);
    // We retained the subscribers so we must close them now
    for (std::vector<dds::sub::Subscriber>::iterator it = subscribers1.begin();
         it != subscribers1.end();
         it++) {
        (*it).close();
    }
}

void create_and_retain_subscriber(dds::domain::DomainParticipant &participant)
{
    dds::sub::Subscriber subscriber(participant);
    subscriber.retain();
}
```

6.52.3 Tearing down a subscriber

- See **Tearing Down An Entity** (p. 129) for examples of the various ways to teardown a Subscriber

6.53 DataReader Use Cases

The following #includes are needed for the examples on this page

```
#include <dds/sub/ddssub.hpp>
#include <dds/domain/ddsdomain.hpp>
#include <dds/core/ddscore.hpp>
#include <dds/topic/ddstopic.hpp>
#include <dds/pub/ddspub.hpp>
#include "Foo.hpp"
```

6.53.1 Setting up a DataReader

- **Set up a Subscriber** (p. 117)
- **Set up a Topic** (p. 109)
- **Create a DataReader of user-defined type Foo** (p. 1332) with each of the available constructors

```
// Create the Participant
dds::domain::DomainParticipant participant(0);
// Create a Topic
dds::topic::Topic<Foo> topic(participant, "MyTopicName");
// When not explicitly provided to the constructor, the
// created DataReader's QoS is default, has a NULL listener, and a status mask
// dds::core::status::StatusMask::all()
// In all of the following constructors 'topic' could also be an instance
// of dds::topic::ContentFilteredTopic

// Creating a DataReader, creating the subscriber inline
dds::sub::DataReader<Foo> reader1(dds::sub::Subscriber(participant), topic);
// Create a Subscriber
dds::sub::Subscriber subscriber(participant);
// Create a DataReader with modified QoS
dds::sub::qos::DataReaderQos reader_qos =
    dds::core::QosProvider::Default().datareader_qos();
reader_qos « dds::core::policy::History::KeepAll();
dds::sub::DataReader<Foo> reader2(subscriber, topic, reader_qos);
// Create a DataReader with the QoS of a topic
reader_qos = topic.qos(); // Copy the policies in TopicQoS into a DataReaderQoS
dds::sub::DataReader<Foo> reader3(subscriber, topic, reader_qos);
// Create a DataReader with modified QoS and a listener
std::shared_ptr<ExampleDataReaderListener> listener =
    std::make_shared<ExampleDataReaderListener>();
dds::sub::DataReader<Foo> reader4(
    subscriber,
    topic,
    reader_qos,
    listener);
// Create a DataReader with modified QoS, a listener, and a
// liveliness_changed() status mask
dds::sub::DataReader<Foo> reader5(
    subscriber,
    topic,
    reader_qos,
    listener,
    dds::core::status::StatusMask::liveliness_changed());
```

6.53.2 Managing instances

- **Getting an instance key value of user data type Foo** (p. 1332)

```
// Instead of a sample of type Foo, key_value() could also take a
// TopicInstance<Foo> object. key_value only populates the key field in the
// sample
Foo retrieved_sample_key;
reader.key_value(retrieved_sample_key, handle);
```

6.53.3 Set up a DataReader to access received data

- **Set up a DataReader** (p. 118)
- Set up the DataReader to handle the DDS_DATA_AVAILABLE_STATUS status, in one or both of the following two ways.
- **Enable DDS_DATA_AVAILABLE_STATUS for the DDSDataReaderListener associated with the data reader** (p. 127)
 - The processing to handle the status change is done in the DataReaderListener on_data_available() method of the attached listener.
 - Typical processing will **access the received data** (p. 119).
- **Enable DDS_DATA_AVAILABLE_STATUS for the DDSStatusCondition associated with the data reader** (p. 128)
 - The processing to handle the status change is done **when the data reader's attached status condition is triggered** (p. 131) and the DDS_DATA_AVAILABLE_STATUS status on the data reader is changed.
 - Typical processing will **access the received data** (p. 119).

6.53.4 Accessing Received Data

6.53.4.1 Reading data samples

You can read data samples from a DataReader by receiving a loan, inspecting the samples and then returning the loan, or you can directly copy them.

- To iterate through loaned data samples in your application you will use a LoanedSamples container. The following code shows different ways to use this container

```

// Take all the samples in the reader queue (if you don't want to remove
// them from the queue and read them later again, use reader.read() instead)
dds::sub::LoanedSamples<Foo> samples = reader.take();
// LoanedSamples<Foo> is a container of LoanedSample<Foo> elements, which
// contain the actual data (Foo) and the SampleInfo
for (dds::sub::LoanedSamples<Foo>::iterator sample_it = samples.begin();
     sample_it != samples.end();
     ++sample_it) {
    if (sample_it->info().valid()) {
        std::cout << "Received: " << sample_it->data() << std::endl;
    }
}
// The previous code is simpler with a range-based for-loop (C++11)
for (auto sample : samples) {
    if (sample.info().valid()) {
        std::cout << "Received: " << sample.data() << std::endl;
    }
}
// If you don't need to access the SampleInfo in invalid-data samples,
// use valid_data() to simplify the for loop
auto valid_samples = rti::sub::valid_data(reader.take());
for (auto sample : valid_samples) {
    // No need to check sample.info().valid()
    std::cout << "Received: " << sample.data() << std::endl;
}
// You can also access samples using the subscript operator
if (samples.length() >= 2) {
    if (samples[1].info().valid()) {
        std::cout << "Second sample is " << samples[1].data() << std::endl;
    } else {
        std::cout << "Second sample is invalid\n";
    }
}

```

```

    }
}
// You can copy the samples using std::copy:
std::vector<rti::sub::LoanedSample<Foo> > samples_copy;
std::copy(samples.begin(), samples.end(), std::back_inserter(samples_copy));
// You can also access the data directly. A sample can be implicitly
// converted into a reference to its data type as long as it contains
// valid data.
//
// The iterator returned by this other overload of valid_data provides
// another way to skip invalid-data samples
//
std::vector<Foo> data_copy;
std::copy(
    rti::sub::valid_data(samples.begin()),
    rti::sub::valid_data(samples.end()),
    std::back_inserter(data_copy));
// Attempting to access invalid data will result in an exception.
try {
    // The following will throw if !samples[0].info().valid()
    Foo data = samples[0].data();
    std::cout << data << std::endl;
    // The following will throw if any sample contains invalid data
    std::copy(samples.begin(), samples.end(), std::back_inserter(data_copy));
} catch (const dds::core::PreconditionNotMetError& ex) {
    std::cerr << "Attempted to access sample containing invalid data: "
              << ex.what() << std::endl;
}
// You can also apply other iterator-based algorithms,
// like this example that prints just one field of the data type
// (assuming that Foo contains an integer field called 'x')
std::transform(
    rti::sub::valid_data(samples.begin()),
    rti::sub::valid_data(samples.end()),
    std::ostream_iterator<int>(std::cout, ", "),
    [](const Foo& data) { return data.x(); });
// Once a LoanedSamples object goes out of scope its destructor
// automatically returns the loan to the middleware. If you need to
// explicitly return it, call return_loan()
//
// samples.return_loan()

```

- Although the `LoanedSamples` is the most generic way to access data in a `DataReader`, for convenience other overloaded versions of `read/take` allow to directly copy the data

```

// The first version of read/take receives a back-insert iterator
std::vector<dds::sub::Sample<Foo> > my_vector1;
reader.take(std::back_inserter(my_vector1));
// The second version receives a forward iterator and the maximum size
std::vector<dds::sub::Sample<Foo> > my_vector2(10);
reader.take(my_vector2.begin(), 10);

```

- See also [Working with IDL types](#) (p. 395)

6.53.4.2 Selecting what samples to read

The functions `read()` (p. 801) and `take()` (p. 801) select all samples in the `DataReader` queue. The function `select()` allows specifying different criteria about the data to read. A equivalent API, using the streaming `>>` operator is available too.

- `select()` example

```

// To select what samples you want to read (or take) from a DataReader
// queue, you can use a Selector. When you don't specify a parameter in the
// Selector, the default applies.
dds::sub::LoanedSamples<Foo> samples =
    // Call select() to create a Selector and then specify its parameters
    reader.select()
        // Specifies the maximum number of samples to read/take
        // in this function call. Default: set by Qos.
        .max_samples(20)
        // Specifies the sample, view and instance states - default: all.
        .state(dds::sub::status::DataState::new_instance())
        // Specifies a query on the data sample - default: all
        .content(dds::sub::Query(reader, "x > 10"))

```

```

        // Specifies what instance to read - default: all instances
        .instance(my_instance_handle)
        // And finally call read() or take()
        .take();
// You can also specify state and content by using a Condition. Reusing
// a Condition for multiple reads is more efficient than specifying the
// content() every time.
dds::sub::cond::QueryCondition query_condition(
    dds::sub::Query(reader, "x > 10"),
    dds::sub::status::DataState(
        dds::sub::status::SampleState::not_read(),
        dds::sub::status::ViewState::new_view(),
        dds::sub::status::InstanceState::alive()));
samples = reader.select()
    .condition(query_condition)
    .take();
// And you can read instance by instance using next_instance().
//
// To read the first instance, use InstanceHandle::nil()
dds::core::InstanceHandle previous_handle = dds::core::InstanceHandle::nil();
do {
    samples = reader.select()
        .next_instance(previous_handle)
        .take();
    if (samples.length() > 0) {
        // do something with samples ...
        // Update previous_handle to read the instance following this one
        previous_handle = samples[0].info().instance_handle();
    }
} while (samples.length() > 0);
// select() returns an object you can reuse
dds::sub::DataReader<Foo>::Selector selector = reader.select().max_samples(20);
samples = selector.read();
// ...
selector.state(dds::sub::status::DataState::new_instance());
samples = selector.take();

```

- Streaming example

```

using namespace dds::sub;
// The overloaded shift operator defines a domain-specific language to
// specify what samples to read. The following code has the same effect as
// the first select() example from the previous code snippet
LoanedSamples<Foo> samples;
reader » take // first indicate if you want to read or take;
    » max_samples(20) // then specify the parameters you want...
    » state(status::DataState::new_instance())
    » content(Query(reader, "x > 10"))
    » instance(my_instance_handle)
    » samples; // and finally, the destination LoanedSamples container.

```

6.53.4.3 Reading samples using coherent access

If a Subscriber's PresentationQosPolicy `access_scope` is `GROUP` and `ordered_access` is `true`, the application can access the samples in order across DataWriters of the same group (Publisher with `access_scope` `GROUP`). The queue is ordered/sorted per topic across all instances belonging to DataWriters (or DataReaders) within the same Publisher (or Subscriber).

- Read samples using CoherentAccess

```

void howto_read_coherently()
{
    dds::domain::DomainParticipant participant(0);
    dds::topic::Topic<Foo> topic1(participant, "Topic1");
    dds::topic::Topic<Foo> topic2(participant, "Topic2");
    // Create a Subscriber with group presentation. The Publisher must also
    // have group presentation set in its QoS
    dds::sub::qos::SubscriberQos subscriber_qos;
    subscriber_qos « dds::core::policy::Presentation::GroupAccessScope(false, true);
    dds::sub::Subscriber subscriber(participant, subscriber_qos);
    dds::sub::DataReader<Foo> reader1(subscriber, topic1);
    dds::sub::DataReader<Foo> reader2(subscriber, topic2);
    // Assuming that a writer of "Topic1" wrote before the writer of "Topic2"
    // reader2 will only be able to access it's samples after reader1 takes

```

```

// its sample as long as CoherentAccess to the samples has been started
int sample_count = read_coherently(subscriber, reader2);
std::cout << sample_count << std::endl; // will be 0
// The CoherentAccess destructor called when read_coherently exited
// will end coherent access to the samples.
// You can also explicitly call coherent_access.end() to end coherent access
// reader2 can now access its sample
// ordered_samples.size() will = 1
dds::sub::LoanedSamples<Foo> ordered_samples = reader2.take();
}
template <typename T>
int read_coherently(dds::sub::Subscriber& subscriber, dds::sub::DataReader<T>& reader)
{
    dds::sub::CoherentAccess coherent_access(subscriber);
    dds::sub::LoanedSamples<T> ordered_samples = reader.take();
    return ordered_samples.length();
}

```

6.53.5 DataReader Listeners

- Implementing a DataReaderListener class

```

// To create a DataReaderListener, inherit from the NoOpDataReaderListener class
// and then override any of the listener callback functions
class ExampleDataReaderListener : public dds::sub::NoOpDataReaderListener<Foo>
{
public:
    ExampleDataReaderListener() {}
public:
    void on_sample_lost(
        dds::sub::DataReader<Foo>&,
        const dds::core::status::SampleLostStatus &status)
    {
        std::cout << "on_sample_lost callback" << std::endl;
        // Access information from the status
        std::cout << "total_count = " << status.total_count() << std::endl;
        std::cout << "total_count_change = " << status.total_count_change() << std::endl;
    }
    void on_subscription_matched(
        dds::sub::DataReader<Foo>&,
        const dds::core::status::SubscriptionMatchedException &status)
    {
        std::cout << "on_subscription_matched callback" << std::endl;
        // Access information from the status
        std::cout << "total_count = " << status.total_count() << std::endl;
        std::cout << "total_count_change = " << status.total_count_change() << std::endl;
        std::cout << "current_count = " << status.current_count() << std::endl;
        std::cout << "current_count_change = " << status.current_count_change() << std::endl;
        dds::core::InstanceHandle handle = status.last_publication_handle();
        // Extension
        std::cout << "current_count_peak = "
            << status.extensions().current_count_peak() << std::endl;
    }
    void on_sample_rejected(
        dds::sub::DataReader<Foo>&,
        const dds::core::status::SampleRejectedStatus &status)
    {
        std::cout << "on_sample_rejected callback" << std::endl;
        // Access information from the status
        std::cout << "total_count = " << status.total_count() << std::endl;
        std::cout << "total_count_change = " << status.total_count_change() << std::endl;
        std::cout << "last_reason = " << status.last_reason() << std::endl;
        dds::core::InstanceHandle handle = status.last_instance_handle();
    }
    void on_requested_incompatible_qos(
        dds::sub::DataReader<Foo>&,
        const dds::core::status::RequestedIncompatibleQosStatus &status)
    {
        std::cout << "on_requested_incompatible_qos callback" << std::endl;
        // Access information from the status
        std::cout << "total_count = " << status.total_count() << std::endl;
        std::cout << "total_count_change = " << status.total_count_change() << std::endl;
        std::cout << "last_policy_id = " << status.last_policy_id() << std::endl;
        dds::core::policy::QosPolicyCountSeq qos_seq = status.policies();
        if (qos_seq.size() > 0) {
            std::cout << "policy_id of one first incompatible Qos policy = "
                << qos_seq[0].policy_id() << std::endl;
        }
    }
}

```

```

    }
}
void on_requested_deadline_missed(
    dds::sub::DataReader<Foo>&,
    const dds::core::status::RequestedDeadlineMissedStatus &status)
{
    std::cout << "on_requested_deadline_missed callback" << std::endl;
    // Access information from the status
    std::cout << "total_count = " << status.total_count() << std::endl;
    std::cout << "total_count_change = " << status.total_count_change() << std::endl;
    dds::core::InstanceHandle handle = status.last_instance_handle();
}
void on_liveliness_changed(
    dds::sub::DataReader<Foo>&,
    const dds::core::status::LivelinessChangedStatus &status)
{
    std::cout << "on_liveliness_changed callback" << std::endl;
    // Access information from the status
    std::cout << "alive_count = " << status.alive_count() << std::endl;
    std::cout << "not_alive_count = " << status.not_alive_count() << std::endl;
    std::cout << "alive_count_change = " << status.alive_count_change() << std::endl;
    std::cout << "not_alive_count_change = " << status.not_alive_count_change() << std::endl;
    dds::core::InstanceHandle handle = status.last_publication_handle();
}
void on_data_available(dds::sub::DataReader<Foo> &reader)
{
    std::cout << "on_data_available callback" << std::endl;
    // Read the available data
    dds::sub::LoanedSamples<Foo> samples = reader.read();
    // Print samples by copying to std::cout
    std::copy(
        samples.begin(),
        samples.end(),
        dds::sub::LoanedSamples<Foo>::ostream_iterator(std::cout, "\n"));
}
};

```

- Setting a listener on a DataReader

```

dds::domain::DomainParticipant participant(0);
dds::topic::Topic<Foo> topic(participant, "Topic1");
auto listener = std::make_shared<ExampleDataReaderListener>();
// Create a DataReader with a listener and default
// dds::core::status::StatusMask::all()
dds::sub::DataReader<Foo> reader1(
    dds::sub::Subscriber(participant),
    topic,
    dds::sub::qos::DataReaderQos(),
    listener);
// Create a DataReader with a null listener
dds::sub::DataReader<Foo> reader2(
    dds::sub::Subscriber(participant),
    topic);
// Set the listener for the DataReader after creation
reader2.set_listener(
    listener,
    dds::core::status::StatusMask::sample_rejected());
// ...
// You can reset the listener to stop receiving status updates:
reader2.set_listener(nullptr);

```

6.53.6 Looking up DataReaders

- Lookup DataReaders by topic name

```

dds::domain::DomainParticipant participant(0);
dds::sub::Subscriber subscriber(participant);
dds::topic::Topic<Foo> topic1(participant, "Topic1");
dds::topic::Topic<Foo> topic2(participant, "Topic2");
// Create three DataReaders for topic1 and one for topic2 and retain them
create_and_retain_reader(subscriber, topic1);
create_and_retain_reader(subscriber, topic1);
create_and_retain_reader(subscriber, topic2);
// We don't have any references to the created DataReaders but we can look

```

```

// them up using the subscriber and topic name that they were created with
std::vector<dds::sub::DataReader<Foo> > readers;
// reader_count will equal 1. If more than one DataReader belongs to a
// subscriber with the same topic name then find may return any one of them
int reader_count =
    dds::sub::find<dds::sub::DataReader<Foo> >(
        subscriber,
        "Topic1",
        std::back_inserter(readers));
reader_count =
    dds::sub::find<dds::sub::DataReader<Foo> >(
        subscriber,
        "Topic2",
        std::back_inserter(readers));

```

- Lookup DataReaders by reader name

```

// Create a Subscriber with the name "MySubscriber"
dds::sub::qos::SubscriberQos subscriber_qos;
subscriber_qos « rti::core::policy::EntityName("MySubscriber");
dds::sub::Subscriber subscriber2(participant, subscriber_qos);
// Create a DataReader with the name "MyDataReader"
dds::sub::qos::DataReaderQos reader_qos;
reader_qos « rti::core::policy::EntityName("MyDataReader");
dds::sub::DataReader<Foo> reader(subscriber2, topic1, reader_qos);
// Retrieve the DataReader from the subscriber:
auto found_reader = rti::sub::find_datareader_by_name<dds::sub::DataReader<Foo> >(
    subscriber2,
    "MyDataReader");
assert(found_reader == reader);
// Retrieve the DataReader from the DomainParticipant, using also the
// name of the Subscriber:
found_reader = rti::sub::find_datareader_by_name<dds::sub::DataReader<Foo> >(
    participant,
    "MySubscriber::MyDataReader");
assert(found_reader == reader);

```

- Lookup all DataReaders

```

// To retrieve all the DataReaders at once, we use a collection of
// AnyDataReader. Each AnyDataReader may have a different template argument
std::vector<dds::sub::AnyDataReader> all_readers;
rti::sub::find_datareaders(subscriber, std::back_inserter(all_readers));
for (auto& r : all_readers) {
    // We can retrieve the typed DataReader if we know the type
    if (r.type_name() == "Foo") {
        dds::sub::DataReader<Foo> foo_reader = r.get<Foo>();
        // ...
    }
}

```

6.53.7 Getting Matched Publications

- Lookup a DataReader's matched publications

```

dds::domain::DomainParticipant participant(0);
dds::topic::Topic<Foo> topic(participant, "Topic1");
dds::sub::DataReader<Foo> reader(dds::sub::Subscriber(participant), topic);
// Create two writers that will match with the above reader
dds::pub::DataWriter<Foo> writer1(dds::pub::Publisher(participant), topic);
dds::pub::DataWriter<Foo> writer2(dds::pub::Publisher(participant), topic);
// Get a list of the InstanceHandles corresponding to the DataReader's
// matched publications.
dds::core::InstanceHandleSeq publication_handles1 =
    dds::sub::matched_publications(reader);
// matched_publications also takes in an iterator range and will return
// an InstanceHandle iterator to the end of the InstanceHandleSeq
dds::core::InstanceHandleSeq publication_handles2(2, dds::core::null);
dds::core::InstanceHandleSeq::iterator last =
    dds::sub::matched_publications(
        reader,
        publication_handles2.begin(),
        publication_handles2.end());
// now last == publication_handles2.end()

```

- Use the InstanceHandles obtained from `matched_publications()` (p. 808) to get the `PublicationBuiltinTopicData` for the publications

```
dds::topic::PublicationBuiltinTopicData publication_data =
    dds::sub::matched_publication_data(reader, publication_handles1[0]);
```

6.53.8 Accessing the Built-in Subscriber and DataReaders

- The next two examples assume the following setup

```
// It is common to create entities disabled when accessing and setting
// listeners on the built-in DataReaders so that information about
// discovery traffic is missed
dds::domain::qos::DomainParticipantFactoryQos qos;
qos < dds::core::policy::EntityFactory(false);
dds::domain::DomainParticipant::participant_factory_qos(qos);
dds::domain::DomainParticipant participant(0);
```

- Access the built-in Subscriber

```
dds::sub::Subscriber builtin_subscriber = dds::sub::builtin_subscriber(participant);
```

- Access the built-in DataReaders

```
// There are constants for each of the built-in topics accessible through
// the dds::topic namespace--see below for their use
// Access the built-in DataReader for ParticipantBuiltinTopicData
std::vector<dds::sub::DataReader<dds::topic::ParticipantBuiltinTopicData> > participant_reader;
int reader_count =
    dds::sub::find<dds::sub::DataReader<dds::topic::ParticipantBuiltinTopicData> >(
        builtin_subscriber,
        dds::topic::participant_topic_name(),
        std::back_inserter(participant_reader));
// Access the built-in DataReader for PublicationBuiltinTopicData
std::vector<dds::sub::DataReader<dds::topic::PublicationBuiltinTopicData> > publication_reader;
reader_count =
    dds::sub::find<dds::sub::DataReader<dds::topic::PublicationBuiltinTopicData> >(
        builtin_subscriber,
        dds::topic::publication_topic_name(),
        std::back_inserter(publication_reader));
// Access the built-in DataReader for SubscriptionBuiltinTopicData
std::vector<dds::sub::DataReader<dds::topic::SubscriptionBuiltinTopicData> > subscription_reader;
reader_count =
    dds::sub::find<dds::sub::DataReader<dds::topic::SubscriptionBuiltinTopicData> >(
        builtin_subscriber,
        dds::topic::subscription_topic_name(),
        std::back_inserter(subscription_reader));
// participant_reader[0], publication_reader[0] and subscription_reader[0]
// will now hold reference to the built-in DataReaders.
```

6.53.9 Using untyped DataReaders

When you want to hold a reference to a `DataReader` and the type `T` doesn't matter, you can use the class `dds::sub::AnyDataReader` (p. 595), which provides type-independent methods.

- For example, this function receives any `DataReader`

```
// This function can receive any DataReader, independently of the template types
void example_untyped(const dds::sub::AnyDataReader& untyped_reader)
{
    // Use type-independent operations
    std::cout << "The topic name is: " << untyped_reader.topic_name() << std::endl;
```

```

if (untyped_reader.type_name() == "Foo") {
    // Get back the typed DataReader.
    //
    // If the reader's type is not Foo, this operation throws
    // dds::core::InvalidDowncastError.
    //
    // typed_reader and untyped_reader share references to the same object.
    dds::sub::DataReader<Foo> typed_reader = untyped_reader.get<Foo>();
}
}

```

- And this is how you can call it

```

dds::sub::DataReader<Foo> reader(subscriber, topic);
example_untyped(reader); // automatic conversion to AnyDataReader

```

6.53.10 Tearing down a DataReader

- See [Tearing Down An Entity](#) (p. 129) for examples of the various ways to teardown a DataReader

6.54 Entity Use Cases

The following #includes are needed for the examples on this page

```
#include <dds/domain/ddsdomain.hpp>
```

6.54.1 Changing the QoS for an entity

The QoS for an entity can be specified at entity creation time. Once an entity has been created, its QoS can be manipulated as the following examples illustrate. A DataWriter is used in these examples, but the same can be applied to any <<*reference-type*>> (p. 153), such as DomainParticipants, Subscribers, Publishers, DataReaders, and Topics.

- See [QosProvider](#) (p. 393) for examples on how to manage user-defined QoS profiles.

- See [Qos Use Cases](#) (p. 391) for examples on how to work with the Qos policy classes.

- Get an entity's QoS settings

```

dds::pub::DataWriter<Foo> writer(dds::pub::Publisher(participant), a_topic);
// Get the DataWriter's QoS
dds::pub::qos::DataWriterQos writer_qos = writer.qos();

```

- Change the desired qos policy fields

```

// Change the History QoS for the DataWriter using the History QoS's
// KeepAll named constructor
writer_qos « dds::core::policy::History::KeepAll();

```

- Set the qos

```

// Set the modified QoS for the DataWriter
writer_qos(writer_qos);

```

6.54.2 Changing the listener and enabling/disabling statuses associated with it

The listener for an entity can be specified at the entity creation time. By default the listener is *enabled* for all the statuses supported by the entity.

Once an entity has been created, its listener and/or the statuses for which it is enabled can be manipulated as follows.

The following examples use a DomainParticipant but the same examples can be applied to all other entities (Subscribers, Publishers, DataReaders, DataWriters, and Topics)

- User defines entity listener methods

```
class ExampleDomainParticipantListener : public dds::domain::NoOpDomainParticipantListener
{
public:
    ExampleDomainParticipantListener() {}
public:
    void on_liveliness_lost(
        dds::pub::AnyDataWriter&,
        const::dds::core::status::LivelinessLostStatus&)
    {
        std::cout << "on_liveliness_lost" << std::endl;
    }
    void on_liveliness_changed(
        dds::sub::AnyDataReader&,
        const dds::core::status::LivelinessChangedStatus&)
    {
        std::cout << "on_liveliness_changed" << std::endl;
    }
    void on_inconsistent_topic(
        dds::topic::AnyTopic&,
        const dds::core::status::InconsistentTopicStatus&)
    {
        std::cout << "on_inconsistent_topic" << std::endl;
    }
    void on_data_on_readers(
        dds::sub::Subscriber&)
    {
        std::cout << "on_data_on_readers" << std::endl;
    }
    void on_offered_deadline_missed(
        dds::pub::AnyDataWriter&,
        const::dds::core::status::OfferedDeadlineMissedStatus&)
    {
        std::cout << "on_offered_deadline_missed" << std::endl;
    }
    void on_offered_incompatible_qos(
        dds::pub::AnyDataWriter&,
        const::dds::core::status::OfferedIncompatibleQosStatus&)
    {
        std::cout << "on_offered_incompatible_qos" << std::endl;
    }
    void on_publication_matched(
        dds::pub::AnyDataWriter&,
        const::dds::core::status::PublicationMatchedStatus&)
    {
        std::cout << "on_publication_matched" << std::endl;
    }
    void on_requested_deadline_missed(
        dds::sub::AnyDataReader&,
        const dds::core::status::RequestedDeadlineMissedStatus&)
    {
        std::cout << "on_requested_deadline_missed" << std::endl;
    }
    void on_requested_incompatible_qos(
        dds::sub::AnyDataReader&,
        const dds::core::status::RequestedIncompatibleQosStatus&)
    {
        std::cout << "on_requested_incompatible_qos" << std::endl;
    }
    void on_sample_lost(
        dds::sub::AnyDataReader&,
        const dds::core::status::SampleLostStatus&)
    {
        std::cout << "on_sample_lost" << std::endl;
    }
}
```

```

    }
    void on_sample_rejected(
        dds::sub::AnyDataReader&,
        const dds::core::status::SampleRejectedStatus&)
    {
        std::cout << "on_sample_rejected" << std::endl;
    }
    void on_subscription_matched(
        dds::sub::AnyDataReader&,
        const dds::core::status::SubscriptionMatchedStatus&)
    {
        std::cout << "on_subscription_matched" << std::endl;
    }
    void on_data_available(
        dds::sub::AnyDataReader&)
    {
        std::cout << "on_data_available" << std::endl;
    }
};

```

- Get an entity's listener

```

ExampleDomainParticipantListener *listener = new ExampleDomainParticipantListener;
dds::domain::DomainParticipant participant(
    0, dds::domain::qos::DomainParticipantQos(), listener);
dds::domain::DomainParticipantListener *retrieved_listener = participant.listener();

```

- Enable statuses for the listener

```

// The default constructor creates an empty StatusMask
dds::core::status::StatusMask enabled_status_list;
// ...
// Add more statuses to the enabled_status_list
enabled_status_list |= dds::core::status::StatusMask::liveliness_changed() |
    dds::core::status::StatusMask::offered_incompatible_qos();

```

- Disable a status for the listener

```

enabled_status_list &= ~dds::core::status::StatusMask::offered_incompatible_qos();

```

- Set an entity's listener and only enable the listener for the statuses specified by the `enabled_status_list`.

```

participant.listener(listener, enabled_status_list);

```

6.54.3 Enabling/Disabling statuses associated with a status condition

Upon entity creation, by default, all the statuses are *enabled* for the `DDS_StatusCondition` associated with the entity.

Once an entity has been created, the list of statuses for which the `DDS_StatusCondition` is triggered can be manipulated as follows.

- Given an entity and the associated `status_condition`

```

ExampleDomainParticipantListener *listener = new ExampleDomainParticipantListener;
dds::domain::DomainParticipant participant(
    0, dds::domain::qos::DomainParticipantQos(), listener);
dds::core::cond::StatusCondition status_condition(participant);

```

- Get the list of statuses enabled for the `status_condition`

```
dds::core::status::StatusMask enabled_status_list = status_condition.enabled_statuses();
```
- Check if a given status is enabled for the `status_condition`

```
// StatusMask inherits from std::bitset. You can use std::bitset's any()
// method to check if a given status is enabled
if ((enabled_status_list & dds::core::status::StatusMask::data_on_readers()).any()) {
    // Do something to handle the on_data_on_readers status...
}
```
- Enable statuses for the `status_condition`

```
status_condition.enabled_statuses(
    dds::core::status::StatusMask::inconsistent_topic() |
    dds::core::status::StatusMask::sample_rejected());
```
- Disable statuses for the `status_condition`

```
status_condition.enabled_statuses(
    ~dds::core::status::StatusMask::inconsistent_topic());
```

6.54.4 Ignoring Entities

A Topic is used in this example, but each of the other entities (DomainParticipants, Publishers, Subscribers, and Data Writers) also have an `ignore()` (p. 1112) method which takes the DomainParticipant and InstanceHandle(s) of the entities that are to be ignored

- Ignore Topics

```
dds::domain::DomainParticipant participant(0);
dds::topic::Topic<Foo> topic1(participant, "Topic1");
dds::topic::Topic<Foo> topic2(participant, "Topic2");
dds::topic::Topic<Foo> topic3(participant, "Topic3");
// This participant will now ignore this topic
dds::topic::ignore(participant, topic1.instance_handle());
dds::core::InstanceHandleSeq handles;
handles.push_back(topic2.instance_handle());
handles.push_back(topic3.instance_handle());
// This participant will now ignore the other two topics too
dds::topic::ignore(participant, handles.begin(), handles.end());
```

6.54.5 Tearing Down An Entity

The following examples use a DomainParticipant to show the various patterns which exist to tear down an entity, but the same examples can also be applied when shutting down Subscribers, Publishers, DataReaders, DataWriters, and Topics

- Let all references to a given entity go out-of-scope and let the destructor take care of entity clean up

```
{
    {
        // Create a participant on domain 0
        dds::domain::DomainParticipant participant(0);

        // ...
    } // participant destroyed here
    // found_participant will equal dds::core::null because the participant's
```

```

// destructor was called when the only reference to it went out of scope
dds::domain::DomainParticipant found_participant = dds::domain::find(0);
}

```

- Explicitly call **close()** (p. 801) on one of the existing references to an Entity

```

// Create a participant on domain 0
dds::domain::DomainParticipant participant(0);
// All Entities are Reference types, meaning that the assignment operator
// will not make a copy of the participant, but instead will just create
// another reference to the previously created participant
dds::domain::DomainParticipant same_participant = participant;
// Call close() on same_participant to explicitly destroy the participant.
// Both references (participant and same_participant) are now invalid.
same_participant.close();
try {
    // Any attempt to use the closed participant, will cause a
    // dds::core::AlreadyClosedError exception
    participant.enable();
}
catch (dds::core::AlreadyClosedError& ex) {
    std::cout << "Expected AlreadyClosedError: " << ex.what() << std::endl;
}

```

- Assigning **dds::core::null** (p. 238) to a variable has the same effect as if the reference went out of scope. Assigning **dds::core::null** (p. 238) to the last reference destroys the underlying object.

```

// Create a reference to a null participant
dds::domain::DomainParticipant participant1(dds::core::null);
// Now create a participant on domain 0
dds::domain::DomainParticipant participant2(0);
// Assign participant1 to this valid participant
participant1 = participant2;
// Assign dds::core::null to participant2. The participant will not be
// destroyed because participant1 is still a valid reference
participant2 = dds::core::null;
// We can still use the participant because participant1 is still a
// valid reference
dds::domain::qos::DomainParticipantQos qos =
    participant1.default_participant_qos();
// Assigning dds::core::null to the only remaining reference to the
// participant will now cause its destructor to be called
participant1 = dds::core::null;
// found_participant will equal dds::core::null because the previous
// assignment to dds::core::null caused the participant to be destroyed
dds::domain::DomainParticipant found_participant = dds::domain::find(0);

```

- Retaining and then destroying an Entity

```

void howto_tear_down_retain()
{
    // To prevent participant destruction when all references go out of scope
    // you can call retain().
    const uint32_t domain_id_0 = 0;
    const uint32_t domain_id_1 = 1;
    create_and_retain_participant(domain_id_0, false);
    create_and_retain_participant(domain_id_1, true);
    // We did not retain the participant with domain_id_0, so the following
    // will result in participant0 == dds::core::null
    dds::domain::DomainParticipant participant0 = dds::domain::find(domain_id_0);
    // We can recover the participant with domain_id_1 using find() because we
    // retained it. participant1 will be a valid reference to
    // the participant that was created on domain 1
    dds::domain::DomainParticipant participant1 = dds::domain::find(domain_id_1);
    // Because we called retain on the participant, the only way to destroy
    // the participant is to explicitly call close() on a reference to the
    // participant. Any attempt to use the participant after calling
    // close will cause a dds::core::AlreadyClosedError exception to be thrown
    // Destroy the participant
    participant1.close();
    try {
        // This call will cause a dds::core::AlreadyClosedError exception
    }
}

```

```

        participant1.enable();
    }
    catch (dds::core::AlreadyClosedError& ex) {
        std::cout << "Expected AlreadyClosedError: " << ex.what() << std::endl;
    }
}

void create_and_retain_participant(const uint32_t domain_id, bool retain)
{
    // Create and retain a participant. If retained, the participant will not
    // be destroyed when it goes out of scope and can be retrieved again
    dds::domain::DomainParticipant participant(domain_id);
    if (retain) {
        participant.retain();
    }
}

```

6.55 Waitset Use Cases

Using WaitSets and Conditions.

Using WaitSets and Conditions.

The following #includes are needed for the examples on this page

```

#include <iostream>
#include <dds/core/ddscore.hpp>
#include <dds/sub/ddssub.hpp>

```

6.55.1 Setting up a WaitSet

- Create a WaitSet and attach Conditions

```

// Create a WaitSet
dds::core::cond::WaitSet waitset;
// Create a GuardCondition
dds::core::cond::GuardCondition guard_cond;
// Create a StatusCondition for a given Entity
dds::core::cond::StatusCondition status_cond(entity);
// Create a ReadCondition for a reader with a specific DataState
dds::sub::cond::ReadCondition read_cond(
    reader, dds::sub::status::DataState(
        dds::sub::status::SampleState::not_read(),
        dds::sub::status::ViewState::any(),
        dds::sub::status::InstanceState::any()));
// Attach conditions
waitset += guard_cond; // using += operator
waitset += status_cond;
waitset.attach_condition(read_cond); // or using attach_condition()

```

6.55.2 Waiting for Condition(s) to trigger

You have two ways to wait for Conditions to trigger: wait or dispatch.

- Wait example

```
// Wait for at most 20 seconds until one or more conditions are active and
// then return them.
// In case of timeout, active_conditions will be empty.
dds::core::cond::WaitSet::ConditionSeq active_conditions =
    waitset.wait(dds::core::Duration::from_secs(20));
for (uint32_t i = 0; i < active_conditions.size(); i++) {
    if (active_conditions[i] == guard_cond) {
        std::cout << "guard_cond was triggered\n";
    } else if (active_conditions[i] == status_cond) {
        std::cout << "status_cond was triggered\n";
    } // ...
}
```

- Dispatch example

```
using dds::core::cond::Condition;
using dds::sub::cond::ReadCondition;
// create a WaitSet
dds::core::cond::WaitSet waitset;
// Create a ReadCondition for reader1 with a functor handler
ReadCondition read_cond1(reader1, dds::sub::status::DataState::any(), []() {
    std::cout << "read_cond1 was triggered\n";
});
ReadCondition read_cond2(
    reader2,
    dds::sub::status::DataState::any(),
    [](Condition c) { // The handler can optionally
        // receive the condition
        auto rc = dds::core::polymorphic_cast<ReadCondition>(c);
        auto reader = rc.data_reader(); // reader == reader2
        std::cout << "read_cond2 was triggered (topic is "
            << reader.topic_name() << ")" << std::endl;
    });
// Attach conditions
waitset += read_cond1;
waitset += read_cond2;
// Wait at most 20 seconds until one or more conditions are active and
// then call the handler of the active conditions. You can repeat this in
// a loop.
waitset.dispatch(dds::core::Duration::from_secs(20));
```

[Filtering with Query Conditions \(p. 133\)](#)

6.56 Filter Use Cases

Working with data filters.

Working with data filters.

6.56.1 Introduction

RTI Connext supports filtering data either during the exchange from `dds::pub::DataWriter` (p. 908) to `dds::sub::DataReader` (p. 756), or after the data has been stored at the `dds::sub::DataReader` (p. 756).

Filtering during the exchange process is performed by a `dds::topic::ContentFilteredTopic` (p. 735), which is created by the `dds::sub::DataReader` (p. 756) as a way of specifying a subset of the data samples that it wishes to receive.

Filtering samples that have already been received by the `dds::sub::DataReader` (p. 756) is performed by creating a `dds::sub::cond::QueryCondition` (p. 1784), which can then used to check for matching samples, be alerted when matching samples arrive, or retrieve matching samples.

Filtering may be performed on any topic, either keyed or un-keyed, except the built-in topics. Filtering may be performed on any field, subset of fields, or combination of fields, subject only to the limitations of the filter syntax.

6.56.2 Code Examples

The following #includes are needed for the examples on this page

```
#include <iostream>
#include <dds/topic/ddstopic.hpp>
#include <dds/sub/ddssub.hpp>
#include "Foo.hpp"
```

6.56.3 Filtering with ContentFilteredTopic

- [Set up a Subscriber](#) (p. 117)
- [Set up a Topic](#) (p. 109)
- [Create a ContentFilteredTopic, of user data type Foo](#) (p. 1332) :

```
// Create the DomainParticipant
dds::domain::DomainParticipant participant(0);
// Create a Topic
dds::topic::Topic<Foo> topic(participant, "MyTopicName");
// Create the parameter list
std::vector<std::string> cft_parameters(2);
cft_parameters[0] = "1";
cft_parameters[1] = "100";
// Create the ContentFilteredTopic
dds::topic::ContentFilteredTopic<Foo> cft(
    topic, // related topic
    "ContentFilteredTopic", // local name for the CFT
    dds::topic::Filter( // filter (constructed in-line in this example)
        "x > %0 AND x < %1", // expression
        cft_parameters)); // parameter vector
// Parameters are optional
dds::topic::ContentFilteredTopic<Foo> cft2(
    topic,
    "ContentFilteredTopic2",
    dds::topic::Filter("x = 100 AND y < 20"));
```

- [Create a DataReader using the ContentFilteredTopic](#):

```
dds::sub::DataReader<Foo> reader(subscriber, cft);
```

Once setup, reading samples with a `dds::topic::ContentFilteredTopic` (p. 735) is exactly the same as normal reads or takes, as described in [DataReader Use Cases](#) (p. 118).

- [Changing filter criteria](#):

```
std::vector<std::string> new_cft_parameters(2);
new_cft_parameters[0] = "5";
new_cft_parameters[1] = "9";
cft.filter_parameters(new_cft_parameters.begin(), new_cft_parameters.end());
```

6.56.4 Filtering with Query Conditions

- [Creating a QueryCondition](#)

```
// Create parameter list
std::vector<std::string> query_parameters(2);
query_parameters[0] = "1";
query_parameters[1] = "100";
// Create query condition
dds::sub::cond::QueryCondition query_condition(
    dds::sub::Query(reader, "x > %0 AND x < %1", query_parameters),
    dds::sub::status::DataState::any_data());
```

- You can use a QueryCondition in a WaitSet: see [Waiting for Condition\(s\) to trigger](#) (p. 131)
- And to query for data in a DataReader: see [Selecting what samples to read](#) (p. 120)
- To modify the filter criteria you can use `dds::sub::cond::QueryCondition::parameters` (p. 1786) (similar to `dds::topic::ContentFilteredTopic::filter_parameters` (p. 738))
- This example shows how to create a condition with a handler that takes the samples received by a DataReader and selected by the QueryCondition's filter.

```
using dds::sub::cond::QueryCondition;

QueryCondition query_condition2(
    dds::sub::Query(reader, "x > %0 AND x < %1", query_parameters),
    dds::sub::status::DataState::any_data(),
    // The handler function singature allows receiving the related condition
    // as a parameter (it also allows zero arguments).
    [&reader](dds::core::cond::Condition condition)
    {
        // Downcast a Condition (a reference type) into a QueryCondition
        auto condition_as_qc =
            dds::core::polymorphic_cast<QueryCondition>(condition);
        // Use the condition's filter to select specific samples
        auto samples = reader.select().condition(condition_as_qc).take();
        for (auto& sample : samples) {
            std::cout << "Sample received: " << sample << std::endl;
        }
    }
);
```

6.56.5 Filtering Performance

Although RTI Connexx supports filtering on any field or combination of fields using the SQL syntax of the built-in filter, filters for keyed topics that filter solely on the contents of key fields have the potential for much higher performance. This is because for key-only filters, the `dds::sub::DataReader` (p. 756) caches the results of the filter (pass or not pass) for each instance. When another sample of the same instance is seen at the `dds::sub::DataReader` (p. 756), the filter results are retrieved from the cache, dispensing with the need to call the filter function.

This optimization applies to all filtering using the built-in SQL filter, performed by the `dds::sub::DataReader` (p. 756), for either `dds::topic::ContentFilteredTopic` (p. 735) or `dds::sub::cond::QueryCondition` (p. 1784). This does *not* apply to filtering performed for `dds::topic::ContentFilteredTopic` (p. 735) by the `dds::pub::DataWriter` (p. 908).

6.57 Creating Custom Content Filters

Creating a custom content filter.

Creating a custom content filter.

6.57.1 Introduction

By default, RTI Connexx creates content filters with the DDS SQL filter, which implements a superset of the DDS-specified SQL WHERE clause. However, in many cases this filter may not be what you want. Some examples are:

- The default filter can only filter based on the content of a sample, not on a computation on the content of a sample. You can use a custom filter that is customized for a specific type and can filter based on a computation of the type members.
- You want to use a different filter language than SQL

This HOW-TO explains how to write your own custom filter and is divided into the following sections:

- [The Custom Content Filter API](#) (p. 135)
- [Example Custom Writer Content Filter](#) (p. 137)

6.57.2 The Custom Content Filter API

A custom content filter is created by calling the `dds::domain::DomainParticipant::register_contentfilter` (p. 1103) function with a `rti::topic::CustomFilter` (p. 749). A `CustomFilter` is created with either a `rti::topic::ContentFilter` (p. 732) or `rti::topic::WriterContentFilter` (p. 2351).

A `ContentFilter` contains a `compile`, an `evaluate` and a `finalize` function.

A `WriterContentFilter` contains a `compile`, an `evaluate`, a `finalize`, a `writer_attach`, `writer_compile`, `writer_evaluate`, `writer_detach`, and `writer_finalize` functions.

To use a custom filter in a `dds::topic::ContentFilteredTopic` (p. 735) or a `dds::sub::QueryCondition`, the name used to register it with the participant has to be set in the `dds::topic::Filter` (p. 1303) or in the `dds::sub::Query` (p. 1778) that is used to create the corresponding `ContentFilteredTopic` or `QueryCondition`.

A custom `ContentFilter` is used by RTI Connexx at the following times during the life-time of a `ContentFilteredTopic` (the function called is shown in parenthesis).

- When a `ContentFilteredTopic` is created (`compile` (p. 135))
- When the filter parameters are changed on the `ContentFilteredTopic` (`compile` (p. 135))
- When a sample is filtered (`evaluate` (p. 136)). This function is called by the RTI Connexx core with a de-serialized sample
- When a `ContentFilteredTopic` is deleted (`finalize` (p. 136))

A custom `WriterContentFilter` is used by RTI Connexx at the following times during the life-time of a `ContentFilteredTopic` (the function called is shown in parenthesis).

- When a `DataWriter` discovers a `DataReader` with a `ContentFilteredTopic` or when a `DataWriter` is notified of a change in the `DataReader`'s filter parameter (`writer_compile` (p. 136))
- When the `DataWriter` matches a `DataReader` using the specified filter for the first time (`writer_attach` (p. 136))
- When a `DataWriter` writes a new sample (`writer_evaluate` (p. 136)). This function is called by the RTI Connexx core with a de-serialized sample
- When RTI Connexx is finished using the sequence of `Cookies` returned by `writer_evaluate` (`writer_return_loan` (p. 136))
- When a `DataWriter` is no longer matching with a `DataReader` for which it was previously performing writer-side filtering (`writer_finalize` (p. 137))

6.57.2.1 The compile function

The "compile" function is used to **compile** a filter expression and expression parameters. Please note that the term **compile** is intentionally loosely defined. It is up to the user to decide what this function should do and return.

6.57.2.2 The evaluate function

When using a `ContentFilter`, the "evaluate" function is called each time a sample is received to determine if a sample should be filtered out and discarded.

When using a `WriterContentFilter`, the "evaluate" function is called each time a sample is written to determine if a sample should be filtered out and discarded. It is called for each `DataReader` for which the `DataWriter` is filtering and for which the `writer_compile` function set the `ExpressionProperty.writer_side_filter_optimization` to `false`.

6.57.2.3 The finalize function

The "finalize" function is called when an instance of the custom content filter is no longer needed. When this function is called, it is safe to free all resources used by this particular instance of the custom content filter.

6.57.2.4 The writer_attach function

The "writer_attach" function is called the first time that a `DataWriter` matches with a `DataReader` with the same `ContentFilter`. It will not be called for subsequent `DataReaders` that are using the same filter. This function is used to create some state required to perform filtering on the writer-side. It is entirely up to you, as the implementer of the filter, to decide if the filter requires this state.

6.57.2.5 The writer_compile function

The "writer_compile" function is called when a `DataWriter` matches with a `DataReader` with the same `ContentFilter`. It is called every time that the `DataWriter` matches a `DataReader` that is using the same filter as well as each time the `DataWriter` is notified that a `DataReader`'s filter parameters have changed. This function will receive as an input a `rti::core::Cookie` (p. 746) which uniquely identifies the `DataReader` for which the function was invoked.

6.57.2.6 The writer_evaluate function

The "writer_evaluate" function is called every time that a `DataWriter` writes a new sample. Its purpose is to evaluate the sample for all the readers for which the `DataWriter` is performing writer-side filtering and return the sequence of `rti::core::Cookie` (p. 746) associated with the `DataReaders` whose filter pass the sample.

6.57.2.7 The writer_detach function

The "writer_detach" function is called when an instance of the custom content filter is no longer needed. When this function is called, it is safe to free all resources used by this particular instance of the custom content filter.

6.57.2.8 The writer_return_loan function

The "writer_return_loan" function is called to return the loan on the `rti::core::CookieSeq` provided by the `writer_evaluate` function.

6.57.2.9 The writer_finalize function

The "writer_finalize" function will be called by Connex to notify the filter implementation that the DataWriter is no longer matching with a DataReader for which it was previously performing writer-side filtering. This will allow the filter to purge any state it was maintaining for the DataReader.

6.57.3 Example Custom Writer Content Filter

Assume that you have a type **Foo** (p. 1332).

Our filter will show how to enable the writer-side filter optimization for some readers and not for others. The ones with writer-side filter optimization will only pass samples where $Foo.x == y$ where y is a value determined by an expression parameter, see the `writer_evaluate` function. Readers without the optimization turned on will pass all samples where $Foo.x > 7$, see the `evaluate` function. The filter will **only** be used to filter samples of type **Foo** (p. 1332).

The following #includes are needed for the examples on this page

```
#include <iostream>
#include <dds/topic/ddstopic.hpp>
#include <rti/topic/findImpl.hpp>
#include <dds/sub/ddssub.hpp>
#include <dds/pub/ddspub.hpp>
#include <dds/core/ddscore.hpp>
#include "Foo.hpp"
```

The following is the definition of the `WriterFilterData`, the state that is created and returned by the `writer_attach` method:

```
class WriterFilterData
{
public:
    typedef std::pair<rti::core::Cookie, int32_t> CookieValue;
    typedef std::vector<CookieValue> CookieValueSeq;
public:
    WriterFilterData()
    {
    }
    void add_pair(const CookieValue& cookie_value_pair)
    {
        reader_pairs_.push_back(cookie_value_pair);
    }
    CookieValueSeq& reader_pairs()
    {
        return reader_pairs_;
    }
private:
    CookieValueSeq reader_pairs_;
};
```

And here is the declaration of our custom writer content filter. Notice, we are inheriting from `rti::topic::WriterContentFilter` (p. 2351). We could have inherited from `rti::topic::ContentFilter` (p. 732) or `rti::topic::WriterContentFilterHelper` (p. 2356) here too to create other custom content filters.

```
// A custom WriterContentFilter
class ExampleWriterContentFilter :
    public rti::topic::WriterContentFilter<
        Foo,
        rti::topic::no_compile_data_t,
        WriterFilterData>
{
public:
    ExampleWriterContentFilter() {}
    ~ExampleWriterContentFilter() {}
    rti::topic::no_compile_data_t& compile(
        const std::string& expression,
        const dds::core::StringSeq& parameters,
        const dds::core::optional<dds::core::xtypes::DynamicType>& type_code,
        const std::string& type_class_name,
        rti::topic::no_compile_data_t* old_compile_data);
    bool evaluate(
        rti::topic::no_compile_data_t& compile_data,
```

```

    const Foo& sample,
    const rti::topic::FilterSampleInfo& meta_data);
void finalize(rti::topic::no_compile_data_t& compile_data);
WriterFilterData& writer_attach();
void writer_compile(
    WriterFilterData& writer_filter_data,
    rti::topic::ExpressionProperty& prop,
    const std::string& expression,
    const dds::core::StringSeq& parameters,
    const dds::core::optional<dds::core::xtypes::DynamicType>& type_code,
    const std::string& type_class_name,
    const rti::core::Cookie& cookie);
rti::core::CookieSeq& writer_evaluate(
    WriterFilterData& writer_filter_data,
    const Foo& sample,
    const rti::topic::FilterSampleInfo &meta_data);
void writer_finalize(
    WriterFilterData& writer_filter_data,
    const rti::core::Cookie& cookie);
void writer_detach(WriterFilterData& writer_filter_data);
void writer_return_loan(
    WriterFilterData& writer_filter_data,
    rti::core::CookieSeq& cookies);
void writer_data(const WriterFilterData& is_writer_data) { writer_data_ = is_writer_data; }
WriterFilterData& writer_data() { return writer_data_; }
void reset_cookie_seq()
{
    cookie_seq_.clear();
}
void add_cookie(rti::core::Cookie& cookie)
{
    cookie_seq_.resize(cookie_seq_.size() + 1);
    cookie_seq_[cookie_seq_.size() - 1] = cookie;
}
rti::core::CookieSeq& cookie_seq()
{
    return cookie_seq_;
}
private:
    rti::core::CookieSeq cookie_seq_;
    WriterFilterData writer_data_;
};

```

6.57.3.1 Writing the Compile Function

Since we already know what the expression is ($\text{Foo.x} > 7$), we can simply return `rti::topic::no_compile_data`.

Below is the entire **compile** (p. 135) function.

```

rti::topic::no_compile_data_t& ExampleWriterContentFilter::compile(
    const std::string&,
    const dds::core::StringSeq&,
    const dds::core::optional<dds::core::xtypes::DynamicType>&,
    const std::string&,
    rti::topic::no_compile_data_t*)
{
    // We don't have any compile data to setup in this compile function. We
    // will do all necessary setup in the writer_compile function
    return rti::topic::no_compile_data;
}

```

6.57.3.2 Writing the Evaluate Function

The next step is to implement the **evaluate** function. The evaluate function receives `no_compile_data` because it is unnecessary in this example. The function then evaluates the received sample against our filter expression and passes the sample if $\text{Foo.x} > 7$. Below is the entire **evaluate** (p. 136) function.

```

bool ExampleWriterContentFilter::evaluate(
    rti::topic::no_compile_data_t&,
    const Foo& sample,
    const rti::topic::FilterSampleInfo&)
{

```

```

    if (sample.x() > 7) {
        return true;
    }
    return false;
}

```

6.57.3.3 Writing the Finalize Function

The next function to write is the finalize function. It is safe to free all resources used by this particular instance of the custom content filter that is allocated in **compile**. Because we did not create any resources in the **compile** function, we have nothing to do in the **finalize**. Below is the entire **finalize** (p. 136) function.

```

void ExampleWriterContentFilter::finalize(
    rti::topic::no_compile_data_t&)
{
    // There is nothing to finalize in this example
}

```

6.57.3.4 Writing the Writer Attach Function

The **writer_attach** is used to create some state required to perform filtering on the writer-side. In our example filter, this state is kept as part of our custom filter class, ExampleWriterContentFilter, so we therefore simply return a reference to our writer data that will be used during the **writer_compile** and **writer_evaluate** functions.

```

WriterFilterData& ExampleWriterContentFilter::writer_attach()
{
    // Setup the writer_filter_data to point to our WriterFilterData
    return writer_data();
}

```

6.57.3.5 Writing the Writer Compile Function

The **writer_compile** function is called when a DataWriter matches with a DataReader with the same ContentFilter. In our case, we use the parameters to determine if we should turn on the writer-side filtering optimization. If parameters[0] == 1, then we store the provided **rti::core::Cookie** (p.746) along with parameters[1] in our **writer_filter_data** to be accessed during the **writer_evaluate** function whenever we receive a new sample.

```

void ExampleWriterContentFilter::writer_compile(
    WriterFilterData& writer_filter_data,
    rti::topic::ExpressionProperty& prop,
    const std::string& /* expression */,
    const dds::core::StringSeq& parameters,
    const dds::core::optional<dds::core::xtypes::DynamicType>& /* type */,
    const std::string& /* type_class_name */,
    const rti::core::Cookie& cookie)
{
    int length = parameters.size();
    bool optimize = false;
    int32_t x = 0;
    if (length == 2) {
        std::istringstream(parameters[0]) >> optimize;
        std::istringstream(parameters[1]) >> x;
    }
    // Add this DataReader's cookie to our writer filter data
    if (optimize) {
        writer_filter_data.add_pair(std::make_pair(cookie, x));
    }
    prop.writer_side_filter_optimization(optimize);
}

```

6.57.3.6 Writing the Writer Evaluate Function

The `writer_evaluate` function receives our stored `writer_filter_data` and a sample to evaluate. We iterate through our (`rti::core::Cookie` (p. 746), value) pairs and add any `Cookie` with a matching value of `x` to the sample's `Foo.x` to the `rti::core::CookieSeq` that we return. Any `Cookie` in this sequence then represents a `DataReader` to which this sample will be sent.

```
rti::core::CookieSeq& ExampleWriterContentFilter::writer_evaluate(
    WriterFilterData& writer_filter_data,
    const Foo& sample,
    const rti::topic::FilterSampleInfo&)
{
    WriterFilterData::CookieValueSeq& reader_pairs =
        writer_filter_data.reader_pairs();
    // If x == value, pass the reader
    for (uint32_t i = 0; i < reader_pairs.size(); i++) {
        if (sample.x() == reader_pairs[i].second) {
            add_cookie(reader_pairs[i].first);
        }
    }
    return cookie_seq();
}
```

6.57.3.7 Writing the Writer Detach Function

It is safe to free all resources used by this particular instance of the custom content filter that is allocated in `writer_←_attach`. Because we did not allocate any resources in the `writer_attach` function, there is nothing to release in the `writer_finalize`. Below is the entire `writer_detach` (p. 136) function.

```
void ExampleWriterContentFilter::writer_detach(
    WriterFilterData&)
{
    // Nothing to do in writer detach for this example
}
```

6.57.3.8 Writing the Writer Return Loan Function

RTI Connex uses the `writer_return_loan` function specified in the `WriterContentFilter` to indicate to the filter implementation that it has finished using the sequence of cookies returned by the filter `writer_evaluate` function. Your filter implementation should not free the memory associated with the cookie sequence before the `writer_return_loan` function is called. You can also create your custom content filter by inheriting from the `rti::topic::WriterContentFilterHelper` (p. 2356), which manages the `DataReader CookieSeq` for you. If you do that, then the `writer_return_loan` is implemented for you. Below is the entire `writer_return_loan` (p. 136) function.

```
void ExampleWriterContentFilter::writer_return_loan(
    WriterFilterData&,
    rti::core::CookieSeq&)
{
    // The cookie sequence's destructor will take care of returning the loan
    // to the middleware, but we will reset the size to 0
    const_cast<rti::core::CookieSeq&>(cookie_seq()).resize(0);
}
```

6.57.3.9 Writing the Writer Finalize Function

The `writer_finalize` function specified in the `WriterContentFilter` will be called when the `DataWriter` no longer matches with a `DataReader` that was created with `ContentFilteredTopic`. This will allow the filter implementation to delete any state it was maintaining for the `DataReader`. Because we did not create any resources in the `writer_compile` function, we have nothing to do in the `writer_finalize`. Below is the entire `writer_finalize` (p. 137) function.

```
void ExampleWriterContentFilter::writer_finalize(
    WriterFilterData&,
    const rti::core::Cookie&)
{
    // There is nothing to finalize in this example
}
```

6.57.3.10 Creating a CustomFilter

The first thing that an application needs to do when using a custom filter is to give it a name and wrap an instance of their custom filter with a `rti::topic::CustomFilter` (p. 749). The `CustomFilter` class receives shared pointer to an instance of your custom filter and ensures that your filter does not go out-of-scope while it is being used. This means that you do not have to retain a reference to your filter throughout its lifetime, the `CustomFilter` class handles this detail for you.

```
// Create an instance of the ExampleWriterContentFilter and then
// create a CustomFilter object which holds a shared pointer to your
// ContentFilter.
std::string my_filter_name = "my_custom_filter";
rti::topic::CustomFilter<ExampleWriterContentFilter>
    my_custom_filter(new ExampleWriterContentFilter());
dds::domain::DomainParticipant participant1(0);
dds::domain::DomainParticipant participant2(0);
// To make sure that we don't miss any samples in this example,
// setup there DataWriter and DataReaders to be reliable
dds::pub::qos::DataWriterQos writer_qos;
writer_qos < dds::core::policy::Reliability::Reliable();
writer_qos < dds::core::policy::Durability::TransientLocal();
writer_qos < dds::core::policy::History::KeepAll();
dds::sub::qos::DataReaderQos reader_qos;
reader_qos < dds::core::policy::Reliability::Reliable();
reader_qos < dds::core::policy::Durability::TransientLocal();
reader_qos < dds::core::policy::History::KeepAll();
```

6.57.3.11 Registering the Filter

After wrapping your content filter with the `CustomFilter` class, and before the custom filter can be used, it must be registered with RTI Connex:

```
// Register the filter with both participants. Doing this will
// automatically enable writer-side filtering if any DataWriters match with
// any DataReaders that are using the same filter
participant1.extensions().register_contentfilter(my_custom_filter, my_filter_name);
participant2.extensions().register_contentfilter(my_custom_filter, my_filter_name);
```

6.57.3.12 Unregistering the Filter

When the filter is no longer needed, it can be unregistered from RTI Connex:

```
// You do not have to unregister your content filter unless you want to
// register a different filter with the same name
participant1.extensions().unregister_contentfilter(my_filter_name);
participant2.extensions().unregister_contentfilter(my_filter_name);
```

6.57.3.13 Using a CustomFilter

After the custom filter has been registered, you must create `dds::topic::Filter` (p. 1303) that contain the filter expressions and parameters that will be used in your filter. You must give these Filters names that match the name with which the `CustomFilter` was registered in order to associate the two.

Next, create the readers that will be using the custom filter with `dds::topic::ContentFilteredTopics` that have been created with the Filters you created.

After that, everything is set up for you. Now, your readers will only receive samples matching the filter that you have set up for them.

```
dds::topic::Topic<Foo> topic1(participant1, "ExampleTopic");
dds::topic::Topic<Foo> topic2(participant2, "ExampleTopic");
// Create the parameter lists for the filters
std::vector<std::string> cft_parameters(2);
// In this example, the first parameter dictates whether or not the
```

```

// writer-side filter optimization will be turned on. Parameter 2
// tells the writer_evaluate which single value of x this reader wants to
// receive samples for
cft_parameters[0] = "1";
cft_parameters[1] = "5";
dds::topic::Filter filter1("x = %1", cft_parameters);
cft_parameters[0] = "1";
cft_parameters[1] = "10";
dds::topic::Filter filter2("x = %1", cft_parameters);
// Any reader that is not using the writer-side filter optimization will
// receive samples where x > 7. The second parameter in this case is
// ignored, but is set here just as a reminder
cft_parameters[0] = "0";
cft_parameters[1] = "7";
dds::topic::Filter filter3("x > %1", cft_parameters);
// Create a DataWriter that will perform writer-side filtering
dds::pub::DataWriter<Foo> writer(
    dds::pub::Publisher(participant1), topic1, writer_qos);
// Assign filters a name or else the default, rti::topic::sql_filter_name,
// will be used
filter1.extensions().name(my_filter_name);
filter2.extensions().name(my_filter_name);
filter3.extensions().name(my_filter_name);
// Create the ContentFilteredTopics that will be used when creating the
// DataReaders
dds::topic::ContentFilteredTopic<Foo> cft1(
    topic2, "MyContentFilteredTopic1", filter1);
dds::topic::ContentFilteredTopic<Foo> cft2(
    topic2, "MyContentFilteredTopic2", filter2);
dds::topic::ContentFilteredTopic<Foo> cft3(
    topic2, "MyContentFilteredTopic3", filter3);
// Create two readers that will make use of the writer-side filter
// optimization and one that won't
dds::sub::DataReader<Foo> optimizedReader1(
    dds::sub::Subscriber(participant2), cft1, reader_qos);
dds::sub::DataReader<Foo> optimizedReader2(
    dds::sub::Subscriber(participant2), cft2, reader_qos);
dds::sub::DataReader<Foo> reader3(
    dds::sub::Subscriber(participant2), cft3, reader_qos);
// Wait for the writer to match all readers before writing any samples
dds::core::cond::StatusCondition status_condition(writer);
int32_t matched_publications = 0;
while (matched_publications != 3) {
    dds::core::status::PublicationMatchedStatus status =
        writer.publication_matched_status();
    matched_publications = status.total_count();
}
// Write 11 samples with x = 0 through 10
for (int i = 0; i < 11; i++) {
    writer.write(Foo(i, i));
}
// optimizedReader1 will only receive samples with x == 5
std::cout << "optimizedReader1's samples: " << std::endl;
dds::sub::LoanedSamples<Foo> samples = optimizedReader1.take();
std::copy(
    samples.begin(),
    samples.end(),
    dds::sub::LoanedSamples<Foo>::ostream_iterator(std::cout, "\n"));
// optimizedReader2 will only receive samples with x == 10
std::cout << "optimizedReader2's samples: " << std::endl;
samples = optimizedReader2.take();
std::copy(
    samples.begin(),
    samples.end(),
    dds::sub::LoanedSamples<Foo>::ostream_iterator(std::cout, "\n"));
// reader3 will receive samples with x == 8, 9, 10
std::cout << "reader3's samples: " << std::endl;
samples = reader3.take();
std::copy(
    samples.begin(),
    samples.end(),
    dds::sub::LoanedSamples<Foo>::ostream_iterator(std::cout, "\n"));

```

6.57.3.14 Looking up the Filter

A custom filter that is registered with a DomainParticipant can be looked up:

```

rti::topic::CustomFilter<ExampleWriterContentFilter> retrieved_custom_filter =
    rti::topic::find_content_filter<ExampleWriterContentFilter>(
        participant1, my_filter_name);
// You can retrieve your ContentFilter from the CustomFilter:
ExampleWriterContentFilter* retrieved_content_filter =
    retrieved_custom_filter.get();

```

6.58 XML Application Creation

Defining DDS systems in XML.

Defining DDS systems in XML.

6.58.1 Introduction

XML-Based Application Creation is a mechanism to simplify the development and programming of RTI Connex applications. RTI Connex supports the use of XML for the complete system definition. This includes not only the definition of the data types and Quality of Service settings, but also the definition of the Topics, DomainParticipants, and all the Entities they contain (Publishers, Subscribers, DataWriters and DataReaders).

The application code simply indicates the participant configuration name of the DomainParticipant that the application wants to create. The XML-Based Application Creation infrastructure takes care of the rest: creating the DomainParticipant, registering the types and Topics, and populating all the configured Entities. When the application needs to read or write data, register listeners, or perform any other action, it simply looks up the appropriate Entity by name and uses it.

See the [RTI_ConnextDDS_CoreLibraries_XML_AppCreation_GettingStarted.pdf](#) for a more exhaustive description XML Application Creation, most notably, how to set up the XML Configuration files.

The example on this page shows a basic use of the APIs that are necessary in order to access the entities that have been created in an XML file.

Relevant functions that enable the use of XML Application Creation are:

- **dds::core::QosProvider::create_participant_from_config** (p. 1771)
- **rti::domain::find_participant_by_name** (p. 518)
- **rti::sub::find_subscriber(const dds::domain::DomainParticipant participant, const std::string& subscriber_name)** (p. 545);
- **rti::sub::find_datareader_by_name(dds::sub::Subscriber subscriber, const std::string& datareader_name)** (p. 549)
- **rti::sub::find_datareader_by_name(dds::domain::DomainParticipant participant, const std::string& datareader_name)** (p. 550)
- **rti::pub::find_publisher(const dds::domain::DomainParticipant participant, const std::string& publisher_name)** (p. 531);
- **rti::pub::find_datawriter_by_name(dds::pub::Publisher publisher, const std::string& datawriter_name)** (p. 535)
- **rti::pub::find_datawriter_by_name(dds::domain::DomainParticipant participant, const std::string& datawriter_name)** (p. 536)

6.58.2 Setting up this Example

The following #includes are needed for the examples on this page

```
#include <iostream>
#include <dds/core/QosProvider.hpp>
#include <dds/sub/DataReader.hpp>
#include <dds/sub/find.hpp>
#include <dds/pub/DataWriter.hpp>
#include <dds/pub/find.hpp>
#include "Foo.hpp"
```

The following is the configuration that we will be using in this example:

```
<dds>
  <types>
    <struct name="Foo">
      <member name="x" type="long"/>
    </struct>
  </types>
  <domain_library name="ExampleDomainLibrary" >
    <domain name="ExampleDomain" domain_id="0">
      <register_type name="Foo" kind="userGenerated"/>
      <topic name="ExampleTopic" register_type_ref="Foo"/>
    </domain>
  </domain_library>
  <participant_library name="ExampleParticipantLibrary">
    <domain_participant name="ExamplePublicationParticipant"
      domain_ref="ExampleDomainLibrary::ExampleDomain">
      <publisher name="ExamplePublisher">
        <data_writer name="ExampleWriter" topic_ref="ExampleTopic"/>
      </publisher>
    </domain_participant>
    <domain_participant name="ExampleSubscriptionParticipant"
      domain_ref="ExampleDomainLibrary::ExampleDomain">
      <data_reader name="ExampleReader" topic_ref="ExampleTopic">
        <content_filter name="ExampleTopic" kind="builtin.sql">
          <expression> foo > 5 </expression>
        </content_filter>
      </data_reader>
    </domain_participant>
  </participant_library>
</dds>
```

6.58.2.1 Using XML Application Creation

You must first make sure that your configuration file is loaded by RTI Connex by using the QosProvider:

```
rti::core::QosProviderParams provider_params;
// Configure the default QosProvider to load the configuration
// config_file == "/the/path/to/your/xml/configuration.xml"
provider_params.url_profile({ config_file });
rti::core::default_qos_provider_params(provider_params);
```

Then, if you are using a user-generated type, you must register the type with RTI Connex:

```
// When using user-generated types, you must register the type with RTI
// Connex DDS before creating the participants and the rest of the entities
// in your system
rti::domain::register_type<Foo>("Foo");
```

To create and access the system that you have defined in your system, call `dds::core::QosProvider::create_participant_from_config` (p. 1771):

```
// Create the participants, changing the domain id from the one in the
// configuration
rti::domain::DomainParticipantConfigParams params(10);
// Create the participants
auto default_provider = dds::core::QosProvider::Default();
dds::domain::DomainParticipant publication_participant =
  default_provider.extensions().create_participant_from_config(
    "ExampleParticipantLibrary::ExamplePublicationParticipant",
    params);
dds::domain::DomainParticipant subscription_participant =
  default_provider.extensions().create_participant_from_config(
    "ExampleParticipantLibrary::ExampleSubscriptionParticipant",
```

```
params);
```

After you have created the participants which were defined in your configuration, you can use various find functions to access the other entities that you have configured. For example, to lookup the `DataWriter` and `DataReader` from the example configuration:

```
// Lookup the DataWriter and DataReader from the configuration
dds::pub::DataWriter<Foo> found_writer =
    rti::pub::find_datawriter_by_name<dds::pub::DataWriter<Foo>>(
        publication_participant,
        "ExamplePublisher:ExampleWriter");
// The implicit subscriber was used to create this reader so we only
// provide the reader's name, and not a fully qualified name as we did to
// look up the DataWriter
dds::sub::DataReader<Foo> found_reader =
    rti::sub::find_datareader_by_name<dds::sub::DataReader<Foo>>(
        subscription_participant,
        "ExampleReader");
```

6.59 Request-Reply Examples

Examples on how to use the request-reply API .

Examples on how to use the request-reply API .

Request-Reply code examples.

6.59.1 Request-Reply Examples

Requesters and Repliers provide a way to use the Request-Reply communication pattern on top of the DDS entities. An application uses a Requester to send requests to a Replier; another application using a Replier receives a request and can send one or more replies for that request. The Requester that sent the request (and only that one) will receive the reply (or replies).

DDS Types

RTI Connext uses DDS data types for sending and receiving requests and replies. Valid types are those generated by the `rtiddsgen` code generator, the DDS built-in types, and `DynamicData`. Refer to the [Core Libraries User's Manual](#) and the following links for more information:

- [Code Generator User's Manual](#),
- [Using the DDS built-in types](#) (p. 49),
- [Using DynamicData](#) (p. 239)

Set up

- [Create a DomainParticipant](#) (p. 108)
- [Create a requester](#) (p. 146)
- [Create a requester with parameters](#) (p. 146)

- [Create a replier](#) (p. 148)

Requester: sending requests and receiving replies

- [Basic Requester example](#) (p. 147)
- [Correlation between requests and replies](#) (p. 147)

Replier: receiving requests and sending replies

- [Basic Replier example](#) (p. 149)
- [SimpleReplier example](#) (p. 149)

Note

To use Request-Reply you need to build and link your application with the additional `rticonnextmsgcpp2` library.

6.59.2 Requester Creation

- [Setting up a DomainParticipant](#) (p. 108)
- [Creating a Requester](#)

```
using namespace rti::request;
dds::domain::DomainParticipant participant(domain_id);
Requester<Foo, Bar> requester(participant, "TestService");
```

6.59.3 Creating a Requester with optional parameters

- [Setting up a DomainParticipant](#) (p. 108)
- [Creating a Requester with additional parameters](#)

```
using namespace rti::request;
// Create a DomainParticipant
dds::domain::DomainParticipant participant(domain_id);
// Create a Requester with a QoS profile (located for example in
// USER_QOS_PROFILES.xml, in the current working directory, which the
// default QoSProvider will load)
RequesterParams requester_params(participant);
requester_params.service_name("TestService");
dds::core::QoSProvider qos_provider = dds::core::QoSProvider::Default();
requester_params.datareader_qos(
    qos_provider.datareader_qos("RequestReplyExampleProfiles::RequesterExampleProfile"));
requester_params.datawriter_qos(
    qos_provider.datawriter_qos("RequestReplyExampleProfiles::RequesterExampleProfile"));
Requester<Foo, Bar> requester(requester_params);
```

- [Requester Creation](#) (p. 146)
- [Configuring Request-Reply QoS profiles](#) (p. 149)

6.59.4 Basic Requester example

- **Requester Creation** (p. 146)
- **Creating a Requester with optional parameters** (p. 146)

- **Basic Requester example**

```
using namespace rti::request;
// Send request
Foo request("A Request");
requester.send_request(request);
// Receive reply (wait for it and get the sample)
auto replies = requester.receive_replies(MAX_WAIT);
if (replies.length() == 0) {
    std::cout << "Reply not received\n";
}
for (const auto& reply : replies) {
    if (reply.info().valid()) {
        std::cout << "Received reply: " << reply.data() << std::endl;
    } else {
        std::cout << "Received invalid reply\n";
    }
}
}
```

6.59.5 Correlating requests and replies

- **Requester Creation** (p. 146)
- **Example 1) Waiting for a reply to a specific request**

```
using namespace rti::request;
// Create requests
Foo request1("Request 1"), request2("Request 2");
// Send requests and save request ID
rti::core::SampleIdentity request_id1 = requester.send_request(request1);
rti::core::SampleIdentity request_id2 = requester.send_request(request2);
// Wait for a reply to the second request
bool received = requester.wait_for_replies(1, MAX_WAIT, request_id2);
if (!received) {
    std::cout << "Did not receive reply for request 2" << std::endl;
    return;
}
// Take that reply
dds::sub::LoanedSamples<Bar> replies = requester.take_replies(request_id2);
if (replies.length() == 0) {
    throw std::runtime_error("did not receive any replies");
}
// This postcondition should always be true
if (replies[0].info()->related_original_publication_virtual_sample_identity()
    != request_id2) {
    throw std::runtime_error("postcondition failed");
}
if (replies[0].info().valid()) {
    std::cout << "Received reply for request 2: "
              << replies[0].data() << std::endl;
}
// Wait for a reply to the first request
received = requester.wait_for_replies(1, MAX_WAIT, request_id1);
if (!received) {
    std::cout << "Did not receive reply for request 1" << std::endl;
    return;
}
// Take that reply
replies = requester.take_replies(request_id1);
if (replies.length() == 0) {
    throw std::runtime_error("did not receive any replies");
}
// This postcondition should always be true
```

```

if (replies[0].info()->related_original_publication_virtual_sample_identity()
    != request_id1) {
    throw std::runtime_error("postcondition failed");
}
if (replies[0].info().valid()) {
    std::cout << "Received reply for request 1: "
              << replies[0].data() << std::endl;
}
}

```

- **Example 2) Correlating a reply after receiving it**

```

using namespace rti::request;
// Create requests
Foo request1("Request 1"), request2("Request 2");
// Send requests and save request ID
rti::core::SampleIdentity request_id1 = requester.send_request(request1);
rti::core::SampleIdentity request_id2 = requester.send_request(request2);
// Wait for two replies. In this case we don't mind the
// reception order
bool received = requester.wait_for_replies(2, MAX_WAIT);
if (!received) {
    std::cout << "Replies not received" << std::endl;
    return;
}
// Get all the replies
auto replies = requester.take_replies();
// Find the reply for request 1.
//
// We search using the STL find_if algorithm. The search range is all
// the elements in the replies container (from beginning to end).
// We use a predicate included in the API that evaluates to
// true when a Sample's related_identity equals the identity that
// is passed to the constructor (request_id1, in this case)
auto it = std::find_if(
    replies.begin(),
    replies.end(),
    IsReplyRelatedPredicate<Bar>(request_id1));
if (it != replies.end()) {
    std::cout << "Received reply for request 1: "
              << it->data() << std::endl;
}
// Find the reply for request 2
it = std::find_if(
    replies.begin(),
    replies.end(),
    IsReplyRelatedPredicate<Bar>(request_id2));
if (it != replies.end()) {
    std::cout << "Received reply for request 2: "
              << it->data() << std::endl;
}
}

```

6.59.9 Configuring Request-Reply QoS profiles

If you do not specify your own QoS parameters (in RequesterParams and ReplierParams), a `rti::request::Requester` (p. 1907) and `rti::request::Replier` (p. 1888) are created using a default configuration. That configuration is equivalent to the one in the following QoS profile called "default":

```
<?xml version="1.0"?>
<dds xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:noNamespaceSchemaLocation="../../resource/schema/rti_dds_qos_profiles.xsd">
  <qos_library name="RequestReplyExampleProfiles">
    <!-- Default QoS:

        This profile contains the QoS that Requesters and Repliers
        would use by default. We can use it as a base profile to inherit
        from and override some parameters
    -->
    <qos_profile name="default">
      <datawriter_qos>
        <!-- Strict reliable -->
        <reliability>
          <kind>RELIABLE_RELIABILITY_QOS</kind>
          <max_blocking_time>
            <sec>10</sec>
            <nanosec>0</nanosec>
```

```

        </max_blocking_time>
    </reliability>
    <history>
        <kind>KEEP_ALL_HISTORY_QOS</kind>
    </history>
    <!-- These are typical protocol parameters for a reliable
        DataWriter -->
    <protocol>
        <rtps_reliable_writer>
            <max_heartbeat_retries>
                LENGTH_UNLIMITED
            </max_heartbeat_retries>
            <heartbeats_per_max_samples>
                2
            </heartbeats_per_max_samples>

6.60 Documentation Roadmap

This section contains a roadmap for the new user with pointers on what to read first.

If you are new to RTI Connex, we recommend starting in the following order:

- See the [Getting Started Guide](#). This document provides download and installation instructions. It also lays out the core value and concepts behind the product and takes you step-by-step through the creation of a simple example application.
- The [User's Manual](#) describes the features of the product and how to use them. It is organized around the structure of the DDS APIs and certain common high-level tasks.
- The documentation in the [RTI Connex DDS API Reference](#) (p. 159) provides an overview of API classes and modules for the DDS data-centric publish-subscribe (DCPS) package from a programmer's perspective. Start by reading the documentation on the main page.

- After reading the high level module documentation, look at the **Publication Example** (p. 106) and **Subscription Example** (p. 107) for step-by-step examples of creating a publication and subscription. These are hyperlinked code snippets to the full API documentation, and provide a good place to begin learning the APIs.
- Next, work through your own application using the example code files generated by `rtiddsgen`. See the `Code Generator User's Manual`.
- To integrate similar code into your own application and build system, you will likely need to refer to the `Platform Notes`.

6.61 Conventions

Basic concepts required to use the API correctly.

Basic concepts required to use the API correctly.

There are a few basic conventions that you need to understand to use this API correctly:

- The type system, including value types and reference types
- How to use standard and extension APIs
- Error management through exceptions
- C++11 support

6.61.1 Type system

All types in the API are **value types**, **reference types**, or **move-only types**. In this documentation a type is a value type, unless explicitly marked with `<<reference-type>>` (p. 153) or `<<move-only-type>>` (p. 155). In some cases the type may be marked with `<<value-type>>` (p. 152) for clarity.

6.61.1.1 Value types

`<<value-type>>` (p. 152) Value types implement value semantics.

Note that in this API, types that don't specify their type semantics are value types by default. **IDL-generated types** (p. 395) are also value types.

Value types provide the following functionality:

- Deep-copy copy constructor and assignment operator.
- Move constructor and move-assignment operator `<<C++11>>` (p. 155).
- Destructor.
- Equality operators.
- Namespace-level `swap()` (p. 1207) function.

Those operations are not documented for each type unless they deviate from their usual behavior.

6.61.1.2 Reference types

<<**reference-type**>> (p. 153) Reference types implement *reference semantics*.

In a reference type copy operations, such as copy-construction and copy-assignment are *shallow*. The reference types are modeled after shared pointers. Similar to pointers, it is important to distinguish between an entity and a reference (or handle) to it. A single entity may have multiple references. Copying a reference does not copy the entity it is referring to—creating additional references from the existing reference(s) is a relatively inexpensive operation.

The lifecycle of references and the entity they are referring to is not the same. In general, the entity lives as long as there is at least one reference to it. When the last reference to the entity ceases to exist, the entity it is referring to is destroyed.

However, there are some exceptions. It is possible—and often convenient—to *retain* an entity even though it has no references, for example to look it up later. A reference can also be explicitly closed, deleting the object it references, regardless of the existence of other references.

An entity is considered to still be *in use* (i.e., retained) if any of the following conditions are met:

- The entity has one or more references.
- The entity has been explicitly retained with the `retain()` member function.
- The entity created another object that is still in use. For example, while a `Topic` exist, its related `DomainParticipant` won't be deleted.
- **[DEPRECATED]** The entity has a non-null listener pointer. (Using a raw pointer as a listener is deprecated. The way to assign a listener is using a `std::shared_ptr<Listener>` (p. 1381) >. When a `shared_ptr` is used, the entity is not retained.)

All reference types inherit from `dds::core::Reference` (p. 1872). The reference semantics are implemented using a shared count.

Reference types provide the following functionality:

- **Constructors specific to the type**

Creates a new object and a reference to it. For example:

```
// Create a domain participant and one reference to it.
dds::domain::DomainParticipant participant (MY_DOMAIN_ID);
```

- **Copy constructor**

Creates a new reference to an existing object, increasing the reference count. For example:

```
dds::domain::DomainParticipant same_participant = participant;
```

- **Assignment operator**

Replaces the object that was referenced to with a new one, possibly decreasing the reference count of the former object and increasing it for the new one.

- **Constructor from `dds::core::null` (p. 238) (or `nullptr` <<C++11>> (p. 155))**

Creates an instance that doesn't reference any object. For example:

```
dds::domain::DomainParticipant null_participant = dds::core::null;
```

- **Assignment operator from `dds::core::null`** (p. 238) (or `nullptr` <<C++11>> (p. 155))

Makes the reference empty, decreasing the reference count.

```
dds::domain::DomainParticipant participant (MY_DOMAIN_ID);
participant = dds::core::null; // This will destroy the participant object
```

- **Equal operator (to another reference)**

Returns true only if the referenced object is the same. For example:

```
dds::domain::DomainParticipant participant1 (MY_DOMAIN_ID);
dds::domain::DomainParticipant participant2 (MY_DOMAIN_ID);
if (participant1 != participant2) {
    std::cout << "References to different objects\n";
}
// Note that this also destroys the former object referenced to by participant2
participant2 = participant1;
if (participant1 == participant2) {
    std::cout << "References to the same object\n";
}
```

The operators `<`, `<=`, `>`, `>=` are also supported, and compare the underlying pointer.

- **Equal operator to `dds::core::null`** (p. 238) (or `nullptr` <<C++11>> (p. 155))

Returns true only if this reference is empty. For example:

```
dds::domain::DomainParticipant participant = dds::core::null;
// dds::core::null and nullptr are interchangeable in C++11
if (participant == nullptr) {
    std::cout << "Empty reference\n";
}
```

Some reference types, including `dds::core::Entity` (p. 1265) and its subclasses, also provide:

- **`close()`** (p. 801)

Forces the destruction of the underlying object. After this, calling a method on the destroyed object throws `dds::core::AlreadyClosedError` (p. 594). For example:

```
dds::domain::DomainParticipant participant1 (MY_DOMAIN_ID);
dds::domain::DomainParticipant participant2 = participant1;
participant2.close(); // Destroys the underlying object
int id = participant1.domain_id(); // throws dds::core::AlreadyClosedError
```

- **`retain()`**

Disables the destruction of the underlying object. When all references are destroyed the underlying object still exists and can be looked up. To finally destroy a retained object you need to explicitly call `close()` (p. 801).

For example:

```
using namespace dds::domain;
void create_participant()
{
    DomainParticipant participant (MY_DOMAIN_ID);
    participant.retain();
} // participant goes out of scope
void test_retain()
{
    create_participant();
    DomainParticipant participant = find(MY_DOMAIN_ID);

    // ...

    // Since the participant has been retained, we need to explicitly close it:
    participant.close();
}
```

Reference types with an inheritance relationship such as `dds::core::Entity` (p. 1265) or `dds::core::cond::Condition` (p. 729) can use `dds::core::polymorphic_cast` (p. 408) to cast from a base to a derived class.

For more examples on reference types see **Entity Use Cases** (p. 126)

6.61.1.3 Move-only types

`<<move-only-type>>` (p. 155) Move-only types are types that can't be copied, only "moved." A move-only type encapsulates a view of an internal resource. Only one reference to that resource may exist at a time.

6.61.2 C++11 Support

`<<C++11>>` (p. 155) Functionality supported only in C++11.

This API is designed to integrate with and make use of C++11. The API headers are prepared to detect at application-compile time what C++11 features are available and make use of them.

Different compilers support different C++11 features, and some require explicitly activating C++11 support. If your compiler activates C++11 by default (for example, Visual Studio 2010 and later), you don't need to do anything. Whatever features are available will be used. If your compiler requires an explicit activation, you will need to pass a flag (for example, `-std=c++0x` or `-std=c++11` in gcc and clang). The `Platform Notes` can help with that.

The API provides the following C++11 features when available:

- Defines move constructors and move-assignment operators for most types, both in the API and in types generated from IDL.
- Enables the use of the range for-loop in classes like `dds::sub::LoanedSamples` (p. 1406).
- Enables the use of lambda functions in places like `dds::sub::cond::ReadCondition` (p. 1858)
- Specifies some key functions as `noexcept`, like move constructors.
- Enables the use of `std::initializer_list` in several functions. For example see `rti::core::policy::Property` (p. 1695). `<<extension>>` (p. 156)
- Provides utilities to manipulate `dds::core::xtypes::DynamicType` (p. 1249) and `dds::core::xtypes::DynamicData` (p. 1208) using `tuples` (p. 402). `<<extension>>` (p. 156) `<<experimental>>` (p. 157)
- Supports the interchangeable use of `std::chrono::duration` and `dds::core::Duration` (p. 1194). `<<extension>>` (p. 156)
- Supports the interchangeable use of `nullptr` and `dds::core::null` (p. 238).

6.61.3 Exceptions in the API

The modern C++ API uses exceptions to report errors.

If a function doesn't document what exceptions it may throw and is not declared `noexcept`, then it may throw any of the **standard exceptions** (p. 227).

Destructors won't throw exceptions. There are cases however where you may need to handle an error during an object destruction. Some classes, like the **reference types** (p. 153) provide a `close()` (p. 801) operation—which can throw—that destroys the underlying entity.

Note that the API can also throw C++ standard exceptions such as `std::bad_alloc`.

For a few critical operations both a regular exception-throwing function and a `noexcept` function are provided. The `noexcept` versions always return an `rti::core::Result` (p. 1927) object, and are always extension functions that need to be accessed with the `->` operator. For example, a `dds::sub::DataReader` (p. 756) provides both `take()` (p. 801) and `take_noexcept()` (p. 795):

```
auto samples = reader.take(); // may throw
auto result = reader->take_noexcept(); // never throws
if (result.is_ok()) {
    auto& samples = result.get();
    // ...
}
```

See also

[Exceptions](#) (p. 227)

6.61.4 Extensions to the standard API

`<<extension>>` (p. 156) The stereotype `<<extension>>` (p. 156) indicates that a type or a function is RTI Connex product extension to the standard DDS specification.

The RTI extension APIs complement the standard APIs specified by the OMG DDS specification.

There are the following kinds of extensions: extension methods for a standard class, extension types, and extension standalone functions.

To call an extension methods for an standard class use the `extensions()` method or the overloaded **arrow operator** (`->`). For example:

```
// Standard class (in dds namespace)
dds::domain::DomainParticipant participant(MY_DOMAIN_ID);
// Call a standard method
participant.assert_liveliness();
// Call an extension method:
participant.extensions().register_durable_subscription(...);
// or:
participant->register_durable_subscription(...);
```

Note that the arrow operator is `noexcept` but the `extensions()` method of a reference type is not (it may throw `dds::core::NullReferenceError` (p. 1602) if the object is `dds::core::null` (p. 238)).

In this documentation extension members in a standard type appear as members of that type, although they are members of a delegate type called through the standard type (calling `extensions()` or the arrow operator). We omit this implementation detail from the API documentation for simplicity.

Extension types reside in the `rti` namespace instead of the `dds` namespace. For example:

```
// FlowController is an extension class and it resides in the rti namespace
rti::pub::FlowController flow_controller(participant);
// All methods in an extension class are called using the usual dot operator
flow_controller.trigger_flow();
```

The following example combines an extension function for a standard type (`Reliability`) and an extension type (`AcknowledgmentKind`):

```
// Standard class (in dds namespace)
dds::core::policy::Reliability reliability;
// Call a standard method
reliability.kind(dds::core::policy::ReliabilityKind::RELIABLE);
// Call an extension method, passing an extension enumeration:
reliability.extensions().acknowledgment_kind(
    rti::core::policy::AcknowledgmentKind::APPLICATION_AUTO);
// or:
reliability->acknowledgment_kind(
    rti::core::policy::AcknowledgmentKind::APPLICATION_AUTO);
```

Extension standalone functions are also in the `rti` namespace. For example:

```
// Standard function (in the dds namespace)
dds::sub::find<dds::sub::DataReader<Foo>>(
    subscriber, "Foo Topic", std::back_inserter(readers));

// Extension function (in the rti namespace)
rti::sub::find_datareaders(subscriber, std::back_inserter(readers));
```

6.61.5 Experimental

<<*experimental*>> (p. 157) Experimental features subject to change.

- RTI Connex experimental features are used to evaluate new features and get user feedback.
- These features are not guaranteed to be fully supported and might be implemented only of some of the programming languages supported bt RTI Connex
- Experimental features may or may not appear in future product releases.
- Experimental features should not be used in production.

6.61.6 Method Parameters

Some times the parameter may have one of the following stereotypes, but in most cases the function signature reveals if the parameter is an input parameter (by value or const-reference), or output parameter (non-const reference).

- <<*in*>> (p. 157)
 - An *input* parameter.
- <<*out*>> (p. 157)
 - An *output* parameter.
- <<*inout*>> (p. 157)
 - An *input* and *output* parameter.

6.62 Namespaces and headers

This section describes the headers and namespaces in the modern C++ API.

6.62.1 Header Files

The modern C++ API is organized using a set of standard header files that you will find in the \$NDDSHOME/include/hpp/dds directory of your installation. The headers in this directory are organized into 5 modules defined by the DDS v1.2 Platform Independent Mapping (PIM):

- **domain:** DomainParticipant specific headers
- **pub:** Publisher, DataWriter and other headers specific to the publication of data
- **sub:** Subscriber, DataReader and other headers specific to the consumption of data
- **topic:** Topic management specific headers

- **core**: headers that define classes and DDS types that are used by all of the other modules

You will also find an `$NDDSHOME/include/hpp/rti` directory in your installation. This directory contains RTI Connex implementation specific details along with **extensions** (p. 156) to the standard API.

To import the DDS API into your application you must include these header files. There are several ways to do this:

1. Include the entire standard API:

```
#include <dds/dds.hpp>
```
2. Include the standard API plus all the extensions:

```
#include <rti/rti.hpp>
```
3. Include complete namespaces, for example:

```
#include <dds/domain/ddsdomain.hpp>
#include <dds/sub/ddssub.hpp>
```
4. Include individual headers, for example:

```
#include <dds/domain/DomainParticipant.hpp>
#include <dds/sub/DataReader.hpp>
```

All of the **Programming How-To** (p. 164) pages start with a section showing which header that the code snippets on that page require.

6.62.2 Namespaces

There are a number of different namespaces in the modern C++ API that organize the API into logical groups. The two main namespaces are `dds` and `rti`.

The `dds` namespace includes all of the standard types, classes and methods. The `rti` namespace includes all RTI **extensions** (p. 156) to the standard API.

The `dds` and `rti` namespaces both contain several nested namespaces. There is a namespace for each of the 5 modules: **`dds::core`** (p. 404), **`dds::domain`** (p. 422), **`dds::topic`** (p. 476), **`dds::pub`** (p. 433), **`dds::sub`** (p. 446) (and the corresponding **`rti::core`** (p. 489), **`rti::domain`** (p. 514), **`rti::topic`** (p. 558), **`rti::pub`** (p. 523), **`rti::sub`** (p. 538)).

The `rti` namespace also contains **`rti::util`** (p. 564) and **`rti::config`** (p. 487).

There are further specialized namespaces within each module namespace.

All of the modules, excluding `core`, contain a `qos` namespace that contains the Qos classes for the entities contained in that module:

- **`dds::domain::qos`** (p. 428)
 - `DomainParticipantQos`
 - `DomainParticipantFactoryQos`
- **`dds::pub::qos`** (p. 441)

- PublisherQos
- DataWriterQos
- **dds::sub::qos** (p. 469)
 - SubscriberQos
 - DataReaderQos
- **dds::topic::qos** (p. 483)
 - TopicQos

All of the individual Qos policies can be accessed from either the **dds::core::policy** (p. 415) namespace for standard Qos policies or the `rti::core::policy` namespace for RTI extension Qos policies.

In addition to the `policy` namespace, the `core` namespace contains two other nested namespaces.

- **dds::core::status** (p. 418)
 - Contains all communication statuses and `StatusMask`
- **dds::core::cond** (p. 415)
 - `Condition`
 - `GuardCondition`
 - `StatusCondition`
 - `Waitset`

The `sub` namespace also contains the `status` and `cond` nested namespaces.

- **dds::sub::status** (p. 474)
 - `DataState`
- **dds::sub::cond** (p. 468)
 - `QueryCondition`
 - `ReadCondition`

Two convenience namespaces bring all the symbols into a single place: **dds::all** (p. 403) and **rti::all** (p. 487).

6.63 RTI Connex DDS API Reference

RTI Connex modules following the DDS module definitions.

Modules

- **Domain Module**

Contains the `dds::domain::DomainParticipant` (p. 1079) class that acts as an entrypoint of RTI Connex and acts as a factory for many of the classes. The `dds::domain::DomainParticipant` (p. 1079) also acts as a container for the other objects that make up RTI Connex.

- **Topic Module**

Contains the `dds::topic::Topic` (p. 2178), `dds::topic::ContentFilteredTopic` (p. 735), and `MultiTopic` classes, the `TopicListener` interface, and more generally, all that is needed by an application to define `dds::topic::Topic` (p. 2178) objects and attach QoS policies to them.

- **Publication Module**

Contains the `rti::pub::FlowController` (p. 1316), `dds::pub::Publisher` (p. 1719), and `dds::pub::DataWriter` (p. 908) classes as well as the `PublisherListener` and `dds::pub::DataWriterListener` (p. 972) interfaces, and more generally, all that is needed on the publication side.

- **Subscription Module**

Contains the `dds::sub::Subscriber` (p. 2116), `dds::sub::DataReader` (p. 756), `dds::sub::cond::ReadCondition` (p. 1858), `dds::sub::cond::QueryCondition` (p. 1784), and `rti::sub::TopicQuery` (p. 2220) classes, as well as the `dds::sub::SubscriberListener` (p. 2128) and `dds::sub::DataReaderListener` (p. 832) interfaces, and more generally, all that is needed on the subscription side.

- **Infrastructure Module**

Defines the abstract classes and the interfaces that are refined by the other modules. Contains common definitions such as return codes, status values, and QoS policies.

- **Transports**

APIs related to RTI Connex pluggable transports.

- **Queries and Filters Syntax**

- **Logging and Version**

APIs of troubleshooting utilities and APIs designed to configure the overall behavior of RTI Connex.

- **General Utilities and Compliance Configuration**

API of general utilities used in the RTI Connex distribution.

- **Observability**

API of RTI Connex Observability Framework.

- **Durability and Persistence**

APIs related to RTI Connex Durability and Persistence.

- **System Properties**

System Properties.

- **Configuring QoS Profiles with XML**

APIs related to XML QoS Profiles.

- **Additional RTI Connex Communication Patterns**

Extensions to the RTI Connex publish-subscribe functionality.

6.63.1 Detailed Description

RTI Connex modules following the DDS module definitions.

6.63.2 Overview

Information flows with the aid of the following constructs: **dds::pub::Publisher** (p. 1719) and **dds::pub::DataWriter** (p. 908) on the sending side, **dds::sub::Subscriber** (p. 2116) and **dds::sub::DataReader** (p. 756) on the receiving side.

- A **dds::pub::Publisher** (p. 1719) is an object responsible for data distribution. It may publish data of different data types. A **TDDataWriter** acts as a *typed* (i.e. each **dds::pub::DataWriter** (p. 908) object is dedicated to one application data type) accessor to a publisher. A **dds::pub::DataWriter** (p. 908) is the object the application must use to communicate to a publisher the existence and value of data objects of a given type. When data object values have been communicated to the publisher through the appropriate data-writer, it is the publisher's responsibility to perform the distribution (the publisher will do this according to its own QoS, or the QoS attached to the corresponding data-writer). A *publication* is defined by the association of a data-writer to a publisher. This association expresses the intent of the application to publish the data described by the data-writer in the context provided by the publisher.
- A **dds::sub::Subscriber** (p. 2116) is an object responsible for receiving published data and making it available (according to the Subscriber's QoS) to the receiving application. It may receive and dispatch data of different specified types. To access the received data, the application must use a *typed* **TDDataReader** attached to the subscriber. Thus, a *subscription* is defined by the association of a data-reader with a subscriber. This association expresses the intent of the application to subscribe to the data described by the data-reader in the context provided by the subscriber.

dds::topic::Topic (p. 2178) objects conceptually fit between publications and subscriptions. Publications must be known in such a way that subscriptions can refer to them unambiguously. A **dds::topic::Topic** (p. 2178) is meant to fulfill that purpose: it associates a name (unique in the domain i.e. the set of applications that are communicating with each other), a data type, and QoS related to the data itself. In addition to the topic QoS, the QoS of the **dds::pub::DataWriter** (p. 908) associated with that Topic and the QoS of the **dds::pub::Publisher** (p. 1719) associated to the **dds::pub::DataWriter** (p. 908) control the behavior on the publisher's side, while the corresponding **dds::topic::Topic** (p. 2178), **dds::sub::DataReader** (p. 756) and **dds::sub::Subscriber** (p. 2116) QoS control the behavior on the subscriber's side.

When an application wishes to publish data of a given type, it must create a **dds::pub::Publisher** (p. 1719) (or reuse an already created one) and a **dds::pub::DataWriter** (p. 908) with all the characteristics of the desired publication. Similarly, when an application wishes to receive data, it must create a **dds::sub::Subscriber** (p. 2116) (or reuse an already created one) and a **dds::sub::DataReader** (p. 756) to define the subscription.

6.63.3 Conceptual Model

The overall conceptual model is shown below.

Notice that all the main communication objects (the specializations of Entity) follow unified patterns of:

- Supporting QoS (made up of several QoSPolicy); QoS provides a generic mechanism for the application to control the behavior of the Service and tailor it to its needs. Each **dds::core::Entity** (p. 1265) supports its own specialized kind of QoS policies (see **QoS Policies** (p. 302)).

- Accepting a **Listener** (p. 1381); listeners provide a generic mechanism for the middleware to notify the application of relevant asynchronous events, such as arrival of data corresponding to a subscription, violation of a QoS setting, etc. Each **dds::core::Entity** (p. 1265) supports its own specialized kind of listener. Listeners are related to changes in status conditions (see **Status Kinds** (p. 229)).

Note that only one **Listener** (p. 1381) per entity is allowed (instead of a list of them). The reason for that choice is that this allows a much simpler (and, thus, more efficient) implementation as far as the middleware is concerned. Moreover, if it were required, the application could easily implement a listener that, when triggered, triggers in return attached 'sub-listeners'.

- Accepting a **dds::core::cond::StatusCondition** (p.2079) (and a set of **dds::sub::cond::ReadCondition** (p. 1858) objects for the **dds::sub::DataReader** (p. 756)); conditions (in conjunction with **dds::core::cond::WaitSet** (p. 2318) objects) provide support for an alternate communication style between the middleware and the application (i.e., wait-based rather than notification-based).

All DCPS entities are attached to a **dds::domain::DomainParticipant** (p. 1079). A domain participant represents the local membership of the application in a domain. A *domain* is a distributed concept that links all the applications able to communicate with each other. It represents a communication plane: only the publishers and the subscribers attached to the same domain may interact.

DomainEntity is an intermediate object whose only purpose is to state that a DomainParticipant cannot contain other domain participants.

At the DCPS level, data types represent information that is sent atomically. For performance reasons, only plain data structures are handled by this level.

By default, each data modification is propagated individually, independently, and uncorrelated with other modifications. However, an application may request that several modifications be sent as a whole and interpreted as such at the recipient side. This functionality is offered on a Publisher/Subscriber basis. That is, these relationships can only be specified among **dds::pub::DataWriter** (p.908) objects attached to the same **dds::pub::Publisher** (p. 1719) and retrieved among **dds::sub::DataReader** (p. 756) objects attached to the same **dds::sub::Subscriber** (p. 2116).

By definition, a **dds::topic::Topic** (p.2178) corresponds to a single data type. However, several topics may refer to the same data type. Therefore, a **dds::topic::Topic** (p.2178) identifies data of a single type, ranging from one single instance to a whole collection of instances of that given type. This is shown below for the hypothetical data type **Foo** (p. 1332).

In case a set of instances is gathered under the same topic, different instances must be distinguishable. This is achieved by means of the values of some data fields that form the **key** to that data set. The *key description* (i.e., the list of data fields whose value forms the key) has to be indicated to the middleware. The rule is simple: *different data samples with the same key value represent successive values for the same instance, while different data samples with different key values represent different instances*. If no key is provided, the data set associated with the **dds::topic::Topic** (p. 2178) is restricted to a *single instance*.

Topics need to be known by the middleware and potentially propagated. Topic objects are created using the create operations provided by **dds::domain::DomainParticipant** (p. 1079).

The interaction style is straightforward on the publisher's side: when the application decides that it wants to make data available for publication, it calls the appropriate operation on the related **dds::pub::DataWriter** (p. 908) (this, in turn, will trigger its **dds::pub::Publisher** (p. 1719)).

On the subscriber's side however, there are more choices: relevant information may arrive when the application is busy doing something else or when the application is just waiting for that information. Therefore, depending on the way the application is designed, asynchronous notifications or synchronous access may be more appropriate. Both interaction

modes are allowed, a **Listener** (p. 1381) is used to provide a callback for synchronous access and a **dds::core::cond::WaitSet** (p. 2318) associated with one or several **dds::core::cond::Condition** (p. 729) objects provides asynchronous data access.

The same synchronous and asynchronous interaction modes can also be used to access changes that affect the middleware communication status (see **Status Kinds** (p. 229)). For instance, this may occur when the middleware asynchronously detects an inconsistency. In addition, other middleware information that may be relevant to the application (such as the list of the existing topics) is made available by means of **built-in topics** (p. 44) that the application can access as plain application data, using built-in data-readers.

6.63.4 Modules

DCPS consists of five modules:

- **Infrastructure module** (p. 70) defines the abstract classes and the interfaces that are refined by the other modules. It also provides support for the two interaction styles (notification-based and wait-based) with the middleware.
- **Domain module** (p. 42) contains the **dds::domain::DomainParticipant** (p. 1079) class that acts as an endpoint of the Service and acts as a factory for many of the classes. The **dds::domain::DomainParticipant** (p. 1079) also acts as a container for the other objects that make up the Service.
- **Topic module** (p. 46) contains the **dds::topic::Topic** (p. 2178) class, the **TopicListener** interface, and more generally, all that is needed by the application to define **dds::topic::Topic** (p. 2178) objects and attach QoS policies to them.
- **Publication module** (p. 54) contains the **dds::pub::Publisher** (p. 1719) and **dds::pub::DataWriter** (p. 908) classes as well as the **PublisherListener** and **dds::pub::DataWriterListener** (p. 972) interfaces, and more generally, all that is needed on the publication side.
- **Subscription module** (p. 60) contains the **dds::sub::Subscriber** (p. 2116), **dds::sub::DataReader** (p. 756), **dds::sub::cond::ReadCondition** (p. 1858), and **dds::sub::cond::QueryCondition** (p. 1784) classes, as well as the **dds::sub::SubscriberListener** (p. 2128) and **dds::sub::DataReaderListener** (p. 832) interfaces, and more generally, all that is needed on the subscription side.

6.64 Additional RTI Connex Communication Patterns

Extensions to the RTI Connex publish-subscribe functionality.

Modules

- **Request-Reply Pattern**
Support for the request-reply communication pattern.
- **Queuing Pattern**
Support for the queuing communication pattern.
- **Remote Procedure Call**
Remote Procedure call (RPC) communication pattern.
- **Utilities**
Utilities for the RTI Connex Messaging module.

6.64.1 Detailed Description

Extensions to the RTI Connex publish-subscribe functionality.

6.65 Programming How-To's

These "How To"s illustrate how to apply RTI Connex APIs to common use cases.

Modules

- **Publication Example**
A data publication example.
- **Subscription Example**
A data subscription example.
- **Participant Use Cases**
Working with domain participants.
- **Topic Use Cases**
- **Publisher Use Cases**
- **DataWriter Use Cases**
- **Subscriber Use Cases**
- **DataReader Use Cases**
- **Entity Use Cases**
- **Waitset Use Cases**
Using WaitSets and Conditions.
- **Filter Use Cases**
Working with data filters.
- **Creating Custom Content Filters**
Creating a custom content filter.
- **XML Application Creation**
Defining DDS systems in XML.
- **Request-Reply Examples**
Examples on how to use the request-reply API .
- **RPC Tutorial**
Getting Started with Remote Procedure Call with DDS.
- **Built-in Types Examples**
Using Built-in Types.
- **Exceptions**
How DDS return codes map to C++ exceptions.
- **Qos Use Cases**
- **Qos Provider Use Cases**
How to use `dds::core::QosProvider` (p. 1752) to access XML QoS profiles.
- **Working with IDL types**
How IDL types map to C++ classes.
- **DynamicType and DynamicData Use Cases**
Using DynamicType and DynamicData.

6.65.1 Detailed Description

These "How To"s illustrate how to apply RTI Connex APIs to common use cases.

These are a good starting point to familiarize yourself with DDS. You can use these code fragments as "templates" for writing your own code.

6.66 Interface

Abstraction of a Transport Plugin network interface.

Classes

- struct **NDDS_Transport_Interface_t**
Storage for the description of a network interface used by a Transport Plugin.

Enumerations

- enum **NDDS_Transport_Interface_Status_t** {
 NDDS_TRANSPORT_INTERFACE_OFF = 0 ,
 NDDS_TRANSPORT_INTERFACE_ON = 1 }
Interface status.

6.66.1 Detailed Description

Abstraction of a Transport Plugin network interface.

A Transport Plugin may be able to use several logical or physical network interfaces in a single node (machine). For example, there may be multiple NICs for IP networks or multiple serial ports for serial networks.

An instance of a Transport Plugin is a conduit to one or more network interfaces associated with the transport.

Instances of a Transport Plugin must assign a unique unicast address to each of the network interfaces that it can use to send and receive messages. The unicast address should be within the range of addresses that are addressable by the Transport Plugin (as defined by the plugin itself).

Then, when RTI Connex sends a message to an unicast destination address, the destination address will be made of two parts. The network address and an interface address. The network address portion will be used by RTI Connex to select the Transport Plugin instance that will send the message. The interface address portion is passed to the Transport Plugin instance as the destination interface to which the message should be sent.

See also

NDDS_Transport_Address_t (p. 1518) **NDDS_Transport_ClassId_t** (p. 172)

6.66.2 Enumeration Type Documentation

6.66.2.1 NDDS_Transport_Interface_Status_t

enum **NDDS_Transport_Interface_Status_t**

Interface status.

Enumerator

NDDS_TRANSPORT_INTERFACE_OFF	The transport interface is OFF.
NDDS_TRANSPORT_INTERFACE_ON	The transport interface is ON.

6.67 Transport Plugins Configuration

Transport plugins configuration with RTI Connex.

Classes

- struct **NDDS_Transport_UUID**
Univocally identifies a transport plugin instance.
- struct **TransportAllocationSettings_t**
Allocation settings used by various internal buffers.
- struct **NDDS_Transport_Property_t**
Base configuration structure that must be inherited by derived Transport Plugin classes.

Macros

- #define **NDDS_TRANSPORT_PORT_INVALID** ((**NDDS_Transport_Port_t**) 0)
Port 0 is considered to be invalid.
- #define **NDDS_TRANSPORT_UUID_SIZE** 12
*Size of a **NDDS_Transport_UUID** (p. 1561).*
- #define **NDDS_TRANSPORT_LENGTH_UNLIMITED** -1
Represent an unlimited length.
- #define **NDDS_TRANSPORT_INTERFACE_RANK_UNKNOWN** 0
Rank interface as unknown or not yet set.
- #define **NDDS_TRANSPORT_UUID_UNKNOWN** {{0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0}}
- #define **NDDS_TRANSPORT_ALLOCATION_SETTINGS_MAX_COUNT_UNLIMITED** (-1)
*The constant used as 'unlimited' for the 'max_count' field of the structure **TransportAllocationSettings_t** (p. 2236).*

- **#define NDDS_TRANSPORT_ALLOCATION_SETTINGS_INCREMENTAL_COUNT_AUTOMATIC (-1)**
*The constant used as 'automatic' for the 'incremental_count' field of the structure **TransportAllocationSettings_t** (p. 2236).*
- **#define NDDS_TRANSPORT_ALLOCATION_SETTINGS_DEFAULT**
*The constant used as default value for the struct **TransportAllocationSettings_t** (p. 2236).*
- **#define NDDS_TRANSPORT_CLASSID_INVALID (-1)**
Invalid Transport Class ID.
- **#define NDDS_TRANSPORT_CLASSID_UDPv4 (1)**
Builtin IPv4 UDP/IP Transport Plugin class ID.
- **#define NDDS_TRANSPORT_CLASSID_SHMEM (0x01000000)**
Builtin Shared-Memory Transport Plugin class ID.
- **#define NDDS_TRANSPORT_CLASSID_SHMEM_510 (2)**
Builtin Shared-Memory Transport Plugin class ID for Connex 5.1.0 and earlier.
- **#define NDDS_TRANSPORT_CLASSID_UDPv6 (2)**
Builtin IPv6 UDP/IP Transport Plugin class ID.
- **#define NDDS_TRANSPORT_CLASSID_UDPv6_510 (5)**
Builtin IPv6 UDP/IP Transport Plugin class ID for Connex 5.1.0 and earlier.
- **#define NDDS_TRANSPORT_CLASSID_TCPV4_LAN (8)**
IPv4 TCP/IP Transport Plugin class ID for LAN case.
- **#define NDDS_TRANSPORT_CLASSID_TCPV4_WAN (9)**
IPv4 TCP/IP Transport Plugin class ID for WAN case.
- **#define NDDS_TRANSPORT_CLASSNAME_TCPV4_WAN "tcpv4_wan"**
IPv4 TCP/IP Transport Plugin class name for WAN case.
- **#define NDDS_TRANSPORT_CLASSID_TLsv4_LAN (10)**
IPv4 TCP/IP Transport Plugin class ID for LAN case with TLS enabled.
- **#define NDDS_TRANSPORT_CLASSID_TLsv4_WAN (11)**
IPv4 TCP/IP Transport Plugin class ID for WAN case with TLS enabled.
- **#define NDDS_TRANSPORT_CLASSID_UDPv4_WAN (0x01000001)**
Builtin IPv4 UDP/IP Asymmetric Transport Plugin class ID.
- **#define NDDS_TRANSPORT_CLASSID_RESERVED_RANGE (1000)**
Transport Plugin class IDs below this are reserved by RTI.
- **#define NDDS_TRANSPORT_PROPERTY_BIT_BUFFER_ALWAYS_LOANED (0x2)**
Specified zero-copy behavior of transport.
- **#define NDDS_TRANSPORT_PROPERTY_GATHER_SEND_BUFFER_COUNT_MIN (3)**
Minimum number of gather-send buffers that must be supported by a Transport Plugin implementation.

Typedefs

- **typedef RTI_UINT32 NDDS_Transport_Port_t**
Type for storing RTI Connex RTPS ports.
- **typedef RTI_INT32 NDDS_Transport_Classid_t**
Type for storing RTI Connex Transport Plugin class IDs.

6.67.1 Detailed Description

Transport plugins configuration with RTI Connex.

Transport plugins are configured using properties. Each transport plugin must derive its property from a base configuration structure **NDDS_Transport_Property_t** (p. 1520).

To see how to configure the Built-in Transport Plugins, see **Built-in Transport Plugins** (p. 81).

See also

Built-in Transport Plugins (p. 81)

6.67.2 Macro Definition Documentation

6.67.2.1 NDDS_TRANSPORT_PORT_INVALID

```
#define NDDS_TRANSPORT_PORT_INVALID (( NDDS_Transport_Port_t) 0)
```

Port 0 is considered to be invalid.

6.67.2.2 NDDS_TRANSPORT_UUID_SIZE

```
#define NDDS_TRANSPORT_UUID_SIZE 12
```

Size of a **NDDS_Transport_UUID** (p. 1561).

6.67.2.3 NDDS_TRANSPORT_LENGTH_UNLIMITED

```
#define NDDS_TRANSPORT_LENGTH_UNLIMITED -1
```

Represent an unlimited length.

6.67.2.4 NDDS_TRANSPORT_INTERFACE_RANK_UNKNOWN

```
#define NDDS_TRANSPORT_INTERFACE_RANK_UNKNOWN 0
```

Rank interface as unknown or not yet set.

6.67.2.5 NDDS_TRANSPORT_UUID_UNKNOWN

```
#define NDDS_TRANSPORT_UUID_UNKNOWN {{0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0}}
```

Value for UUIDs that have no known value. Used as default.

6.67.2.6 NDDS_TRANSPORT_ALLOCATION_SETTINGS_MAX_COUNT_UNLIMITED

```
#define NDDS_TRANSPORT_ALLOCATION_SETTINGS_MAX_COUNT_UNLIMITED (-1)
```

The constant used as 'unlimited' for the 'max_count' field of the structure **TransportAllocationSettings_t** (p. 2236).

6.67.2.7 NDDS_TRANSPORT_ALLOCATION_SETTINGS_INCREMENTAL_COUNT_AUTOMATIC

```
#define NDDS_TRANSPORT_ALLOCATION_SETTINGS_INCREMENTAL_COUNT_AUTOMATIC (-1)
```

The constant used as 'automatic' for the 'incremental_count' field of the structure **TransportAllocationSettings_t** (p. 2236).

Automatic means the buffer size will double at every reallocation.

6.67.2.8 NDDS_TRANSPORT_ALLOCATION_SETTINGS_DEFAULT

```
#define NDDS_TRANSPORT_ALLOCATION_SETTINGS_DEFAULT
```

Value:

```
{
    2L, /* initial_count */
    NDDS_TRANSPORT_ALLOCATION_SETTINGS_MAX_COUNT_UNLIMITED, /* max_count */
    NDDS_TRANSPORT_ALLOCATION_SETTINGS_INCREMENTAL_COUNT_AUTOMATIC /* incremental_count */
}
```

The constant used as default value for the struct **TransportAllocationSettings_t** (p. 2236).

The default value defined in this constant, sets the buffer to have:

- initial_count = 2 elements
- max_count = **NDDS_TRANSPORT_ALLOCATION_SETTINGS_MAX_COUNT_UNLIMITED** (p. 169)
- incremental_count = **NDDS_TRANSPORT_ALLOCATION_SETTINGS_INCREMENTAL_COUNT_AUTOMATIC**

6.67.2.9 NDDS_TRANSPORT_CLASSID_INVALID

```
#define NDDS_TRANSPORT_CLASSID_INVALID (-1)
```

Invalid Transport Class ID.

Transport-Plugins implementations should set their class ID to a value different than this.

6.67.2.10 NDDS_TRANSPORT_CLASSID_UDPv4

```
#define NDDS_TRANSPORT_CLASSID_UDPv4 (1)
```

Builtin IPv4 UDP/IP Transport Plugin class ID.

6.67.2.11 NDDS_TRANSPORT_CLASSID_SHMEM

```
#define NDDS_TRANSPORT_CLASSID_SHMEM (0x01000000)
```

Builtin Shared-Memory Transport Plugin class ID.

6.67.2.12 NDDS_TRANSPORT_CLASSID_SHMEM_510

```
#define NDDS_TRANSPORT_CLASSID_SHMEM_510 (2)
```

Builtin Shared-Memory Transport Plugin class ID for Connex 5.1.0 and earlier.

6.67.2.13 NDDS_TRANSPORT_CLASSID_UDPv6

```
#define NDDS_TRANSPORT_CLASSID_UDPv6 (2)
```

Builtin IPv6 UDP/IP Transport Plugin class ID.

6.67.2.14 NDDS_TRANSPORT_CLASSID_UDPv6_510

```
#define NDDS_TRANSPORT_CLASSID_UDPv6_510 (5)
```

Builtin IPv6 UDP/IP Transport Plugin class ID for Connex 5.1.0 and earlier.

6.67.2.15 NDDS_TRANSPORT_CLASSID_TCPV4_LAN

```
#define NDDS_TRANSPORT_CLASSID_TCPV4_LAN (8)
```

IPv4 TCP/IP Transport Plugin class ID for LAN case.

6.67.2.16 NDDS_TRANSPORT_CLASSID_TCPV4_WAN

```
#define NDDS_TRANSPORT_CLASSID_TCPV4_WAN (9)
```

IPv4 TCP/IP Transport Plugin class ID for WAN case.

6.67.2.17 NDDS_TRANSPORT_CLASSNAME_TCPV4_WAN

```
#define NDDS_TRANSPORT_CLASSNAME_TCPV4_WAN "tcpv4_wan"
```

IPv4 TCP/IP Transport Plugin class name for WAN case.

6.67.2.18 NDDS_TRANSPORT_CLASSID_TLsv4_LAN

```
#define NDDS_TRANSPORT_CLASSID_TLsv4_LAN (10)
```

IPv4 TCP/IP Transport Plugin class ID for LAN case with TLS enabled.

6.67.2.19 NDDS_TRANSPORT_CLASSID_TLsv4_WAN

```
#define NDDS_TRANSPORT_CLASSID_TLsv4_WAN (11)
```

IPv4 TCP/IP Transport Plugin class ID for WAN case with TLS enabled.

6.67.2.20 NDDS_TRANSPORT_CLASSID_UDPv4_WAN

```
#define NDDS_TRANSPORT_CLASSID_UDPv4_WAN (0x01000001)
```

Builtin IPv4 UDP/IP Asymmetric Transport Plugin class ID.

6.67.2.21 NDDS_TRANSPORT_CLASSID_RESERVED_RANGE

```
#define NDDS_TRANSPORT_CLASSID_RESERVED_RANGE (1000)
```

Transport Plugin class IDs below this are reserved by RTI.

User-defined Transport-Plugins should use a class ID greater than this number.

6.67.2.22 NDDS_TRANSPORT_PROPERTY_BIT_BUFFER_ALWAYS_LOANED

```
#define NDDS_TRANSPORT_PROPERTY_BIT_BUFFER_ALWAYS_LOANED (0x2)
```

Specified zero-copy behavior of transport.

A Transport Plugin may commit to one of three behaviors for zero copy receives:

1. Always does zero copy.
2. Sometimes does zero copy, up to the transport discretion.
3. Never does zero copy.

This bit should be set only if the Transport Plugin commits to always doing a zero copy receive, or more specifically, always loaning a buffer through its `receive_rEA()` call.

In that case, RTI Connexx will not need to allocate storage for a message that it retrieves with the `receive_rEA()` call.

6.67.2.23 NDDS_TRANSPORT_PROPERTY_GATHER_SEND_BUFFER_COUNT_MIN

```
#define NDDS_TRANSPORT_PROPERTY_GATHER_SEND_BUFFER_COUNT_MIN (3)
```

Minimum number of gather-send buffers that must be supported by a Transport Plugin implementation.

For the `NDDS_Transport_Property_t` (p. 1520) structure to be valid, the value of `NDDS_Transport_Property_t::gather_send_buffer_count_max` (p. 1523) must be greater than or equal to this value.

6.67.3 Typedef Documentation

6.67.3.1 NDDS_Transport_Port_t

```
typedef RTI_UINT32 NDDS_Transport_Port_t
```

Type for storing RTI Connexx RTPS ports.

Unlike IPv4 Socket API ports, which are 2 bytes long, the RTI Connexx representation of an RTPS port is 4 bytes.

6.67.3.2 NDDS_Transport_ClassId_t

```
typedef RTI_INT32 NDDS_Transport_ClassId_t
```

Type for storing RTI Connex Transport Plugin class IDs.

Each implementation of a Transport Plugin must have a unique ID. For example, a UDP/IP Transport Plugin implementation must have a different ID than a Shared Memory Transport Plugin.

User-implemented Transport Plugins must have an ID higher than **NDDS_TRANSPORT_CLASSID_RESERVED_RANGE** (p. 171).

6.68 Transport Address

Transport-independent addressing scheme using IPv6 presentation strings and numerically stored in network-ordered format.

Classes

- struct **NDDS_Transport_Address_t**
Addresses are stored individually as network-ordered bytes.

Macros

- #define **NDDS_TRANSPORT_ADDRESS_INVALID_INITIALIZER** {{0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0}}
- #define **NDDS_TRANSPORT_ADDRESS_STRING_BUFFER_SIZE** (72)
*The minimum size of the buffer that should be passed to **NDDS_Transport_Address_to_string** (p. 175).*

Functions

- RTI_INT32 **NDDS_Transport_Address_to_string** (const **NDDS_Transport_Address_t** *self, char *buffer_↔ inout, RTI_INT32 buffer_length_in)
Converts a numerical address to a printable string representation.
- RTIBool **NDDS_Transport_Address_to_string_with_protocol_family_format** (const **NDDS_Transport_↔ Address_t** *me, char *buffer, RTI_INT32 buffer_length_in, RTIOsapiSocketAFKind family)
Converts a numerical address to a printable string representation with IPv4 dotted notation or IPv6 presentation string depending on the provided protocol family.
- RTI_INT32 **NDDS_Transport_Address_from_string** (**NDDS_Transport_Address_t** *address_out, const char *address_in)
Converts an address (IPv4 dotted notation or IPv6 presentation string) into a numerical address.
- void **NDDS_Transport_Address_print** (const **NDDS_Transport_Address_t** *address_in, const char *desc_in, RTI_INT32 indent_in)
Prints an address to standard out.
- RTI_INT32 **NDDS_Transport_Address_is_ipv4** (const **NDDS_Transport_Address_t** *address_in)
Checks if an address is an IPv4 address.
- RTI_INT32 **NDDS_Transport_Address_is_multicast** (const **NDDS_Transport_Address_t** *address_in)
Checks if an address is an IPv4 or IPv6 multicast address.

Variables

- const **NDDS_Transport_Address_t NDDS_TRANSPORT_ADDRESS_INVALID**
An invalid transport address.

6.68.1 Detailed Description

Transport-independent addressing scheme using IPv6 presentation strings and numerically stored in network-ordered format.

The APIs of RTI Connex uses IPv6 address notation for all transports.

Transport Plugin implementations that are not IP-based are required to map whatever addressing scheme natively used by the physical transport (if any) to an address in IPv6 notation and vice versa.

IPv6 addresses are numerically stored in 16 bytes. An IPv6 address can be presented in string notation in a variety of ways. For example,

```
"00AF:0000:0037:FE01:0000:0000:034B:0089"  
"AF:0:37:FE01:0:0:34B:89"  
"AF:0:37:FE01::34B:89"
```

are all valid IPv6 presentation of the same address.

IPv4 address in dot notation can be used to specify the last 4 bytes of the address. For example,

```
"0000:0000:0000:0000:0000:0000:192.168.0.1"  
"0:0:0:0:0:0:192.168.0.1"  
"::192.168.0.1"
```

are all valid IPv6 presentation of the same address.

For a complete description of valid IPv6 address notation, consult the IPv6 Addressing Architecture (RFC 2373).

Addresses are divided into unicast addresses and multicast addresses.

Multicast addresses are defined as

- Addresses that start with 0xFF. That is `FFxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx`.

or an IPv4 multicast address

- Address in the range `:::224.0.0.0, :::239.255.255.255]`

Multicast addresses do not refer to any specific destination (network interface). Instead, they usually refer to a group of network interfaces, often called a "multicast group".

Unicast addresses always refer to a specific network interface.

6.68.2 Macro Definition Documentation

6.68.2.1 NDDS_TRANSPORT_ADDRESS_INVALID_INITIALIZER

```
#define NDDS_TRANSPORT_ADDRESS_INVALID_INITIALIZER {{0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0}}
```

An invalid transport address. Used as an initializer.

For example: `NDDS_Transport_Address_t` (p.1518) `address = NDDS_TRANSPORT_ADDRESS_INVALID_INITIALIZER;`

6.68.2.2 NDDS_TRANSPORT_ADDRESS_STRING_BUFFER_SIZE

```
#define NDDS_TRANSPORT_ADDRESS_STRING_BUFFER_SIZE (72)
```

The minimum size of the buffer that should be passed to `NDDS_Transport_Address_to_string` (p. 175).

For regular addresses, the string size needs to be at least 40 to include space for 8 tuples of 4 characters each plus 7 delimiting colons plus a terminating NULL.

To support UDPv4_WAN strings, it has been adjusted to 72 to fit the following representation (plus NULL terminator):
f=XXXXRBPU,u={FF,FF,FF,FF,FF,FF,FF,FF,FF,FF},p=255.255.255.255:65555:65555

6.68.3 Function Documentation

6.68.3.1 NDDS_Transport_Address_to_string()

```
RTI_INT32 NDDS_Transport_Address_to_string (
    const NDDS_Transport_Address_t * self,
    char * buffer_inout,
    RTI_INT32 buffer_length_in )
```

Converts a numerical address to a printable string representation.

Precondition

The `buffer_inout` provided must be at least `NDDS_TRANSPORT_ADDRESS_STRING_BUFFER_SIZE` (p. 175) characters long.

Parameters

<i>self</i>	<< <i>in</i> >> (p. 157) The address to be converted.
<i>buffer_inout</i>	<< <i>inout</i> >> (p. 157) Storage passed in which to return the string corresponding to the address.
<i>buffer_length_in</i>	<< <i>in</i> >> (p. 157) The length of the storage buffer. Must be >= <code>NDDS_TRANSPORT_ADDRESS_STRING_BUFFER_SIZE</code> (p. 175)

Returns

1 upon success; 0 upon failure (not enough space in the provided buffer)

6.68.3.2 NDDS_Transport_Address_to_string_with_protocol_family_format()

```
RTIBool NDDS_Transport_Address_to_string_with_protocol_family_format (
    const NDDS_Transport_Address_t * me,
    char * buffer,
    RTI_INT32 buffer_length_in,
    RTIOsapiSocketAFKind family )
```

Converts a numerical address to a printable string representation with IPv4 dotted notation or IPv6 presentation string depending on the provided protocol family.

Precondition

The `buffer_inout` provided must be at least `NDDS_TRANSPORT_ADDRESS_STRING_BUFFER_SIZE` (p. 175) characters long.

Parameters

<i>me</i>	<< <i>in</i> >> (p. 157) The address to be converted.
<i>buffer</i>	<< <i>inout</i> >> (p. 157) Storage passed in which to return the string corresponding to the address.
<i>buffer_length_in</i>	<< <i>in</i> >> (p. 157) The length of the storage buffer. Must be >= NDDS_TRANSPORT_ADDRESS_STRING_BUFFER_SIZE (p. 175)
<i>family</i>	<< <i>in</i> >> (p. 157) The protocol family <code>RTI_OSAPI_SOCKET_AF_INET</code> or <code>RTI_OSAPI_SOCKET_AF_INET6</code>

Returns

`RTI_TRUE` upon success; 0 upon failure (not enough space in the provided buffer)

6.68.3.3 NDDS_Transport_Address_from_string()

```
RTI_INT32 NDDS_Transport_Address_from_string (
    NDDS_Transport_Address_t * address_out,
    const char * address_in )
```

Converts an address (IPv4 dotted notation or IPv6 presentation string) into a numerical address.

The address string must be in IPv4 dotted notation (X.X.X.X) or IPv6 presentation notation. The string cannot be a hostname since this function does not perform a hostname lookup.

Parameters

<i>address_out</i>	<< out >> (p. 157) Numerical value of the address.
<i>address_in</i>	<< in >> (p. 157) String representation of an address.

Returns

- 1 if *address_out* contains a valid address
- 0 if it was not able to convert the string into an address.

6.68.3.4 NDDS_Transport_Address_print()

```
void NDDS_Transport_Address_print (
    const NDDS_Transport_Address_t * address_in,
    const char * desc_in,
    RTI_INT32 indent_in )
```

Prints an address to standard out.

Parameters

<i>address_in</i>	<< in >> (p. 157) Address to be printed.
<i>desc_in</i>	<< in >> (p. 157) A prefix to be printed before the address.
<i>indent_in</i>	<< in >> (p. 157) Indentation level for the printout.

6.68.3.5 NDDS_Transport_Address_is_ipv4()

```
RTI_INT32 NDDS_Transport_Address_is_ipv4 (
    const NDDS_Transport_Address_t * address_in )
```

Checks if an address is an IPv4 address.

Parameters

<i>address_in</i>	<< in >> (p. 157) Address to be tested.
-------------------	--

Note

May be implemented as a macro for efficiency.

Returns

1 if address is an IPv4 address
0 otherwise.

6.68.3.6 NDDS_Transport_Address_is_multicast()

```
RTI_INT32 NDDS_Transport_Address_is_multicast (
    const NDDS_Transport_Address_t * address_in )
```

Checks if an address is an IPv4 or IPv6 multicast address.

Parameters

<i>address</i> _↔ <i>_in</i>	<< <i>in</i> >> (p. 157) Address to be tested.
---	--

May be implemented as a macro for efficiency.

Returns

1 if address is a multicast address
0 otherwise.

6.68.4 Variable Documentation**6.68.4.1 NDDS_TRANSPORT_ADDRESS_INVALID**

```
const NDDS_Transport_Address_t NDDS_TRANSPORT_ADDRESS_INVALID
```

An invalid transport address.

6.69 UDP Transport Plugin definitions

UDP Transport Plugin definitions.

Classes

- struct **NDDS_Transport_UDP_WAN_CommPortsMappingInfo**
Type for storing UDP WAN communication ports.

Macros

- `#define NDDS_TRANSPORT_UDP_PROPERTIES_BITMAP_DEFAULT (0)`
Default value of `NDDS_Transport_Property_t::properties_bitmap` (p. 1522).
- `#define NDDS_TRANSPORT_UDP_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT (16)`
Default value of `NDDS_Transport_Property_t::gather_send_buffer_count_max` (p. 1523).
- `#define NDDS_TRANSPORT_UDP_SOCKET_BUFFER_SIZE_OS_DEFAULT (-1)`
Used to specify that os default be used to specify socket buffer size.
- `#define NDDS_TRANSPORT_UDP_SEND_SOCKET_BUFFER_SIZE_DEFAULT (131072)`
Default value of `send_socket_buffer_size`.
- `#define NDDS_TRANSPORT_UDP_RECV_SOCKET_BUFFER_SIZE_DEFAULT (131072)`
Default value of `recv_socket_buffer_size`.
- `#define NDDS_TRANSPORT_UDP_MULTICAST_TTL_DEFAULT (1)`
Default value of `multicast_ttl`.

Typedefs

- `typedef RTI_UINT16 NDDS_Transport_UDP_Port`
UDP port.

6.69.1 Detailed Description

UDP Transport Plugin definitions.

6.69.2 Macro Definition Documentation

6.69.2.1 NDDS_TRANSPORT_UDP_PROPERTIES_BITMAP_DEFAULT

```
#define NDDS_TRANSPORT_UDP_PROPERTIES_BITMAP_DEFAULT (0)
```

Default value of `NDDS_Transport_Property_t::properties_bitmap` (p. 1522).

6.69.2.2 NDDS_TRANSPORT_UDP_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT

```
#define NDDS_TRANSPORT_UDP_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT (16)
```

Default value of `NDDS_Transport_Property_t::gather_send_buffer_count_max` (p. 1523).

This is also the maximum value that can be used when instantiating the udp transport.

16 is sufficient for RTI Connex, but more may improve discovery and reliable performance. Porting note: find out what the maximum gather buffer count is on your OS!

6.69.2.3 NDDS_TRANSPORT_UDP_SOCKET_BUFFER_SIZE_OS_DEFAULT

```
#define NDDS_TRANSPORT_UDP_SOCKET_BUFFER_SIZE_OS_DEFAULT (-1)
```

Used to specify that os default be used to specify socket buffer size.

6.69.2.4 NDDS_TRANSPORT_UDP_SEND_SOCKET_BUFFER_SIZE_DEFAULT

```
#define NDDS_TRANSPORT_UDP_SEND_SOCKET_BUFFER_SIZE_DEFAULT (131072)
```

Default value of send_socket_buffer_size.

6.69.2.5 NDDS_TRANSPORT_UDP_RECV_SOCKET_BUFFER_SIZE_DEFAULT

```
#define NDDS_TRANSPORT_UDP_RECV_SOCKET_BUFFER_SIZE_DEFAULT (131072)
```

Default value of recv_socket_buffer_size.

6.69.2.6 NDDS_TRANSPORT_UDP_MULTICAST_TTL_DEFAULT

```
#define NDDS_TRANSPORT_UDP_MULTICAST_TTL_DEFAULT (1)
```

Default value of multicast_ttl.

6.69.3 Typedef Documentation

6.69.3.1 NDDS_Transport_UDP_Port

```
typedef RTI_UINT16 NDDS_Transport_UDP_Port
```

UDP port.

6.70 Shared Memory Transport

Built-in transport plug-in for inter-process communications using shared memory.

Classes

- struct **NDDS_Transport_Shmem_Property_t**

*Subclass of **NDDS_Transport_Property_t** (p. 1520) allowing specification of parameters that are specific to the shared-memory transport.*

Macros

- #define **NDDS_TRANSPORT_SHMEM_ADDRESS_BIT_COUNT** (-96)
*Default value of **NDDS_Transport_Property_t::address_bit_count** (p. 1522).*
- #define **NDDS_TRANSPORT_SHMEM_PROPERTIES_BITMAP_DEFAULT** (**NDDS_TRANSPORT_↔
PROPERTY_BIT_BUFFER_ALWAYS_LOADED**)
*Default value of **NDDS_Transport_Property_t::properties_bitmap** (p. 1522).*
- #define **NDDS_TRANSPORT_SHMEM_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT** (1024)
*Default value of **NDDS_Transport_Property_t::gather_send_buffer_count_max** (p. 1523).*
- #define **NDDS_TRANSPORT_SHMEM_MESSAGE_SIZE_MAX_DEFAULT** (65536)
*Default value of **NDDS_Transport_Property_t::message_size_max** (p. 1523).*
- #define **NDDS_TRANSPORT_SHMEM_RECEIVED_MESSAGE_COUNT_MAX_DEFAULT** (64)
*Default value of **NDDS_Transport_Shmem_Property_t::received_message_count_max** (p. 1529).*
- #define **NDDS_TRANSPORT_SHMEM_RECEIVE_BUFFER_SIZE_DEFAULT**
*Default value of **NDDS_Transport_Shmem_Property_t::receive_buffer_size** (p. 1529).*
- #define **NDDS_TRANSPORT_SHMEM_MAJOR_AFTER_BUG_14240_FIX** (2)
Major version for the transport plugin after fixing bug 14240 (RTI-28)
- #define **NDDS_TRANSPORT_SHMEM_PROPERTY_DEFAULT**
Use this to initialize stack variable.

Functions

- **NDDS_Transport_Plugin * NDDS_Transport_Shmem_new** (const struct **NDDS_Transport_Shmem_↔
Property_t *property_in**)
Create a new shmem process transport.

6.70.1 Detailed Description

Built-in transport plug-in for inter-process communications using shared memory.

This transport plugin uses System Shared Memory to send messages between processes on the same node. This transport is installed as a built-in transport plugin with the alias **rti::core::policy::TransportBuiltin::SHMEM_ALIAS** (p. 2240).

6.70.2 Compatibility of Sender and Receiver Transports

Opening a receiver "port" on shared memory corresponds to creating a shared memory segment using a name based on the port number. The transport plugin's properties are embedded in the shared memory segment.

When a sender tries to send to the shared memory port, it verifies that properties of the receiver's shared memory transport are compatible with those specified in its transport plugin. If not, the sender will fail to attach to the port and will output messages such as below (with numbers appropriate to the properties of the transport plugins involved).

```
NDDS_Transport_Shmem_attachShmem:failed to initialize incompatible properties
NDDS_Transport_Shmem_attachShmem:countMax 0 > -19417345 or max size -19416188 > 2147482624
```

In this scenario, the properties of the sender or receiver transport plugin instances should be adjusted, so that they are compatible.

6.70.3 Crashing and Restarting Programs

If a process using shared memory crashes (say because the user typed in $\wedge C$), resources associated with its shared memory ports may not be properly cleaned up. Later, if another RTI Connex process needs to open the same ports (say, the crashed program is restarted), it will attempt to reuse the shared memory segment left behind by the crashed process.

The reuse is allowed iff the properties of transport plugin are compatible with those embedded in the shared memory segment (i.e., of the original creator). Otherwise, the process will fail to open the ports, and will output messages such as below (with numbers appropriate to the properties of the transport plugins involved).

```
NDDS_Transport_Shmem_create_recvresource_rrEA:failed to initialize shared
memory resource Cannot recycle existing shmem: size not compatible for key 0x1234
```

In this scenario, the shared memory segments must be cleaned up using appropriate platform specific commands. For details, please refer to the [Platform Notes](#).

6.70.4 Shared Resource Keys

The transport uses the **shared memory segment keys**, given by the formula below.

```
0x400000 + port
```

The transport also uses signaling **shared semaphore** keys given by the formula below.

```
0x800000 + port
```

The transport also uses mutex **shared semaphore keys** given by the formula below.

```
0xb00000 + port
```

where the `port` is a function of the `domain_id` and the `participant_id`, as described in [rti::core::policy::WireProtocol::participant_id](#) (p. 2336)

See also

[rti::core::policy::WireProtocol::participant_id](#) (p. 2336)

`Transport_Support::set_builtin_transport_property()`

6.70.5 Creating and Registering Shared Memory Transport Plugin

RTI Connex can implicitly create this plugin and register with the `dds::domain::DomainParticipant` (p. 1079) if this transport is specified in `rti::core::policy::TransportBuiltin` (p. 2237).

To specify the properties of the builtin shared memory transport that is implicitly registered, you can either:

- call `Transport_Support::set_builtin_transport_property` or
- specify the pre-defined property names in `rti::core::policy::Property` (p. 1695) associated with the `dds::domain::DomainParticipant` (p. 1079). (see **Shared Memory Transport Property Names in Property QoS Policy of Domain Participant** (p. 183)).

Builtin transport plugin properties specified in `rti::core::policy::Property` (p. 1695) always overwrite the ones specified through `Transport_Support::set_builtin_transport_property()`. The default value is assumed on any unspecified property. Note that all properties should be set before the transport is implicitly created and registered by RTI Connex. See **Built-in Transport Plugins** (p. 81) for details on when a builtin transport is registered.

6.70.6 Shared Memory Transport Property Names in Property QoS Policy of Domain Participant

The following table lists the predefined property names that can be set in the `dds::domain::qos::DomainParticipantQoS::property` to configure the builtin shared memory transport plugin.

Table 6.19 Property Strings for Shared Memory Transport

Name	Descriptions
<code>dds.transport.shmem.builtin.parent.address_bit_count</code>	See <code>NDDS_Transport_Property_t::address_bit_count</code> (p. 1522)
<code>dds.transport.shmem.builtin.parent.properties_bitmap</code>	See <code>NDDS_Transport_Property_t::properties_bitmap</code> (p. 1522)
<code>dds.transport.shmem.builtin.parent.gather_send_buffer_count_max</code>	See <code>NDDS_Transport_Property_t::gather_send_buffer_count_max</code> (p. 1523)
<code>dds.transport.shmem.builtin.parent.message_size_max</code>	See <code>NDDS_Transport_Property_t::message_size_max</code> (p. 1523)
<code>dds.transport.shmem.builtin.parent.allow_interfaces</code>	See <code>NDDS_Transport_Property_t::allow_interfaces_list</code> (p. 1523) and <code>NDDS_Transport_Property_t::allow_interfaces_list_length</code> (p. 1524). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: <code>127.0.0.1,eth0</code>
<code>dds.transport.shmem.builtin.parent.deny_interfaces</code>	See <code>NDDS_Transport_Property_t::deny_interfaces_list</code> (p. 1524) and <code>NDDS_Transport_Property_t::deny_interfaces_list_length</code> (p. 1525). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: <code>127.0.0.1,eth0</code>

Name	Descriptions
dds.transport.shmem.builtin.parent.allow_multicast_↔ interfaces	See NDDS_Transport_Property_t::allow_multicast_↔ _interfaces_list (p.1525) and NDDS_Transport_↔ Property_t::allow_multicast_interfaces_list_length (p.1526). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.shmem.builtin.parent.deny_multicast_↔ interfaces	See NDDS_Transport_Property_t::deny_multicast_↔ _interfaces_list (p.1526) and NDDS_Transport_↔ Property_t::deny_multicast_interfaces_list_length (p.1526). Interfaces should be specified as comma- separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.shmem.builtin.parent.max_interface_↔ count	See NDDS_Transport_Property_t::max_interface_↔ count (p.1527)
dds.transport.shmem.builtin.parent.thread_name_prefix	See NDDS_Transport_Property_t::thread_name_↔ prefix (p.1527)
dds.transport.shmem.builtin.received_message_↔ count_max	See ShmemTransport_Property_t::received_message_↔ _count_max
dds.transport.shmem.builtin.receive_buffer_size	See ShmemTransport_Property_t::receive_buffer_size
dds.transport.shmem.builtin.enable_udp_debugging	See ShmemTransport_Property_t::enable_udp_↔ debugging
dds.transport.shmem.builtin.udp_debugging_address	See ShmemTransport_Property_t::udp_debugging_↔ address
dds.transport.shmem.builtin.udp_debugging_port	See ShmemTransport_Property_t::udp_debugging_port

6.70.7 Macro Definition Documentation

6.70.7.1 NDDS_TRANSPORT_SHMEM_ADDRESS_BIT_COUNT

```
#define NDDS_TRANSPORT_SHMEM_ADDRESS_BIT_COUNT (-96)
```

Default value of **NDDS_Transport_Property_t::address_bit_count** (p.1522).

6.70.7.2 NDDS_TRANSPORT_SHMEM_PROPERTIES_BITMAP_DEFAULT

```
#define NDDS_TRANSPORT_SHMEM_PROPERTIES_BITMAP_DEFAULT ( NDDS_TRANSPORT_PROPERTY_BIT_BUFFER_↔  
ALWAYS_LOANED )
```

Default value of **NDDS_Transport_Property_t::properties_bitmap** (p.1522).

6.70.7.3 NDDS_TRANSPORT_SHMEM_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT

```
#define NDDS_TRANSPORT_SHMEM_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT (1024)
```

Default value of `NDDS_Transport_Property_t::gather_send_buffer_count_max` (p. 1523).

6.70.7.4 NDDS_TRANSPORT_SHMEM_MESSAGE_SIZE_MAX_DEFAULT

```
#define NDDS_TRANSPORT_SHMEM_MESSAGE_SIZE_MAX_DEFAULT (65536)
```

Default value of `NDDS_Transport_Property_t::message_size_max` (p. 1523).

6.70.7.5 NDDS_TRANSPORT_SHMEM_RECEIVED_MESSAGE_COUNT_MAX_DEFAULT

```
#define NDDS_TRANSPORT_SHMEM_RECEIVED_MESSAGE_COUNT_MAX_DEFAULT (64)
```

Default value of `NDDS_Transport_Shmem_Property_t::received_message_count_max` (p. 1529).

6.70.7.6 NDDS_TRANSPORT_SHMEM_RECEIVE_BUFFER_SIZE_DEFAULT

```
#define NDDS_TRANSPORT_SHMEM_RECEIVE_BUFFER_SIZE_DEFAULT
```

Value:

```
(NDDS_TRANSPORT_SHMEM_RECEIVED_MESSAGE_COUNT_MAX_DEFAULT * \  
NDDS_TRANSPORT_SHMEM_MESSAGE_SIZE_MAX_DEFAULT / 4)
```

Default value of `NDDS_Transport_Shmem_Property_t::receive_buffer_size` (p. 1529).

6.70.7.7 NDDS_TRANSPORT_SHMEM_MAJOR_AFTER_BUG_14240_FIX

```
#define NDDS_TRANSPORT_SHMEM_MAJOR_AFTER_BUG_14240_FIX (2)
```

Major version for the transport plugin after fixing bug 14240 (RTI-28)

6.70.7.8 NDDS_TRANSPORT_SHMEM_PROPERTY_DEFAULT

```
#define NDDS_TRANSPORT_SHMEM_PROPERTY_DEFAULT
```

Use this to initialize stack variable.

6.70.8 Function Documentation

6.70.8.1 NDDS_Transport_Shmem_new()

```
NDDS_Transport_Plugin * NDDS_Transport_Shmem_new (
    const struct NDDS_Transport_Shmem_Property_t * property_in )
```

Create a new shmем process transport.

An application may create multiple transports, possibly for use in different domains.

Parameters

<i>property</i> <i>_in</i>	<< <i>in</i> >> (p. 157) Desired behavior of this transport. May be NULL for default property. The transport plugin can only support one unicast receive interface; therefore the interface selection lists are ignored.
-------------------------------	--

Returns

handle to a Shmem inter-process Transport Plugin on success
NULL on failure.

6.71 UDPv4 Transport

Transport plug-in using UDP/IPv4.

Classes

- struct **NDDS_Transport_UDPv4_Property_t**
Configurable IPv4/UDP Transport-Plugin properties.

Macros

- #define **NDDS_TRANSPORT_UDPv4_ADDRESS_BIT_COUNT** (32)
Default value of `NDDS_Transport_Property_t::address_bit_count` (p. 1522).
- #define **NDDS_TRANSPORT_UDPv4_WAN_ADDRESS_BIT_COUNT** (128)
Default value of `NDDS_Transport_Property_t::address_bit_count` (p. 1522) for UDPv4 asymmetric transport.
- #define **NDDS_TRANSPORT_UDPv4_PROPERTIES_BITMAP_DEFAULT** **NDDS_TRANSPORT_UDP_↔
PROPERTIES_BITMAP_DEFAULT**
Default value of `NDDS_Transport_Property_t::properties_bitmap` (p. 1522).
- #define **NDDS_TRANSPORT_UDPv4_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT** **NDDS_↔
TRANSPORT_UDP_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT**
Default value of `NDDS_Transport_Property_t::gather_send_buffer_count_max` (p. 1523).
- #define **NDDS_TRANSPORT_UDPv4_SOCKET_BUFFER_SIZE_OS_DEFAULT** **NDDS_TRANSPORT_↔
UDP_SOCKET_BUFFER_SIZE_OS_DEFAULT**
Used to specify that os default be used to specify socket buffer size.
- #define **NDDS_TRANSPORT_UDPv4_SEND_SOCKET_BUFFER_SIZE_DEFAULT** **NDDS_TRANSPORT_↔
UDP_SEND_SOCKET_BUFFER_SIZE_DEFAULT**
*Default value for `NDDS_Transport_UDPv4_Property_t::send_socket_buffer_size` (p. 1534) and `NDDS_Transport_↔
UDPv4_WAN_Property_t::send_socket_buffer_size` (p. 1543).*
- #define **NDDS_TRANSPORT_UDPv4_RECV_SOCKET_BUFFER_SIZE_DEFAULT** **NDDS_TRANSPORT_↔
UDP_RECV_SOCKET_BUFFER_SIZE_DEFAULT**
*Default value for `NDDS_Transport_UDPv4_Property_t::recv_socket_buffer_size` (p. 1534) and `NDDS_Transport_↔
UDPv4_WAN_Property_t::recv_socket_buffer_size` (p. 1544).*
- #define **NDDS_TRANSPORT_UDPv4_PAYLOAD_SIZE_MAX** (65507)
Maximum value of `NDDS_Transport_Property_t::message_size_max` (p. 1523).
- #define **NDDS_TRANSPORT_UDPv4_MESSAGE_SIZE_MAX_DEFAULT** **NDDS_TRANSPORT_UDPv4_↔
PAYLOAD_SIZE_MAX**
Maximum value of `NDDS_Transport_Property_t::message_size_max` (p. 1523).
- #define **NDDS_TRANSPORT_UDPv4_MULTICAST_TTL_DEFAULT** **NDDS_TRANSPORT_UDP_↔
MULTICAST_TTL_DEFAULT**
Default value of `NDDS_Transport_UDPv4_Property_t::multicast_ttl` (p. 1535).
- #define **NDDS_TRANSPORT_UDPv4_BLOCKING_NEVER**
Value for `NDDS_Transport_UDPv4_Property_t::send_blocking` (p. 1537) to specify non-blocking sockets.
- #define **NDDS_TRANSPORT_UDPv4_BLOCKING_ALWAYS**
[default] Value for `NDDS_Transport_UDPv4_Property_t::send_blocking` (p. 1537) to specify blocking sockets.
- #define **NDDS_TRANSPORT_UDPv4_BLOCKING_DEFAULT** **NDDS_TRANSPORT_UDP_BLOCKING_↔
DEFAULT**
Default value for `NDDS_Transport_UDPv4_Property_t::send_blocking` (p. 1537) to specify blocking sockets.
- #define **NDDS_TRANSPORT_UDPv4_PROPERTY_DEFAULT**
Use this to initialize a `NDDS_Transport_UDPv4_Property_t` (p. 1532) structure.
- #define **NDDS_Transport_UDPv4_string_to_address_cEA** **NDDS_Transport_UDP_string_to_address_cEA**
Realization of `NDDS_Transport_String_To_Address_Fcn_cEA` for IP transports.

Functions

- **NDDS_Transport_Plugin** * **NDDS_Transport_UDPv4_new** (const struct **NDDS_Transport_UDPv4_↔
Property_t** *property_in)
Create an instance of a UDPv4 Transport Plugin.

6.71.1 Detailed Description

Transport plug-in using UDP/IPv4.

This transport plugin uses UDPv4 sockets to send and receive messages. It supports both unicast and multicast communications in a single instance of the plugin. By default, this plugin will use all interfaces that it finds enabled and "UP" at instantiation time to send and receive messages. This transport is installed as a built-in transport plugin with the alias `rti::core::policy::TransportBuiltin::UDPv4_ALIAS` (p. 2240).

You can configure an instance of this plugin to only use unicast or only use multicast, see `NDDS_Transport_UDPv4_Property_t::unicast_enabled` (p. 1534) and `NDDS_Transport_UDPv4_Property_t::multicast_enabled` (p. 1535).

In addition, you can configure an instance of this plugin to selectively use the network interfaces of a node (and restrict a plugin from sending multicast messages on specific interfaces) by specifying the `NDDS_Transport_Property_t::max_interface_count` (p. 1527) and the "white" and "black" lists in the base property's fields (`NDDS_Transport_Property_t::allow_interfaces_list` (p. 1523), `NDDS_Transport_Property_t::deny_interfaces_list` (p. 1524), `NDDS_Transport_Property_t::allow_multicast_interfaces_list` (p. 1525), `NDDS_Transport_Property_t::deny_multicast_interfaces_list` (p. 1526)).

RTI Connexant can implicitly create this plugin and register with the `dds::domain::DomainParticipant` (p. 1079) if this transport is specified in `rti::core::policy::TransportBuiltin` (p. 2237).

To specify the properties of the builtin UDPv4 transport that is implicitly registered, you can either:

- call `Transport_Support::set_builtin_transport_property` or
- specify the predefined property names in `rti::core::policy::Property` (p. 1695) associated with the `dds::domain::DomainParticipant` (p. 1079). (see **UDPv4 Transport Property Names in Property QoS Policy of Domain Participant** (p. 188)). Builtin transport plugin properties specified in `rti::core::policy::Property` (p. 1695) always overwrite the ones specified through `Transport_Support::set_builtin_transport_property()`. The default value is assumed on any unspecified property.

Note that all properties should be set before the transport is implicitly created and registered by RTI Connexant. Any properties set after the builtin transport is registered will be ignored. See **Built-in Transport Plugins** (p. 81) for details on when a builtin transport is registered.

6.71.2 UDPv4 Transport Property Names in Property QoS Policy of Domain Participant

The following table lists the predefined property names that can be set in the `dds::domain::qos::DomainParticipant_QoS::property` to configure the builtin UDPv4 transport plugin.

Table 6.21 Property Names for UDPv4 Transport Plugin

Property Name	Description
<code>dds.transport.UDPv4.builtin.parent.classid</code>	See <code>NDDS_Transport_Property_t::classid</code> (p. 1521)
<code>dds.transport.UDPv4.builtin.parent.address_bit_count</code>	See <code>NDDS_Transport_Property_t::address_bit_count</code> (p. 1522)
<code>dds.transport.UDPv4.builtin.parent.properties_bitmap</code>	See <code>NDDS_Transport_Property_t::properties_bitmap</code> (p. 1522)

Property Name	Description
dds.transport.UDPv4.builtin.parent.gather_send_↔ buffer_count_max	See NDDS_Transport_Property_t::gather_send_↔ buffer_count_max (p. 1523)
dds.transport.UDPv4.builtin.parent.message_size_max	See NDDS_Transport_Property_t::message_size_↔ max (p. 1523)
dds.transport.UDPv4.builtin.parent.allow_interfaces	See NDDS_Transport_Property_t::allow_↔ interfaces_list (p. 1523) and NDDS_Transport_↔ Property_t::allow_interfaces_list_length (p. 1524). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example, 127.0.0.1,eth0
dds.transport.UDPv4.builtin.parent.deny_interfaces	See NDDS_Transport_Property_t::deny_interfaces_↔ _list (p. 1524) and NDDS_Transport_Property_t_↔ ::deny_interfaces_list_length (p. 1525). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.UDPv4.builtin.parent.allow_multicast_↔ interfaces	See NDDS_Transport_Property_t::allow_multicast_↔ _interfaces_list (p. 1525) and NDDS_Transport_↔ Property_t::allow_multicast_interfaces_list_length (p. 1526). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.UDPv4.builtin.parent.deny_multicast_↔ interfaces	See NDDS_Transport_Property_t::deny_multicast_↔ _interfaces_list (p. 1526) and NDDS_Transport_↔ Property_t::deny_multicast_interfaces_list_length (p. 1526). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.UDPv4.builtin.parent.max_interface_count	See NDDS_Transport_Property_t::max_interface_↔ count (p. 1527)
dds.transport.UDPv4.builtin.parent.thread_name_prefix	See NDDS_Transport_Property_t::thread_name_↔ prefix (p. 1527)
dds.transport.UDPv4.builtin.send_socket_buffer_size	See NDDS_Transport_UDPv4_Property_t::send_↔ socket_buffer_size (p. 1534)
dds.transport.UDPv4.builtin.recv_socket_buffer_size	See NDDS_Transport_UDPv4_Property_t::recv_↔ socket_buffer_size (p. 1534)
dds.transport.UDPv4.builtin.unicast_enabled	See NDDS_Transport_UDPv4_Property_t::unicast_↔ _enabled (p. 1534)
dds.transport.UDPv4.builtin.multicast_enabled	See NDDS_Transport_UDPv4_Property_t_↔ ::multicast_enabled (p. 1535)
dds.transport.UDPv4.builtin.multicast_ttl	See NDDS_Transport_UDPv4_Property_t_↔ ::multicast_ttl (p. 1535)
dds.transport.UDPv4.builtin.multicast_loopback_↔ disabled	See NDDS_Transport_UDPv4_Property_t_↔ ::multicast_loopback_disabled (p. 1535)
dds.transport.UDPv4.builtin.ignore_loopback_interface	See NDDS_Transport_UDPv4_Property_t::ignore_↔ loopback_interface (p. 1535)
dds.transport.UDPv4.builtin.ignore_nonrunning_↔ interfaces	See NDDS_Transport_UDPv4_Property_t::ignore_↔ nonrunning_interfaces (p. 1536)

Property Name	Description
dds.transport.UDPv4.builtin.ignore_nonup_interfaces	[DEPRECATED] See <code>NDDS_Transport_UDPv4_Property_t::ignore_nonup_interfaces</code> (p. 1536)
dds.transport.UDPv4.builtin.no_zero_copy	[DEPRECATED] See <code>NDDS_Transport_UDPv4_Property_t::no_zero_copy</code> (p. 1537)
dds.transport.UDPv4.builtin.send_blocking	See <code>NDDS_Transport_UDPv4_Property_t::send_blocking</code> (p. 1537)
dds.transport.UDPv4.builtin.transport_priority_mask	See <code>NDDS_Transport_UDPv4_Property_t::transport_priority_mask</code> (p. 1538)
dds.transport.UDPv4.builtin.transport_priority_mapping_low	See <code>NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_low</code> (p. 1538)
dds.transport.UDPv4.builtin.transport_priority_mapping_high	See <code>NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_high</code> (p. 1538)
dds.transport.UDPv4.builtin.send_ping	See <code>NDDS_Transport_UDPv4_Property_t::send_ping</code> (p. 1539)
dds.transport.UDPv4.builtin.force_interface_poll_detection	See <code>NDDS_Transport_UDPv4_Property_t::force_interface_poll_detection</code> (p. 1539)
dds.transport.UDPv4.builtin.interface_poll_period	See <code>NDDS_Transport_UDPv4_Property_t::interface_poll_period</code> (p. 1539)
dds.transport.UDPv4.builtin.reuse_multicast_receive_resource	See <code>NDDS_Transport_UDPv4_Property_t::reuse_multicast_receive_resource</code> (p. 1539)
dds.transport.UDPv4.builtin.protocol_overhead_max	See <code>NDDS_Transport_UDPv4_Property_t::protocol_overhead_max</code> (p. 1540)
dds.transport.UDPv4.builtin.disable_interface_tracking	See <code>NDDS_Transport_UDPv4_Property_t::disable_interface_tracking</code> (p. 1540)
dds.transport.UDPv4.builtin.public_address	See <code>NDDS_Transport_UDPv4_Property_t::public_address</code> (p. 1541)
dds.transport.UDPv4.builtin.join_multicast_group_timeout	See <code>NDDS_Transport_UDPv4_Property_t::join_multicast_group_timeout</code> (p. 1540)
dds.transport.UDPv4.builtin.port_offset	See <code>NDDS_Transport_UDPv4_Property_t::port_offset</code> (p. 1541)

`Transport_Support::set_builtin_transport_property()`

6.71.3 Macro Definition Documentation

6.71.3.1 NDDS_TRANSPORT_UDPv4_ADDRESS_BIT_COUNT

```
#define NDDS_TRANSPORT_UDPv4_ADDRESS_BIT_COUNT (32)
```

Default value of `NDDS_Transport_Property_t::address_bit_count` (p. 1522).

6.71.3.2 NDDS_TRANSPORT_UDPV4_WAN_ADDRESS_BIT_COUNT

```
#define NDDS_TRANSPORT_UDPV4_WAN_ADDRESS_BIT_COUNT (128)
```

Default value of **NDDS_Transport_Property_t::address_bit_count** (p. 1522) for UDPv4 asymmetric transport.

6.71.3.3 NDDS_TRANSPORT_UDPV4_PROPERTIES_BITMAP_DEFAULT

```
#define NDDS_TRANSPORT_UDPV4_PROPERTIES_BITMAP_DEFAULT NDDS_TRANSPORT_UDP_PROPERTIES_BITMAP_↔  
DEFAULT
```

Default value of **NDDS_Transport_Property_t::properties_bitmap** (p. 1522).

6.71.3.4 NDDS_TRANSPORT_UDPV4_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT

```
#define NDDS_TRANSPORT_UDPV4_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT NDDS_TRANSPORT_UDP_GATHER_↔  
SEND_BUFFER_COUNT_MAX_DEFAULT
```

Default value of **NDDS_Transport_Property_t::gather_send_buffer_count_max** (p. 1523).

This is also the maximum value that can be used when instantiating the UDP transport.

16 is sufficient for RTI Connex, but more may improve discovery and reliable performance. Porting note: find out what the maximum gather buffer count is on your OS!

6.71.3.5 NDDS_TRANSPORT_UDPV4_SOCKET_BUFFER_SIZE_OS_DEFAULT

```
#define NDDS_TRANSPORT_UDPV4_SOCKET_BUFFER_SIZE_OS_DEFAULT NDDS_TRANSPORT_UDP_SOCKET_BUFFER_↔  
SIZE_OS_DEFAULT
```

Used to specify that os default be used to specify socket buffer size.

6.71.3.6 NDDS_TRANSPORT_UDPV4_SEND_SOCKET_BUFFER_SIZE_DEFAULT

```
#define NDDS_TRANSPORT_UDPV4_SEND_SOCKET_BUFFER_SIZE_DEFAULT NDDS_TRANSPORT_UDP_SEND_SOCKET_↔  
BUFFER_SIZE_DEFAULT
```

Default value for **NDDS_Transport_UDPv4_Property_t::send_socket_buffer_size** (p. 1534) and **NDDS_Transport_↔
_UDPv4_WAN_Property_t::send_socket_buffer_size** (p. 1543).

6.71.3.7 NDDS_TRANSPORT_UDPV4_RECV_SOCKET_BUFFER_SIZE_DEFAULT

```
#define NDDS_TRANSPORT_UDPV4_RECV_SOCKET_BUFFER_SIZE_DEFAULT NDDS_TRANSPORT_UDP_RECV_SOCKET_↵  
BUFFER_SIZE_DEFAULT
```

Default value for **NDDS_Transport_UDPv4_Property_t::recv_socket_buffer_size** (p. 1534) and **NDDS_Transport_↵
_UDPv4_WAN_Property_t::recv_socket_buffer_size** (p. 1544).

6.71.3.8 NDDS_TRANSPORT_UDPV4_PAYLOAD_SIZE_MAX

```
#define NDDS_TRANSPORT_UDPV4_PAYLOAD_SIZE_MAX (65507)
```

Maximum value of **NDDS_Transport_Property_t::message_size_max** (p. 1523).

6.71.3.9 NDDS_TRANSPORT_UDPV4_MESSAGE_SIZE_MAX_DEFAULT

```
#define NDDS_TRANSPORT_UDPV4_MESSAGE_SIZE_MAX_DEFAULT NDDS_TRANSPORT_UDPV4_PAYLOAD_SIZE_MAX
```

Maximum value of **NDDS_Transport_Property_t::message_size_max** (p. 1523).

6.71.3.10 NDDS_TRANSPORT_UDPV4_MULTICAST_TTL_DEFAULT

```
#define NDDS_TRANSPORT_UDPV4_MULTICAST_TTL_DEFAULT NDDS_TRANSPORT_UDP_MULTICAST_TTL_DEFAULT
```

Default value of **NDDS_Transport_UDPv4_Property_t::multicast_ttl** (p. 1535).

6.71.3.11 NDDS_TRANSPORT_UDPV4_BLOCKING_NEVER

```
#define NDDS_TRANSPORT_UDPV4_BLOCKING_NEVER
```

Value for **NDDS_Transport_UDPv4_Property_t::send_blocking** (p. 1537) to specify non-blocking sockets.

6.71.3.12 NDDS_TRANSPORT_UDPv4_BLOCKING_ALWAYS

```
#define NDDS_TRANSPORT_UDPv4_BLOCKING_ALWAYS
```

[default] Value for `NDDS_Transport_UDPv4_Property_t::send_blocking` (p. 1537) to specify blocking sockets.

6.71.3.13 NDDS_TRANSPORT_UDPv4_BLOCKING_DEFAULT

```
#define NDDS_TRANSPORT_UDPv4_BLOCKING_DEFAULT NDDS_TRANSPORT_UDP_BLOCKING_DEFAULT
```

Default value for `NDDS_Transport_UDPv4_Property_t::send_blocking` (p. 1537) to specify blocking sockets.

6.71.3.14 NDDS_TRANSPORT_UDPv4_PROPERTY_DEFAULT

```
#define NDDS_TRANSPORT_UDPv4_PROPERTY_DEFAULT
```

Use this to initialize a `NDDS_Transport_UDPv4_Property_t` (p. 1532) structure.

6.71.3.15 NDDS_Transport_UDPv4_string_to_address_cEA

```
#define NDDS_Transport_UDPv4_string_to_address_cEA NDDS_Transport_UDP_string_to_address_cEA
```

Realization of `NDDS_Transport_String_To_Address_Fcn_cEA` for IP transports.

Converts a host name string to a IPv4 address.

Parameters

<i>self</i>	NOT USED. May be NULL.
<i>address_out</i>	<< out >> (p. 157) The corresponding numerical value in IPv4 format.
<i>address_in</i>	<< in >> (p. 157) The name of the IPv4 address. It can be a dot notation name or a host name. If NULL, then the IP address of the localhost will be returned.

See also

NDDS_Transport_String_To_Address_Fcn_cEA for complete documentation.

6.71.4 Function Documentation

6.71.4.1 NDDS_Transport_UDPv4_new()

```
NDDS_Transport_Plugin * NDDS_Transport_UDPv4_new (
    const struct NDDS_Transport_UDPv4_Property_t * property_in )
```

Create an instance of a UDPv4 Transport Plugin.

An application may create and register multiple instances of this Transport Plugin with RTI Connex. Multiple instances of the plugin may be useful for partitioning the network interfaces across multiple RTI Connex domains. However, note that the underlying transport, the operating system's IP layer, is still a "singleton." For example, if a unicast transport has already bound to a port, and another unicast transport tries to bind to the same port, the second attempt will fail.

The transport plugin honors the interface/multicast "white" and "black" lists specified in the NDDS_Transport_UDP_↔_Property_t::parent:

- **NDDS_Transport_Property_t::allow_interfaces_list** (p. 1523),
- **NDDS_Transport_Property_t::deny_interfaces_list** (p. 1524),
- **NDDS_Transport_Property_t::allow_multicast_interfaces_list** (p. 1525),
- **NDDS_Transport_Property_t::deny_multicast_interfaces_list** (p. 1526)

The format of a string in these lists is assumed to be in standard IPv4 dot notation, possibly containing wildcards. For example:

- 10.10.30.232
- 10.10.*.*
- 192.168.1.*
- etc. Strings not in the correct format will be ignored.

Parameters

<i>property_↔_in</i>	<< <i>in</i> >> (p. 157) Desired behavior of this transport. May be NULL for default property.
----------------------	--

Returns

A UDPv4 Transport Plugin instance on success; or NULL on failure.

6.72 Real-Time WAN Transport

Transport plug-in using UDP/IPv4 for WAN communications..

Classes

- struct **NDDS_Transport_UDPv4_WAN_Property_t**
Configurable IPv4/UDP WAN Transport-Plugin properties.

Macros

- #define **NDDS_TRANSPORT_UDPv4_WAN_PROPERTY_DEFAULT**
*Use this to initialize a **NDDS_Transport_UDPv4_WAN_Property_t** (p. 1542) structure.*

Functions

- NDDS_Transport_Plugin * **NDDS_Transport_UDPv4_WAN_new** (const struct **NDDS_Transport_UDPv4_WAN_Property_t** *property_in)
Create an instance of a UDPv4_WAN Transport Plugin.

6.72.1 Detailed Description

Transport plug-in using UDP/IPv4 for WAN communications..

RTI Real-Time WAN Transport (RWT) is a transport that enables secure, scalable, and high-performance communication over wide area networks (WANs), including public networks.

It extends RTI Connex capabilities to WAN environments. Real-Time WAN Transport uses UDPv4 as the underlying IP transport-layer protocol to better anticipate and adapt to the challenges of diverse network conditions, device mobility, and the dynamic nature of WAN system architectures.

Real-Time WAN Transport, in combination with RTI Cloud Discovery Service (CDS), provides a complete, seamless solution out of the box for WAN connectivity.

This transport is not installed as part of an RTI Connex package; it must be downloaded and installed separately.

Real-Time WAN Transport replaces the transport capabilities of the Secure WAN Transport optionally available with previous RTI Connex releases (prior to 7.0.0), and provides the following capabilities:

- NAT (Network Address Translator) traversal: Ability to communicate between DomainParticipants running in a Local Area Network (LAN) that is behind a NAT-enabled router, and DomainParticipants on the outside of the NAT across a WAN. This functionality is provided in combination with Cloud Discovery Service.
- IP mobility: Support for network transitions and changes in IP addresses in any of the DomainParticipants participating in the communication.
- Security: Secure communications between DomainParticipants using Security Plugins.

Real-Time WAN Transport does not require third-party components, such as STUN servers, or protocols like SIP to handle session establishment. Using a single API and security model, you can leverage the extensive capabilities of the RTI Connex framework and ecosystem, including tools and infrastructure services, even for real-time connectivity from edge to cloud and back in highly distributed systems that communicate across wide area networks.

This transport plugin uses UDPv4 sockets to send and receive messages. It supports unicast communications in a single instance of the plugin. By default, this plugin will use all interfaces that it finds enabled and "UP" at instantiation time to send and receive messages. This transport is installed as a built-in transport plugin with the alias `rti::core::policy::TransportBuiltin::UDPv4_WAN_ALIAS` (p. 2240).

In addition, you can configure an instance of this plugin to selectively use the network interfaces of a node by specifying the `NDDS_Transport_Property_t::max_interface_count` (p. 1527) and the "white" and "black" lists in the base property's fields (`NDDS_Transport_Property_t::allow_interfaces_list` (p. 1523), `NDDS_Transport_Property_t::deny_interfaces_list` (p. 1524)).

RTI Connex can implicitly create this plugin and register with the `dds::domain::DomainParticipant` (p. 1079) if this transport is specified in `rti::core::policy::TransportBuiltin` (p. 2237).

To specify the properties of the Real-Time WAN Transport that is implicitly registered, you can either:

- call `Transport_Support::set_builtin_transport_property` or
- specify the predefined property names in `rti::core::policy::Property` (p. 1695) associated with the `dds::domain::DomainParticipant` (p. 1079). (see **Real-Time WAN Transport Property** (p. 196)). Builtin transport plugin properties specified in `rti::core::policy::Property` (p. 1695) always overwrite the ones specified through `Transport_Support::set_builtin_transport_property()`. The default value is assumed on any unspecified property.

Note that all properties should be set before the transport is implicitly created and registered by RTI Connex. Any properties set after the builtin transport is registered will be ignored. See **Built-in Transport Plugins** (p. 81) for details on when a builtin transport is registered.

For additional details on how to configure and use the Real-Time WAN Transport, see the [Core Libraries User's Manual](#).

6.72.2 Real-Time WAN Transport Property

Names in Property QoS Policy of Domain Participant

The following table lists the predefined property names that can be set in the `dds::domain::qos::DomainParticipant::Qos::property` to configure the Real-Time WAN Transport plugin.

Table 6.24 Property Names for Real-Time WAN Transport Plugin

Property Name	Description
dds.transport.UDPv4_WAN.builtin.parent.classid	See NDDS_Transport_Property_t::classid (p. 1521)
dds.transport.UDPv4_WAN.builtin.parent.address_bit_count	See NDDS_Transport_Property_t::address_bit_count (p. 1522)
dds.transport.UDPv4_WAN.builtin.parent.properties_bitmap	See NDDS_Transport_Property_t::properties_bitmap (p. 1522)
dds.transport.UDPv4_WAN.builtin.parent.gather_send_buffer_count_max	See NDDS_Transport_Property_t::gather_send_buffer_count_max (p. 1523)
dds.transport.UDPv4_WAN.builtin.parent.message_size_max	See NDDS_Transport_Property_t::message_size_max (p. 1523)
dds.transport.UDPv4_WAN.builtin.parent.allow_interfaces	See NDDS_Transport_Property_t::allow_interfaces_list (p. 1523) and NDDS_Transport_Property_t::allow_interfaces_list_length (p. 1524). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example, 127.0.0.1,eth0
dds.transport.UDPv4_WAN.builtin.parent.deny_interfaces	See NDDS_Transport_Property_t::deny_interfaces_list (p. 1524) and NDDS_Transport_Property_t::deny_interfaces_list_length (p. 1525). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.UDPv4_WAN.builtin.parent.max_interface_count	See NDDS_Transport_Property_t::max_interface_count (p. 1527)
dds.transport.UDPv4_WAN.builtin.parent.thread_name_prefix	See NDDS_Transport_Property_t::thread_name_prefix (p. 1527)
dds.transport.UDPv4_WAN.builtin.send_socket_buffer_size	See NDDS_Transport_UDPv4_WAN_Property_t::send_socket_buffer_size (p. 1543)
dds.transport.UDPv4_WAN.builtin.recv_socket_buffer_size	See NDDS_Transport_UDPv4_WAN_Property_t::recv_socket_buffer_size (p. 1544)
dds.transport.UDPv4_WAN.builtin.ignore_loopback_interface	See NDDS_Transport_UDPv4_WAN_Property_t::ignore_loopback_interface (p. 1544)
dds.transport.UDPv4_WAN.builtin.ignore_nonrunning_interfaces	See NDDS_Transport_UDPv4_WAN_Property_t::ignore_nonrunning_interfaces (p. 1545)
dds.transport.UDPv4_WAN.builtin.ignore_nonup_interfaces	[DEPRECATED] See NDDS_Transport_UDPv4_WAN_Property_t::ignore_nonup_interfaces (p. 1544)
dds.transport.UDPv4_WAN.builtin.no_zero_copy	[DEPRECATED] See NDDS_Transport_UDPv4_WAN_Property_t::no_zero_copy (p. 1545)
dds.transport.UDPv4_WAN.builtin.send_blocking	See NDDS_Transport_UDPv4_WAN_Property_t::send_blocking (p. 1546)
dds.transport.UDPv4_WAN.builtin.transport_priority_mask	See NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mask (p. 1546)
dds.transport.UDPv4_WAN.builtin.transport_priority_mapping_low	See NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mapping_low (p. 1547)
dds.transport.UDPv4_WAN.builtin.transport_priority_mapping_high	See NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mapping_high (p. 1547)
dds.transport.UDPv4_WAN.builtin.send_ping	See NDDS_Transport_UDPv4_WAN_Property_t::send_ping (p. 1547)

Property Name	Description
dds.transport.UDPv4_WAN.builtin.force_interface_↔ poll_detection	See NDDS_Transport_UDPv4_WAN_Property_t↔::force_interface_poll_detection (p. 1548)
dds.transport.UDPv4_WAN.builtin.interface_poll_period	See NDDS_Transport_UDPv4_WAN_Property_t↔::interface_poll_period (p. 1548)
dds.transport.UDPv4_WAN.builtin.protocol_overhead↔ _max	See NDDS_Transport_UDPv4_WAN_Property_t↔::protocol_overhead_max (p. 1548)
dds.transport.UDPv4_WAN.builtin.disable_interface_↔ tracking	See NDDS_Transport_UDPv4_WAN_Property_t↔::disable_interface_tracking (p. 1548)
dds.transport.UDPv4_WAN.builtin.public_address	See NDDS_Transport_UDPv4_WAN_Property_t↔::public_address (p. 1549)
dds.transport.UDPv4_WAN.builtin.comm_ports	See NDDS_Transport_UDPv4_WAN_Property_t↔::comm_ports_list (p. 1549)
dds.transport.UDPv4_WAN.builtin.port_offset	See NDDS_Transport_UDPv4_WAN_Property_t↔::port_offset (p. 1551)
dds.transport.UDPv4_WAN.builtin.binding_ping_period	See NDDS_Transport_UDPv4_WAN_Property_t↔::binding_ping_period (p. 1551)

6.72.3 Macro Definition Documentation

6.72.3.1 NDDS_TRANSPORT_UDPv4_WAN_PROPERTY_DEFAULT

```
#define NDDS_TRANSPORT_UDPv4_WAN_PROPERTY_DEFAULT
```

Use this to initialize a [NDDS_Transport_UDPv4_WAN_Property_t](#) (p. 1542) structure.

6.72.4 Function Documentation

6.72.4.1 NDDS_Transport_UDPv4_WAN_new()

```
NDDS_Transport_Plugin * NDDS_Transport_UDPv4_WAN_new (
    const struct NDDS_Transport_UDPv4_WAN_Property_t * property_in )
```

Create an instance of a UDPv4_WAN Transport Plugin.

An application may create and register multiple instances of this Transport Plugin with RTI Connex. Multiple instances of the plugin may be useful for partitioning the network interfaces across multiple RTI Connex domains. However, note that the underlying transport, the operating system's IP layer, is still a "singleton." For example, if a unicast transport has already bound to a port, and another unicast transport tries to bind to the same port, the second attempt will fail.

The transport plugin honors the interface "white" and "black" lists specified in the NDDS_Transport_UDP_Property_t::parent:

- **NDDS_Transport_Property_t::allow_interfaces_list** (p. 1523),
- **NDDS_Transport_Property_t::deny_interfaces_list** (p. 1524),

The format of a string in these lists is assumed to be in standard IPv4 dot notation, possibly containing wildcards. For example:

- 10.10.30.232
- 10.10.*.*
- 192.168.1.*
- etc. Strings not in the correct format will be ignored.

Parameters

<i>property_in</i>	<< <i>in</i> >> (p. 157) Desired behavior of this transport. May be NULL for default property.
--------------------	--

Returns

A UDPv4_WAN Transport Plugin instance on success; or NULL on failure.

6.73 UDPv6 Transport

Transport plug-in using UDP/IPv6.

Classes

- struct **NDDS_Transport_UDPv6_Property_t**
Configurable IPv6/UDP Transport-Plugin properties.

Macros

- `#define NDDS_TRANSPORT_UDPv6_ADDRESS_BIT_COUNT (128)`
Default value of `NDDS_Transport_Property_t::address_bit_count` (p. 1522).
- `#define NDDS_TRANSPORT_UDPv6_PROPERTIES_BITMAP_DEFAULT NDDS_TRANSPORT_UDP_↔
 PROPERTIES_BITMAP_DEFAULT`
Default value of `NDDS_Transport_Property_t::properties_bitmap` (p. 1522).
- `#define NDDS_TRANSPORT_UDPv6_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT NDDS_↔
 TRANSPORT_UDP_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT`
Default value of `NDDS_Transport_Property_t::gather_send_buffer_count_max` (p. 1523).
- `#define NDDS_TRANSPORT_UDPv6_SOCKET_BUFFER_SIZE_OS_DEFAULT NDDS_TRANSPORT_↔
 UDP_SOCKET_BUFFER_SIZE_OS_DEFAULT`
Used to specify that os default be used to specify socket buffer size.
- `#define NDDS_TRANSPORT_UDPv6_SEND_SOCKET_BUFFER_SIZE_DEFAULT NDDS_TRANSPORT_↔
 UDP_SEND_SOCKET_BUFFER_SIZE_DEFAULT`
Default value for `NDDS_Transport_UDPv6_Property_t::send_socket_buffer_size` (p. 1553).
- `#define NDDS_TRANSPORT_UDPv6_RECV_SOCKET_BUFFER_SIZE_DEFAULT NDDS_TRANSPORT_↔
 UDP_RECV_SOCKET_BUFFER_SIZE_DEFAULT`
Default value for `NDDS_Transport_UDPv6_Property_t::recv_socket_buffer_size` (p. 1553).
- `#define NDDS_TRANSPORT_UDPv6_PAYLOAD_SIZE_MAX (65487)`
Maximum value of `NDDS_Transport_Property_t::message_size_max` (p. 1523).
- `#define NDDS_TRANSPORT_UDPv6_MESSAGE_SIZE_MAX_DEFAULT NDDS_TRANSPORT_UDPv6_↔
 PAYLOAD_SIZE_MAX`
Default value of `NDDS_Transport_Property_t::message_size_max` (p. 1523).
- `#define NDDS_TRANSPORT_UDPv6_MULTICAST_TTL_DEFAULT NDDS_TRANSPORT_UDP_↔
 MULTICAST_TTL_DEFAULT`
Default value of `NDDS_Transport_UDPv6_Property_t::multicast_ttl` (p. 1554).
- `#define NDDS_TRANSPORT_UDPv6_BLOCKING_NEVER`
Value for `NDDS_Transport_UDPv6_Property_t::send_blocking` (p. 1556) to specify non-blocking sockets.
- `#define NDDS_TRANSPORT_UDPv6_BLOCKING_ALWAYS`
[default] Value for `NDDS_Transport_UDPv6_Property_t::send_blocking` (p. 1556) to specify blocking sockets.
- `#define NDDS_TRANSPORT_UDPv6_PROPERTY_DEFAULT`
Use this to initialize a `NDDS_Transport_UDPv6_Property_t` (p. 1552) structure.
- `#define NDDS_Transport_UDPv6_string_to_address_cEA NDDS_Transport_UDP_string_to_address_cEA`
Realization of `NDDS_Transport_String_To_Address_Fcn_cEA` for IP transports.

Functions

- `NDDS_Transport_Plugin * NDDS_Transport_UDPv6_new (const struct NDDS_Transport_UDPv6_↔
 Property_t *property_in)`
Create an instance of a UDPv6 Transport Plugin.

6.73.1 Detailed Description

Transport plug-in using UDP/IPv6.

This transport plugin uses UDPv6 sockets to send and receive messages. It supports both unicast and multicast communications in a single instance of the plugin. By default, this plugin will use all interfaces that it finds enabled and "UP" at instantiation time to send and receive messages. This transport is installed as a built-in transport plugin with the alias `rti::core::policy::TransportBuiltin::UDPv6_ALIAS` (p. 2240).

You can configure an instance of this plugin to only use unicast or only use multicast, see `NDDS_Transport_UDPv6_Property_t::unicast_enabled` (p. 1554) and `NDDS_Transport_UDPv6_Property_t::multicast_enabled` (p. 1554).

In addition, you can configure an instance of this plugin to selectively use the network interfaces of a node (and restrict a plugin from sending multicast messages on specific interfaces) by specifying the `NDDS_Transport_Property_t::max_interface_count` (p. 1527) and the "white" and "black" lists in the base property's fields (`NDDS_Transport_Property_t::allow_interfaces_list` (p. 1523), `NDDS_Transport_Property_t::deny_interfaces_list` (p. 1524), `NDDS_Transport_Property_t::allow_multicast_interfaces_list` (p. 1525), `NDDS_Transport_Property_t::deny_multicast_interfaces_list` (p. 1526)).

RTI Connexant can implicitly create this plugin and register it with the `dds::domain::DomainParticipant` (p. 1079) if this transport is specified in the `rti::core::policy::TransportBuiltin` (p. 2237).

To specify the properties of the builtin UDPv6 transport that is implicitly registered, you can either:

- call `Transport_Support::set_builtin_transport_property` or
- specify the predefined property names in `rti::core::policy::Property` (p. 1695) associated with the `dds::domain::DomainParticipant` (p. 1079). (see **UDPv6 Transport Property Names in Property QoS Policy of Domain Participant** (p. 201)). Builtin transport plugin properties specified in `rti::core::policy::Property` (p. 1695) always overwrite the ones specified through `Transport_Support::set_builtin_transport_property()`. The default value is assumed on any unspecified property.

Note that all properties should be set before the transport is implicitly created and registered by RTI Connexant. Any properties that are set after the builtin transport is registered will be ignored. See **Built-in Transport Plugins** (p. 81) for details on when a builtin transport is registered.

6.73.2 UDPv6 Transport Property Names in Property QoS Policy of Domain Participant

The following table lists the predefined property names that can be set in `rti::core::policy::Property` (p. 1695) of a `dds::domain::DomainParticipant` (p. 1079) to configure the builtin UDPv6 transport plugin.

Table 6.26 Property Names for UDPv6 Transport Plugin

Property Name	Description
<code>dds.transport.UDPv6.builtin.parent.address_bit_count</code>	See <code>NDDS_Transport_Property_t::address_bit_count</code> (p. 1522)
<code>dds.transport.UDPv6.builtin.parent.properties_bitmap</code>	See <code>NDDS_Transport_Property_t::properties_bitmap</code> (p. 1522)
<code>dds.transport.UDPv6.builtin.parent.gather_send_buffer_count_max</code>	See <code>NDDS_Transport_Property_t::gather_send_buffer_count_max</code> (p. 1523)

Property Name	Description
dds.transport.UDPv6.builtin.parent.message_size_max	See <code>NDDS_Transport_Property_t::message_size_max</code> (p. 1523)
dds.transport.UDPv6.builtin.parent.allow_interfaces	See <code>NDDS_Transport_Property_t::allow_interfaces_list</code> (p.1523) and <code>NDDS_Transport_Property_t::allow_interfaces_list_length</code> (p. 1524). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.UDPv6.builtin.parent.deny_interfaces	See <code>NDDS_Transport_Property_t::deny_interfaces_list</code> (p.1524) and <code>NDDS_Transport_Property_t::deny_interfaces_list_length</code> (p. 1525). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.UDPv6.builtin.parent.allow_multicast_interfaces	See <code>NDDS_Transport_Property_t::allow_multicast_interfaces_list</code> (p.1525) and <code>NDDS_Transport_Property_t::allow_multicast_interfaces_list_length</code> (p. 1526). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.UDPv6.builtin.parent.deny_multicast_interfaces	See <code>NDDS_Transport_Property_t::deny_multicast_interfaces_list</code> (p.1526) and <code>NDDS_Transport_Property_t::deny_multicast_interfaces_list_length</code> (p.1526). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.UDPv6.builtin.parent.max_interface_count	See <code>NDDS_Transport_Property_t::max_interface_count</code> (p. 1527)
dds.transport.UDPv6.builtin.parent.thread_name_prefix	See <code>NDDS_Transport_Property_t::thread_name_prefix</code> (p. 1527)
dds.transport.UDPv6.builtin.send_socket_buffer_size	See <code>NDDS_Transport_UDPv6_Property_t::send_socket_buffer_size</code> (p. 1553)
dds.transport.UDPv6.builtin.recv_socket_buffer_size	See <code>NDDS_Transport_UDPv6_Property_t::recv_socket_buffer_size</code> (p. 1553)
dds.transport.UDPv6.builtin.unicast_enabled	See <code>NDDS_Transport_UDPv6_Property_t::unicast_enabled</code> (p. 1554)
dds.transport.UDPv6.builtin.multicast_enabled	See <code>NDDS_Transport_UDPv6_Property_t::multicast_enabled</code> (p. 1554)
dds.transport.UDPv6.builtin.multicast_ttl	See <code>NDDS_Transport_UDPv6_Property_t::multicast_ttl</code> (p. 1554)
dds.transport.UDPv6.builtin.multicast_loopback_disabled	See <code>NDDS_Transport_UDPv6_Property_t::multicast_loopback_disabled</code> (p. 1554)
dds.transport.UDPv6.builtin.ignore_loopback_interface	See <code>NDDS_Transport_UDPv6_Property_t::ignore_loopback_interface</code> (p. 1555)
dds.transport.UDPv6.builtin.ignore_nonrunning_interfaces	See <code>NDDS_Transport_UDPv6_Property_t::ignore_nonrunning_interfaces</code> (p. 1555)
dds.transport.UDPv6.builtin.no_zero_copy	[DEPRECATED] See <code>NDDS_Transport_UDPv6_Property_t::no_zero_copy</code> (p. 1556)

Property Name	Description
dds.transport.UDPv6.builtin.send_blocking	See <code>NDDS_Transport_UDPv6_Property_t::send_blocking</code> (p. 1556)
dds.transport.UDPv6.builtin.enable_v4mapped	See <code>NDDS_Transport_UDPv6_Property_t::enable_v4mapped</code> (p. 1556)
dds.transport.UDPv6.builtin.transport_priority_mask	See <code>NDDS_Transport_UDPv6_Property_t::transport_priority_mask</code> (p. 1557)
dds.transport.UDPv6.builtin.transport_priority_mapping_low	See <code>NDDS_Transport_UDPv6_Property_t::transport_priority_mapping_low</code> (p. 1557)
dds.transport.UDPv6.builtin.transport_priority_mapping_high	See <code>NDDS_Transport_UDPv6_Property_t::transport_priority_mapping_high</code> (p. 1557)
dds.transport.UDPv6.builtin.send_ping	See <code>NDDS_Transport_UDPv6_Property_t::send_ping</code> (p. 1558) <code>interface_poll_detection_kind</code>
dds.transport.UDPv6.builtin.force_interface_poll_detection	See <code>NDDS_Transport_UDPv6_Property_t::force_interface_poll_detection</code> (p. 1558)
dds.transport.UDPv6.builtin.interface_poll_period	See <code>NDDS_Transport_UDPv6_Property_t::interface_poll_period</code> (p. 1558)
dds.transport.UDPv6.builtin.reuse_multicast_receive_resource	See <code>NDDS_Transport_UDPv6_Property_t::reuse_multicast_receive_resource</code> (p. 1558)
dds.transport.UDPv6.builtin.protocol_overhead_max	See <code>NDDS_Transport_UDPv6_Property_t::protocol_overhead_max</code> (p. 1559)
dds.transport.UDPv6.builtin.disable_interface_tracking	See <code>NDDS_Transport_UDPv6_Property_t::disable_interface_tracking</code> (p. 1559)
dds.transport.UDPv6.builtin.public_address	See <code>NDDS_Transport_UDPv6_Property_t::public_address</code> (p. 1560)
dds.transport.UDPv6.builtin.join_multicast_group_timeout	See <code>NDDS_Transport_UDPv6_Property_t::join_multicast_group_timeout</code> (p. 1559)
dds.transport.UDPv6.builtin.port_offset	See <code>NDDS_Transport_UDPv6_Property_t::port_offset</code> (p. 1560)

`Transport_Support::set_builtin_transport_property()`

6.73.3 Macro Definition Documentation

6.73.3.1 NDDS_TRANSPORT_UDPv6_ADDRESS_BIT_COUNT

```
#define NDDS_TRANSPORT_UDPv6_ADDRESS_BIT_COUNT (128)
```

Default value of `NDDS_Transport_Property_t::address_bit_count` (p. 1522).

6.73.3.2 NDDS_TRANSPORT_UDPv6_PROPERTIES_BITMAP_DEFAULT

```
#define NDDS_TRANSPORT_UDPv6_PROPERTIES_BITMAP_DEFAULT  NDDS_TRANSPORT_UDP_PROPERTIES_BITMAP_↔  
DEFAULT
```

Default value of `NDDS_Transport_Property_t::properties_bitmap` (p. 1522).

6.73.3.3 NDDS_TRANSPORT_UDPv6_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT

```
#define NDDS_TRANSPORT_UDPv6_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT  NDDS_TRANSPORT_UDP_GATHER_↔  
SEND_BUFFER_COUNT_MAX_DEFAULT
```

Default value of `NDDS_Transport_Property_t::gather_send_buffer_count_max` (p. 1523).

This is also the maximum value that can be used when instantiating the UDP transport.

16 is sufficient for NDDS, but more may improve discovery and reliable performance. Porting note: find out what the maximum gather buffer count is on your OS!

6.73.3.4 NDDS_TRANSPORT_UDPv6_SOCKET_BUFFER_SIZE_OS_DEFAULT

```
#define NDDS_TRANSPORT_UDPv6_SOCKET_BUFFER_SIZE_OS_DEFAULT  NDDS_TRANSPORT_UDP_SOCKET_BUFFER_↔  
SIZE_OS_DEFAULT
```

Used to specify that os default be used to specify socket buffer size.

6.73.3.5 NDDS_TRANSPORT_UDPv6_SEND_SOCKET_BUFFER_SIZE_DEFAULT

```
#define NDDS_TRANSPORT_UDPv6_SEND_SOCKET_BUFFER_SIZE_DEFAULT  NDDS_TRANSPORT_UDP_SEND_SOCKET_↔  
BUFFER_SIZE_DEFAULT
```

Default value for `NDDS_Transport_UDPv6_Property_t::send_socket_buffer_size` (p. 1553).

6.73.3.6 NDDS_TRANSPORT_UDPv6_RECV_SOCKET_BUFFER_SIZE_DEFAULT

```
#define NDDS_TRANSPORT_UDPv6_RECV_SOCKET_BUFFER_SIZE_DEFAULT  NDDS_TRANSPORT_UDP_RECV_SOCKET_↔  
BUFFER_SIZE_DEFAULT
```

Default value for `NDDS_Transport_UDPv6_Property_t::recv_socket_buffer_size` (p. 1553).

6.73.3.7 NDDS_TRANSPORT_UDPv6_PAYLOAD_SIZE_MAX

```
#define NDDS_TRANSPORT_UDPv6_PAYLOAD_SIZE_MAX (65487)
```

Maximum value of `NDDS_Transport_Property_t::message_size_max` (p. 1523).

6.73.3.8 NDDS_TRANSPORT_UDPv6_MESSAGE_SIZE_MAX_DEFAULT

```
#define NDDS_TRANSPORT_UDPv6_MESSAGE_SIZE_MAX_DEFAULT NDDS_TRANSPORT_UDPv6_PAYLOAD_SIZE_MAX
```

Default value of `NDDS_Transport_Property_t::message_size_max` (p. 1523).

6.73.3.9 NDDS_TRANSPORT_UDPv6_MULTICAST_TTL_DEFAULT

```
#define NDDS_TRANSPORT_UDPv6_MULTICAST_TTL_DEFAULT NDDS_TRANSPORT_UDP_MULTICAST_TTL_DEFAULT
```

Default value of `NDDS_Transport_UDPv6_Property_t::multicast_ttl` (p. 1554).

6.73.3.10 NDDS_TRANSPORT_UDPv6_BLOCKING_NEVER

```
#define NDDS_TRANSPORT_UDPv6_BLOCKING_NEVER
```

Value for `NDDS_Transport_UDPv6_Property_t::send_blocking` (p. 1556) to specify non-blocking sockets.

6.73.3.11 NDDS_TRANSPORT_UDPv6_BLOCKING_ALWAYS

```
#define NDDS_TRANSPORT_UDPv6_BLOCKING_ALWAYS
```

[default] Value for `NDDS_Transport_UDPv6_Property_t::send_blocking` (p. 1556) to specify blocking sockets.

6.73.3.12 NDDS_TRANSPORT_UDPv6_PROPERTY_DEFAULT

```
#define NDDS_TRANSPORT_UDPv6_PROPERTY_DEFAULT
```

Use this to initialize a `NDDS_Transport_UDPv6_Property_t` (p. 1552) structure.

6.73.3.13 NDDS_Transport_UDPv6_string_to_address_cEA

```
#define NDDS_Transport_UDPv6_string_to_address_cEA NDDS_Transport_UDP_string_to_address_cEA
```

Realization of `NDDS_Transport_String_To_Address_Fcn_cEA` for IP transports.

Converts a host name string to a IPv6 address.

Parameters

<i>self</i>	NOT USED. May be NULL.
<i>address_out</i>	<< <i>out</i> >> (p. 157) The corresponding numerical value in IPv6 format.
<i>address_in</i>	<< <i>in</i> >> (p. 157) The name of the IPv6 address. It can be a dot notation name or a host name. If NULL, then the IP address of the localhost will be returned.

See also

NDDS_Transport_String_To_Address_Fcn_cEA for complete documentation.

6.73.4 Function Documentation

6.73.4.1 NDDS_Transport_UDPv6_new()

```
NDDS_Transport_Plugin * NDDS_Transport_UDPv6_new (
    const struct NDDS_Transport_UDPv6_Property_t * property_in )
```

Create an instance of a UDPv6 Transport Plugin.

An application may create and register multiple instances of this Transport Plugin with RTI Connex. Multiple instances of the plugin may be useful for partitioning the network interfaces across multiple RTI Connex domains. However, note that the underlying transport, the operating system's IP layer, is still a "singleton." For example, if a unicast transport has already bound to a port, and another unicast transport tries to bind to the same port, the second attempt will fail.

The transport plugin honors the interface/multicast "white" and "black" lists specified in the **NDDS_Transport_UDPv6_Property_t::parent** (p. 1553):

- **NDDS_Transport_Property_t::allow_interfaces_list** (p. 1523),
- **NDDS_Transport_Property_t::deny_interfaces_list** (p. 1524),
- **NDDS_Transport_Property_t::allow_multicast_interfaces_list** (p. 1525),
- **NDDS_Transport_Property_t::deny_multicast_interfaces_list** (p. 1526)

The format of a string in these lists is assumed to be in standard IPv6 dot notation, possibly containing wildcards. For example:

- 10.10.30.232
- 10.10.*.*
- 192.168.1.*
- etc. Strings not in the correct format will be ignored.

Parameters

<code>property↔ _in</code>	<< <i>in</i> >> (p. 157) Desired behavior of this transport. May be NULL for default property.
--------------------------------	--

Returns

A UDPv6 Transport Plugin instance on success; or NULL on failure.

6.74 Client-side API

Part of the RPC API that relates to the client.

Classes

- class **dds::rpc::ClientEndpoint**< **Request, Reply** >
 - <<*reference-type*>> (p. 153) *Manages the DDS entities required to make remote function calls.*
- class **rpc_example::RobotControlClient**
 - <<*reference-type*>> (p. 153) *Allows client applications to make remote function calls*
- class **dds::rpc::ClientParams**
 - <<*value-type*>> (p. 152) *The parameters used to configure a **ClientEndpoint** (p. 707)*

Typedefs

- using **rpc_example::RobotControlClientEndpoint** = **dds::rpc::ClientEndpoint**< RobotControl_Call, Robot↔Control_Return >
 - An instantiation of **dds::rpc::ClientEndpoint** (p. 707) for the DDS types that allow making function calls to the **Robot↔Control** (p. 1931) service interface.*

6.74.1 Detailed Description

Part of the RPC API that relates to the client.

6.74.2 Typedef Documentation

6.74.2.1 RobotControlClientEndpoint

```
using rpc_example::RobotControlClientEndpoint = typedef dds::rpc::ClientEndpoint<RobotControl_↔
Call, RobotControl_Return>
```

An instantiation of **dds::rpc::ClientEndpoint** (p. 707) for the DDS types that allow making function calls to the **Robot↔Control** (p. 1931) service interface.

6.75 Server-side API

Part of the RPC API that relates to the **Server** (p. 2053) and **ServiceEndpoint** (p. 2061).

Classes

- class **dds::rpc::ServiceEndpoint**< **Dispatcher** >
Manages the DDS entities required to receive function calls and send the return values.
- class **dds::rpc::Server**
<<*reference-type*>> (p. 153) *Provides the execution environment for one or more **ServiceEndpoint** (p. 2061).*
- class **dds::rpc::ServerParams**
<<*value-type*>> (p. 152) *The parameters used to configure a **Server** (p. 2053)*

Typedefs

- using **rpc_example::RobotControlService** = **dds::rpc::ServiceEndpoint**< **RobotControlDispatcher** >
*Executes a **RobotControl** (p. 1931) interface implementation.*
- using **dds::rpc::ServiceParams** = **rti::request::ReplierParams**
*The parameters used to configure a **ServiceEndpoint** (p. 2061).*

6.75.1 Detailed Description

Part of the RPC API that relates to the **Server** (p. 2053) and **ServiceEndpoint** (p. 2061).

6.75.2 Typedef Documentation

6.75.2.1 RobotControlService

```
using rpc_example::RobotControlService = typedef dds::rpc::ServiceEndpoint<RobotControlDispatcher>
```

Executes a **RobotControl** (p. 1931) interface implementation.

6.75.2.2 ServiceParams

```
typedef dds::rpc::detail::ServiceParams dds::rpc::ServiceParams
```

The parameters used to configure a **ServiceEndpoint** (p. 2061).

6.76 FlatData Builders

A Builder allows creating and initializing variable-size data.

Classes

- class **rti::flat::AggregationBuilder**
Base class of struct and union builders.
- class **rti::flat::UnionBuilder**< **Discriminator** >
Base class of builders for user-defined mutable unions.
- class **MyFlatMutableBuilder**
Represents the Builder for an arbitrary user-defined mutable type.
- class **MyFlatUnionBuilder**
Represents the Builder for an arbitrary user-defined mutable IDL union.
- class **rti::flat::AbstractBuilder**
*Base class of all **Builders** (p. 209).*
- class **rti::flat::AbstractListBuilder**< **DHeaderGen** >
Base class of all array and sequence builders.
- class **rti::flat::MutableArrayBuilder**< **ElementBuilder**, **N** >
Builds an array member of variable-size elements.
- class **rti::flat::AbstractSequenceBuilder**< **DHeaderGen** >
Base class of Builders for sequence members.
- class **rti::flat::MutableSequenceBuilder**< **ElementBuilder** >
Builds a sequence member of variable-size elements.
- class **rti::flat::FinalSequenceBuilder**< **ElementOffset** >
Builds a sequence member of fixed-size elements.
- class **rti::flat::PrimitiveSequenceBuilder**< **T** >
Builds a sequence of primitive members.
- class **rti::flat::StringBuilder**
Builds a string.

Functions

- template<typename TopicType >
rti::flat::flat_type_traits< TopicType >::builder **rti::flat::build_data** (**dds::pub::DataWriter**< TopicType > &writer)
Begins building a new sample.
- template<typename TopicType >
void **rti::flat::discard_builder** (**dds::pub::DataWriter**< TopicType > &writer, typename **rti::flat::flat_type_traits**< TopicType >::builder &builder)
Discards a sample builder.

6.76.1 Detailed Description

A Builder allows creating and initializing variable-size data.

Builders allow creating variable-size **FlatData samples** (p. 212), as described in **Publishing FlatData** (p. 220).

There are the following Builder types:

Category	Builder type
User types	For example: <ul style="list-style-type: none"> • MyFlatMutableBuilder (p. 1497), a mutable struct • MyFlatUnionBuilder (p. 1511), a union • Final structs are fixed-size and do not have a Builder (see for example MyFlatMutableBuilder::add_my_final() (p. 1502)).
Arrays	<ul style="list-style-type: none"> • rti::flat::MutableArrayBuilder (p. 1487) • Arrays of final elements are fixed-size and do not have a Builder (see for example MyFlatMutableBuilder::add_my_final_array() (p. 1502)).
Sequences	<ul style="list-style-type: none"> • rti::flat::MutableSequenceBuilder (p. 1491) for sequences of mutable elements • rti::flat::FinalSequenceBuilder (p. 1313) for sequences of final elements • rti::flat::PrimitiveSequenceBuilder (p. 1681) for sequences of primitive elements • rti::flat::StringBuilder (p. 2099)
Primitive types	<ul style="list-style-type: none"> • Primitive members are added using one of the member functions of the Builder of the type that contains them. See for example MyFlatMutableBuilder::add_my_primitive() (p. 1501)

Builder for user types, such as **MyFlatMutableBuilder** (p. 1497), can behave as **sample builders**, when they build a sample, or **member builders** when they build a member for another Builder (such as the Builder returned by **MyFlatMutableBuilder::build_my_mutable()** (p. 1503)). All the other Builder types (sequences, arrays) are always member builders (such as the Builder returned by **MyFlatMutableBuilder::build_my_final_seq()** (p. 1502)).

Builders are **move-only** types. They cannot be copied, only moved. When you assign a Builder as the return value of a function, this happens automatically.

```
// the return value of 'build_data' is moved into 'builder'
MyFlatMutableBuilder builder = rti::flat::build_data(writer);
```

To explicitly move a Builder variable use `std::move()` in C++11 platforms or call the **move()** (p. 1412) member function in pre-C++11 platforms.

6.76.2 Builder Error Management

In the Modern C++ API errors are notified with exceptions. Builder operations may throw the following exceptions

- **dds::core::PreconditionNotMetError** (p. 1669), for any precondition failure.
- **dds::core::OutOfResourcesError** (p. 1629), when the Builder's underlying buffer runs out of space (this should not happen when the Builder has been created with **rti::flat::build_data()** (p. 211)).

See also **Offset Error Management** (p. 216).

See also

MyFlatMutableBuilder (p. 1497) for more information specific to builders for user types.

6.76.3 Function Documentation

6.76.3.1 build_data()

```
template<typename TopicType >
rti::flat::flat_type_traits< TopicType >::builder rti::flat::build_data (
    dds::pub::DataWriter< TopicType > & writer )
```

Begins building a new sample.

Template Parameters

<i>TopicType</i>	A FlatData mutable type that corresponds to the type of the DataWriter argument.
------------------	--

Parameters

<i>writer</i>	The writer that will be used to write this sample.
---------------	--

Returns

The Builder to build the sample. For example if TopicType is **MyFlatMutable** (p.213), this function returns a **MyFlatMutableBuilder** (p.1497).

Once you have completed the sample, call **finish_sample()** (p.1500) to obtain a **MyFlatMutable** (p.213) sample that can be written with *writer*.

If the building of this sample needs to be aborted before calling **finish_sample()**, use **rti::flat::discard_builder()** (p.211). If, after obtaining a sample with **finish_sample()**, this sample is not written, then discard it with **dds::pub::DataWriter::discard_loan()** (p.955).

See also

dds::pub::DataWriter::get_loan (p.953), the function that **build_data()** (p.211) uses to obtain the memory required to build the sample.

Publishing FlatData (p.220)

References **dds::pub::DataWriter< T >::get_loan()**.

6.76.3.2 discard_builder()

```
template<typename TopicType >
void rti::flat::discard_builder (
    dds::pub::DataWriter< TopicType > & writer,
    typename rti::flat::flat_type_traits< TopicType >::builder & builder )
```

Discards a sample builder.

Template Parameters

<i>TopicType</i>	An IDL-defined FlatData type that corresponds to the type of the DataWriter argument.
------------------	---

This function invalidates and discards a builder before it is finished() and before the sample it would have created was written.

Parameters

<i>writer</i>	The writer that was used to create the builder
<i>builder</i>	The builder, created with <code>rti::flat::build_data(writer);</code>

References `dds::pub::DataWriter< T >::discard_loan()`.

6.77 FlatData Samples

A Sample represents an instance of the IDL topic-type and contains the data in serialized format.

Classes

- class `rti::flat::Sample< OffsetType >`
The generic definition of FlatData topic-types.
- struct `rti::flat::flat_type_traits< T >`
*Given a **Sample** (p. 1981), an Offset or a Builder, it allows obtaining the other types.*

Typedefs

- typedef `rti::flat::Sample< MyFlatFinalOffset > MyFlatFinal`
Represents an arbitrary user-defined FlatData final IDL struct.
- typedef `rti::flat::Sample< MyFlatMutableOffset > MyFlatMutable`
Represents an arbitrary user-defined flat mutable IDL struct.
- typedef `rti::flat::Sample< MyFlatUnionOffset > MyFlatUnion`
Represents an arbitrary user-defined flat mutable IDL union.

6.77.1 Detailed Description

A Sample represents an instance of the IDL topic-type and contains the data in serialized format.

All FlatData topic-types are instantiations of `rti::flat::Sample` (p. 1981). This documentation uses the following three example types to illustrate the different ways FlatData IDL types map to C++:

- **MyFlatFinal** (p. 213), the type generated for a final IDL struct
- **MyFlatMutable** (p. 213), the type generated for a mutable IDL struct
- **MyFlatUnion** (p. 213), the type generated for an IDL union

6.77.2 Typedef Documentation

6.77.2.1 MyFlatFinal

```
typedef rti::flat::Sample< MyFlatFinalOffset> MyFlatFinal
```

Represents an arbitrary user-defined FlatData final IDL struct.

This documentation uses the following example IDL definition of MyFlatFinal:

```
@language_binding(FLAT_DATA)
@final
struct MyFlatFinal {
    long my_primitive;
    FlatFinalBar my_complex; // Another arbitrary final FlatData type
    long my_primitive_array[10];
    FlatFinalBar my_complex_array[10];
};
```

For this type, `rtiddsgen` generates:

- MyFlatFinal (this instantiation of Sample),
- **MyFlatFinalOffset** (p. 1493).

Note that, as a final FlatData type, MyFlatFinal can only contain fixed-size types, such as primitives, other final FlatData structs, and arrays of fixed-size types.

Samples of MyFlatFinal are created with `dds::pub::DataWriter::get_loan` (p. 953). After creating a final Sample, modify its values using the **MyFlatFinalOffset** (p. 1493) returned by `root()` (p. 1983).

6.77.2.2 MyFlatMutable

```
typedef rti::flat::Sample< MyFlatMutableOffset> MyFlatMutable
```

Represents an arbitrary user-defined flat mutable IDL struct.

This documentation uses the following example IDL definition of MyFlatMutable:

```
@language_binding(FLAT_DATA)
@mutable
struct MyFlatMutable {
    long my_primitive;
    @optional long my_optional_primitive;
    long my_primitive_array[10];
    sequence<long, 10> my_primitive_seq;
    MyFlatFinal my_final;
    MyFlatFinal my_final_array[10];
    sequence<MyFlatFinal, 10> my_final_seq;
    FlatMutableBar my_mutable;
    FlatMutableBar my_mutable_array[10];
    sequence<FlatMutableBar, 10> my_mutable_seq;
    string<255> my_string;
    sequence<string<255>, 10> my_string_seq;
};
```

For this type, `rtiddsgen` generates:

- MyFlatMutable (this instantiation of Sample),
- **MyFlatMutableOffset** (p. 1504),
- **MyFlatMutableBuilder** (p. 1497).

As a mutable FlatData type, MyFlatMutable is not restricted to fixed-size members. Samples of MyFlatMutable are created with `rti::flat::build_data()` (p. 211), which returns a **MyFlatMutableBuilder** (p. 1497). Once built, a mutable Sample can't change in size, but the value of members that already exist can be changed using the **MyFlatMutableOffset** (p. 1504) returned by `root()` (p. 1983).

6.77.2.3 MyFlatUnion

```
typedef rti::flat::Sample< MyFlatUnionOffset> MyFlatUnion
```

Represents an arbitrary user-defined flat mutable IDL union.

This documentation uses the following example IDL definition of MyFlatUnion:

```
@language_binding(FLAT_DATA)
@mutable
union MyFlatUnion switch (long) {
  case 0:
    long my_primitive;
  case 1:
  case 2:
    MyFlatMutable my_mutable;
  case 3:
    MyFlatFinal my_final;
};
```

Note

FlatData unions can only be **mutable** since unions are, by definition, variable-size types.

For this type, **rtiddsgen** generates:

- MyFlatUnion (this instantiation of Sample),
- **MyFlatUnionOffset** (p. 1514),
- **MyFlatUnionBuilder** (p. 1511).

6.78 FlatData Offsets

Offsets provide access to the members of a FlatData Sample.

Classes

- class **MyFlatFinalOffset**
Represents the Offset to an arbitrary user-defined FlatData final IDL struct.
- class **MyFlatMutableOffset**
Represents the Offset to an arbitrary user-defined FlatData mutable IDL struct.
- class **MyFlatUnionOffset**
Represents the Offset to an arbitrary user-defined FlatData mutable IDL union.
- class **rti::flat::OffsetBase**
Base class of all Offset types.
- class **rti::flat::FinalOffset< T >**
The base class of all Offsets to a final struct type.
- class **rti::flat::MutableOffset**
The base class of all Offsets to a final struct type.
- struct **rti::flat::PrimitiveConstOffset< T >**
A const Offset to an optional primitive member.

- struct `rti::flat::PrimitiveOffset< T >`
An Offset to an optional primitive member.
- class `rti::flat::Sequencelerator< E, OffsetKind >`
Iterator for collections of Offsets.
- class `rti::flat::AbstractPrimitiveList< T >`
Base class for Offsets to sequences and arrays of primitive types.
- class `rti::flat::PrimitiveSequenceOffset< T >`
Offset to a sequence of primitive elements.
- class `rti::flat::PrimitiveArrayOffset< T, N >`
Offset to an array of primitive elements.
- class `rti::flat::StringOffset`
Offset to a string.
- class `rti::flat::AbstractAlignedList< ElementOffset >`
Base class of Offsets to sequences and arrays of non-primitive members.
- class `rti::flat::SequenceOffset< ElementOffset >`
Offset to a sequence of non-primitive elements.
- class `rti::flat::MutableArrayOffset< ElementOffset, N >`
Offset to an array of variable-size elements.
- class `rti::flat::FinalArrayOffset< ElementOffset, N >`
Offset to an array of final elements.
- class `rti::flat::FinalAlignedArrayOffset< ElementOffset, N >`
Offset to an array of final elements.

Functions

- `template<typename OffsetType >`
`flat_type_traits< OffsetType >::plain_type * rti::flat::plain_cast (OffsetType &offset)`
Casts into an equivalent plain C++ type.
- `template<typename OffsetType >`
`const flat_type_traits< OffsetType >::plain_type * rti::flat::plain_cast (const OffsetType &offset)`
Const version of plain_cast.

6.78.1 Detailed Description

Offsets provide access to the members of a FlatData Sample.

An Offset represents a position within a **FlatData Sample** (p.212) that allows accessing a member of that Sample, or the Sample's **root** (p. 1983).

Offsets can be described as **iterators**. They represent a position in a buffer, not the value itself. As such, they're lightweight objects that can be copied to point to the same data.

There are the following Offset types to access the different IDL types:

Category	Offset type
User types	For example: <ul style="list-style-type: none"> • MyFlatFinalOffset (p. 1493), an Offset to a final struct • MyFlatMutableOffset (p. 1504), an Offset to a mutable struct • MyFlatUnionOffset (p. 1514), an Offset to a union
Arrays	<ul style="list-style-type: none"> • rti::flat::PrimitiveArrayOffset (p. 1678) • rti::flat::FinalArrayOffset (p. 1310) (array of final elements in a final type) • rti::flat::FinalAlignedArrayOffset (p. 1309) (array of final elements in a mutable type) • rti::flat::MutableArrayOffset (p. 1489)
Sequences	<ul style="list-style-type: none"> • rti::flat::PrimitiveSequenceOffset (p. 1684) • rti::flat::SequenceOffset (p. 2050)
Primitive types	<ul style="list-style-type: none"> • The type itself, such as <code>double</code> • rti::flat::PrimitiveOffset (p. 1680) (when the member is optional)

Offsets for user types are generated by **rtiddsgen** and provide methods to access the type's members by their names. Offsets for arrays and sequences provide methods to access each element.

Some offsets allow accessing the data through a pointer to the equivalent plain C++ type, which generally provides better performance. See **rti::flat::plain_cast()** (p. 217).

6.78.2 Offset Error Management

Functions that return an Offset may return a "null" Offset (one such that **is_null()** (p. 1607) returns `true`).

An Offset may be null if a member doesn't exist in the **Sample** (p. 212). For example, if the member 'my_final' in **MyFlatMutable** (p. 213) doesn't exist (because it wasn't added while building the Sample, or because it wasn't received in the subscribing application), **MyFlatMutableOffset::my_final()** (p. 1509) returns a null Offset. Note that a **member in a final type** (for example, **MyFlatFinalOffset::my_complex()** (p. 1496)) always exists, except in the case of an error.

Other than that, any error condition will cause one of the following exceptions, not a null Offset:

- **dds::core::NullReferenceError** (p. 1602), when accessing a null Offset
- **dds::core::PreconditionNotMetError** (p. 1669), for any precondition failure.
- **dds::core::OutOfResourcesError** (p. 1629), when a **Builder** (p. 209) runs out of space while adding a member.

6.78.3 Function Documentation

6.78.3.1 `plain_cast()` [1/2]

```
template<typename OffsetType >
flat_type_traits< OffsetType >::plain_type * rti::flat::plain_cast (
    OffsetType & offset )
```

Casts into an equivalent plain C++ type.

Some FlatData types can be cast to their equivalent **plain** definition as a regular non-FlatData C++ type. This is a more efficient way to access the data. This function casts, if possible, the member pointed to by the offset argument to an equivalent plain C++ type. Any changes made through the plain type are reflected in the FlatData sample.

Template Parameters

<i>OffsetType</i>	The Offset type
-------------------	-----------------

Precondition

`plain_cast` requires the type to meet the following restrictions:

- The type must be a final struct, or an array or sequence of members of a type that meets these restrictions (including primitive types)
- The type must be defined in a way such that the packing of the plain C++ type doesn't differ from the padding in XCDR2.
- The type may not inherit from another type.
- In addition, the sample must be serialized in the native endianness. For example, if a subscribing application on a little-endian platform receives a sample published from a big-endian system, it is not possible to `plain_cast` the sample or any of its members, except if the member is a primitive array or sequence of 1-byte elements.

`offset.is_cpp_compatible()` (p. 1607) indicates if the member meets the requirements. If the type doesn't, this function throws `dds::core::PreconditionNotMetError` (p. 1669).

Parameters

<i>offset</i>	The offset to the member to cast.
---------------	-----------------------------------

Returns

The data that `offset` referred to, cast as a plain C++ type with the same definition. If `offset` is an array or sequence member, the returned pointer represents a C++ array with the same number of elements.

The following table summarizes the possible parameters to this function (assuming that they meet the previous requirements), and the return type in each case:

OffsetType	return type
Offset to a final struct, such as MyFlatFinalOffset (p.1493)	MyFlatFinalPlainHelper* (pointer to a single element). This is a type with the same IDL definition, but without @language_binding (FLAT_DATA).
Offset to an array of final structs, such as FinalArrayOffset (p.1310) <MyFlatFinalOffset (p.1493), N>	MyFlatFinalPlainHelper* (array of N elements)
Offset to a sequence of final structs, such as SequenceOffset (p.2050) <MyFlatFinalOffset (p.1493)>	MyFlatFinalPlainHelper* (array of offset.element_count() elements)
Offset to an array of primitive types, such as PrimitiveArrayOffset (p.1678) <int32_t, N>	int32_t* (array of N elements)
Offset to a sequence of primitive types, such as PrimitiveSequenceOffset (p.1684) <int32_t>	int32_t* (array of offset.element_count() elements)

Due to the performance advantages that `plain_cast` offers, it is recommended to define FlatData types in a way that their largest member(s) can be `plain_cast`.

The following example shows how to use `plain_cast` to cast a **MyFlatFinalOffset** (p. 1493) into the type with the same IDL definition as **MyFlatFinal** (p. 213), but without the `@language_binding (FLAT_DATA)` annotation:

```
MyFlatMutable *my_sample = ...;
auto my_root = my_sample->root();
auto my_final = my_root.my_final();
// Get the plain C++ type and modify an array
auto my_final_plain = rti::flat::plain_cast(my_final);
my_final_plain->my_primitive(3); // this is using the plain C++ setter
my_final_plain->my_complex_array()[1].x(20); // this is a std::array
// The change to my_complex_array is reflected in the FlatData sample
std::cout << my_final.my_primitive() << std::endl; // 3
std::cout << my_final.my_complex_array().get_element(1).x() << std::endl; // 20
```

This example shows how to use `plain_cast` to efficiently build a sequence of final elements and a sequence of integers, both members of a mutable type:

```
MyFlatMutableBuilder builder = rti::flat::build_data(writer);
// 1)
//
// Build a sequence of 5 elements with add_n() instead of 5 calls to
// add_next()
rti::flat::FinalSequenceBuilder<MyFlatFinalOffset> seq_builder =
    builder.build_my_final_seq();
seq_builder.add_n(5);
// Finish the member, getting the offset to the member
rti::flat::SequenceOffset<MyFlatFinalOffset> seq_offset = seq_builder.finish();
// Cast it to an array of plain C++ type and initialize it.
// This way to initialize it is more efficient than add_next().
auto seq_elements = rti::flat::plain_cast(seq_offset);
for (int i = 0; i < 5; i++) {
    seq_elements[i].my_primitive(i);
    // ...
}
// 2)
//
// Build a sequence of 1000 integers
auto seq_builder = builder.build_my_primitive_seq();
// make space for 1000 elements, but leave them uninitialized
seq_builder.add_n(1000);
auto seq_offset = seq_builder.finish();
// Initialize the elements:
int32_t *elements = rti::flat::plain_cast(seq_offset);
for (int i = 0; i < 1000; i++) {
    elements[i] = ...;
}
// ... continue building the sample using 'builder'
```

6.78.3.2 plain_cast() [2/2]

```
template<typename OffsetType >
const flat_type_traits< OffsetType >::plain_type * rti::flat::plain_cast (
    const OffsetType & offset )
```

Const version of plain_cast.

6.79 FlatData Topic-Types

<<*extension*>> (p. 156) FlatData Language Binding for IDL topic-types

Modules

- **FlatData Builders**
A Builder allows creating and initializing variable-size data.
- **FlatData Samples**
A Sample represents an instance of the IDL topic-type and contains the data in serialized format.
- **FlatData Offsets**
Offsets provide access to the members of a FlatData Sample.

6.79.1 Detailed Description

<<*extension*>> (p. 156) FlatData Language Binding for IDL topic-types

Note

For a complete description of the FlatData language binding and its benefits, and a tutorial, see the "Sending Large Data" chapter in the **RTI Connex User's Manual**.

For buildable **code examples**, see <https://community.rti.com/kb/flatdata-and-zero-copy-examples>.

The FlatData language binding is available in the Traditional C++ API and in the Modern C++ API.

RTI FlatData™ is a language binding for IDL types in which the in-memory representation of a sample matches the wire representation. Therefore, the cost of serialization/deserialization is zero.

To select FlatData as the language binding of a type, annotate it with @language_binding(FLAT_DATA) in IDL or apply the attribute languageBinding="flat_data" in XML.

There are some restrictions regarding the kinds of types to which the FlatData language binding can be applied.

- For final types, the FlatData language binding can be applied only to fixed-size types. A fixed-size type is a type whose wire representation always has the same size. This includes primitive types, arrays of fixed-size types, and structs containing only members of fixed-size types. Unions are not fixed-size types.
- For mutable types, any member is permitted.

- Extensible types cannot be marked as FlatData.

Final types are more efficient, but more restrictive. In general, a good compromise is to define mutable top-level types, but making sure their largest data members are final.

When a type is marked with the FlatData language binding, its mapping into C++ is different than that of a regular type (plain language binding). Rather than a single C++ class with direct access to its members, for a FlatData type **rtiddsgen** generates the following:

- A **Sample** (p. 212), the data in serialized format
- An **Offset** (p. 214), which allows reading the data members of that type inside a Sample, and modifying them without changing the size
- A **Builder** (p. 209), if the type is mutable, which allows creating a variable-size Sample

For example, for the IDL types **MyFlatFinal** (p. 213) and **MyFlatMutable** (p. 213) **rtiddsgen** generates the following C++ types:

- The Sample types **MyFlatFinal** (p. 213) and **MyFlatMutable** (p. 213)
- The Offset types **MyFlatFinalOffset** (p. 1493) and **MyFlatMutableOffset** (p. 1504).
- The Builder type **MyFlatMutableBuilder** (p. 1497).

6.79.2 Publishing FlatData

The typical way to publish FlatData samples includes the following steps:

- Create a **dds::pub::DataWriter** (p. 908) as you would for a non-FlatData (plain) topic-type (see **Setting up a DataWriter** (p. 112)).

(For final topic-types such as **MyFlatFinal** (p. 213))

- Obtain a FlatData sample with **dds::pub::DataWriter::get_loan** (p. 953).

```
MyFlatFinal *foo_sample = writer.get_loan();
```
- Initialize the sample, starting from the **root()** (p. 1983) offset.

```
MyFlatFinalOffset foo_root = foo_sample->root();
foo_root.my_primitive(3);
auto my_complex_offset = foo_root.my_complex();
// ... initialize my_complex_offset
```

(For mutable topic-types such as **MyFlatMutable** (p. 213))

- Obtain a **Builder** (p. 209) to create a variable-size sample with **rti::flat::build_data()** (p. 211).

```
MyFlatMutableBuilder foo_builder = rti::flat::build_data(writer);
```

- Use this builder (and possibly nested member builders) to initialize the members.

```
foo_builder.add_my_primitive(3);
auto my_mutable_builder = foo_builder.build_my_mutable();
// ... build 'my_mutable' (a member with a mutable type)
my_mutable_builder.finish(); // completes a member
auto my_final_offset = foo_builder.add_my_final();
// ... initialize 'my_final' (a member with a final type)
```

- Obtain the completed sample with **MyFlatMutableBuilder::finish_sample()** (p. 1500). After that, the builder is no longer usable, and the sample size cannot change.

```
MyFlatMutable *foo_sample = foo_builder.finish_sample();
```

- Optionally, it is possible to change the values of the sample accessing its `root()`, as long as the size doesn't change. For example, if the sample was built with a sequence member with two elements, it is possible to modify any of those elements, but it's not possible to add a third element.

(For both final and mutable topic-types)

- Write the sample with **dds::pub::DataWriter::write()** (p. 918).

```
writer.write(*foo_sample);
```

After write, the DataWriter owns the FlatData sample. This allows avoiding additional copies, the main goal of the Flat↔Data language binding. This means that the sample cannot be reused. The DataWriter will return it to the sample pool when appropriate, as described in **dds::pub::DataWriter::get_loan** (p. 953).

6.79.3 Subscribing to FlatData

To subscribe to a topic using a FlatData topic-type:

- Create a **dds::sub::DataReader** (p. 756) normally (see **Setting up a DataReader** (p. 118)).
- Read or take the samples using a loaning operation, such as **dds::sub::DataReader::take** (p. 774) (copying read/take operations cannot be used with FlatData types).
- Access the **root()** (p. 1983) offset, and any of the sample's members from there.

Note that the language binding is a local concept. It is possible to publish with a FlatData topic-type and subscribe to it with a **plain** topic-type with the same (or assignable) definition. It is also possible to use a plain topic-type on the publisher side and subscribe to it using FlatData. The DataWriter or DataReader of the plain topic-type has to use **dds::core::policy::DataRepresentation::xcdr2()** (p. 313) in **dds::core::policy::DataRepresentation** (p. 883).

6.80 RPC Tutorial

Getting Started with Remote Procedure Call with DDS.

Getting Started with Remote Procedure Call with DDS.

This tutorial will walk you through the steps to define an interface and write the service and client applications:

- **Defining a service interface in IDL** (p. 222)
- **Writing the Service application** (p. 222)
- **Writing the Client application** (p. 224)
- **Advanced interface definition** (p. 224)

6.80.1 Defining a service interface in IDL

The first step is to define a `@service-annotated` interface in IDL:

```
@final
struct Coordinates {
    int32 x;
    int32 y;
};
@service
interface RobotControl {
    Coordinates walk_to(Coordinates destination, float speed);
    float get_speed();
};
```

This IDL file defines an interface with two methods:

- `walk_to` receives two arguments and returns a `Coordinates` structure
- `get_speed` takes no arguments and returns a `float`.

These are the methods that we will implement in the Service application, and the methods we will call in the Client application.

To generate the supporting code and example client and service applications, copy the IDL code above into a file called `RobotControl.idl` and run `rtiddsgen` as follows (see the [Code Generator User's Manual](#) for more information):

```
<Connexx DDS installation directory>/bin/rtiddsgen -language C++11 -example <your architecture> RobotControl.idl
```

This will generate the following files:

- `RobotControl.hpp`, `RobotControl.cxx`, `RobotControlPlugin.hpp`, `RobotControlPlugin.cxx`. These files contain the supporting types. You should not edit these files.
- `RobotControl_service.cxx` contains the example service application
- `RobotControl_client.cxx` contains the example client application

In the following sections we will modify `RobotControl_service.cxx` and `RobotControl_client.cxx`.

6.80.2 Writing the Service application

`RobotControl_service.cxx` contains an implementation of the `RobotControl` interface:

```
class RobotControlExample : public RobotControl {
public:
    Coordinates walk_to(const Coordinates& destination, float speed) override
    {
        std::cout << "calling walk_to" << std::endl;
        // Implement walk_to function here
        return Coordinates();
    }
    float get_speed() override
    {
        std::cout << "calling get_speed" << std::endl;
        // Implement get_speed function here
        return 0.0f;
    }
};
```

The generated methods simply print a message and return a default value. You can modify it to do something a little more interesting:

```
class RobotControlExample : public RobotControl {
public:
    Coordinates walk_to(const Coordinates& destination, float speed) override
    {
        if (speed_ > 0.0f) {
            std::cout << "already moving" << std::endl;
            return position_; // return previously known position
        }
        if (speed > 100.0f) {
            speed_ = 100; // maximum speed
        } else if (speed <= 0.0f) {
            std::cout << "staying put at position " << position_ << std::endl;
            return position_;
        } else {
            speed_ = speed;
        }
        std::cout << "walking to " << destination << " at a speed of "
            << speed_ << "...\\n";
        // sleep for 0 to 10 seconds, depending on the speed
        std::this_thread::sleep_for(std::chrono::milliseconds(
            10000 - static_cast<int>(100 * speed_));
        std::cout << "arrived!\\n";
        speed_ = 0.0f;
        position_ = destination;
        return destination;
    }
    float get_speed() override
    {
        return speed_;
    }
private:
    Coordinates position_ {0, 0};
    std::atomic<float> speed_ {0.0f};
};
```

The next step is to create a Server and a RobotControlService that uses an instance of MyRobotControl.

```
// Create a DomainParticipant with default Qos. The Service will communicate
// only with Clients that join the same domain_id
dds::domain::DomainParticipant participant(domain_id);
// Create an instance of the service interface
auto service_impl = std::make_shared<RobotControlExample>();
// A server provides the execution environment (a thread pool) for one or
// more services
dds::rpc::ServerParams server_params;
// Use a thread_pool_size > 1 to dispatch incoming function calls in
// parallel
server_params.extensions().thread_pool_size(4);
// Create the server with the server_params configuration
dds::rpc::Server server(server_params);
// Create a service with an instance of the service interface, and attach
// it to a server. The service will wait for remote calls, call the
// service interface to compute the results, and send them back.
dds::rpc::ServiceParams params(participant);
params.service_name("Example RobotControl Service");
RobotControlService service(service_impl, server, params);
std::cout << "RobotControlService running... " << std::endl;
server.run();
```

A Service instance creates the necessary DDS entities (**dds::topic::Topic** (p. 2178), **dds::sub::DataReader** (p. 756), **dds::pub::DataWriter** (p. 908)) to receive function calls, process them using an interface implementation, and send back the return values. Several Service instances (of the same or different interfaces) can share the same **dds::domain::DomainParticipant** (p. 1079).

This RobotControlService will communicate with clients that run on the same domain id and specify the same service name, "Example RobotControl Service".

The execution of Service instances is managed by a Server. A Server provides a thread pool for one or more Service instances (of the same or different interfaces). By default, a Server creates only one thread, and therefore all the function calls are processed sequentially. In the example, the thread pool size is set to 4. Keep in mind that now the MyRobotControl methods can be executed in parallel, so you may need to provide mutual exclusion for shared variables and critical areas.

The `RobotControlService` is ready to receive remote calls as soon as you instantiate it. `Server` and `RobotControlService` are **reference types** (p. 153), and will be destroyed when they're not referenced by any variable. The call to `server.run()` simply sleeps so that `server` and `service` don't go out scope.

6.80.3 Writing the Client application

In `RobotControl_client.cxx`, we create a `RobotControlClient` that allows making remote function calls to the service:

```
// Create a DomainParticipant with default Qos
dds::domain::DomainParticipant client_participant(domain_id);
// Create a ClientParams
dds::rpc::ClientParams client_params(client_participant);
// And register the service
client_params.service_name("Example RobotControl Service");
// Create a client and assign the ClientParams
RobotControlClient client(client_params);
// Wait until the service is started
client.wait_for_service();
```

The client is configured with the same service name we used for the service, "Example RobotControl Service". With `wait_for_service` we wait until the client's readers and writers have matched with the service's own readers and writers.

After that we're ready to make function calls. Function calls can be synchronous or asynchronous. Synchronous function calls block until a response is received:

```
Coordinates final_position = client.walk_to(Coordinates(150, 200), 85.0f);
std::cout << "Robot walked to " << final_position << std::endl;
```

Asynchronous function calls send the request immediately but return a `std::future` that will contain the result when it's received:

```
std::future<Coordinates> final_position_future =
    client.walk_to_async(Coordinates(10, 0), 40.0f);
std::this_thread::sleep_for(std::chrono::seconds(1));
// The walk_to function may still be running, but we can get the speed
// before we receive the result:
std::cout << "Current speed is " << client.get_speed() << std::endl;
final_position = final_position_future.get();
std::cout << "Robot walked to " << final_position << std::endl;
```

The call to `std::future::get()` provides the result if it's already available or blocks until it is.

You can configure the maximum wait time for function calls in the `ClientParams`. By default the wait is infinite. When set to a finite value, operations that do not receive the return value on time throw `dds::core::TimeoutError` (p. 2177).

`RobotControlClient` is also a **reference type** (p. 153) and will be destroyed automatically when it's no longer referenced by any variable.

6.80.4 Advanced interface definition

In this section we will explore other features you can use to define service interfaces:

- Attributes
- Exceptions
- Out and in/out parameters

An attribute is a data member that generates a getter and a setter function.

Exceptions allow reporting errors in remote function calls.

We will modify our previous IDL to add a name attribute for RobotControl and an exception for the walk_to operation.

```
exception WalkError {
    string<32> message;
};
exception TooFastError {
};
@final
struct Coordinates {
    int32 x;
    int32 y;
};
@service
interface RobotControl {
    Coordinates walk_to(Coordinates destination, float speed)
        raises(WalkError, TooFastError);
    float get_speed();
    attribute string<128> name;
};
```

Now run rtiddsgen to update the type files:

```
<Connex DDS installation directory>/bin/rtiddsgen -language C++11 -update
typefiles RobotControl.idl
```

We can now modify MyRobotControl to report errors in walk_to as exceptions and add the name getters and setters:

```
class RobotControlExample : public RobotControl {
public:
    Coordinates walk_to(const Coordinates& destination, float speed) override
    {
        if (speed_ > 0.0f) {
            throw WalkError("Already moving");
        }
        if (speed > 100.0f) {
            throw TooFastError();
        }
        if (speed <= 0.0f) {
            throw WalkError("Invalid speed");
        }
        speed_ = speed;
        std::cout << "walking to " << destination << " at a speed of "
            << speed_ << "...\\n";
        // sleep for 0 to 10 seconds, depending on the speed
        std::this_thread::sleep_for(std::chrono::milliseconds(
            10000 - static_cast<int>(100 * speed_));
        std::cout << "arrived!\\n";
        speed_ = 0.0f;
        position_ = destination;
        return destination;
    }
    float get_speed() override
    {
        return speed_;
    }
    void set_attribute_name(const std::string& name) override
    {
        name_ = name;
    }
    std::string get_attribute_name() override
    {
        return name_;
    }
private:
    std::string name_ {"Unknown"};
    Coordinates position_ {0, 0};
    std::atomic<float> speed_ {0.0f};
};
```

These exceptions are propagated and rethrown in the client:

```
try {
    client.walk_to(Coordinates(5, 20), 105);
```

```

} catch (const TooFastError&) {
    std::cout << "walk_to failed: too fast\n";
} catch (const WalkError& walk_error) {
    std::cout << "walk_to failed: " << walk_error.message() << std::endl;
}

```

In asynchronous calls, exceptions are thrown in `std::future::get()`.

If you need to return more than one value in a method, you can wrap the values in a struct and use that as the return type (as we do in `walk_to`) but you can also specify `out` and `inout` parameters (by default parameters are `in`).

For example, an alternative definition of `walk_to` can use an `inout` parameter to pass the target position and return the final position, and return a boolean indicating whether the operation succeeded.

```
boolean walk_to(inout Coordinates destination, float speed);
```

This changes how the interfaces are generated. The synchronous interface (`RobotControl`) now receives the `destination` argument by non-const reference so it can be modified. The asynchronous interface (`RobotControlAsync`) returns a future that wraps all the output values: the return type, and all the `out` and `inout` parameters.

6.81 Conditions and WaitSets

`dds::core::cond::Condition` (p. 729) and `dds::core::cond::WaitSet` (p. 2318).

Modules

- **AsyncWaitSet**

<<*extension*>> (p. 156) A specialization of `dds::core::cond::WaitSet` (p. 2318) that provides a mechanism to perform the wait asynchronously and uses a thread pool to dispatch the attached active `dds::core::cond::Condition` (p. 729).

Classes

- class **dds::core::cond::Condition**

<<*reference-type*>> (p. 153) Abstract base class of all the conditions

- class **dds::core::cond::GuardCondition**

<<*reference-type*>> (p. 153) A condition whose trigger value is under the control of the application.

- class **dds::core::cond::StatusCondition**

<<*reference-type*>> (p. 153) A condition associated with each `dds::core::Entity` (p. 1265)

- class **dds::core::cond::WaitSet**

<<*reference-type*>> (p. 153) Allows an application to wait until one or more of the attached `Condition` (p. 729) objects have a trigger_value of true or else until the timeout expires.

- class **rti::core::cond::WaitSetProperty**

<<*extension*>> (p. 156) <<*value-type*>> (p. 152) Specifies the `dds::core::cond::WaitSet` (p. 2318) behavior for multiple trigger events

6.81.1 Detailed Description

`dds::core::cond::Condition` (p. 729) and `dds::core::cond::WaitSet` (p. 2318).

6.82 Time Support

Time and duration types.

Classes

- class **dds::core::Duration**
<<*value-type*>> (p. 152) Represents a time interval
- class **dds::core::Time**
<<*extension*>> (p. 156) Represents a point in time

6.82.1 Detailed Description

Time and duration types.

6.83 Exceptions

Classes

- class **dds::core::Exception**
The abstract base class for all of the DDS exceptions which may be thrown by the API.
- class **dds::core::Error**
*A generic, unspecified **Error** (p. 1284).*
- class **dds::core::AlreadyClosedError**
Indicates that an object has been closed.
- class **dds::core::IllegalOperationError**
Indicates that an operation was called under improper circumstances.
- class **dds::core::NotAllowedBySecurityError**
Indicates that an operation on the DDS API fails because the security plugins do not allow it.
- class **dds::core::ImmutablePolicyError**
Indicates that the application attempted to modify an immutable QoS policy.
- class **dds::core::InconsistentPolicyError**
Indicates that the application specified a set of QoS policies that are not consistent with each other.
- class **dds::core::InvalidArgumentError**
Indicates that the application passed an illegal parameter value into an operation.
- class **dds::core::NotEnabledError**
*A **NotEnabledError** (p. 1601) is thrown when an operation is invoked on a **dds::core::Entity** (p. 1265) that is not yet enabled.*
- class **dds::core::OutOfResourcesError**
Indicates that RTI Connexant ran out of the resources needed to complete the operation.
- class **dds::core::PreconditionNotMetError**
*A **PreconditionNotMetError** (p. 1669) is thrown when a pre-condition for the operation was not met.*
- class **dds::core::TimeoutError**

Indicates that an operation has timed out.

- class **dds::core::UnsupportedError**

Indicates that the application used an unsupported operation.

- class **dds::core::InvalidDowncastError**

Indicates that a downcast was incorrect.

- class **dds::core::NullReferenceError**

Indicates an attempt to access a null object.

- class **rti::core::Result< T >**

A result from an operation that doesn't throw exceptions containing a return code and (if successful) a value.

6.83.1 Detailed Description

6.83.2 Standard Exceptions

Any operation can throw one of the following "standard exceptions" unless it indicates the opposite:

- **dds::core::Error** (p. 1284)
- **dds::core::IllegalOperationError** (p. 1352)
- **dds::core::AlreadyClosedError** (p. 594)
- **dds::core::InvalidArgumentError** (p. 1363)
- **dds::core::UnsupportedError** (p. 2291)
- **dds::core::NotAllowedBySecurityError** (p. 1600)

Operations that throw other exceptions will document them explicitly.

As a general rule constructors may only throw **dds::core::Error** (p. 1284). Destructors never throw, even in case of error.

Note that any operation can throw C++ standard exceptions such as `std::bad_alloc`.

6.83.3 Catching exceptions

The class **dds::core::Exception** (p. 1291) is the abstract base class for all DDS exceptions. All concrete exceptions inherit also from subclasses of `std::exception`, so when you need to catch an exception you have flexibility on the level of detail you need. For example, if you are setting the DomainParticipant QoS:

```
try {
    my_participant.qos(my_participant_qos);
} catch (const dds::core::InconsistentPolicyError& ipe) {
    // catch a specific exception (documented in DomainParticipant::qos())
} catch (const std::exception& ex) {
    // catch any other exception here, including other DDS exceptions
}
```

6.84 QoS Policy Traits

The traits types `policy_id` (p. 1668) and `policy_name` (p. 1668) provide information about a QoS policy.

Classes

- class `dds::core::policy::policy_id`< `Policy` >
Obtains the QoS PolicyId of a QoS Policy.
- class `dds::core::policy::policy_name`< `Policy` >
Obtains the policy name.

6.84.1 Detailed Description

The traits types `policy_id` (p. 1668) and `policy_name` (p. 1668) provide information about a QoS policy.

6.85 Safe Enumeration

Describes the `safe_enum` (p. 1972) class.

Classes

- class `dds::core::safe_enum`< `def`, `inner` >
<< *value-type* >> (p. 152) *Provides a safe, scoped enumeration based on def::type*

6.85.1 Detailed Description

Describes the `safe_enum` (p. 1972) class.

6.86 Status Kinds

Kinds of communication status.

Classes

- class **dds::core::status::StatusMask**
A `std::bitset` (list) of statuses.
- class **dds::core::status::InconsistentTopicStatus**
Information about the status `dds::core::status::StatusMask::inconsistent_topic()` (p. 2086)
- class **dds::core::status::SampleLostStatus**
Information about the status `dds::core::status::StatusMask::sample_lost()` (p. 2088)
- class **dds::core::status::SampleRejectedStatus**
Information about the status `dds::core::status::StatusMask::sample_rejected()` (p. 2089)
- class **dds::core::status::LivelinessLostStatus**
Information about the status `dds::core::status::StatusMask::liveliness_lost()` (p. 2090)
- class **dds::core::status::LivelinessChangedStatus**
Information about the status `dds::core::status::StatusMask::liveliness_changed()` (p. 2090)
- class **dds::core::status::OfferedDeadlineMissedStatus**
Information about the status `dds::core::status::StatusMask::offered_deadline_missed()` (p. 2086)
- class **dds::core::status::RequestedDeadlineMissedStatus**
Information about the status `dds::core::status::StatusMask::requested_deadline_missed()` (p. 2087)
- class **dds::core::status::OfferedIncompatibleQosStatus**
Information about the status `dds::core::status::StatusMask::offered_incompatible_qos()` (p. 2087)
- class **dds::core::status::RequestedIncompatibleQosStatus**
Information about the status `dds::core::status::StatusMask::requested_incompatible_qos()` (p. 2088)
- class **dds::core::status::PublicationMatchedStatus**
Information about the status `dds::core::status::StatusMask::publication_matched()` (p. 2091)
- class **dds::core::status::SubscriptionMatchedStatus**
Information about the status `dds::core::status::StatusMask::subscription_matched()` (p. 2091)
- class **rti::core::status::EventCount** < IntegerType >
<<extension>> (p. 156) <<value-type>> (p. 152) Encapsulates an event count containing a total count and an incremental count since the last time a status was read.
- class **rti::core::status::DataReaderCacheStatus**
<<extension>> (p. 156) Information about the status `dds::core::status::StatusMask::datareader_cache()` (p. 2093)
- class **rti::core::status::DataReaderProtocolStatus**
<<extension>> (p. 156) Information about the status `dds::core::status::StatusMask::datareader_protocol()` (p. 2094)
- class **rti::core::status::DataWriterCacheStatus**
<<extension>> (p. 156) Information about the status `dds::core::status::StatusMask::datawriter_cache()` (p. 2093)
- class **rti::core::status::ReliableWriterCacheChangedStatus**
<<extension>> (p. 156) Information about the status `dds::core::status::StatusMask::reliable_writer_cache_↔changed()` (p. 2092)
- class **rti::core::status::ReliableReaderActivityChangedStatus**
<<extension>> (p. 156) Information about the status `dds::core::status::StatusMask::reliable_reader_activity_↔changed()` (p. 2092)
- class **rti::core::status::DataWriterProtocolStatus**
<<extension>> (p. 156) Information about the status `dds::core::status::StatusMask::datawriter_protocol()` (p. 2093)
- class **rti::core::status::DomainParticipantProtocolStatus**
- class **rti::core::status::ServiceRequestAcceptedStatus**
<<extension>> (p. 156) Information about the status `dds::core::status::StatusMask::service_request_accepted()` (p. 2095)
- class **rti::core::status::InvalidLocalIdentityAdvanceNoticeStatus**
<<extension>> (p. 156) Information about the status `dds::core::status::StatusMask::invalid_local_identity_↔advance_notice()` (p. 2095)

6.86.1 Detailed Description

Kinds of communication status.

Entity:

dds::core::Entity (p. 1265)

QoS:

QoS Policies (p. 302)

Listener:

Listener (p. 1381)

Each concrete **dds::core::Entity** (p. 1265) is associated with a set of Status objects whose value represents the communication status of that entity. Each status value can be accessed with a corresponding method on the **dds::core::Entity** (p. 1265).

When these status values change, the corresponding **dds::core::cond::StatusCondition** (p. 2079) objects are activated and the proper **Listener** (p. 1381) objects are invoked to asynchronously inform the application.

An application is notified of communication status by means of the **Listener** (p. 1381) or the **dds::core::cond::WaitSet** (p. 2318) / **dds::core::cond::Condition** (p. 729) mechanism. The two mechanisms may be combined in the application (e.g., using **dds::core::cond::WaitSet** (p. 2318) (s) / **dds::core::cond::Condition** (p. 729) (s) to access the data and **Listener** (p. 1381) (s) to be warned asynchronously of erroneous communication statuses).

It is likely that the application will choose one or the other mechanism for each particular communication status (not both). However, if both mechanisms are enabled, then the **Listener** (p. 1381) mechanism is used first and then the **dds::core::cond::WaitSet** (p. 2318) objects are signalled.

The statuses may be classified into:

- *read communication statuses*: i.e., those that are related to arrival of data, namely **dds::core::status::StatusMask::data_on_readers()** (p. 2089) and **dds::core::status::StatusMask::data_available()** (p. 2090).
- *plain communication statuses*: i.e., all the others.

Read communication statuses are treated slightly differently than the others because they don't change independently. In other words, at least two changes will appear at the same time (**dds::core::status::StatusMask::data_on_readers()** (p. 2089) and **dds::core::status::StatusMask::data_available()** (p. 2090)) and even several of the last kind may be part of the set. This 'grouping' has to be communicated to the application.

For each plain communication status, there is a corresponding structure to hold the status value. These values contain the information related to the change of status, as well as information related to the statuses themselves (e.g., contains cumulative counts).

"Status Values"

6.86.2 Changes in Status

Associated with each one of an `dds::core::Entity` (p. 1265)'s communication status is a logical `StatusChangedFlag`. This flag indicates whether that particular communication status has changed since the last time the status was read by the application. The way the status changes is slightly different for the Plain Communication Status and the Read Communication status.

"\p StatusChangedFlag indicates if status has changed"

6.86.2.1 Changes in plain communication status

For the plain communication status, the `StatusChangedFlag` flag is initially set to `FALSE`. It becomes `TRUE` whenever the plain communication status changes and it is reset to `false` each time the application accesses the plain communication status via the proper getter operation on the `dds::core::Entity` (p. 1265).

The communication status is also reset to `FALSE` whenever the associated listener operation is called as the listener implicitly accesses the status which is passed as a parameter to the operation. The fact that the status is reset prior to calling the listener means that if the application calls the getter from inside the listener it will see the status already reset.

An exception to this rule is when the associated listener is the 'nil' listener. The 'nil' listener is treated as a NOOP and the act of calling the 'nil' listener does not reset the communication status.

For example, the value of the `StatusChangedFlag` associated with the `dds::core::status::StatusMask::requested_deadline_missed()` (p.2087) will become `TRUE` each time new deadline occurs (which increases `dds::core::status::RequestedDeadlineMissedStatus::total_count` (p.1904)). The value changes to `FALSE` when the application accesses the status via the corresponding `dds::sub::DataReader::requested_deadline_missed_status` (p. 788) method on the proper `Entity` (p. 1265)

"Changes in \p StatusChangedFlag for plain communication status"

6.86.2.2 Changes in read communication status

For the read communication status, the `StatusChangedFlag` flag is initially set to `FALSE`. The `StatusChangedFlag` becomes `TRUE` when either a data-sample arrives or else the `dds::sub::status::ViewState` (p. 2315), `dds::sub::status::SampleState` (p.2023), or `dds::sub::status::InstanceState` (p.1359) of any existing sample changes for any reason other than a call to `dds::sub::DataReader::read` (p.773), `dds::sub::DataReader::take` (p.774) or their variants. Specifically any of the following events will cause the `StatusChangedFlag` to become `TRUE`:

- The arrival of new data.
- A change in the `dds::sub::status::InstanceState` (p. 1359) of a contained instance. This can be caused by either:
 - The arrival of the notification that an instance has been disposed by:
 - * the `dds::pub::DataWriter` (p. 908) that owns it if `OWNERSHIP` (p. 329) QoS kind= `dds::core::policy::OwnershipKind_def::EXCLUSIVE` (p. 1637)
 - * or by any `dds::pub::DataWriter` (p. 908) if `OWNERSHIP` (p. 329) QoS kind= `dds::core::policy::OwnershipKind_def::SHARED` (p. 1637)

- The loss of liveness of the `dds::pub::DataWriter` (p. 908) of an instance for which there is no other `dds::pub::DataWriter` (p. 908).
- The arrival of the notification that an instance has been unregistered by the only `dds::pub::DataWriter` (p. 908) that is known to be writing the instance.

Depending on the kind of `StatusChangedFlag`, the flag transitions to `FALSE` again as follows:

- The `dds::core::status::StatusMask::data_available()` (p. 2090) `StatusChangedFlag` becomes `FALSE` when either the corresponding listener operation (`on_data_available`) is called or the read or take operation (or their variants) is called on the associated `dds::sub::DataReader` (p. 756).
- The `dds::core::status::StatusMask::data_on_readers()` (p. 2089) `StatusChangedFlag` becomes `FALSE` when any of the following events occurs:
 - The corresponding listener operation (`on_data_on_readers`) is called.
 - The `on_data_available` listener operation is called on any `dds::sub::DataReader` (p. 756) belonging to the `dds::sub::Subscriber` (p. 2116).
 - The read or take operation (or their variants) is called on any `dds::sub::DataReader` (p. 756) belonging to the `dds::sub::Subscriber` (p. 2116).

6.87 Supporting Types and Constants

Miscellaneous, general-purpose types and constants.

Classes

- class `dds::core::external< T >`
A managed reference to an object.
- class `dds::core::basic_string< CharType, Allocator >`
<<value-type>> (p. 152) A string convertible to `std::string` and with similar functionality
- class `rti::core::bounded_sequence< T, MaxLength >`
<<value-type>> (p. 152) A bounded sequence of elements
- class `rti::core::ListenerBinder< Entity, Listener >`
<<reference-type>> (p. 153) Automatically manages the association of an `Entity` and a `Listener` (p. 1381)
- class `rti::core::LongDouble`
<<extension>> (p. 156) <<value-type>> (p. 152) Encapsulates an IDL long double
- class `dds::core::optional< T >`
<<value-type>> (p. 152) Represents an object that may not contain a valid value
- class `rti::core::optional_value< T >`
<<extension>> (p. 156) Represents a value that can be initialized or not
- class `rti::core::UnregisterThreadOnExit`
<<extension>> (p. 156) Utility that calls `rti::core::unregister_thread` (p. 237) when leaving scope
- struct `rti::core::qos_print_all_t`
A tag type that selects the `to_string` overload that prints all the values of a Qos object.
- class `dds::core::vector< T >`
<<value-type>> (p. 152) A vector convertible to `std::vector` and with similar functionality

Typedefs

- using **dds::core::external**< T >::**shared_ptr** = std::shared_ptr< T >
The smart pointer that external<T> uses.
- typedef **basic_string**< char, rti::core::memory::OsapiAllocator< char > > **dds::core::string**
A string convertible to std::string and with similar functionality.
- typedef **basic_string**< DDS_Wchar, rti::core::memory::OsapiAllocator< DDS_Wchar > > **dds::core::wstring**
An IDL-derived wide string.
- typedef std::vector< uint8_t > **dds::core::ByteSeq**
A vector of bytes.
- typedef std::vector< std::string > **dds::core::StringSeq**
A vector of strings.
- typedef std::nullptr_t **dds::core::null_type**
 <<C++11>> (p. 155) The type of **dds::core::null** (p. 238)
- template<typename T >
 using **omg::types::optional** = **dds::core::optional**< T >
Optional type according to the IDL4-C++ OMG specification. Alias of dds::core::optional (p. 1610).
- template<typename T >
 using **omg::types::sequence** = std::vector< T >
Unbounded sequence type according to the IDL4-C++ OMG specification. Alias of std::vector.
- template<typename T , size_t N>
 using **omg::types::bounded_sequence** = **rti::core::bounded_sequence**< T, N >
Bounded sequence type according to the IDL4-C++ OMG specification. Alias of rti::core::bounded_sequence (p. 671).
- using **omg::types::string_view** = std::string_view
String view type according to the IDL4-C++ OMG specification. Alias of std::string_view when the compiler supports it.
- using **omg::types::wstring_view** = std::wstring_view
Wstring view type according to the IDL4-C++ OMG specification. Alias of std::wstring_view when the compiler supports it.

Functions

- void **rti::core::unregister_thread** ()
 <<extension>> (p. 156) Releases resources that RTI Connnext keeps for this thread

Variables

- const int32_t **dds::core::LENGTH_UNLIMITED** = -1
A special value indicating an unlimited quantity.
- const **null_type** **dds::core::null**
Indicates an empty reference.
- constexpr int32_t **rti::core::length_auto** = -2
A special value indicating an auto quantity.
- const **qos_print_all_t** **rti::core::qos_print_all**
Sentinel value that selects the to_string overload that prints all of the values of a Qos object.

6.87.1 Detailed Description

Miscellaneous, general-purpose types and constants.

6.87.2 Typedef Documentation

6.87.2.1 `shared_ptr`

```
template<typename T >
using dds::core::external< T >::shared_ptr = std::shared_ptr<T>
```

The smart pointer that `external<T>` uses.

6.87.2.2 `string`

```
typedef basic_string<char, rti::core::memory::OsapiAllocator<char> > dds::core::string
```

A string convertible to `std::string` and with similar functionality.

See also

basic_string (p. 660)

Examples

Foo.hpp.

6.87.2.3 `wstring`

```
typedef basic_string<DDS_Wchar, rti::core::memory::OsapiAllocator<DDS_Wchar> > dds::core←  
::wstring
```

An IDL-derived wide string.

IDL `wstring` maps to this type in the C++ API.

It's character type is `DDS_Wchar`, a portable 4-byte character type.

See also

basic_string (p. 660)

6.87.2.4 ByteSeq

```
typedef std::vector<uint8_t> dds::core::ByteSeq
```

A vector of bytes.

6.87.2.5 StringSeq

```
typedef std::vector<std::string> dds::core::StringSeq
```

A vector of strings.

6.87.2.6 null_type

```
typedef std::nullptr_t dds::core::null_type
```

<<**C++11**>> (p. 155) The type of **dds::core::null** (p. 238)

6.87.2.7 optional

```
template<typename T >  
using omg::types::optional = typedef dds::core::optional<T>
```

Optional type according to the IDL4-C++ OMG specification. Alias of **dds::core::optional** (p. 1610).

6.87.2.8 sequence

```
template<typename T >  
using omg::types::sequence = typedef std::vector<T>
```

Unbounded sequence type according to the IDL4-C++ OMG specification. Alias of **std::vector**.

6.87.2.9 bounded_sequence

```
template<typename T , size_t N>
using omg::types::bounded_sequence = typedef rti::core::bounded_sequence<T, N>
```

Bounded sequence type according to the IDL4-C++ OMG specification. Alias of `rti::core::bounded_sequence` (p. 671).

6.87.2.10 string_view

```
using omg::types::string_view = typedef std::string_view
```

String view type according to the IDL4-C++ OMG specification. Alias of `std::string_view` when the compiler supports it.

6.87.2.11 wstring_view

```
using omg::types::wstring_view = typedef std::wstring_view
```

Wstring view type according to the IDL4-C++ OMG specification. Alias of `std::wstring_view` when the compiler supports it.

6.87.3 Function Documentation

6.87.3.1 unregister_thread()

```
void rti::core::unregister_thread ( )
```

<<*extension*>> (p. 156) Releases resources that RTI Connexx keeps for this thread

This function should be called by the user right before exiting a thread where DDS API were used. In this way the middleware will be able to free all the resources related to this specific thread. The best approach is to call the function during the thread deletion after all the DDS related API have been called.

Exceptions

One	of the Standard Exceptions (p. 228)
-----	--

6.87.4 Variable Documentation

6.87.4.1 LENGTH_UNLIMITED

```
const int32_t dds::core::LENGTH_UNLIMITED = -1
```

A special value indicating an unlimited quantity.

Referenced by `dds::topic::Topic< T >::discover_any_topic()`, and `dds::topic::Topic< T >::discover_topic_↔data()`.

6.87.4.2 null

```
const null_type dds::core::null [extern]
```

Indicates an empty reference.

See also

<<*reference-type*>> (p. 153)

Referenced by `rti::topic::find_content_filter()`, `dds::sub::DataReader< T >::find_datareader_by_name()`, `dds::sub::DataReader< T >::find_datareader_by_topic_description()`, `dds::sub::DataReader< T >::find_↔datareader_by_topic_name()`, `dds::pub::DataWriter< T >::find_datawriter_by_name()`, `dds::pub::DataWriter< T >::find_datawriter_by_topic_name()`, and `rti::core::operator<<()`.

6.87.4.3 length_auto

```
constexpr int32_t rti::core::length_auto = -2 [constexpr]
```

A special value indicating an auto quantity.

6.87.4.4 qos_print_all

```
const qos_print_all_t rti::core::qos_print_all [extern]
```

Sentinel value that selects the to_string overload that prints all of the values of a Qos object.

See also

rti::sub::qos::to_string

6.88 DynamicType and DynamicData

Describes `dds::core::xtypes::DynamicType` (p. 1249), `dds::core::xtypes::DynamicData` (p. 1208) and related types and functions.

Classes

- struct **dds::core::xtypes::TypeKind_def**
The definition of TypeKind.
- class **dds::core::xtypes::AliasType**
<<value-type>> (p. 152) Represents and IDL typedef
- class **dds::core::xtypes::CollectionType**
<<value-type>> (p. 152) The base class of all collection types
- class **dds::core::xtypes::UnidimensionalCollectionType**
<<value-type>> (p. 152) The base class of collection types with only one dimension.
- class **dds::core::xtypes::SequenceType**
<<value-type>> (p. 152) Represents an IDL sequence type.
- class **dds::core::xtypes::StringType**
<<value-type>> (p. 152) Represents an IDL string type.
- class **dds::core::xtypes::WStringType**
<<value-type>> (p. 152) Represents an IDL wstring type.
- class **dds::core::xtypes::ArrayType**
<<value-type>> (p. 152) Represents an IDL array type.
- class **dds::core::xtypes::DynamicData**
<<value-type>> (p. 152) A data sample of any complex data type, which can be inspected and manipulated reflectively.
- class **rti::core::xtypes::LoanedDynamicData**
<<move-only-type>> (p. 155) Gives temporary access to a member of another DynamicData object.
- class **rti::core::xtypes::DynamicDataInfo**
Contains information about a DynamicData sample.
- class **rti::core::xtypes::DynamicDataMemberInfo**
Contains information about a DynamicData member.
- class **rti::core::xtypes::DynamicDataProperty**
<<extension>> (p. 156) <<value-type>> (p. 152) Specifies the properties of a DynamicData object
- class **rti::core::xtypes::DynamicDataTypeSerializationProperty**

- <<[extension](#)>> (p. 156) <<[value-type](#)>> (p. 152) Configures aspects of the memory management in the serialization of [dds::core::xtypes::DynamicData](#) (p. 1208) samples.
- class [dds::core::xtypes::DynamicType](#)
 - <<[value-type](#)>> (p. 152) Represents a runtime type.
- class [rti::core::xtypes::DynamicTypePrintFormatProperty](#)
 - <<[extension](#)>> (p. 156) <<[value-type](#)>> (p. 152) A collection of attributes used to configure how [DynamicTypes](#) will be formatted when converted to strings.
- class [dds::core::xtypes::EnumType](#)
 - <<[value-type](#)>> (p. 152) Represents and IDL *enum* type
- class [dds::core::xtypes::Member](#)
 - <<[value-type](#)>> (p. 152) Represents a [StructType](#) (p. 2107) member
- class [dds::core::xtypes::UnionMember](#)
 - <<[value-type](#)>> (p. 152) Represents a [UnionType](#) (p. 2285) member
- class [dds::core::xtypes::EnumMember](#)
 - <<[value-type](#)>> (p. 152) Represents a [EnumType](#) (p. 1280) member
- class [dds::core::xtypes::PrimitiveType](#)
 - <<[value-type](#)>> (p. 152) Represents and IDL primitive type
- class [dds::core::xtypes::StructType](#)
 - <<[value-type](#)>> (p. 152) Represents and IDL *struct* type
- class [dds::core::xtypes::UnionType](#)
 - <<[value-type](#)>> (p. 152) Represents and IDL *union* type

Typedefs

- typedef [dds::core::safe_enum](#)< [TypeKind_def](#) > [dds::core::xtypes::TypeKind](#)
The different type kinds.

6.88.1 Detailed Description

Describes [dds::core::xtypes::DynamicType](#) (p. 1249), [dds::core::xtypes::DynamicData](#) (p. 1208) and related types and functions.

[DynamicType](#) is a mechanism for representing a type at runtime and [DynamicData](#) the way to instantiate data samples of a [DynamicType](#) and manipulate data reflectively.

6.88.2 Typedef Documentation

6.88.2.1 TypeKind

```
typedef dds::core::safe\_enum< TypeKind\_def> dds::core::xtypes::TypeKind
```

The different type kinds.

The actual enumeration is in [TypeKind_def](#) (p. 2273).

See also

[DynamicType::kind\(\)](#) (p. 1251)

6.89 Participant Built-in Topics

Builtin topic for accessing information about the DomainParticipants discovered by RTI Connex.

Classes

- class **dds::topic::ParticipantBuiltinTopicData**
*Entry created when a **dds::domain::DomainParticipant** (p. 1079) is discovered.*

Functions

- `std::string dds::topic::participant_topic_name ()`
Participant builtin topic name.

6.89.1 Detailed Description

Builtin topic for accessing information about the DomainParticipants discovered by RTI Connex.

6.89.2 Function Documentation

6.89.2.1 `participant_topic_name()`

```
std::string dds::topic::participant_topic_name ( )
```

Participant builtin topic name.

Topic (p. 2178) name of the builtin **dds::sub::DataReader** (p. 756) for the **dds::topic::ParticipantBuiltinTopicData** (p. 1639) type

6.90 Topic Built-in Topics

Builtin topic for accessing information about the Topics discovered by RTI Connex.

Classes

- class **dds::topic::TopicBuiltinTopicData**
*Entry created when a **dds::topic::Topic** (p. 2178) object is discovered.*

Functions

- `std::string dds::topic::topic_topic_name ()`
Topic (p. 2178) topic name.

6.90.1 Detailed Description

Builtin topic for accessing information about the Topics discovered by RTI Connex.

6.90.2 Function Documentation

6.90.2.1 topic_topic_name()

```
std::string dds::topic::topic_topic_name ( )
```

Topic (p. 2178) topic name.

Topic (p. 2178) name of the builtin **dds::sub::DataReader** (p. 756) for the **dds::topic::TopicBuiltinTopicData** (p. 2197) type

6.91 Publication Built-in Topics

Builtin topic for accessing information about the Publications discovered by RTI Connex.

Classes

- class **dds::topic::PublicationBuiltinTopicData**
*Entry created when a **dds::pub::DataWriter** (p. 908) is discovered in association with its **dds::pub::Publisher** (p. 1719).*

Functions

- `std::string dds::topic::publication_topic_name ()`
Publication topic name.

6.91.1 Detailed Description

Builtin topic for accessing information about the Publications discovered by RTI Connex.

6.91.2 Function Documentation

6.91.2.1 `publication_topic_name()`

```
std::string dds::topic::publication_topic_name ( )
```

Publication topic name.

Topic (p. 2178) name of the builtin **dds::sub::DataReader** (p. 756) for the **dds::topic::PublicationBuiltinTopicData** (p. 1703) type

6.92 Subscription Built-in Topics

Builtin topic for accessing information about the Subscriptions discovered by RTI Connex.

Classes

- class **dds::topic::SubscriptionBuiltinTopicData**

*Entry created when a **dds::sub::DataReader** (p. 756) is discovered in association with its **dds::sub::Subscriber** (p. 2116).*

Functions

- `std::string dds::topic::subscription_topic_name ()`

Subscription topic name.

6.92.1 Detailed Description

Builtin topic for accessing information about the Subscriptions discovered by RTI Connex.

6.92.2 Function Documentation

6.92.2.1 `subscription_topic_name()`

```
std::string dds::topic::subscription_topic_name ( )
```

Subscription topic name.

Topic (p. 2178) name of the builtin **dds::sub::DataReader** (p. 756) for the **dds::topic::SubscriptionBuiltinTopicData** (p. 2133) type

6.93 Topic traits and data-type support

Traits and operations associated to topic-types.

Modules

- **Topic-type serialization and deserialization**

Provides functions to serialize and deserialize user data types to and from Common Data Representation (CDR) format.

Classes

- struct **dds::topic::is_topic_type**< T >
*Trait that indicates if a type is suitable to be the type of a **dds::topic::Topic** (p. 2178).*
- struct **dds::topic::topic_type_support**< T >
Provides convenience operations for a topic-type.
- struct **dds::topic::topic_type_name**< T >
Provides the name of a topic-type.
- struct **rti::topic::PrintFormatKind_def**
*The definition of the **dds::core::safe_enum** (p. 1972) **PrintFormatKind**.*
- class **rti::topic::PrintFormatProperty**
<<extension>> (p. 156) <<value-type>> (p. 152) A collection of attributes used to configure how data samples will be formatted when converted to a string.
- struct **rti::topic::extensibility**< TopicType >
<<extension>> (p. 156) Indicates the extensibility kind of a topic-type
- struct **rti::topic::topic_type_disabled_copy**< TopicType >
<<extension>> (p. 156) Indicates whether a TopicType is uncopyable
- struct **rti::topic::topic_type_has_external_members**< TopicType >
<<extension>> (p. 156) Indicates if a topic type contains directly or indirectly IDL external members.
- struct **rti::topic::dynamic_type**< TopicType >
Provides a DynamicType that represents an IDL-generated type.

Typedefs

- typedef **dds::core::safe_enum**< **PrintFormatKind_def** > **rti::topic::PrintFormatKind**
*Safe Enumeration (p. 229) of **PrintFormatKind_def** (p. 1687) Format kinds available when converting data samples to string representations.*

Functions

- template<typename TopicType >
std::ostream & **rti::topic::to_string** (std::ostream &out, const TopicType &sample, const **PrintFormatProperty** &print_format= **PrintFormatProperty::Default**())
Prints a data sample to an output stream.
- template<typename TopicType >
std::string **rti::topic::to_string** (const TopicType &sample, const **PrintFormatProperty** &print_format= **PrintFormatProperty::Default**())
Transforms a data sample into a human-readable string format.
- template<typename TopicType >
TopicType **rti::topic::from_string** (RTI_STRING_IN str, **PrintFormatKind** format_kind=PrintFormatKind::JSON)
Creates a data sample from a JSON string representation.

6.93.1 Detailed Description

Traits and operations associated to topic-types.

6.93.2 Typedef Documentation

6.93.2.1 PrintFormatKind

```
typedef dds::core::safe_enum< PrintFormatKind_def> rti::topic::PrintFormatKind
```

Safe Enumeration (p. 229) of **PrintFormatKind_def** (p. 1687) Format kinds available when converting data samples to string representations.

See also

PrintFormatKind_def (p. 1687)

6.93.3 Function Documentation

6.93.3.1 to_string() [1/2]

```
template<typename TopicType >
std::ostream & rti::topic::to_string (
    std::ostream & out,
    const TopicType & sample,
    const PrintFormatProperty & print_format = PrintFormatProperty::Default() )
```

Prints a data sample to an output stream.

```
#include <rti/topic/to_string.hpp>
```

Template Parameters

<i>TopicType</i>	A valid topic-type. Valid types are IDL-generated types (p. 395) that were generated with typecodes enabled, the built-in types (p. 49) and dds::core::xtypes::DynamicData (p. 1208).
------------------	--

Parameters

<i>out</i>	The output stream to print to
<i>sample</i>	The sample to print to the output stream

Parameters

<i>print_format</i>	Properties describing the format with which to print the sample. For example, a sample may be printed in a default format, JSON format or XML format.
---------------------	---

Referenced by `dds::topic::qos::TopicQos::operator>>()`.

6.93.3.2 to_string() [2/2]

```
template<typename TopicType >
std::string rti::topic::to_string (
    const TopicType & sample,
    const PrintFormatProperty & print_format = PrintFormatProperty::Default () )
```

Transforms a data sample into a human-readable string format.

```
#include <rti/topic/to_string.hpp>
```

Template Parameters

<i>TopicType</i>	A valid topic-type. Valid types are IDL-generated types (p. 395) that were generated with typecodes enabled, the built-in types (p. 49) and <code>dds::core::xtypes::DynamicData</code> (p. 1208).
------------------	--

Parameters

<i>sample</i>	The sample to get the string representation of
<i>print_format</i>	Properties describing the format with which to print the sample. For example, a sample may be printed in a default format, JSON format or XML format.

6.93.3.3 from_string()

```
template<typename TopicType >
TopicType rti::topic::from_string (
    RTI_STRING_IN str,
    PrintFormatKind format_kind = PrintFormatKind::JSON )
```

Creates a data sample from a JSON string representation.

```
#include <rti/topic/to_string.hpp>
```

Template Parameters

<i>TopicType</i>	An IDL-generated type (p. 395), generated with typecodes enabled.
------------------	--

For example:

```
Point p = rti::core::xtypes::from_string<Point>("{ \"x\": 1, \"y\": 2 }");
```

Parameters

<i>str</i>	The JSON string to convert to a sample
<i>format_kind</i>	The only supported value is PrintFormatKind::JSON

Returns

The sample created from the JSON string

See also

dds::core::xtypes::DynamicData::from_string (p. 1234)

References **dds::core::xtypes::DynamicData::from_string()**.

6.94 Activity Context

Add contextual information to log messages.

Classes

- class **rti::config::activity_context::AttributeKindMask**

The attributes used in the string representation of the Activity Context can be configured through this mask.

Functions

- void **rti::config::activity_context::set_attribute_mask** (**AttributeKindMask** attribute_mask)

Set the ActivityContextAttributeKindMask of the Activity Context.

6.94.1 Detailed Description

Add contextual information to log messages.

The Activity Context is a group of resources and activities associated with an action such as the creation of an entity.

- A resource is a abstraction of an entity. It can contain attributes such as Topic or domain ID.
- An activity is a general task that the resource is doing, such as "Getting QoS".

Logging context is one of the formats RTI Connex logging infrastructure supports. It is used by default in `PrintFormat_def::DEFAULT`. It provides information about resources and activities. The activity context is used in two places:

- Logging: activity context is one of the `PrintFormat_def` DDS logging infrastructure supports. If that format is set every time RTI Connex logs a message, it will contain the contextual information.
- Heap monitoring: every time memory is allocated and heap monitoring is enabled, the string representation of the activity context will be associated with the allocation. This information will be available when taking the snapshot.

For example, in the creation of a `DataWriter`, the activity context will provide information about:

- Resource: the Publisher creating the `DataWriter`. Attributes of the publisher will be GUID, kind, name and domain ID.
- Activity: entity creation. It will have two parameters, the entity kind and the Topic. In the example below, these are "Writer" and "TestTopic".

The string representation of the above activity context would be:

```
[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000088{Entity=Pu,Name=TestPublisher,Domain=1}|CREATE Writer WITH TOPIC TestTopic]
```

Another example could be when a `DataWriter` writes a sample. The activity context will provide information about:

- Resource: the `DataWriter` writing the sample. The attributes of the `DataWriter` will be GUID, name, kind, Topic, data type, and the domain ID.
- Activity will be "write a sample".

The string representation of the activity context will be:

```
[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName,Entity=DW,Topic=test,Type=Foo,Domain=1}|Write]
```

6.94.2 Function Documentation

6.94.2.1 `set_attribute_mask()`

```
void rti::config::activity_context::set_attribute_mask (
    AttributeKindMask attribute_mask )
```

Set the `ActivityContextAttributeKindMask` of the Activity Context.

Set the `AttributeKindMask` (p. 649) of the Activity Context.

6.95 Compliance Configuration

APIs to configure compliance with certain standard specifications.

Classes

- class **rti::config::compliance::XTypesMask**

This mask configures different aspects of the Extended CDR encoding (XCDR and XCDR2).

Functions

- **XTypesMask** **rti::config::compliance::get_xtypes_mask** ()
Gets the XTypes compliance mask value for the application.
- void **rti::config::compliance::set_xtypes_mask** (**XTypesMask** mask)
Sets the level of compliance of the application with the XTypes specification.
- void **rti::config::compliance::load_compliance_masks** ()
Load the compliance masks from the environment variables.

6.95.1 Detailed Description

APIs to configure compliance with certain standard specifications.

6.95.2 Function Documentation

6.95.2.1 get_xtypes_mask()

```
XTypesMask rti::config::compliance::get_xtypes_mask ( )
```

Gets the XTypes compliance mask value for the application.

```
#include <rti/config/Compliance.hpp>
```

Note

This is a standalone function in the namespace `rti::config::compliance`

The **rti::config::compliance::XTypesMask** (p. 2364) configures different aspects of the Extended CDR encoding (XCDR and XCDR2) for the application.

Returns

The **rti::config::compliance::XTypesMask** (p. 2364) value.

See also

rti::config::compliance::XTypesMask (p. 2364)

rti::config::compliance::get_xtypes_mask() (p. 249)

rti::config::compliance::load_compliance_masks() (p. 250)

6.95.2.2 set_xtypes_mask()

```
void rti::config::compliance::set_xtypes_mask (
    XTypesMask mask )
```

Sets the level of compliance of the application with the XTypes specification.

```
#include <rti/config/Compliance.hpp>
```

Note

This is a standalone function in the namespace `rti::config::compliance`

The `rti::config::compliance::XTypesMask` (p. 2364) configures different aspects of the Extended CDR encoding (XCDR and XCDR2) for the application.

Once you call this function the value of the mask will apply to all the DomainParticipants created after the call. It won't apply to DomainParticipants created before the call.

In general, applications should only set the mask once, before executing any other RTI Connex API. The mask can also be set using the environment variable **NDDS_XTYPES_COMPLIANCE_MASK**.

Parameters

<i>mask</i>	<< <i>in</i> >> (p. 157) Compliance mask.
-------------	---

See also

- `rti::config::compliance::XTypesMask` (p. 2364)
- `rti::config::compliance::get_xtypes_mask()` (p. 249)
- `rti::config::compliance::load_compliance_masks()` (p. 250)

6.95.2.3 load_compliance_masks()

```
void rti::config::compliance::load_compliance_masks ( )
```

Load the compliance masks from the environment variables.

```
#include <rti/config/Compliance.hpp>
```

Note

This is a standalone function in the namespace `rti::config::compliance`

The only compliance mask loaded by this function is the XTypes compliance mask, which can be set using the environment variable **NDDS_XTYPES_COMPLIANCE_MASK**.

See also

- `rti::config::compliance::XTypesMask` (p. 2364)
- `rti::config::compliance::set_xtypes_mask()` (p. 249)
- `rti::config::compliance::get_xtypes_mask()` (p. 249)

6.96 Logging

Configure how much debugging information is reported during runtime and where it is logged.

Modules

- **Activity Context**

Add contextual information to log messages.

Classes

- struct **rti::config::LogLevel_def**

The definition of the `dds::core::safe_enum` (p. 1972) `LogLevel`;

- struct **rti::config::Verbosity_def**

The definition of the `dds::core::safe_enum` (p. 1972) `Verbosity`.

- struct **rti::config::LogCategory_def**

The definition of the `dds::core::safe_enum` (p. 1972) `LogCategory`.

- struct **rti::config::PrintFormat_def**

The definition of the `dds::core::safe_enum` (p. 1972) `PrintFormat`.

- struct **rti::config::LogMessage**

A log message, including the text and additional information.

- class **rti::config::Logger**

The singleton type used to configure RTI Connex logging.

- class **rti::config::ScopedLoggerVerbosity**

Changes the logger verbosity temporarily during the scope of a variable.

Typedefs

- typedef **dds::core::safe_enum< LogLevel_def > rti::config::LogLevel**

The log level at which RTI Connex diagnostic information is logged.

- typedef **dds::core::safe_enum< Verbosity_def > rti::config::Verbosity**

The verbosity at which RTI Connex diagnostic information is logged.

- typedef **dds::core::safe_enum< LogCategory_def > rti::config::LogCategory**

Categories of logged messages.

- typedef **dds::core::safe_enum< PrintFormat_def > rti::config::PrintFormat**

The format used to output RTI Connex diagnostic information.

Enumerations

- enum class `rti::config::SyslogLevel` {
 `rti::config::SyslogLevel::emergency` ,
 `rti::config::SyslogLevel::alert` ,
 `rti::config::SyslogLevel::critical` ,
 `rti::config::SyslogLevel::error` ,
 `rti::config::SyslogLevel::warning` ,
 `rti::config::SyslogLevel::notice` ,
 `rti::config::SyslogLevel::informational` ,
 `rti::config::SyslogLevel::debug` }
- enum class `rti::config::SyslogVerbosity` {
 `rti::config::SyslogVerbosity::silent` ,
 `rti::config::SyslogVerbosity::emergency` ,
 `rti::config::SyslogVerbosity::alert` ,
 `rti::config::SyslogVerbosity::critical` ,
 `rti::config::SyslogVerbosity::error` ,
 `rti::config::SyslogVerbosity::warning` ,
 `rti::config::SyslogVerbosity::notice` ,
 `rti::config::SyslogVerbosity::informational` ,
 `rti::config::SyslogVerbosity::debug` }
- enum class `rti::config::LogFacility` {
 `rti::config::LogFacility::user` ,
 `rti::config::LogFacility::security_event` ,
 `rti::config::LogFacility::service` ,
 `rti::config::LogFacility::middleware` }

6.96.1 Detailed Description

Configure how much debugging information is reported during runtime and where it is logged.

6.96.2 Typedef Documentation

6.96.2.1 LogLevel

```
typedef dds::core::safe_enum< LogLevel_def> rti::config::LogLevel
```

The log level at which RTI Connex diagnostic information is logged.

See also

[LogLevel_def](#) (p. 1435)

6.96.2.2 Verbosity

```
typedef dds::core::safe_enum< Verbosity_def> rti::config::Verbosity
```

The verbosity levels at which RTI Connext diagnostic information is logged.

See also

Verbosity_def (p. 2314)

6.96.2.3 LogCategory

```
typedef dds::core::safe_enum< LogCategory_def> rti::config::LogCategory
```

Categories of logged messages.

See also

LogCategory_def (p. 1425)

6.96.2.4 PrintFormat

```
typedef dds::core::safe_enum< PrintFormat_def> rti::config::PrintFormat
```

The format used to output RTI Connext diagnostic information.

See also

PrintFormat_def (p. 1686)

6.96.3 Enumeration Type Documentation

6.96.3.1 SyslogLevel

```
enum class rti::config::SyslogLevel [strong]
```

Syslog level category assigned to RTI Connext log messages. See [Syslog Level and Verbosity Mapping](#), in the Core Libraries User's Manual, for more information.

Enumerator

emergency	System is unusable. Maps to <code>rti::config::LogLevel_def::FATAL_ERROR</code> (p. 1436).
alert	Should be corrected immediately. Maps to <code>rti::config::LogLevel_def::EXCEPTION</code> (p. 1436).
critical	Critical conditions. Maps to <code>rti::config::LogLevel_def::EXCEPTION</code> (p. 1436).
error	Error conditions. Maps to <code>rti::config::LogLevel_def::EXCEPTION</code> (p. 1436).
warning	May indicate that an error will occur if action is not taken. Maps to <code>rti::config::LogLevel_def::WARNING</code> (p. 1436).
notice	Events that are unusual, but not error conditions. Maps to <code>rti::config::LogLevel_def::STATUS_LOCAL</code> (p. 1436).
informational	Normal operational messages that require no action. Maps to <code>rti::config::LogLevel_def::STATUS_LOCAL</code> (p. 1436).
debug	Information useful to developers for debugging the application. Maps to <code>rti::config::LogLevel_def::STATUS_ALL</code> (p. 1436).

6.96.3.2 SyslogVerbosity

```
enum class rti::config::SyslogVerbosity [strong]
```

The Syslog verbosity levels at which RTI Connex diagnostic information is logged. These Syslog verbosity levels are mapped to `rti::config::Verbosity_def` (p. 2314). See `Syslog Level and Verbosity Mapping`, in the Core Libraries User's Manual, for more information.

Enumerator

silent	No messages will be logged. (lowest verbosity) Equivalent to <code>rti::config::Verbosity_def::silent</code> (p. 2315).
emergency	Emergency, critical, alert, and error messages will be logged. This Syslog verbosity level is translated to <code>rti::config::Verbosity_def::exception</code> (p. 2315) when interpreted by RTI Connex. (That's why this level actually logs more than just emergency messages.)
alert	Emergency, critical, and alert messages will be logged. This Syslog verbosity level is translated to <code>rti::config::Verbosity_def::exception</code> (p. 2315) when interpreted by RTI Connex. (That's why this level actually logs more than just emergency, critical and alert messages.)
critical	Emergency, critical, alert, and error messages will be logged. This Syslog verbosity level is translated to <code>rti::config::Verbosity_def::exception</code> (p. 2315) when interpreted by RTI Connex. (That's why this level actually logs more than just emergency and critical messages.)
error	Emergency, critical, alert, and error messages will be logged. This Syslog verbosity level is translated to <code>rti::config::Verbosity_def::exception</code> (p. 2315) when interpreted by RTI Connex.
warning	Emergency, critical, alert, error, and warning messages will be logged. This Syslog verbosity level is translated to <code>rti::config::Verbosity_def::warning</code> (p. 2315) when interpreted by RTI Connex.
notice	Emergency, critical, alert, error, warning, notice and informational messages will be logged. This Syslog verbosity level is translated to <code>rti::config::Verbosity_def::status_remote</code> (p. 2315) when interpreted by RTI Connex. (That's why this level actually logs more than just emergency, critical, alert, error, warning and notice messages.)
informational	Emergency, critical, alert, error, warning, notice, and informational messages will be logged. This Syslog verbosity level is translated to <code>rti::config::Verbosity_def::status_remote</code> (p. 2315) when interpreted by RTI Connex.
debug	All messages will be logged. This Syslog verbosity level is translated to <code>rti::config::Verbosity_def::status_all</code> (p. 2315) when interpreted by RTI Connex.

6.96.3.3 LogFacility

```
enum class rti::config::LogFacility [strong]
```

A number that identifies the source of a log message.

In the Syslog Protocol, the Facility is a numerical code that represents the machine process that created a Syslog event. RTI Connex uses the facility to represent the source of a given log message.

Enumerator

user	A log message produced by the APIs that log user messages in rti::config::Logger (p. 1426) (e.g, rti::config::Logger::emergency (p. 1432)). Numerical code: 1
security_event	A security-related message logged by the RTI Security Plugins Logging Plugin. Numerical code: 10
service	A log message produced by an Infrastructure Service, such as Routing Service. Infrastructure Services operate using the Core Libraries. The messages that the Core Libraries create are categorized under the MIDDLEWARE facility. Log messages that are directly generated by the Infrastructure Service itself are marked with the SERVICE facility. Numerical code: 22
middleware	A log message produced by RTI Connex Core Libraries. Numerical code: 23

6.97 Version

Retrieve information for the RTI Connex product, the core library, and the C, C++ or Java libraries.

Classes

- class **rti::config::LibraryVersion**
 <<**extension**>> (p. 156) <<**value-type**>> (p. 152) *The version of a single library shipped as part of an RTI Connex distribution.*

Functions

- XMQCPP2DIIExport **rti::core::ProductVersion rti::config::request_reply_api_version ()**
Get the version of the C++ API library.
- XMQCPP2DIIExport std::string **rti::config::request_reply_build_number ()**
Get the build number of the C++ API library.
- **LibraryVersion rti::config::core_version ()**
Get the version of the core library.
- std::string **rti::config::core_build_number ()**
Get the build number of the core library.

- **LibraryVersion rti::config::c_api_version ()**
Get the version of the C API library.
- `std::string rti::config::c_build_number ()`
Get the build number of the C API library.
- **LibraryVersion rti::config::cpp_api_version ()**
Get the version of the C++ API library.
- `std::string rti::config::cpp_build_number ()`
Get the build number of the C++ API library.
- **rti::core::ProductVersion rti::config::product_version ()**
Get the RTI Connex product version.

6.97.1 Detailed Description

Retrieve information for the RTI Connex product, the core library, and the C, C++ or Java libraries.

There are three ways to obtain version information: looking at the revision files, using Visual Studio or the command line, or programmatically at run time. This HTML documentation includes a reference for consulting the APIs that allow you to get version information programmatically. For more information see the RTI Connex DDS Core Libraries User's Manual.

The version information includes four fields:

- Major product version.
- Minor product version.
- Release letter for product version.
- Revision number of product.

6.97.2 Function Documentation

6.97.2.1 request_reply_api_version()

```
XMQCPP2D11Export rti::core::ProductVersion rti::config::request_reply_api_version ( )
```

Get the version of the C++ API library.

6.97.2.2 request_reply_build_number()

```
XMQCPP2D11Export std::string rti::config::request_reply_build_number ( )
```

Get the build number of the C++ API library.

6.97.2.3 core_version()

```
LibraryVersion rti::config::core_version ( )
```

Get the version of the core library.

6.97.2.4 core_build_number()

```
std::string rti::config::core_build_number ( )
```

Get the build number of the core library.

6.97.2.5 c_api_version()

```
LibraryVersion rti::config::c_api_version ( )
```

Get the version of the C API library.

6.97.2.6 c_build_number()

```
std::string rti::config::c_build_number ( )
```

Get the build number of the C API library.

6.97.2.7 cpp_api_version()

```
LibraryVersion rti::config::cpp_api_version ( )
```

Get the version of the C++ API library.

6.97.2.8 cpp_build_number()

```
std::string rti::config::cpp_build_number ( )
```

Get the build number of the C++ API library.

6.97.2.9 product_version()

```
rti::core::ProductVersion rti::config::product_version ( )
```

Get the RTI Connext product version.

6.98 Builtin QoS Profiles

<<**extension**>> (p. 156) QoS libraries and profiles that are automatically built into RTI Connext.

Functions

- `std::string rti::core::builtin_profiles::qos_lib::library_name ()`
A library of non-experimental QoS profiles.
- `std::string rti::core::builtin_profiles::qos_lib::baseline ()`
The most up-to-date QoS default values.
- `std::string rti::core::builtin_profiles::qos_lib::baseline_5_0_0 ()`
The QoS default values for version 5.0.0.
- `std::string rti::core::builtin_profiles::qos_lib::baseline_5_1_0 ()`
The QoS default values for version 5.1.0.
- `std::string rti::core::builtin_profiles::qos_lib::baseline_5_2_0 ()`
The QoS default values for version 5.2.0.
- `std::string rti::core::builtin_profiles::qos_lib::baseline_5_3_0 ()`
The QoS default values for version 5.3.0.
- `std::string rti::core::builtin_profiles::qos_lib::baseline_6_0_0 ()`
The QoS default values for version 6.0.0.
- `std::string rti::core::builtin_profiles::qos_lib::baseline_6_1_0 ()`
The QoS default values for version 6.1.0.
- `std::string rti::core::builtin_profiles::qos_lib::baseline_7_0_0 ()`
The QoS default values for version 7.0.0.
- `std::string rti::core::builtin_profiles::qos_lib::baseline_7_1_0 ()`
The QoS default values for version 7.1.0.
- `std::string rti::core::builtin_profiles::qos_lib::generic_common ()`
A common Participant base profile.
- `std::string rti::core::builtin_profiles::qos_lib::generic_monitoring_common ()`
Enables RTI Monitoring Library.
- `std::string rti::core::builtin_profiles::qos_lib::generic_connext_micro_compatibility ()`
Sets the values necessary to communicate with RTI Connext Micro.
- `std::string rti::core::builtin_profiles::qos_lib::generic_connext_micro_compatibility_2_4_9 ()`
Sets the values necessary to communicate with RTI Connext Micro versions 2.4.4 through at least 2.4.9.
- `std::string rti::core::builtin_profiles::qos_lib::generic_connext_micro_compatibility_2_4_3 ()`
Sets the values necessary to communicate with RTI Connext Micro versions 2.4.3 and earlier.
- `std::string rti::core::builtin_profiles::qos_lib::generic_other_dds_vendor_compatibility ()`
Sets the values necessary to interoperate with other DDS vendors.
- `std::string rti::core::builtin_profiles::qos_lib::generic_510_transport_compatibility ()`

Sets the values necessary to interoperate with RTI Connex 5.1.0 using the UDPv6 and/or SHMEM transports.

- `std::string rti::core::builtin_profiles::qos_lib::generic_security ()`
Loads the DDS Secure builtin plugins.
- `std::string rti::core::builtin_profiles::qos_lib::generic_strict_reliable ()`
Enables strict reliability.
- `std::string rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable ()`
Enables keep-last reliability.
- `std::string rti::core::builtin_profiles::qos_lib::generic_best_effort ()`
Enables best-effort reliability kind.
- `std::string rti::core::builtin_profiles::qos_lib::generic_strict_reliable_high_throughput ()`
A profile that can be used to achieve high throughput.
- `std::string rti::core::builtin_profiles::qos_lib::generic_strict_reliable_low_latency ()`
A profile that can be used to achieve low latency.
- `std::string rti::core::builtin_profiles::qos_lib::generic_participant_large_data ()`
A common Participant base profile to facilitate sending large data.
- `std::string rti::core::builtin_profiles::qos_lib::generic_participant_large_data_monitoring ()`
Configures Participants for large data and monitoring.
- `std::string rti::core::builtin_profiles::qos_lib::generic_strict_reliable_large_data ()`
Configures endpoints for sending large data with strict reliability.
- `std::string rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable_large_data ()`
Configures endpoints for sending large data with keep-last reliability.
- `std::string rti::core::builtin_profiles::qos_lib::generic_strict_reliable_large_data_fast_flow ()`
Configures strictly reliable communication for large data with a fast flow controller.
- `std::string rti::core::builtin_profiles::qos_lib::generic_strict_reliable_large_data_medium_flow ()`
Configures strictly reliable communication for large data with a medium flow controller.
- `std::string rti::core::builtin_profiles::qos_lib::generic_strict_reliable_large_data_slow_flow ()`
Configures strictly reliable communication for large data with a slow flow controller.
- `std::string rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable_large_data_fast_flow ()`
Configures keep-last reliable communication for large data with a fast flow controller.
- `std::string rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable_large_data_medium_flow ()`
Configures keep-last reliable communication for large data with a medium flow controller.
- `std::string rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable_large_data_slow_flow ()`
Configures keep-last reliable communication for large data with a slow flow controller.
- `std::string rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable_transient_local ()`
Persists the samples of a DataWriter as long as the entity exists.
- `std::string rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable_transient ()`
Persists samples using RTI Persistence Service.
- `std::string rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable_persistent ()`
Persists samples in permanent storage, like a disk, using RTI Persistence Service.
- `std::string rti::core::builtin_profiles::qos_lib::generic_auto_tuning ()`
Enables the Turbo Mode batching and Auto Throttle experimental features.
- `std::string rti::core::builtin_profiles::qos_lib::generic_minimal_memory_footprint ()`
Uses a set of QoS which reduces the memory footprint of the application.
- `std::string rti::core::builtin_profiles::qos_lib::generic_monitoring2 ()`
The default QoS profile that the DDS entities created by the RTI Monitoring Library 2.0 use.
- `std::string rti::core::builtin_profiles::qos_lib::pattern_periodic_data ()`
Used for applications that expect periodic data.

- `std::string rti::core::builtin_profiles::qos_lib::pattern_streaming ()`
Used for applications that stream data.
- `std::string rti::core::builtin_profiles::qos_lib::pattern_reliable_streaming ()`
Used for applications that stream data and require reliable communication.
- `std::string rti::core::builtin_profiles::qos_lib::pattern_event ()`
Used for applications that handle events.
- `std::string rti::core::builtin_profiles::qos_lib::pattern_alarm_event ()`
Used for applications that handle alarm events.
- `std::string rti::core::builtin_profiles::qos_lib::pattern_status ()`
Used for applications whose samples represent statuses.
- `std::string rti::core::builtin_profiles::qos_lib::pattern_alarm_status ()`
Used for applications in which samples represent alarm statuses.
- `std::string rti::core::builtin_profiles::qos_lib::pattern_last_value_cache ()`
Used for applications that only need the last published value.
- `std::string rti::core::builtin_profiles::qos_lib_exp::library_name ()`
A library of experimental QoS profiles.
- `std::string rti::core::builtin_profiles::qos_lib_exp::generic_strict_reliable ()`
Enables strict reliability.
- `std::string rti::core::builtin_profiles::qos_lib_exp::generic_keep_last_reliable ()`
Enables keep-last reliability.
- `std::string rti::core::builtin_profiles::qos_lib_exp::generic_best_effort ()`
Enables best-effort reliability kind.
- `std::string rti::core::builtin_profiles::qos_lib_exp::generic_strict_reliable_high_throughput ()`
A profile that can be used to achieve high throughput.
- `std::string rti::core::builtin_profiles::qos_lib_exp::generic_strict_reliable_low_latency ()`
A profile that can be used to achieve low latency.
- `std::string rti::core::builtin_profiles::qos_lib_exp::generic_participant_large_data ()`
A common Participant base profile to facilitate sending large data.
- `std::string rti::core::builtin_profiles::qos_lib_exp::generic_participant_large_data_monitoring ()`
Configures Participants for large data and monitoring.
- `std::string rti::core::builtin_profiles::qos_lib_exp::generic_strict_reliable_large_data ()`
Configures endpoints for sending large data with strict reliability.
- `std::string rti::core::builtin_profiles::qos_lib_exp::generic_keep_last_reliable_large_data ()`
Configures endpoints for sending large data with keep-last reliability.
- `std::string rti::core::builtin_profiles::qos_lib_exp::generic_strict_reliable_large_data_fast_flow ()`
Configures strictly reliable communication for large data with a fast flow controller.
- `std::string rti::core::builtin_profiles::qos_lib_exp::generic_strict_reliable_large_data_medium_flow ()`
Configures strictly reliable communication for large data with a medium flow controller.
- `std::string rti::core::builtin_profiles::qos_lib_exp::generic_strict_reliable_large_data_slow_flow ()`
Configures strictly reliable communication for large data with a slow flow controller.
- `std::string rti::core::builtin_profiles::qos_lib_exp::generic_keep_last_reliable_large_data_fast_flow ()`
Configures keep-last reliable communication for large data with a fast flow controller.
- `std::string rti::core::builtin_profiles::qos_lib_exp::generic_keep_last_reliable_large_data_medium_flow ()`
Configures keep-last reliable communication for large data with a medium flow controller.
- `std::string rti::core::builtin_profiles::qos_lib_exp::generic_keep_last_reliable_large_data_slow_flow ()`
Configures keep-last reliable communication for large data with a slow flow controller.
- `std::string rti::core::builtin_profiles::qos_lib_exp::generic_keep_last_reliable_transient_local ()`

- Persists the samples of a DataWriter as long as the entity exists.*
- `std::string rti::core::builtin_profiles::qos_lib_exp::generic_keep_last_reliable_transient ()`
Persists samples using RTI Persistence Service.
 - `std::string rti::core::builtin_profiles::qos_lib_exp::generic_keep_last_reliable_persistent ()`
Persists samples in permanent storage, like a disk, using RTI Persistence Service.
 - `std::string rti::core::builtin_profiles::qos_lib_exp::generic_auto_tuning ()`
Enables the Turbo Mode batching and Auto Throttle experimental features.
 - `std::string rti::core::builtin_profiles::qos_lib_exp::generic_minimal_memory_footprint ()`
Uses a set of QoS which reduces the memory footprint of the application.
 - `std::string rti::core::builtin_profiles::qos_lib_exp::pattern_periodic_data ()`
Used for applications that expect periodic data.
 - `std::string rti::core::builtin_profiles::qos_lib_exp::pattern_streaming ()`
Used for applications that stream data.
 - `std::string rti::core::builtin_profiles::qos_lib_exp::pattern_reliable_streaming ()`
Used for applications that stream data and require reliable communication.
 - `std::string rti::core::builtin_profiles::qos_lib_exp::pattern_event ()`
Used for applications that handle events.
 - `std::string rti::core::builtin_profiles::qos_lib_exp::pattern_alarm_event ()`
Used for applications that handle alarm events.
 - `std::string rti::core::builtin_profiles::qos_lib_exp::pattern_status ()`
Used for applications whose samples represent statuses.
 - `std::string rti::core::builtin_profiles::qos_lib_exp::pattern_alarm_status ()`
Used for applications in which samples represent alarm statuses.
 - `std::string rti::core::builtin_profiles::qos_lib_exp::pattern_last_value_cache ()`
Used for applications that only need the last published value.
 - `std::string rti::core::builtin_profiles::qos_snippet_lib::library_name ()`
A library of QoS Snippets.
 - `std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_protocol_common ()`
QoS Snippet that configures the reliability protocol with a common configuration.
 - `std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_protocol_keep_all ()`
QoS Snippet that configures the reliability protocol for KEEP_ALL.
 - `std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_protocol_keep_↔last ()`
QoS Snippet that configures the reliability protocol for KEEP_LAST.
 - `std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_protocol_high_↔rate ()`
QoS Snippet that configures the reliability protocol for sending data at a high rate.
 - `std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_protocol_low_↔latency ()`
QoS Snippet that configures the reliability protocol for sending data at low latency.
 - `std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_protocol_large_↔data ()`
QoS Snippet that configures the reliability protocol for large data.
 - `std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_protocol_↔dynamicmemalloc ()`
Configures the DataWriter and DataReader caches to use dynamic memory allocation for Large Data samples.

- `std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_discovery_common ()`
QoS Snippet that optimizes discovery with a common configuration.
- `std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_discovery_participant_↵ compact ()`
QoS Snippet that optimizes the Participant QoS to send less discovery information.
- `std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_discovery_endpoint_fast ()`
QoS Snippet that optimizes the Endpoint Discovery to be faster.
- `std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_transport_large_buffers ()`
QoS Snippet that increases the Participant default buffer that shm and udpv4 use.
- `std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_reliability_reliable ()`
QoS Snippet that sets RELIABILITY QoS to RELIABLE.
- `std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_reliability_best_effort ()`
QoS Snippet that sets RELIABILITY QoS to BEST_EFFORT.
- `std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_history_keep_last_1 ()`
QoS Snippet that sets HISTORY QoS to KEEP_LAST kind with depth 1.
- `std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_history_keep_all ()`
QoS Snippet that sets HISTORY QoSPolicy to KEEP_ALL kind.
- `std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_publish_mode_asynchronous ()`
QoS Snippet that sets PUBLISH_MODE QoSPolicy to ASYNCHRONOUS kind.
- `std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_durability_transient_local ()`
QoS Snippet that sets DURABILITY QoSPolicy to TRANSIENT_LOCAL kind.
- `std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_durability_transient ()`
QoS Snippet that sets DURABILITY QoSPolicy to TRANSIENT kind.
- `std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_durability_persistent ()`
QoS Snippet that sets DURABILITY QoSPolicy to PERSISTENT kind.
- `std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_batching_enable ()`
QoS Snippet that sets BATCH QoSPolicy to true.
- `std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_flow_controller_838mbps ()`
QoS Snippet that configures and set a FlowController of 838 Mbps.
- `std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_flow_controller_209mbps ()`
QoS Snippet that configures and sets a FlowController of 209 Mbps.
- `std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_flow_controller_52mbps ()`
QoS Snippet that configures and sets a FlowController of 52 Mbps.
- `std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_feature_auto_tuning_enable ()`
QoS Snippet that enables auto_throttle and turbo_mode to true.
- `std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_feature_monitoring_enable ()`
QoS Snippet that enables the use of the RTI Monitoring Library.
- `std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_feature_monitoring2_enable ()`
QoS Snippet that enables the use of the RTI Monitoring Library 2.0.
- `std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_feature_security_enable ()`
QoS Snippet that enables security using the Builtin Security Plugins.
- `std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_feature_topic_query_enable ()`
QoS Snippet that enables Topic Query.
- `std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_transport_tcp_lan_client ()`
QoS Snippet that configures a TCP LAN Client over DDS.
- `std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_transport_tcp_wan_symmetric_client ()`

- QoS Snippet that configures a symmetric WAN TCP Client over DDS.*

 - `std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_transport_tcp_wan_asymmetric_server ()`

QoS Snippet that an asymmetric WAN TCP Server over DDS.

 - `std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_transport_tcp_wan_asymmetric_client ()`

QoS Snippet that configures an asymmetric WAN TCP Client over DDS.

 - `std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_transport_udp_avoid_ip_fragmentation ()`

QoS Snippet that configures RTI Connex and the UDP built-in transports (UDPv4, UDPv6, UDPv4_WAN) to avoid IP fragmentation.

 - `std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_transport_udp_wan ()`

QoS Snippet that enables the RTI Real-Time WAN Transport (UDPv4_WAN).

 - `std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_compatibility_connex_micro_version_2_4_3 ()`

QoS Snippet that configures sets LIVELINESS QoS to be compatible with RTI Connex Micro 2.4.3.

 - `std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_compatibility_other_dds_vendors_enable ()`

QoS Snippet that configures RTI Connex to interoperate with other DDS vendors.

 - `std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_compatibility_5_1_0_transport_enable ()`

QoS Snippet that configures RTI Connex to interoperate with RTI Connex 5.1.0 and below for UDPv6 and SHMEM transports.

6.98.1 Detailed Description

<<**extension**>> (p. 156) QoS libraries and profiles that are automatically built into RTI Connex.

The built-in profiles can be accessed in QoS XML configuration files and by using any of the APIs that accept library and profiles names by using the constants or string versions as documented on this page.

The built-in profiles are provided as a way to quickly and easily configure RTI Connex applications with a set of QoS values aimed at achieving a specific behavior.

There are three built-in QoS libraries:

- **BuiltinQosLib**: A library containing built-in QoS Profiles.
- **BuiltinQosLibExp**: A library containing experimental QoS Profiles. Experimental QoS Profiles are new QoS Profiles that have been tested internally but have not gone through an extensive validation period. Therefore, some of the settings may change in future releases based on customer and internal feedback. After validation, experimental QoS Profiles will be moved into the non-experimental library.
- **BuiltinQosSnippetLib**: A library containing QoS Snippets that are ready to use as elements for the QoS Profile composition pattern. For further information about this pattern visit the following article: <https://community.rti.com/best-practices/qos-profile-inheritance-and-composition-guidance>

There are three types of profiles:

- **Baseline.X.X.X**: These profiles represent the QoS defaults for /ndds version X.X.X. To access the defaults for the latest RTI Connex version, use the `BuiltinQosLib::Baseline` profile.

- **Generic.X:** These profiles allow you to easily configure different features and communication use-cases with RTI Connex. For example, there is a `Generic.StrictReliable` profile for use when your application has a requirement for no data loss.
- **Pattern.X:** These profiles inherit from the `Generic.X` profiles and allow you to configure various domain-specific communication use cases. For example, there is a `Pattern.Alarm` profile that can be used to manage the generation and consumption of alarm events.

There are several types of QoS Snippets. These are the current QoS Snippets available:

- **Optimization.X:** these QoS Snippets optimize one or more parameters related to the X QoS Policy or a specific use-case.
- **QoSPolicy.X.Y:** these QoS Snippets set a specific QoS Policy X to the value Y.
- **Feature.X:** these QoS Snippets set all the needed QoS values to enable/modify a specific feature.
- **Transport.X:** these QoS Snippets set a specific transport defined by X. This transport may have specific scenarios that are also specified in the name.
- **Compatibility.X:** these QoS Snippets change the specific QoS policies to ensure compatibility with specific products or versions specified by X.

These QoS Profiles can be used as base profiles in XML configuration, then QoS Snippets can modify specific aspects of this base QoS Profile, and finally files and values can be modified to fit a specific system's needs. For example:

```
<qos_profile name="MyProfile" base_name="BuiltinQosLib::Generic.Common">
  <domain_participant_qos base_name="BuiltinQosLib::Generic.Monitoring.Common">
    <base_name>
      <element>BuiltinQosSnippetLib::Feature.Monitoring.Enable</element>
    </base_name>
    <!-- Override and add values -->
  </domain_participant_qos>
</qos_profile>
```

These names can also be used to look up the built-in QoS Profiles and QoS Snippets in the default `QosProvider` (`dds::core::QosProvider::Default()` (p. 1761)), for example:

```
dds::sub::qos::DataReaderQos reader_qos =
  dds::core::QosProvider::Default().datareader_qos(
    rti::core::builtin_profiles::qos_lib::strict_reliable());
dds::sub::qos::DataReaderQos reader_qos =
  dds::core::QosProvider::Default().datareader_qos(
    rti::core::builtin_profiles::qos_snippet_lib::snippet_feature_monitoring_enable());
```

Note that the QoS Profile and QoS Snippets names also contain the library name. For example `strict_reliable()` returns `"BuiltinQosLib::Generic.StrictReliable"`

The QoS Profiles and QoS Snippets are contained in three different libraries, in three namespaces:

- `rti::core::builtin_profiles::qos_lib` (p. 499),
- `rti::core::builtin_profiles::qos_lib_exp` (p. 502), and
- `rti::core::builtin_profiles::qos_snippet_lib` (p. 503)

All the built-in QoS Profiles and QoS Snippets are documented in the `BaselineRoot.documentationONLY.xml` and `BuiltinProfiles.documentationONLY.xml` files that are included in the `NDDSHOME/xml` directory of the RTI Connex installation.

- `BaselineRoot.documentationONLY.xml` contains the root baseline QoS profile that corresponds to the default values of RTI Connex 5.0.0.
- `BuiltinProfiles.documentationONLY.xml` contains the rest of the built-in QoS Profiles and QoS Snippets.

6.98.2 Function Documentation

6.98.2.1 `library_name()` [1/3]

```
std::string rti::core::builtin_profiles::qos_lib::library_name ( )
```

A library of non-experimental QoS profiles.

String-version: "BuiltinQosLib"

6.98.2.2 `baseline()`

```
std::string rti::core::builtin_profiles::qos_lib::baseline ( )
```

The most up-to-date QoS default values.

You can use this profile if you want your application to pick up and use any new QoS default settings each time a new RTI Connex version is released – without changing your application code.

String-version: "Baseline"

6.98.2.3 `baseline_5_0_0()`

```
std::string rti::core::builtin_profiles::qos_lib::baseline_5_0_0 ( )
```

The QoS default values for version 5.0.0.

String-version: "Baseline.5.0.0"

6.98.2.4 `baseline_5_1_0()`

```
std::string rti::core::builtin_profiles::qos_lib::baseline_5_1_0 ( )
```

The QoS default values for version 5.1.0.

String-version: "Baseline.5.1.0"

6.98.2.5 `baseline_5_2_0()`

```
std::string rti::core::builtin_profiles::qos_lib::baseline_5_2_0 ( )
```

The QoS default values for version 5.2.0.

String-version: "Baseline.5.2.0"

6.98.2.6 `baseline_5_3_0()`

```
std::string rti::core::builtin_profiles::qos_lib::baseline_5_3_0 ( )
```

The QoS default values for version 5.3.0.

String-version: "Baseline.5.3.0"

6.98.2.7 `baseline_6_0_0()`

```
std::string rti::core::builtin_profiles::qos_lib::baseline_6_0_0 ( )
```

The QoS default values for version 6.0.0.

String-version: "Baseline.6.0.0"

6.98.2.8 `baseline_6_1_0()`

```
std::string rti::core::builtin_profiles::qos_lib::baseline_6_1_0 ( )
```

The QoS default values for version 6.1.0.

String-version: "Baseline.6.1.0"

6.98.2.9 `baseline_7_0_0()`

```
std::string rti::core::builtin_profiles::qos_lib::baseline_7_0_0 ( )
```

The QoS default values for version 7.0.0.

String-version: "Baseline.7.0.0"

6.98.2.10 `baseline_7_1_0()`

```
std::string rti::core::builtin_profiles::qos_lib::baseline_7_1_0 ( )
```

The QoS default values for version 7.1.0.

String-version: "Baseline.7.1.0"

6.98.2.11 generic_common()

```
std::string rti::core::builtin_profiles::qos_lib::generic_common ( )
```

A common Participant base profile.

All Generic.X and Pattern.X profiles inherit from this profile.

String-version: "Generic.Common"

6.98.2.12 generic_monitoring_common()

```
std::string rti::core::builtin_profiles::qos_lib::generic_monitoring_common ( )
```

Enables RTI Monitoring Library.

Generic Base participant QoS Profile that enables RTI Monitoring Library.

Use of this QoS Profile is deprecated. It is included for backwards compatibility.

Instead of using the (deprecated) "BuiltinQosLib::Generic.Monitoring.Common", apply the QoS Snippet "BuiltinQos← SnippetLib::Feature.Monitoring.Enable" via composition. For example:

```
<qos_profile name="MyProfile">
  <base_name>
    <element>BuiltinQosSnippetLib::Feature.Monitoring.Enable</element>
  </base_name>
</qos_profile>
```

Legacy applications may use this QoS Profile via inheritance. To do this, create a derived QoS Profile that inherits from this one. For example:

```
<qos_profile name="MyProfile" base_name="BuiltinQosLib::Generic.StrictReliable">
  <domain_participant_qos base_name="BuiltinQosLib::Generic.Monitoring.Common">
  </domain_participant_qos>
</qos_profile>
```

String-version: "Generic.Monitoring.Common"

6.98.2.13 generic_connex_micro_compatibility()

```
std::string rti::core::builtin_profiles::qos_lib::generic_connex_micro_compatibility ( )
```

Sets the values necessary to communicate with RTI Connex Micro.

This profile will always represent the QoS values required for interoperability between the most recent version of RTI Connex Micro at the time of release of the most recent version of RTI Connex.

String-version: "Generic.ConnexMicroCompatibility"

6.98.2.14 `generic_connex_micro_compatibility_2_4_9()`

```
std::string rti::core::builtin_profiles::qos_lib::generic_connex_micro_compatibility_2_4_9 ( )
```

Sets the values necessary to communicate with RTI Connex Micro versions 2.4.4 through at least 2.4.9.

At the time of the release of RTI Connex 5.3.0 it was not necessary to set any QoS values in order to interoperate with RTI Connex Micro. This applies to RTI Connex Micro versions 2.4.4 and later. The most recent version of RTI Connex Micro at the time of release of RTI Connex 5.3.0 was 2.4.9. There is no guarantee that this profile will interoperate with versions of RTI Connex Micro after 2.4.9.

String-version: "Generic.ConnexMicroCompatibility.2.4.9"

6.98.2.15 `generic_connex_micro_compatibility_2_4_3()`

```
std::string rti::core::builtin_profiles::qos_lib::generic_connex_micro_compatibility_2_4_3 ( )
```

Sets the values necessary to communicate with RTI Connex Micro versions 2.4.3 and earlier.

RTI Connex Micro versions 2.4.3 and earlier only supported the `dds::core::policy::LivelinessKind::MANUAL_BY_TOPIC` LivelinessQos kind. In order to be compatible with these versions of RTI Connex Micro, the **`dds::sub::DataReader`** (p. 756) and **`dds::pub::DataWriter`** (p. 908) must have their Liveliness kind changed to this value because the default kind in RTI Connex is `dds::core::policy::LivelinessKind::AUTOMATIC`.

String-version: "Generic.ConnexMicroCompatibility.2.4.3"

6.98.2.16 `generic_other_dds_vendor_compatibility()`

```
std::string rti::core::builtin_profiles::qos_lib::generic_other_dds_vendor_compatibility ( )
```

Sets the values necessary to interoperate with other DDS vendors.

String-version: "Generic.OtherDDSVendorCompatibility"

6.98.2.17 `generic_510_transport_compatibility()`

```
std::string rti::core::builtin_profiles::qos_lib::generic_510_transport_compatibility ( )
```

Sets the values necessary to interoperate with RTI Connex 5.1.0 using the UDPv6 and/or SHMEM transports.

String-version: "Generic.510TransportCompatibility"

6.98.2.18 generic_security()

```
std::string rti::core::builtin_profiles::qos_lib::generic_security ( )
```

Loads the DDS Secure builtin plugins.

Generic Base Participant Profile that enables the builtin DDS Security Plugins.

Use of this QoS Profile is deprecated. It is included for backwards compatibility.

Instead of using the (deprecated) "BuiltinQosLib::Generic.Security", apply the QoS Snippet "BuiltinQosSnippetLib::Feature.Security.Enable" via composition. For example:

```
<qos_profile name="MyProfile">
  <base_name>
    <element>BuiltinQosSnippetLib::Feature.Security.Enable</element>
  </base_name>
</qos_profile>
```

Legacy applications may use this QoS Profile via inheritance. To do this, create a derived QoS Profile that inherits from this one. For example:

```
<qos_profile name="MyProfile" base_name="BuiltinQosLib::Generic.StrictReliable">
  <domain_participant_qos base_name="BuiltinQosLib::Generic.Security">
</qos_profile>
```

String-version: "Generic.Security"

6.98.2.19 generic_strict_reliable() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_strict_reliable ( )
```

Enables strict reliability.

Configures communication to be "strict reliable" where every sample is reliably delivered.

Combines the use of the **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 1881) for **dds::core::policy::Reliability** (p. 1873) with a **dds::core::policy::HistoryKind::KEEP_ALL** for the **dds::core::policy::HistoryKind** (p. 325).

This QoS Profile also optimizes the reliability protocol setting for this configuration.

String-version: "Generic.StrictReliable"

6.98.2.20 generic_keep_last_reliable() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable ( )
```

Enables keep-last reliability.

Like the Generic.StrictReliable profile, this profile ensures in-order delivery of samples. However, new data can overwrite data that has not yet been acknowledged by the reader, therefore causing possible sample loss.

String-version: "Generic.KeepLastReliable"

6.98.2.21 `generic_best_effort()` [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_best_effort ( )
```

Enables best-effort reliability kind.

This profile enables best-effort communication. No effort or resources are spent to track whether or not sent samples are received. Minimal resources are used. This is the most deterministic method of sending data since there is no indeterministic delay that can be introduced by resending data. Data samples may be lost. This setting is good for periodic data.

String-version: "Generic.BestEffort"

6.98.2.22 `generic_strict_reliable_high_throughput()` [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_strict_reliable_high_throughput ( )
```

A profile that can be used to achieve high throughput.

This QoS Profile extends the `rti::core::builtin_profiles::qos_lib::generic_strict_reliable()` (p. 269) QoS Profile to perform additional, fine-grained performance tuning specific to applications that send continuously streaming data. The parameters specified here add to and/or override the parameters specified in the `rti::core::builtin_profiles::qos_lib::generic_strict_reliable()` (p. 269) QoS Profile..

String-version: "Generic.StrictReliable.HighThroughput"

6.98.2.23 `generic_strict_reliable_low_latency()` [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_strict_reliable_low_latency ( )
```

A profile that can be used to achieve low latency.

This QoS Profile extends the `rti::core::builtin_profiles::qos_lib::generic_strict_reliable()` (p. 269) QoS Profile to perform additional, fine-grained performance tuning specific to applications that send continuously streaming data. The parameters specified here add to and/or override the parameters specified in the `rti::core::builtin_profiles::qos_lib::generic_strict_reliable()` (p. 269) QoS Profile.

String-version: "Generic.StrictReliable.LowLatency"

6.98.2.24 `generic_participant_large_data()` [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_participant_large_data ( )
```

A common Participant base profile to facilitate sending large data.

This is a common Participant base QoS Profile that configures 3 different flow controllers: 838, 209, and 52 Mbps that can each be used to throttle application data flow at different rates.

String-version: "Generic.Participant.LargeData"

6.98.2.25 generic_participant_large_data_monitoring() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_participant_large_data_monitoring ( )
```

Configures Participants for large data *and* monitoring.

This is a common base Participant QoS Profile to configure Participants to both handle large data and use RTI Monitoring Library.

This QoS Profile is deprecated. It is included for backwards compatibility.

It is recommended that instead of inheriting from this QoS Profile, new applications apply the following QoS Snippets to their application-specific QoS Profiles:

Enable Monitoring

- **rti::core::builtin_profiles::qos_snippet_lib::snippet_feature_monitoring_enable()** (p. 296)

Enable Large Data + optimizations

- **rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_publish_mode_asynchronous()** (p. 292)
- **rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_protocol_large_data()** (p. 288)
- **rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_protocol_dynamicmemalloc()** (p. 289)

String-version: "Generic.Participant.LargeData.Monitoring"

See also

rti::core::builtin_profiles::qos_lib::generic_participant_large_data() (p. 270)

rti::core::builtin_profiles::qos_lib::generic_monitoring_common() (p. 267)

6.98.2.26 generic_strict_reliable_large_data() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_strict_reliable_large_data ( )
```

Configures endpoints for sending large data with strict reliability.

This QoS Profile extends the **rti::core::builtin_profiles::qos_lib::generic_participant_large_data()** (p. 270) QoS Profile to handle sending large samples. This QoS Profile optimizes memory usage per sample within RTI Connex, but it does not do any flow control. You can use this QoS Profile directly, which enables asynchronous publication with the default flow controller (i.e. no flow control) or you can use one of the three QoS Profiles below (Generic.Strict↔Reliable.LargeData.*Flow), which uses this QoS Profile as a common base QoS Profile. Each of these three QoS Profiles uses one of the three flow controllers defined in **rti::core::builtin_profiles::qos_lib::generic_participant_↔large_data()** (p. 270) in order to throttle application data flow.

String-version: "Generic.StrictReliable.LargeData"

6.98.2.27 `generic_keep_last_reliable_large_data()` [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable_large_data ( )
```

Configures endpoints for sending large data with keep-last reliability.

This QoS Profile is similar to the `rti::core::builtin_profiles::qos_lib::generic_participant_large_data()` (p. 270) QoS Profile, but also adds QoS Snippets to handle sending large data. You can use this QoS Profile directly, which enables the default flow controller (i.e., no flow control) or you can choose one of the three QoS Profiles below (`Generic.KeepLastReliable.LargeData.*Flow`) which uses this QoS Profile as a common base QoS Profile. Each of these three QoS Profiles uses one of the three flow controllers defined in `rti::core::builtin_profiles::qos_lib::generic_participant_large_data()` (p. 270) in order to throttle application data flow.

String-version: "Generic.KeepLastReliable.LargeData"

6.98.2.28 `generic_strict_reliable_large_data_fast_flow()` [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_strict_reliable_large_data_fast_flow ( )
```

Configures strictly reliable communication for large data with a fast flow controller.

Strictly reliable communication for large data with a 838 Mbps (~ 100 MB/sec) flow controller.

String-version: "Generic.StrictReliable.LargeData.FastFlow"

6.98.2.29 `generic_strict_reliable_large_data_medium_flow()` [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_strict_reliable_large_data_medium_flow ( )
```

Configures strictly reliable communication for large data with a medium flow controller.

Strictly reliable communication for large data with a 209Mbps (~ 25 MB/sec) flow controller.

String-version: "Generic.StrictReliable.LargeData.MediumFlow"

6.98.2.30 `generic_strict_reliable_large_data_slow_flow()` [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_strict_reliable_large_data_slow_flow ( )
```

Configures strictly reliable communication for large data with a slow flow controller.

Strictly reliable communication for large data with a 52 MB/sec (~ 6.25 MB/sec) flow controller.

String-version: "Generic.StrictReliable.LargeData.SlowFlow"

6.98.2.31 generic_keep_last_reliable_large_data_fast_flow() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable_large_data_fast_flow  
( )
```

Configures keep-last reliable communication for large data with a fast flow controller.

Keep-last reliable communication for large data with a 838 Mbps (~ 100 MB/sec) flow controller.

String-version: "Generic.KeepLastReliable.LargeData.FastFlow"

6.98.2.32 generic_keep_last_reliable_large_data_medium_flow() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable_large_data_medium_↵  
flow ( )
```

Configures keep-last reliable communication for large data with a medium flow controller.

Keep-last reliable communication for large data with a 209Mbps (~ 25 MB/sec) flow controller.

String-version: "Generic.KeepLastReliable.LargeData.MediumFlow"

6.98.2.33 generic_keep_last_reliable_large_data_slow_flow() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable_large_data_slow_flow  
( )
```

Configures keep-last reliable communication for large data with a slow flow controller.

Keep-last reliable communication for large data with a 52 MB/sec (~ 6.25 MB/sec) flow controller.

String-version: "Generic.KeepLastReliable.LargeData.SlowFlow"

6.98.2.34 generic_keep_last_reliable_transient_local() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable_transient_local ( )
```

Persists the samples of a DataWriter as long as the entity exists.

This profile extends the **rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable()** (p. 269) profile, but persists the samples of a **dds::pub::DataWriter** (p. 908) as long as the entity exists in order to deliver them to late-joining DataReaders.

String-version: "Generic.KeepLastReliable.TransientLocal"

6.98.2.35 `generic_keep_last_reliable_transient()` [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable_transient ( )
```

Persists samples using RTI Persistence Service.

This profile extends the `rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable()` (p. 269) profile, but persists samples using Persistence Service in order to deliver them to late-joining DataReaders.

String-version: "Generic.KeepLastReliable.Transient"

6.98.2.36 `generic_keep_last_reliable_persistent()` [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable_persistent ( )
```

Persists samples in permanent storage, like a disk, using RTI Persistence Service.

This profile extends the `rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable()` (p. 269) profile, but persists samples in permanent storage, such as a disk, using Persistence Service in order to deliver them to late-joining DataReaders.

String-version: "Generic.KeepLastReliable.Persistent"

6.98.2.37 `generic_auto_tuning()` [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_auto_tuning ( )
```

Enables the Turbo Mode batching and Auto Throttle experimental features.

Turbo Mode batching adjusts the maximum number of bytes of a batch based on how frequently samples are being written. Auto Throttle auto-adjusts the speed at which a writer will write samples, based on the number of unacknowledged samples in its queue.

These features are designed to auto-adjust the publishing behavior within a system in order to achieve the best possible performance with regards to throughput and latency.

String-version: "Generic.AutoTuning"

6.98.2.38 `generic_minimal_memory_footprint()` [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::generic_minimal_memory_footprint ( )
```

Uses a set of QoS which reduces the memory footprint of the application.

Uses a set of QoS which reduces the memory footprint of the application.

String-version: "Generic.MinimalMemoryFootprint"

6.98.2.39 generic_monitoring2()

```
std::string rti::core::builtin_profiles::qos_lib::generic_monitoring2 ( )
```

The default QoS profile that the DDS entities created by the RTI Monitoring Library 2.0 use.

This profile inherits from `rti::core::builtin_profiles::qos_lib::generic_minimal_memory_footprint()` (p. 274).

The following DomainParticipant QoS policy of this profile cannot be modified and it is overwritten by the RTI Monitoring Library 2.0:

- Discovery Config Built-in Channel Kind.

The following DataWriter and DataReader QoS policies of this profile cannot be modified and they are overwritten by the RTI Monitoring Library 2.0:

- Reliability Kind.
- Durability Kind.
- History Kind.
- Publish Mode Kind.
- Protocol -> RTPS Reliable Writer -> Max Heartbeat Retries.

This profile uses Topic Filters to select the DataWriter and DataReader QoS depending on the Observability Distribution Topic.

You should be using this profile or a profile inheriting from it when you configure the distribution of telemetry data using the `<distribution_settings>` tag under `<monitoring>` for the `<participant_factory_qos>`.

Note: This profile does not enable the use of the RTI Monitoring Library 2.0. To do that you can use the Snippet `rti::core::builtin_profiles::qos_snippet_lib::snippet_feature_monitoring2_enable()` (p. 296).

String-version: "Generic.Monitoring2"

MONITORING_PERIODIC_TOPIC_NAME
MONITORING_EVENT_TOPIC_NAME
MONITORING_LOGGING_TOPIC_NAME

6.98.2.40 pattern_periodic_data() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::pattern_periodic_data ( )
```

Used for applications that expect periodic data.

This QoS Profile is intended to be used for applications that expect periodic data such as sensor data. The deadline that is set in this profile can be used to detect when DataWriters are not publishing data with the expected periodicity.

String-version: "Pattern.PeriodicData"

6.98.2.41 pattern_streaming() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::pattern_streaming ( )
```

Used for applications that stream data.

The data sent in streaming applications is commonly periodic. Therefore this profile simply inherits from the **rti::core::builtin_profiles::qos_lib::pattern_periodic_data()** (p.275) profile. Note: With this QoS Profile, the application may lose data, which may be acceptable in use cases such as video conferencing.

String-version: "Pattern.Streaming"

6.98.2.42 pattern_reliable_streaming() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::pattern_reliable_streaming ( )
```

Used for applications that stream data *and* require reliable communication.

Sometimes streaming applications require reliable communication while still tolerating some data loss. In this case, we inherit from the **rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable()** (p. 269) QoS Profile and the following QoS Snippets:

- **rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_reliability_reliable()** (p. 291)
- **rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_history_keep_last_1()** (p. 292)
- **rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_protocol_keep_last()** (p. 287)

This QoS Snippet also increases the **dds::core::policy::History::depth** (p. 1349) to reduce the probability of losing samples.

String-version: "Pattern.ReliableStreaming"

6.98.2.43 pattern_event() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::pattern_event ( )
```

Used for applications that handle events.

This QoS Profile can be used by applications in which samples represent events such as button pushes or alerts. When events are triggered, the system should almost always do something, meaning that you don't want the system to lose the event. This means that the system requires strictly reliable communication. To enable it, use the following QoS Snippets:

- **rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_reliability_reliable()** (p. 291)
- **rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_history_keep_all()** (p. 292)
- **rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_protocol_keep_all()** (p. 286)

Since events and alerts are critical and non-periodic data, it is important to detect situations in which communication between a **dds::pub::DataWriter** (p. 908) and **dds::sub::DataReader** (p. 756) is broken. This is why this profile sets the **dds::core::policy::Liveliness** (p. 1389). If the **dds::pub::DataWriter** (p. 908) does not assert its liveliness in a timely manner, the **dds::sub::DataReader** (p. 756) will report 'loss of liveliness' to the application.

String-version: "Pattern.Event"

6.98.2.44 pattern_alarm_event() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::pattern_alarm_event ( )
```

Used for applications that handle alarm events.

An alarm is a type of event; therefore this profile simply inherits from **rti::core::builtin_profiles::qos_lib::pattern_event()** (p. 276).

String-version: "Pattern.AlarmEvent"

6.98.2.45 pattern_status() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::pattern_status ( )
```

Used for applications whose samples represent statuses.

This QoS Profile can be used by applications in which samples represent state variables whose values remain valid as long as they don't explicitly change. State variables typically do not change periodically. State variables and their values should also be available to applications that appear after the value originally changed because it is unreasonable to have to wait until the next change of state, which may be indeterminate.

Whether to use this QoS Profile or **rti::core::builtin_profiles::qos_lib::pattern_periodic_data()** (p. 275) can often be an application choice. For example, if a DataWriter is publishing temperature sensor data, it could use the **rti::core::builtin_profiles::qos_lib::pattern_periodic_data()** (p. 275) QoS Profile and publish the data at a fixed rate or it could use the **rti::core::builtin_profiles::qos_lib::pattern_status()** (p. 277) QoS Profile and only publish the temperature when it changes more than 1 degree.

String-version: "Pattern.Status"

6.98.2.46 pattern_alarm_status() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::pattern_alarm_status ( )
```

Used for applications in which samples represent alarm statuses.

An alarm status is a type of status; therefore this QoS Profile simply inherits from `rti::core::builtin_profiles::qos_lib::pattern_status()` (p. 277).

String-version: "Pattern.AlarmStatus"

6.98.2.47 pattern_last_value_cache() [1/2]

```
std::string rti::core::builtin_profiles::qos_lib::pattern_last_value_cache ( )
```

Used for applications that only need the last published value.

With this QoS Profile, a `dds::pub::DataWriter` (p. 908) will keep in its queue the last value that was published for each sample instance. Late-joining DataReaders will get that value when they join the system. This QoS Profile inherits from `rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable_transient_local()` (p. 273) because the use case requires delivery to late-joiners.

String-version: "Pattern.LastValueCache"

6.98.2.48 library_name() [2/3]

```
std::string rti::core::builtin_profiles::qos_lib_exp::library_name ( )
```

A library of experimental QoS profiles.

Experimental profiles are new profiles that have been tested internally but have not gone through an extensive validation period. Therefore some of the settings may change in future releases based on customer and internal feedback. After validation, experimental profiles will be moved into the non-experimental library.

QoS Profiles in this library are deprecated. They have been moved to "BuiltinQoSLib". You should use the QoS Profiles from "BuiltinQoSLib" instead of the ones in "BuiltinQoSLibExp". The experimental profiles are still defined here to avoid backward compatibility issues.

String-version: "BuiltinQoSLibExp"

6.98.2.49 generic_strict_reliable() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_strict_reliable ( )
```

Enables strict reliability.

Configures communication to be "strict reliable" where every sample is reliably delivered.

Combines the use of the `dds::core::policy::ReliabilityKind_def::RELIABLE` (p. 1881) for `dds::core::policy::Reliability` (p. 1873) with a `dds::core::policy::HistoryKind::KEEP_ALL` for the `dds::core::policy::HistoryKind` (p. 325).

This QoS Profile also optimizes the reliability protocol setting for this configuration.

String-version: "Generic.StrictReliable"

6.98.2.50 generic_keep_last_reliable() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_keep_last_reliable ( )
```

Enables keep-last reliability.

Like the Generic.StrictReliable profile, this profile ensures in-order delivery of samples. However, new data can overwrite data that has not yet been acknowledged by the reader, therefore causing possible sample loss.

String-version: "Generic.KeepLastReliable"

6.98.2.51 generic_best_effort() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_best_effort ( )
```

Enables best-effort reliability kind.

This profile enables best-effort communication. No effort or resources are spent to track whether or not sent samples are received. Minimal resources are used. This is the most deterministic method of sending data since there is no indeterministic delay that can be introduced by resending data. Data samples may be lost. This setting is good for periodic data.

String-version: "Generic.BestEffort"

6.98.2.52 generic_strict_reliable_high_throughput() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_strict_reliable_high_throughput ( )
```

A profile that can be used to achieve high throughput.

This QoS Profile extends the `rti::core::builtin_profiles::qos_lib::generic_strict_reliable()` (p. 269) QoS Profile to perform additional, fine-grained performance tuning specific to applications that send continuously streaming data. The parameters specified here add to and/or override the parameters specified in the `rti::core::builtin_profiles::qos_lib::generic_strict_reliable()` (p. 269) QoS Profile..

String-version: "Generic.StrictReliable.HighThroughput"

6.98.2.53 generic_strict_reliable_low_latency() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_strict_reliable_low_latency ( )
```

A profile that can be used to achieve low latency.

This QoS Profile extends the `rti::core::builtin_profiles::qos_lib::generic_strict_reliable()` (p. 269) QoS Profile to perform additional, fine-grained performance tuning specific to applications that send continuously streaming data. The parameters specified here add to and/or override the parameters specified in the `rti::core::builtin_profiles::qos_lib::generic_strict_reliable()` (p. 269) QoS Profile.

String-version: "Generic.StrictReliable.LowLatency"

6.98.2.54 generic_participant_large_data() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_participant_large_data ( )
```

A common Participant base profile to facilitate sending large data.

This is a common Participant base QoS Profile that configures 3 different flow controllers: 838, 209, and 52 Mbps that can each be used to throttle application data flow at different rates.

String-version: "Generic.Participant.LargeData"

6.98.2.55 generic_participant_large_data_monitoring() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_participant_large_data_monitoring ( )
```

Configures Participants for large data *and* monitoring.

This is a common base Participant QoS Profile to configure Participants to both handle large data and use RTI Monitoring Library.

This QoS Profile is deprecated. It is included for backwards compatibility.

It is recommended that instead of inheriting from this QoS Profile, new applications apply the following QoS Snippets to their application-specific QoS Profiles:

Enable Monitoring

- **rti::core::builtin_profiles::qos_snippet_lib::snippet_feature_monitoring_enable()** (p. 296)

Enable Large Data + optimizations

- **rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_publish_mode_asynchronous()** (p. 292)
- **rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_protocol_large_data()** (p. 288)
- **rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_protocol_dynamicmemalloc()** (p. 289)

String-version: "Generic.Participant.LargeData.Monitoring"

See also

rti::core::builtin_profiles::qos_lib::generic_participant_large_data() (p. 270)

rti::core::builtin_profiles::qos_lib::generic_monitoring_common() (p. 267)

6.98.2.56 generic_strict_reliable_large_data() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_strict_reliable_large_data ( )
```

Configures endpoints for sending large data with strict reliability.

This QoS Profile extends the `rti::core::builtin_profiles::qos_lib::generic_participant_large_data()` (p. 270) QoS Profile to handle sending large samples. This QoS Profile optimizes memory usage per sample within RTI Connex, but it does not do any flow control. You can use this QoS Profile directly, which enables asynchronous publication with the default flow controller (i.e. no flow control) or you can use one of the three QoS Profiles below (`Generic.StrictReliable.LargeData.*Flow`), which uses this QoS Profile as a common base QoS Profile. Each of these three QoS Profiles uses one of the three flow controllers defined in `rti::core::builtin_profiles::qos_lib::generic_participant_large_data()` (p. 270) in order to throttle application data flow.

String-version: "Generic.StrictReliable.LargeData"

6.98.2.57 generic_keep_last_reliable_large_data() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_keep_last_reliable_large_data ( )
```

Configures endpoints for sending large data with keep-last reliability.

This QoS Profile is similar to the `rti::core::builtin_profiles::qos_lib::generic_participant_large_data()` (p. 270) QoS Profile, but also adds QoS Snippets to handle sending large data. You can use this QoS Profile directly, which enables the default flow controller (i.e., no flow control) or you can choose one of the three QoS Profiles below (`Generic.KeepLastReliable.LargeData.*Flow`) which uses this QoS Profile as a common base QoS Profile. Each of these three QoS Profiles uses one of the three flow controllers defined in `rti::core::builtin_profiles::qos_lib::generic_participant_large_data()` (p. 270) in order to throttle application data flow.

String-version: "Generic.KeepLastReliable.LargeData"

6.98.2.58 generic_strict_reliable_large_data_fast_flow() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_strict_reliable_large_data_fast_flow ( )
```

Configures strictly reliable communication for large data with a fast flow controller.

Strictly reliable communication for large data with a 838 Mbps (~ 100 MB/sec) flow controller.

String-version: "Generic.StrictReliable.LargeData.FastFlow"

6.98.2.59 generic_strict_reliable_large_data_medium_flow() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_strict_reliable_large_data_medium_flow ( )
```

Configures strictly reliable communication for large data with a medium flow controller.

Strictly reliable communication for large data with a 209Mbps (~ 25 MB/sec) flow controller.

String-version: "Generic.StrictReliable.LargeData.MediumFlow"

6.98.2.60 generic_strict_reliable_large_data_slow_flow() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_strict_reliable_large_data_slow_flow  
( )
```

Configures strictly reliable communication for large data with a slow flow controller.

Strictly reliable communication for large data with a 52 MB/sec (~ 6.25 MB/sec) flow controller.

String-version: "Generic.StrictReliable.LargeData.SlowFlow"

6.98.2.61 generic_keep_last_reliable_large_data_fast_flow() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_keep_last_reliable_large_data_fast↔  
_flow ( )
```

Configures keep-last reliable communication for large data with a fast flow controller.

Keep-last reliable communication for large data with a 838 Mbps (~ 100 MB/sec) flow controller.

String-version: "Generic.KeepLastReliable.LargeData.FastFlow"

6.98.2.62 generic_keep_last_reliable_large_data_medium_flow() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_keep_last_reliable_large_data↔  
medium_flow ( )
```

Configures keep-last reliable communication for large data with a medium flow controller.

Keep-last reliable communication for large data with a 209Mbps (~ 25 MB/sec) flow controller.

String-version: "Generic.KeepLastReliable.LargeData.MediumFlow"

6.98.2.63 generic_keep_last_reliable_large_data_slow_flow() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_keep_last_reliable_large_data_slow↔  
_flow ( )
```

Configures keep-last reliable communication for large data with a slow flow controller.

Keep-last reliable communication for large data with a 52 MB/sec (~ 6.25 MB/sec) flow controller.

String-version: "Generic.KeepLastReliable.LargeData.SlowFlow"

6.98.2.64 generic_keep_last_reliable_transient_local() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_keep_last_reliable_transient_local ( )
```

Persists the samples of a DataWriter as long as the entity exists.

This profile extends the **rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable()** (p. 269) profile, but persists the samples of a **dds::pub::DataWriter** (p. 908) as long as the entity exists in order to deliver them to late-joining DataReaders.

String-version: "Generic.KeepLastReliable.TransientLocal"

6.98.2.65 generic_keep_last_reliable_transient() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_keep_last_reliable_transient ( )
```

Persists samples using RTI Persistence Service.

This profile extends the **rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable()** (p. 269) profile, but persists samples using Persistence Service in order to deliver them to late-joining DataReaders.

String-version: "Generic.KeepLastReliable.Transient"

6.98.2.66 generic_keep_last_reliable_persistent() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_keep_last_reliable_persistent ( )
```

Persists samples in permanent storage, like a disk, using RTI Persistence Service.

This profile extends the **rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable()** (p. 269) profile, but persists samples in permanent storage, such as a disk, using Persistence Service in order to deliver them to late-joining DataReaders.

String-version: "Generic.KeepLastReliable.Persistent"

6.98.2.67 generic_auto_tuning() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_auto_tuning ( )
```

Enables the Turbo Mode batching and Auto Throttle experimental features.

Turbo Mode batching adjusts the maximum number of bytes of a batch based on how frequently samples are being written. Auto Throttle auto-adjusts the speed at which a writer will write samples, based on the number of unacknowledged samples in its queue.

These features are designed to auto-adjust the publishing behavior within a system in order to achieve the best possible performance with regards to throughput and latency.

String-version: "Generic.AutoTuning"

6.98.2.68 generic_minimal_memory_footprint() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::generic_minimal_memory_footprint ( )
```

Uses a set of QoS which reduces the memory footprint of the application.

Uses a set of QoS which reduces the memory footprint of the application.

String-version: "Generic.MinimalMemoryFootprint"

6.98.2.69 pattern_periodic_data() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::pattern_periodic_data ( )
```

Used for applications that expect periodic data.

This QoS Profile is intended to be used for applications that expect periodic data such as sensor data. The deadline that is set in this profile can be used to detect when DataWriters are not publishing data with the expected periodicity.

String-version: "Pattern.PeriodicData"

6.98.2.70 pattern_streaming() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::pattern_streaming ( )
```

Used for applications that stream data.

The data sent in streaming applications is commonly periodic. Therefore this profile simply inherits from the **rti::core::builtin_profiles::qos_lib::pattern_periodic_data()** (p. 275) profile. Note: With this QoS Profile, the application may lose data, which may be acceptable in use cases such as video conferencing.

String-version: "Pattern.Streaming"

6.98.2.71 pattern_reliable_streaming() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::pattern_reliable_streaming ( )
```

Used for applications that stream data *and* require reliable communication.

Sometimes streaming applications require reliable communication while still tolerating some data loss. In this case, we inherit from the **rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable()** (p. 269) QoS Profile and the following QoS Snippets:

- **rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_reliability_reliable()** (p. 291)
- **rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_history_keep_last_1()** (p. 292)
- **rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_protocol_keep_last()** (p. 287)

This QoS Snippet also increases the **dds::core::policy::History::depth** (p. 1349) to reduce the probability of losing samples.

String-version: "Pattern.ReliableStreaming"

6.98.2.72 pattern_event() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::pattern_event ( )
```

Used for applications that handle events.

This QoS Profile can be used by applications in which samples represent events such as button pushes or alerts. When events are triggered, the system should almost always do something, meaning that you don't want the system to lose the event. This means that the system requires strictly reliable communication. To enable it, use the following QoS Snippets:

- **rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_reliability_reliable()** (p. 291)
- **rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_history_keep_all()** (p. 292)
- **rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_protocol_keep_all()** (p. 286)

Since events and alerts are critical and non-periodic data, it is important to detect situations in which communication between a **dds::pub::DataWriter** (p. 908) and **dds::sub::DataReader** (p. 756) is broken. This is why this profile sets the **dds::core::policy::Liveliness** (p. 1389). If the **dds::pub::DataWriter** (p. 908) does not assert its liveliness in a timely manner, the **dds::sub::DataReader** (p. 756) will report 'loss of liveliness' to the application.

String-version: "Pattern.Event"

6.98.2.73 pattern_alarm_event() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::pattern_alarm_event ( )
```

Used for applications that handle alarm events.

An alarm is a type of event; therefore this profile simply inherits from **rti::core::builtin_profiles::qos_lib::pattern_event()** (p. 276).

String-version: "Pattern.AlarmEvent"

6.98.2.74 pattern_status() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::pattern_status ( )
```

Used for applications whose samples represent statuses.

This QoS Profile can be used by applications in which samples represent state variables whose values remain valid as long as they don't explicitly change. State variables typically do not change periodically. State variables and their values should also be available to applications that appear after the value originally changed because it is unreasonable to have to wait until the next change of state, which may be indeterminate.

Whether to use this QoS Profile or **rti::core::builtin_profiles::qos_lib::pattern_periodic_data()** (p. 275) can often be an application choice. For example, if a DataWriter is publishing temperature sensor data, it could use the **rti::core::builtin_profiles::qos_lib::pattern_periodic_data()** (p. 275) QoS Profile and publish the data at a fixed rate or it could use the **rti::core::builtin_profiles::qos_lib::pattern_status()** (p. 277) QoS Profile and only publish the temperature when it changes more than 1 degree.

String-version: "Pattern.Status"

6.98.2.75 pattern_alarm_status() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::pattern_alarm_status ( )
```

Used for applications in which samples represent alarm statuses.

An alarm status is a type of status; therefore this QoS Profile simply inherits from `rti::core::builtin_profiles::qos_lib::pattern_status()` (p. 277).

String-version: "Pattern.AlarmStatus"

6.98.2.76 pattern_last_value_cache() [2/2]

```
std::string rti::core::builtin_profiles::qos_lib_exp::pattern_last_value_cache ( )
```

Used for applications that only need the last published value.

With this QoS Profile, a `dds::pub::DataWriter` (p. 908) will keep in its queue the last value that was published for each sample instance. Late-joining DataReaders will get that value when they join the system. This QoS Profile inherits from `rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable_transient_local()` (p. 273) because the use case requires delivery to late-joiners.

String-version: "Pattern.LastValueCache"

6.98.2.77 library_name() [3/3]

```
std::string rti::core::builtin_profiles::qos_snippet_lib::library_name ( )
```

A library of QoS Snippets.

String-version: "BuiltinQoSSnippetLib"

6.98.2.78 snippet_optimization_reliability_protocol_common()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_
protocol_common ( )
```

QoS Snippet that configures the reliability protocol with a common configuration.

The QoS Snippets starting with "Optimization.ReliabilityProtocol." provide alternative configurations of the same QoS Policies. Choose just one QoS Snippet of the alternatives when defining a new QoS Profile or QoS Snippet.

This QoS Snippet defines parameters common to a set of "alternative" QoS Snippets that configure the reliability protocol.

Modified QoS Parameters:

- `rti::core::policy::DataWriterProtocol::rtps_reliable_writer` (p. 985)
- `dds::sub::qos::DataReaderQos` (p. 848) => `dds::core::policy::ResourceLimits` (p. 1921)
- `rti::core::policy::DataReaderProtocol::rtps_reliable_reader` (p. 841)

This QoS Snippet configures the reliability protocol parameters for more aggressive (faster) heartbeats so that sample loss is detected and repaired faster.

This QoS Snippet also sets the `rti::core::RtpsReliableWriterProtocol::max_heartbeat_retries`, which works in combination with the heartbeat rate to determine when the `dds::pub::DataWriter` (p. 908) considers a `dds::sub::DataReader` (p. 756) non-responsive. This QoS Snippet configures the `rti::core::policy::DataWriterProtocol::rtps_reliable_writer` (p. 985) parameters so that the `dds::pub::DataWriter` (p. 908) considers the `dds::sub::DataReader` (p. 756) to be "inactive" after 500 unresponded heartbeats.

String-version: "Optimization.ReliabilityProtocol.Common"

6.98.2.79 snippet_optimization_reliability_protocol_keep_all()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_↵
protocol_keep_all ( )
```

QoS Snippet that configures the reliability protocol for KEEP_ALL.

The QoS Snippets starting with "Optimization.ReliabilityProtocol." provide alternative configurations of the same QoS Policies. Choose just one QoS Snippet of the alternatives when defining a new QoS Profile or QoS Snippet.

This QoS Snippet optimizes the **dds::pub::DataWriter** (p. 908) reliable protocol parameters for a reliable **dds::pub::↵**
DataWriter (p. 908) with **dds::core::policy::HistoryKind** (p. 325) set to **dds::core::policy::HistoryKind::KEEP_ALL**.

Modified QoS Parameters:

- **rti::core::policy::DataWriterProtocol::rtps_reliable_writer** (p. 985)
- **dds::sub::qos::DataReaderQos** (p. 848) => **dds::core::policy::ResourceLimits** (p. 1921)
- **rti::core::policy::DataReaderProtocol::rtps_reliable_reader** (p. 841)

Note that this QoS Snippet does not configure the **dds::core::policy::Reliability** (p. 1873) or **dds::core::policy::↵**
History (p. 1346) QoS policies. It is intended to be used in combination with other QoS Snippets that configure those policies.

String-version: "Optimization.ReliabilityProtocol.KeepAll"

6.98.2.80 snippet_optimization_reliability_protocol_keep_last()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_↵
protocol_keep_last ( )
```

QoS Snippet that configures the reliability protocol for KEEP_LAST.

The QoS Snippets starting with "Optimization.ReliabilityProtocol." provide alternative configurations of the same QoS Policies. Choose just one QoS Snippet of the alternatives when defining a new QoS Profile or QoS Snippet.

This QoS Snippet optimizes the **dds::pub::DataWriter** (p. 908) reliable protocol parameters for a reliable **dds::pub::↵**
DataWriter (p. 908) with **dds::core::policy::HistoryKind** (p. 325) set to **dds::core::policy::HistoryKind::KEEP_LAST**.

Modified QoS Parameters:

- **dds::pub::qos::DataWriterQos** (p. 994) => **dds::core::policy::ResourceLimits** (p. 1921)
- **rti::core::policy::DataWriterProtocol::rtps_reliable_writer** (p. 985)
- **dds::sub::qos::DataReaderQos** (p. 848) => **dds::core::policy::ResourceLimits** (p. 1921)
- **rti::core::policy::DataReaderProtocol::rtps_reliable_reader** (p. 841)

Note that this QoS Snippet does not configure the **dds::core::policy::Reliability** (p. 1873) or **dds::core::policy::↵**
History (p. 1346) QoS policies. It is intended to be used in combination with other QoS Snippets that configure those policies.

String-version: "Optimization.ReliabilityProtocol.KeepLast"

6.98.2.81 snippet_optimization_reliability_protocol_high_rate()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_↔
protocol_high_rate ( )
```

QoS Snippet that configures the reliability protocol for sending data at a high rate.

The QoS Snippets starting with "Optimization.ReliabilityProtocol." provide alternative configurations of the same QoS Policies. Choose just one QoS Snippet of the alternatives when defining a new QoS Profile or QoS Snippet.

This QoS Snippet optimizes the **dds::pub::DataWriter** (p. 908) reliable protocol parameters for a reliable **dds::pub↔
::DataWriter** (p. 908) that is writing messages at high rates, especially in situations where throughput is favored over latency.

Modified QoS Parameters:

- **rti::core::policy::DataWriterProtocol::rtps_reliable_writer** (p. 985)
- **dds::sub::qos::DataReaderQos** (p. 848) => **dds::core::policy::ResourceLimits** (p. 1921)
- **rti::core::policy::DataReaderProtocol::rtps_reliable_reader** (p. 841)

This QoS Snippet sets a fast rate of heartbeats so that errors are detected and repaired more swiftly.

Note that to get the highest throughput you may need to apply additional changes to the final QoS Profile. See the QoS Profile **rti::core::builtin_profiles::qos_lib::generic_strict_reliable_high_throughput()** (p. 270) for further information.

String-version: "Optimization.ReliabilityProtocol.HighRate"

6.98.2.82 snippet_optimization_reliability_protocol_low_latency()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_↔
protocol_low_latency ( )
```

QoS Snippet that configures the reliability protocol for sending data at low latency.

The QoS Snippets starting with "Optimization.ReliabilityProtocol." provide alternative configurations of the same QoS Policies. Choose just one QoS Snippet of the alternatives when defining a new QoS Profile or QoS Snippet.

This QoS Snippet modifies the Reliable Protocol parameters to accomplish low latency.

Modified QoS Parameters:

- **rti::core::policy::DataWriterProtocol::rtps_reliable_writer** (p. 985)
- **dds::sub::qos::DataReaderQos** (p. 848) => **dds::core::policy::ResourceLimits** (p. 1921)
- **rti::core::policy::DataReaderProtocol::rtps_reliable_reader** (p. 841)

Note that to get the lowest latency you may need to apply additional changes to the final QoS Profile. See the QoS Profile **rti::core::builtin_profiles::qos_lib::generic_strict_reliable_low_latency()** (p. 270) for further information.

String-version: "Optimization.ReliabilityProtocol.LowLatency"

6.98.2.83 snippet_optimization_reliability_protocol_large_data()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_↵
protocol_large_data ( )
```

QoS Snippet that configures the reliability protocol for large data.

The QoS Snippets starting with "Optimization.ReliabilityProtocol." provide alternative configurations of the same QoS Policies. Choose just one QoS Snippet of the alternatives when defining a new QoS Profile or QoS Snippet.

Modifies the Reliable Protocol parameters and Resource Limits to work with Large Data.

Modified QoS Parameters:

- **rti::core::policy::DataWriterProtocol::rtps_reliable_writer** (p. 985)
- **dds::sub::qos::DataReaderQos** (p. 848) => **dds::core::policy::ResourceLimits** (p. 1921)
- **rti::core::policy::DataReaderProtocol::rtps_reliable_reader** (p. 841)

Note that to send large data you need to apply additional changes that configure the data caches, asynchronous writing, transport buffers, etc. See, for example, **rti::core::builtin_profiles::qos_lib::generic_keep_last_reliable_large_↵ data()** (p. 271), and derivatives for fully functional Large Data QoS Profiles.

String-version: "Optimization.ReliabilityProtocol.LargeData"

6.98.2.84 snippet_optimization_reliability_protocol_dynamicmemalloc()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_reliability_↵
protocol_dynamicmemalloc ( )
```

Configures the DataWriter and DataReader caches to use dynamic memory allocation for Large Data samples.

Modified QoS Parameters:

- **dds::pub::qos::DataWriterQos** (p. 994) => **dds::core::policy::ResourceLimits** (p. 1921)
- **dds::pub::qos::DataWriterQos** (p. 994) => **rti::core::policy::Property** (p. 1695) named "dds.data_writer.↵ history.memory_manager.*"
- **dds::sub::qos::DataReaderQos** (p. 848) => **dds::core::policy::ResourceLimits** (p. 1921)
- **rti::core::policy::DataReaderResourceLimits** (p. 856)
- **dds::sub::qos::DataReaderQos** (p. 848) => **rti::core::policy::Property** (p. 1695) named "dds.data_reader.↵ history.memory_manager.*"

This configuration is needed to handle data that contains unbounded sequences or strings. This QoS Snippet is also recommended if samples can have very different sizes and the bigger samples can be very large.

If dynamic memory allocation is not used for the larger samples, then all samples are allocated to their maximum size which can consume a lot of resources.

String-version: "Optimization.DataCache.LargeData.DynamicMemAlloc"

6.98.2.85 snippet_optimization_discovery_common()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_discovery_common (
)
```

QoS Snippet that optimizes discovery with a common configuration.

Optimizes the `dds::domain::qos::DomainParticipantQos` (p. 1136) to detect faster discovery changes. This QoS Snippet increases the speed moderately so that it fits the normal scenarios.

Modified QoS Parameters:

- `rti::core::policy::DiscoveryConfig::participant_liveliness_lease_duration` (p. 1041)
- `rti::core::policy::DiscoveryConfig::participant_liveliness_assert_period` (p. 1042)
- `rti::core::policy::DiscoveryConfig::max_liveliness_loss_detection_period` (p. 1044)
- `rti::core::policy::DiscoveryConfig::initial_participant_announcements` (p. 1044)
- `rti::core::policy::DiscoveryConfig::publication_writer` (p. 1049)
- `rti::core::policy::DiscoveryConfig::subscription_writer` (p. 1051)

String-version: "Optimization.Discovery.Common"

6.98.2.86 snippet_optimization_discovery_participant_compact()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_discovery_participant←
_compact ( )
```

QoS Snippet that optimizes the Participant QoS to send less discovery information.

Modified QoS Parameters:

- `dds::domain::qos::DomainParticipantQos` (p. 1136) => `rti::core::policy::Property` (p. 1695) named "dds.← participant.inter_participant.*"
- `dds::domain::qos::DomainParticipantQos` (p. 1136) => `rti::core::policy::Property` (p. 1695) named "dds.← sys_info.*"

String-version: "Optimization.Discovery.Participant.Compact"

6.98.2.87 snippet_optimization_discovery_endpoint_fast()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_discovery_endpoint←
_fast ( )
```

QoS Snippet that optimizes the Endpoint Discovery to be faster.

This is useful when using security, to prevent a noticeable delay.

Modified QoS Parameters:

- `rti::core::policy::DiscoveryConfig::publication_writer` (p. 1049)
- `rti::core::policy::DiscoveryConfig::subscription_writer` (p. 1051)

String-version: "Optimization.Discovery.Endpoint.Fast"

6.98.2.88 snippet_optimization_transport_large_buffers()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_optimization_transport_large_buffers ( )
```

QoS Snippet that increases the Participant default buffer that shmexec and udpv4 use.

This is useful when using Large Data

Modified QoS Parameters:

- **rti::core::policy::ReceiverPool** (p. 1868)
- **rti::core::policy::TransportBuiltin** (p. 2237)

String-version: "Optimization.Transport.LargeBuffers"

6.98.2.89 snippet_qos_policy_reliability_reliable()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_reliability_reliable ( )
```

QoS Snippet that sets RELIABILITY QoS to RELIABLE.

This also configures a blocking time in case the **dds::pub::DataWriter** (p. 908) writes faster than the DataReaders can accommodate.

Modified QoS Parameters:

- **dds::pub::qos::DataWriterQos** (p. 994) => **dds::core::policy::Reliability** (p. 1873)
- **dds::sub::qos::DataReaderQos** (p. 848) => **dds::core::policy::Reliability** (p. 1873)

Note that by itself enabling reliability does not ensure that every sample written is delivered to the DataReaders. This is because the **dds::pub::DataWriter** (p. 908) and/or **dds::sub::DataReader** (p. 756) can be configured to override samples in its cache based on the configuration of the **dds::core::policy::History** (p. 1346) QoS policy.

To ensure delivery of every sample (at the expense of potentially blocking the **dds::pub::DataWriter** (p. 908)), use the QoS Profile **rti::core::builtin_profiles::qos_lib::generic_strict_reliable()** (p. 269) or one of the derived QoS Profiles.

String-version: "QosPolicy.Reliability.Reliable"

6.98.2.90 snippet_qos_policy_reliability_best_effort()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_reliability_best_effort ( )
```

QoS Snippet that sets RELIABILITY QoS to BEST_EFFORT.

Modified QoS Parameters:

- **dds::pub::qos::DataWriterQos** (p. 994) => **dds::core::policy::Reliability** (p. 1873)
- **dds::sub::qos::DataReaderQos** (p. 848) => **dds::core::policy::Reliability** (p. 1873)

With best-effort, there are no resources spent to confirm delivery of samples nor repairs of any samples that may be lost.

Best-effort communication reduces jitter; therefore, the delay between sending data and receiving it is more deterministic for the samples that are actually received. Best-effort is good for periodic data where it may be better to get the next value than to wait for the previous one to be repaired.

String-version: "QoSPolicy.Reliability.BestEffort"

6.98.2.91 snippet_qos_policy_history_keep_last_1()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_history_keep_last_1 ( )
```

QoS Snippet that sets HISTORY QoS to KEEP_LAST kind with depth 1.

Modified QoS Parameters:

- **dds::pub::qos::DataWriterQos** (p. 994) => **dds::core::policy::History** (p. 1346)
- **dds::sub::qos::DataReaderQos** (p. 848) => **dds::core::policy::History** (p. 1346)

String-version: "QoSPolicy.History.KeepLast_1"

6.98.2.92 snippet_qos_policy_history_keep_all()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_history_keep_all ( )
```

QoS Snippet that sets HISTORY QoS to KEEP_ALL kind.

Modified QoS Parameters:

- **dds::pub::qos::DataWriterQos** (p. 994) => **dds::core::policy::History** (p. 1346)
- **dds::sub::qos::DataReaderQos** (p. 848) => **dds::core::policy::History** (p. 1346)

String-version: "QoSPolicy.History.KeepAll"

6.98.2.93 snippet_qos_policy_publish_mode_asynchronous()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_publish_mode_asynchronous
( )
```

QoS Snippet that sets PUBLISH_MODE QoSPolicy to ASYNCHRONOUS kind.

Modified QoS Parameters:

- **rti::core::policy::PublishMode** (p. 1739)

Asynchronous Publish mode decouples the application thread that calls the **dds::pub::DataWriter** (p.908) "write" operation from the thread used to send the data on the network. See <https://community.rti.com/glossary/asynchronous-writer>

String-version: "QoSPolicy.PublishMode.Asynchronous"

6.98.2.94 snippet_qos_policy_durability_transient_local()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_durability_transient_
_local ( )
```

QoS Snippet that sets DURABILITY QoSPolicy to TRANSIENT_LOCAL kind.

Modified QoS Parameters:

- **dds::pub::qos::DataWriterQos** (p. 994) => **dds::core::policy::Durability** (p. 1181)
- **dds::sub::qos::DataReaderQos** (p. 848) => **dds::core::policy::Durability** (p. 1181)

DataWriters will store and send previously published DDS samples for delivery to newly discovered DataReaders as long as the **dds::pub::DataWriter** (p. 908) still exists. For this setting to be effective, you must also set the **dds::core::policy::ReliabilityKind_def** (p. 1879) to **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 1881) (not Best Effort). Which particular DDS samples are kept depends on other QoS settings such as **dds::core::policy::History** (p. 1346) and **dds::core::policy::ResourceLimits** (p. 1921).

String-version: "QoSPolicy.Durability.TransientLocal"

6.98.2.95 snippet_qos_policy_durability_transient()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_durability_transient
( )
```

QoS Snippet that sets DURABILITY QoSPolicy to TRANSIENT kind.

Modified QoS Parameters:

- **dds::pub::qos::DataWriterQos** (p. 994) => **dds::core::policy::Durability** (p. 1181)
- **dds::sub::qos::DataReaderQos** (p. 848) => **dds::core::policy::Durability** (p. 1181)

RTI Connext will store previously published DDS samples in memory using Persistence Service, which will send the stored data to newly discovered DataReaders. Which particular DDS samples are kept and sent by Persistence Service depends on the **dds::core::policy::History** (p. 1346) and **dds::core::policy::ResourceLimits** (p. 1921) of the Persistence Service DataWriters. These QoS Policies can be configured in the Persistence Service configuration file or through the **dds::core::policy::DurabilityKind** (p. 321) of the DataWriters configured with **dds::core::policy::DurabilityKind::TRANSIENT**.

You need a Persistence Service instance running to use this behavior.

String-version: "QoSPolicy.Durability.Transient"

6.98.2.96 snippet_qos_policy_durability_persistent()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_durability_persistent
( )
```

QoS Snippet that sets DURABILITY QoSPolicy to PERSISTENT kind.

Modified QoS Parameters:

- **dds::pub::qos::DataWriterQos** (p. 994) => **dds::core::policy::Durability** (p. 1181)
- **dds::sub::qos::DataReaderQos** (p. 848) => **dds::core::policy::Durability** (p. 1181)

RTI Connex will store previously published DDS samples in permanent storage, like a disk, using Persistence Service, which will send the stored data to newly discovered DataReaders. Which particular DDS samples are kept and sent by Persistence Service depends on the **dds::core::policy::History** (p. 1346) and **dds::core::policy::ResourceLimits** (p. 1921) in the Persistence Service DataWriters. These QoS Policies can be configured in the Persistence Service configuration file or through the **dds::core::policy::DurabilityKind** (p. 321) of the DataWriters configured with `dds::core::policy::DurabilityKind::PERSISTENT`.

You need a Persistence Service instance running to use this behavior.

String-version: "QoSPolicy.Durability.Persistent"

6.98.2.97 snippet_qos_policy_batching_enable()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_batching_enable ( )
```

QoS Snippet that sets BATCH QoSPolicy to true.

Modified QoS Parameters:

- **rti::core::policy::Batch** (p. 665)

This QoS Snippet specifies and configures the mechanism that allows RTI Connex to collect multiple user data DDS samples to be sent in a single network packet, to take advantage of the efficiency of sending larger packets and thus increase effective throughput.

String-version: "QoSPolicy.Batching.Enable"

6.98.2.98 snippet_qos_policy_flow_controller_838mbps()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_flow_controller_↵
838mbps ( )
```

QoS Snippet that configures and set a FlowController of 838 Mbps.

Defines a **rti::pub::FlowController** (p. 1316) and configures the **dds::pub::qos::DataWriterQos** (p. 994) with it.

This is a **rti::pub::FlowController** (p. 1316) of 838 Mbps (~ 100 MB/sec)

Modified QoS Parameters:

- **dds::domain::qos::DomainParticipantQos** (p. 1136) => **rti::core::policy::Property** (p. 1695) named "dds.↵
flow_controller.token_bucket.*"
- **rti::core::policy::PublishMode** (p. 1739)

String-version: "Feature.FlowController.838Mbps"

6.98.2.99 snippet_qos_policy_flow_controller_209mbps()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_flow_controller_↵  
209mbps ( )
```

QoS Snippet that configures and sets a FlowController of 209 Mbps.

Defines a **rti::pub::FlowController** (p. 1316) and configures the **dds::pub::qos::DataWriterQos** (p. 994) with it.

This is a **rti::pub::FlowController** (p. 1316) of 209 Mbps (~ 25 MB/sec)

Modified QoS Parameters:

- **dds::domain::qos::DomainParticipantQos** (p. 1136) => **rti::core::policy::Property** (p. 1695) named "dds.↵
flow_controller.token_bucket.*"
- **rti::core::policy::PublishMode** (p. 1739)

String-version: "Feature.FlowController.209Mbps"

6.98.2.100 snippet_qos_policy_flow_controller_52mbps()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_qos_policy_flow_controller_↵  
52mbps ( )
```

QoS Snippet that configures and sets a FlowController of 52 Mbps.

Defines a **rti::pub::FlowController** (p. 1316) and configures the **dds::pub::qos::DataWriterQos** (p. 994) with it.

This is a **rti::pub::FlowController** (p. 1316) of 52 Mbps (~ 6.25 MB/sec)

Modified QoS Parameters:

- **dds::domain::qos::DomainParticipantQos** (p. 1136) => **rti::core::policy::Property** (p. 1695) named "dds.↵
flow_controller.token_bucket.*"
- **rti::core::policy::PublishMode** (p. 1739)

String-version: "Feature.FlowController.52Mbps"

6.98.2.101 snippet_feature_auto_tuning_enable()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_feature_auto_tuning_enable ( )
```

QoS Snippet that enables auto_throttle and turbo_mode to true.

Sets the **dds::domain::qos::DomainParticipantQos** (p. 1136) properties to enable auto_throttle and turbo_mode to true.

Modified QoS Parameters:

- **dds::domain::qos::DomainParticipantQos** (p. 1136) => **rti::core::policy::Property** (p. 1695) named "dds.↔ domain_participant.auto_throttle"
- **dds::pub::qos::DataWriterQos** (p. 994) => **rti::core::policy::Property** (p. 1695) named "dds.data_writer.↔ auto_throttle.enable"
- **dds::pub::qos::DataWriterQos** (p. 994) => **rti::core::policy::Property** (p. 1695) named "dds.data_writer.↔ enable_turbo_mode"

The domain_participant.auto_throttle configures the **dds::domain::DomainParticipant** (p. 1079) to gather internal measurements (during **dds::domain::DomainParticipant** (p. 1079) creation) that are required for the Auto Throttle feature. This allows DataWriters belonging to this **dds::domain::DomainParticipant** (p. 1079) to use the Auto Throttle feature.

The turbo_mode adjusts the batch max_data_bytes based on how frequently the **dds::pub::DataWriter** (p. 908) writes data.

Data_writer.auto_throttle enables automatic throttling in the **dds::pub::DataWriter** (p. 908) so it can automatically adjust the writing rate and the send window size; this minimizes the need for repairing DDS samples and improves latency.

String-version: "Feature.AutoTuning.Enable"

6.98.2.102 snippet_feature_monitoring_enable()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_feature_monitoring_enable ( )
```

QoS Snippet that enables the use of the RTI Monitoring Library.

To enable the use of RTI Monitoring Library apply this QoS Snippet to the QoS Profile used to create your **dds↔ ::domain::DomainParticipant** (p. 1079). For example:

```
<qos_profile name="MyProfile">
  <base_name>
    <element>BuiltinQosLib::Feature.Monitoring.Enable</element>
  </base_name>
</qos_profile>
```

String-version: "Feature.Monitoring.Enable"

6.98.2.103 snippet_feature_monitoring2_enable()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_feature_monitoring2_enable ( )
```

QoS Snippet that enables the use of the RTI Monitoring Library 2.0.

QoS Snippet to enable the use of the RTI Monitoring Library 2.0 with a dedicated DomainParticipant publishing telemetry data from your application in domain ID 2. All metrics are enabled for all resources in this profile.

To enable the use of RTI Monitoring Library 2.0, apply this QoS Snippet to the QoS Profile used to create your DomainParticipantFactory. For example:

```
<qos_profile name="MyProfile" is_default_participant_factory_profile="true">
  <base_name>
    <element>BuiltinQosSnippetLib::Feature.Monitoring2.Enable</element>
  </base_name>
</qos_profile>
```

String-version: "Feature.Monitoring2.Enable"

6.98.2.104 snippet_feature_security_enable()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_feature_security_enable ( )
```

QoS Snippet that enables security using the Builtin Security Plugins.

To enable the use of the Builtin DDS Security Library apply this QoS Snippet to the QoS Profile used to create your **dds::domain::DomainParticipant** (p. 1079). For example:

```
<qos_profile name="MyProfile">
  <base_name>
    <element>BuiltinQosLib::Feature.Security.Enable</element>
  </base_name>
</qos_profile>
```

String-version: "Feature.Security.Enable"

6.98.2.105 snippet_feature_topic_query_enable()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_feature_topic_query_enable ( )
```

QoS Snippet that enables Topic Query.

To enable the use of the RTI Connexrt **rti::sub::TopicQuery** (p. 2220) feature, apply this QoS Snippet to the QoS Profile used to create your **dds::pub::DataWriter** (p. 908). For example:

```
<qos_profile name="MyProfile">
  <base_name>
    <element>BuiltinQosLib::Feature.TopicQuery.Enable</element>
  </base_name>
</qos_profile>
```

For more information on Topic Query see the "Topic Queries" chapter in the User's Manual.

String-version: "Feature.TopicQuery.Enable"

6.98.2.106 snippet_transport_tcp_lan_client()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_transport_tcp_lan_client ( )
```

QoS Snippet that configures a TCP LAN Client over DDS.

This QoS Snippet sets all the mandatory properties; however the final QoS Profile requires additional configuration.

The values of the `initial_peers` and the property `dds.transport.TCPv4.tcp1.server_bind_port` are incorrect (just sample strings). Therefore, they must be modified:

- `initial_peers`: should point to the remote client IP and port.
- `server_bind_port`: is the port this application will be using.

This modification should be done in the QoS Profile that will be used to create the **dds::core::Entity** (p. 1265). These new values will overwrite the current invalid values.

String-version: "Transport.TCP.LAN.Client"

6.98.2.107 snippet_transport_tcp_wan_symmetric_client()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_transport_tcp_wan_symmetric_↔  
client ( )
```

QoS Snippet that configures a symmetric WAN TCP Client over DDS.

This QoS Snippet sets all the mandatory properties; however the final QoS Profile requires additional configuration.

The values of the properties `dds.transport.TCPv4.tcp1.public_address` and `dds.transport.TCPv4.tcp1.server_bind_port` are incorrect (just sample strings). Also the `initial_peers` information is not correct. Therefore, the following must be modified:

- `initial_peers`: should point to the remote client IP and port.
- `public_address`: public IP address where this application can be reached.
- `server_bind_port`: port this application will be using.

This modification should be done in the QoS Profile that will be used to create the **dds::core::Entity** (p. 1265). These new values will overwrite the current invalid values.

String-version: "Transport.TCP.WAN.Symmetric.Client"

6.98.2.108 snippet_transport_tcp_wan_asymmetric_server()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_transport_tcp_wan_asymmetric_↵
server ( )
```

QoS Snippet that an asymmetric WAN TCP Server over DDS.

This QoS Snippet sets all the mandatory properties; however the final QoS Profile requires additional configuration.

The values of the properties `dds.transport.TCPv4.tcp1.public_address` and `dds.transport.TCPv4.tcp1.server_bind_port` are incorrect (just sample strings). Therefore, they must be modified to the corresponding `public_address` and `port_↵` number. This modification should be done in the QoS Profile that will be used to create the **dds::core::Entity** (p. 1265). These new values will overwrite the current invalid values.

String-version: "Transport.TCP.WAN.Asymmetric.Server"

6.98.2.109 snippet_transport_tcp_wan_asymmetric_client()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_transport_tcp_wan_asymmetric_↵
client ( )
```

QoS Snippet that configures an asymmetric WAN TCP Client over DDS.

This QoS Snippet sets all the mandatory properties; however the final QoS Profile requires additional configuration.

The value of `discovery.initial_peers` and `public_ip` have to match the values set on the Server side (**rti::core::builtin_↵** **profiles::qos_snippet_lib::snippet_transport_tcp_wan_asymmetric_server()** (p. 298)). This modification should be done in the QoS Profile that will be used to create the **dds::core::Entity** (p. 1265). This new value will overwrite the current invalid value.

String-version: "Transport.TCP.WAN.Asymmetric.Client"

6.98.2.110 snippet_transport_udp_avoid_ip_fragmentation()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_transport_udp_avoid_ip_fragmentation
( )
```

QoS Snippet that configures RTI Connex and the UDP built-in transports (UDPv4, UDPv6, UDPv4_WAN) to avoid IP fragmentation.

For WAN communications and, in general, for communications in third party networks, it is not a good idea to rely on IP fragmentation. IP fragmentation causes significant issues in UDP, where there is no integrated support for a path MTU (maximum transmission unit) discovery protocol as there is in TCP.

This snippet provides a way to avoid IP fragmentation in Connex applications using the built-in UDP transports. Instead, Connex will be responsible for fragmentation, which is done at the RTPS level.

Among other changes, this configuration changes the transport MTU (`message_size_max`) to be 1400 bytes. Notice that this change will affect other transports such as SHMEM since Connex chooses the minimum transport MTU across all enabled transports to determine the maximum size of outgoing RTPS messages.

String-version: "Transport.UDP.AvoidIPFragmentation"

6.98.2.111 snippet_transport_udp_wan()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_transport_udp_wan ( )
```

QoS Snippet that enables the RTI Real-Time WAN Transport (UDPv4_WAN).

The snippet disables all the other built-in transports and avoids the use of IP fragmentation.

For WAN communications and, in general, for communications in third-party networks, it is not a good idea to rely on IP fragmentation. IP fragmentation causes significant issues in UDP, where there is no integrated support for a path MTU (maximum transmission unit) discovery protocol as there is in TCP.

String-version: "Transport.UDP.WAN"

6.98.2.112 snippet_compatibility_connex_micro_version_2_4_3()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_compatibility_connex_micro_↔  
version_2_4_3 ( )
```

QoS Snippet that configures sets LIVENESS QoS to be compatible with RTI Connex Micro 2.4.3.

QoS Snippet that sets the **dds::sub::qos::DataReaderQos** (p. 848) and **dds::pub::qos::DataWriterQos** (p. 994) **dds::core::policy::LivelinessKind** (p. 327) to **dds::core::policy::LivelinessKind::MANUAL_BY_TOPIC** It also disables the built-in shared memory transport.

Modified QoS Parameters:

- **dds::sub::qos::DataReaderQos** (p. 848) => **dds::core::policy::Liveliness** (p. 1389)
- **dds::pub::qos::DataWriterQos** (p. 994) => **dds::core::policy::Liveliness** (p. 1389)
- **rti::core::policy::TransportBuiltin** (p. 2237)

RTI Connex Micro versions 2.4.3 and earlier only supported **dds::core::policy::LivelinessKind::MANUAL_BY_TOPIC** **dds::core::policy::LivelinessKind** (p. 327). In order to be compatible with RTI Connex Micro 2.4.3, the **dds::sub↔::DataReader** (p. 756) and **dds::pub::DataWriter** (p. 908) must have their **dds::core::policy::LivelinessKind** (p. 327) changed to this value because the default kind in RTI Connex is **dds::core::policy::LivelinessKind::AUTOMATIC**.

String-version: "Compatibility.ConnexMicro.Version243"

6.98.2.113 snippet_compatibility_other_dds_vendors_enable()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_compatibility_other_dds_vendors↔  
_enable ( )
```

QoS Snippet that configures RTI Connex to interoperate with other DDS vendors.

String-version: "Compatibility.OtherDDSVendor.Enable"

6.98.2.114 snippet_compatibility_5_1_0_transport_enable()

```
std::string rti::core::builtin_profiles::qos_snippet_lib::snippet_compatibility_5_1_0_transport_↔
enable ( )
```

QoS Snippet that configures RTI Connex to interoperate with RTI Connex 5.1.0 and below for UDPv6 and SHMEM transports.

String-version: "Compatibility.510Transport.Enable"

6.99 AsyncWaitSet

<<*extension*>> (p. 156) A specialization of **dds::core::cond::WaitSet** (p. 2318) that provides a mechanism to perform the wait asynchronously and uses a thread pool to dispatch the attached active **dds::core::cond::Condition** (p. 729).

Classes

- class **rti::core::cond::AsyncWaitSetProperty**
*Specifies the **rti::core::cond::AsyncWaitSet** (p. 627) behavior.*
- class **rti::core::cond::AsyncWaitSetCompletionToken**
*Implementation of the completion token role element of the asynchronous completion token pattern that is part of the **AsyncWaitSet** (p. 627) behavior.*
- class **rti::core::cond::AsyncWaitSet**
<<*extension*>> (p. 156) Dispatches **dds::core::cond::Condition** (p. 729) objects using separate threads of execution. Unlike a normal **dds::core::cond::WaitSet** (p. 2318), which operates on the current thread, an **AsyncWaitSet** (p. 627) uses a thread pool.
- class **rti::core::cond::AsyncWaitSetListener**
Listener (p. 1381) for receiving event notifications related to the thread pool of the **AsyncWaitSet** (p. 627).
- class **rti::core::cond::NoOpAsyncWaitSetListener**
*A convenience implementation of **AsyncWaitSetListener** (p. 643) where all methods are overridden to do nothing.*
- class **rti::sub::cond::DataReaderStatusConditionHandler< T >**
*Realization of a **functor handler** (p. 1859) that handles the status of a **dds::sub::DataReader** (p. 756).*

Functions

- static **AsyncWaitSetCompletionToken rti::core::cond::AsyncWaitSetCompletionToken::Ignore ()**
*For the operations that allow an **rti::core::cond::AsyncWaitSetCompletionToken** (p. 640), this sentinel can be provided to indicate an **rti::core::cond::AsyncWaitSet** (p. 627) to perform the action associating a 'null' completion token.*

6.99.1 Detailed Description

<<*extension*>> (p. 156) A specialization of **dds::core::cond::WaitSet** (p. 2318) that provides a mechanism to perform the wait asynchronously and uses a thread pool to dispatch the attached active **dds::core::cond::Condition** (p. 729).

This class is a realization of the `Proactor` pattern applied to WaitSets and Conditions that provide a powerful component for your application process events leveraging concurrency.

6.99.2 Function Documentation

6.99.2.1 Ignore()

```
static AsyncWaitSetCompletionToken rti::core::cond::AsyncWaitSetCompletionToken::Ignore ( ) [static]
```

For the operations that allow an **rti::core::cond::AsyncWaitSetCompletionToken** (p. 640), this sentinel can be provided to indicate an **rti::core::cond::AsyncWaitSet** (p. 627) to perform the action associating a 'null' completion token.

This sentinel is a realization of the null object pattern of an **rti::core::cond::AsyncWaitSetCompletionToken** (p. 640). If this object is provided to a **rti::core::cond::AsyncWaitSet** (p. 627) operation, the resulting operation request will be associated with a 'null' completion token that behaves as no-op.

When 'nul' completion token is provided, the **rti::core::cond::AsyncWaitSet** (p. 627) operation returns immediately after it issues the internal request, and there is no mean for your application to wait for the request to complete.

You can use this sentinel when your application can operate on an **rti::core::cond::AsyncWaitSet** (p. 627) without needing to know when operation requests complete or your application uses other strategies to synchronize resources.

This sentinel is also useful when you need to perform operations on **rti::core::cond::AsyncWaitSet** (p. 627) from within one of the threads from its thread pool, where waiting on a valid **rti::core::cond::AsyncWaitSetCompletionToken** (p. 640) is forbidden.

6.100 QoS Policies

Quality of Service (QoS) policies.

Modules

- **QoS Policy Traits**

*The traits types **policy_id** (p. 1668) and **policy_name** (p. 1668) provide information about a QoS policy.*

- **ASYNCHRONOUS_PUBLISHER**

*<<extension>> (p. 156) Specifies the asynchronous publishing settings of the **dds::pub::Publisher** (p. 1719) instances.*

- **AVAILABILITY**

<<extension>> (p. 156) Configures the availability of data.

- **BATCH**

*<<extension>> (p. 156) Batch QoS policy used to enable batching in **dds::pub::DataWriter** (p. 908) instances.*

- **DATABASE**

<<extension>> (p. 156) Various threads and resource limits settings used by RTI Connex to control its internal database.

- **DATA_READER_PROTOCOL**

<<extension>> (p. 156) Specifies the DataReader-specific protocol QoS.

- **DATA_READER_RESOURCE_LIMITS**

<<extension>> (p. 156) Various settings that configure how DataReaders allocate and use physical memory for internal resources.

- **DATA_REPRESENTATION**

A list of data representations and compression methods supported by a **dds::pub::DataWriter** (p. 908) or **dds::sub::DataReader** (p. 756).

- **DATA_WRITER_PROTOCOL**

<<extension>> (p. 156) Along with **rti::core::policy::WireProtocol** (p. 2331) and **rti::core::policy::DataReaderProtocol** (p. 836), this QoS policy configures the DDS on-the-network protocol (RTPS).

- **DATA_WRITER_RESOURCE_LIMITS**

<<extension>> (p. 156) Various settings that configure how a **dds::pub::DataWriter** (p. 908) allocates and uses physical memory for internal resources.

- **DATA_WRITER_TRANSFER_MODE**

<<extension>> (p. 156) Specifies the DataWriter transfer mode QoS.

- **DATA_TAG**

Stores (name, value) pairs that can be used to determine access permissions.

- **DEADLINE**

Expresses the maximum duration (deadline) within which an instance is expected to be updated.

- **DESTINATION_ORDER**

Controls the criteria used to determine the logical order among changes made by **dds::pub::Publisher** (p. 1719) entities to the same instance of data (i.e., matching **dds::topic::Topic** (p. 2178) and key).

- **DISCOVERY**

<<extension>> (p. 156) Specifies the attributes required to discover participants in the domain.

- **DISCOVERY_CONFIG**

<<extension>> (p. 156) Specifies the discovery configuration QoS.

- **DOMAIN_PARTICIPANT_RESOURCE_LIMITS**

<<extension>> (p. 156) Various settings that configure how a **dds::domain::DomainParticipant** (p. 1079) allocates and uses physical memory for internal resources, including the maximum sizes of various properties.

- **DURABILITY**

This QoS policy specifies whether or not RTI Connext will store and deliver previously published data samples to new **dds::sub::DataReader** (p. 756) entities that join the network later.

- **DURABILITY_SERVICE**

Various settings to configure the external RTI Persistence Service used by RTI Connext for DataWriters with a **dds::core::policy::Durability** (p. 1181) setting of **dds::core::policy::DurabilityKind::PERSISTENT** or **dds::core::policy::DurabilityKind::TRANSIENT**.

- **ENTITY_FACTORY**

A QoS policy for all **dds::core::Entity** (p. 1265) types that can act as factories for one or more other **dds::core::Entity** (p. 1265) types.

- **ENTITY_NAME**

<<extension>> (p. 156) Assigns a name to a **dds::domain::DomainParticipant** (p. 1079), **dds::pub::Publisher** (p. 1719), **dds::sub::Subscriber** (p. 2116), **dds::pub::DataWriter** (p. 908) or **dds::sub::DataReader** (p. 756). Except for **dds::pub::Publisher** (p. 1719) and **dds::sub::Subscriber** (p. 2116), these names are visible during the discovery process and in RTI tools to help you visualize and debug your system.

- **EVENT**

<<extension>> (p. 156) Configures the internal thread in a DomainParticipant that handles timed events.

- **HISTORY**

Specifies the behavior of RTI Connext in the case where the value of an instance changes (one or more times) before it can be successfully communicated to one or more existing subscribers.

- **GROUP_DATA**

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 44) during discovery.

- **LATENCY_BUDGET**

Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.

- **LIFESPAN**

*Specifies how long the data written by the **dds::pub::DataWriter** (p. 908) is considered valid.*

- **LIVELINESS**

*Specifies and configures the mechanism that allows **dds::sub::DataReader** (p. 756) entities to detect when **dds::pub::DataWriter** (p. 908) entities become disconnected or "dead".*

- **LOCATORFILTER**

*<<extension>> (p. 156) The QoS policy used to report the configuration of a MultiChannel DataWriter as part of **dds::topic::PublicationBuiltinTopicData** (p. 1703).*

- **LOGGING**

<<extension>> (p. 156) Configures the RTI Connex logging facility.

- **MONITORING**

Configures the use of RTI Monitoring Library 2.0 to collect and distribute RTI Connex telemetry data.

- **MULTICHANNEL**

<<extension>> (p. 156) Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data.

- **OWNERSHIP**

*Specifies whether it is allowed for multiple **dds::pub::DataWriter** (p. 908) (s) to write the same instance of the data and if so, how these modifications should be arbitrated.*

- **OWNERSHIP_STRENGTH**

*Specifies the value of the strength used to arbitrate among multiple **dds::pub::DataWriter** (p. 908) objects that attempt to modify the same instance of a data type (identified by **dds::topic::Topic** (p. 2178) + key).*

- **PARTITION**

*Set of strings that introduces logical partitions in **dds::domain::DomainParticipant** (p. 1079), **dds::pub::Publisher** (p. 1719), or **dds::sub::Subscriber** (p. 2116) entities.*

- **PRESENTATION**

Specifies how the samples representing changes to data instances are presented to a subscribing application.

- **PROFILE**

<<extension>> (p. 156) Configures the way that XML documents containing QoS profiles are loaded by RTI Connex.

- **PROPERTY**

<<extension>> (p. 156) Stores (name, value) pairs that can be used to configure certain parameters of RTI Connex that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.

- **PUBLISH_MODE**

<<extension>> (p. 156) Specifies how RTI Connex sends application data on the network. This QoS policy can be used to tell RTI Connex to use its own thread to send data, instead of the user thread.

- **READER_DATA_LIFECYCLE**

Controls how a DataReader manages the lifecycle of the data that it has received.

- **RECEIVER_POOL**

<<extension>> (p. 156) Configures threads used by RTI Connex to receive and process data from transports (for example, UDP sockets).

- **RELIABILITY**

Indicates the level of reliability offered/requested by RTI Connex.

- **RESOURCE_LIMITS**

Controls the amount of physical memory allocated for DDS entities, if dynamic allocations are allowed, and how they occur. Also controls memory usage among different instance values for keyed topics.

- **SERVICE**

<<extension>> (p. 156) Service QoS policy is used to indicate what kind of service is associated with the DDS entity.

- **SYSTEM_RESOURCE_LIMITS**

- <<extension>> (p. 156) Configures DomainParticipant-independent resources used by RTI Connext.
- **TIME_BASED_FILTER**
 - Filter that allows a **dds::sub::DataReader** (p. 756) to specify that it is interested only in (potentially) a subset of the values of the data.
- **TOPIC_DATA**
 - Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 44) during discovery.
- **TOPIC_QUERY_DISPATCH**
 - Configures the ability of a **dds::pub::DataWriter** (p. 908) to publish historical samples.
- **TRANSPORT_BUILTIN**
 - <<extension>> (p. 156) Specifies which built-in transports are used.
- **TRANSPORT_MULTICAST**
 - <<extension>> (p. 156) Specifies the multicast address on which a **dds::sub::DataReader** (p. 756) wants to receive its data. It can also specify a port number, as well as a subset of the available (at the **dds::domain::DomainParticipant** (p. 1079) level) transports with which to receive the multicast data.
- **TRANSPORT_MULTICAST_MAPPING**
 - <<extension>> (p. 156) Specifies a list of topic expressions and addresses that can be used by an Entity with a specific topic name to receive data.
- **TRANSPORT_PRIORITY**
 - This QoS policy allows the application to take advantage of transport that are capable of sending messages with different priorities.
- **TRANSPORT_SELECTION**
 - <<extension>> (p. 156) Specifies the physical transports that a **dds::pub::DataWriter** (p. 908) or **dds::sub::DataReader** (p. 756) may use to send or receive data.
- **TRANSPORT_UNICAST**
 - <<extension>> (p. 156) Specifies a subset of transports and a port number that can be used by an Entity to receive data.
- **TYPE_CONSISTENCY_ENFORCEMENT**
 - Defines the rules for determining whether the type used to publish a given topic is consistent with that used to subscribe to it.
- **TYPESUPPORT**
 - <<extension>> (p. 156) Allows you to attach application-specific values to a **dds::pub::DataWriter** (p. 908) or **dds::sub::DataReader** (p. 756), which are passed to the serialization or deserialization routine of the associated data type and choose whether to set padding bytes to zero during serialization.
- **USER_DATA**
 - Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 44) during discovery.
- **WRITER_DATA_LIFECYCLE**
 - Controls how a DataWriter handles the lifecycle of the instances (keys) that it is registered to manage.
- **WIRE_PROTOCOL**
 - <<extension>> (p. 156) Specifies the wire protocol related attributes for the **dds::domain::DomainParticipant** (p. 1079).

Classes

- class **dds::core::policy::QosPolicyCount**
 - <<value-type>> (p. 152) Holds a counter for a QosPolicyId

Typedefs

- typedef std::vector< **QosPolicyCount** > **dds::core::policy::QosPolicyCountSeq**
A vector of *QosPolicyCount* (p. 1746).
- typedef uint32_t **dds::core::policy::QosPolicyId**
Identifies a QoS policy.

6.100.1 Detailed Description

Quality of Service (QoS) policies.

Data Distribution Service (DDS) relies on the use of QoS. A QoS is a set of characteristics that controls some aspect of the behavior of DDS. A QoS is comprised of individual QoS policies (objects conceptually deriving from an *abstract QosPolicy* class).

"Supported QoS policies"

The *QosPolicy* provides the basic mechanism for an application to specify quality of service parameters. It has an attribute name that is used to uniquely identify each *QosPolicy*.

QosPolicy implementation is comprised of a name, an ID, and a type. The type of a *QosPolicy* value may be atomic, such as an integer or float, or compound (a structure). Compound types are used whenever multiple parameters must be set coherently to define a consistent value for a *QosPolicy*.

QoS (i.e., a list of *QosPolicy* objects) may be associated with all **dds::core::Entity** (p. 1265) objects in the system such as **dds::topic::Topic** (p. 2178), **dds::pub::DataWriter** (p. 908), **dds::sub::DataReader** (p. 756), **dds::pub::Publisher** (p. 1719), **dds::sub::Subscriber** (p. 2116), and **dds::domain::DomainParticipant** (p. 1079).

6.100.2 Specifying QoS on entities

QoS Policies can be set programmatically when an **dds::core::Entity** (p. 1265) is created, or modified with the **dds::core::Entity** (p. 1265)'s **set_qos (abstract)** (p. 1267) method.

QoS Policies can also be configured from XML resources (files, strings). With this approach, you can change the QoS without recompiling the application. For more information, see **Configuring QoS Profiles with XML** (p. 103).

To customize a **dds::core::Entity** (p. 1265)'s QoS before creating the entity, the correct pattern is:

- First, initialize a QoS object with the appropriate INITIALIZER constructor.
- Call the relevant get_<entity>_default_qos() method.
- Modify the QoS values as desired.
- Finally, create the entity.

Each `QoSPolicy` is treated independently from the others. This approach has the advantage of being very extensible. However, there may be cases where several policies are in conflict. Consistency checking is performed each time the policies are modified via the `set_qos (abstract)` (p. 1267) operation, or when the `dds::core::Entity` (p. 1265) is created.

When a policy is changed after being set to a given value, it is not required that the new value be applied instantaneously; RTI Connex is allowed to apply it after a transition phase. In addition, some `QoSPolicy` have immutable semantics, meaning that they can only be specified either at `dds::core::Entity` (p. 1265) creation time or else prior to calling the `dds::core::Entity::enable` (p. 1269) operation on the entity.

Each `dds::core::Entity` (p. 1265) can be configured with a list of `QoSPolicy` objects. However, not all `QoSPolicies` are supported by each `dds::core::Entity` (p. 1265). For instance, a `dds::domain::DomainParticipant` (p. 1079) supports a different set of `QoS Policies` than a `dds::topic::Topic` (p. 2178) or a `dds::pub::Publisher` (p. 1719).

Additional properties that are not exposed through the formal QoS policies can also be set for an `dds::core::Entity` (p. 1265) via the `rti::core::policy::Property` (p. 1695). These properties are described in the `Property Reference Guide`.

6.100.3 QoS compatibility

In several cases, for communications to occur properly (or efficiently), a `QoSPolicy` on the publisher side must be compatible with a corresponding policy on the subscriber side. For example, if a `dds::sub::Subscriber` (p. 2116) requests to receive data reliably while the corresponding `dds::pub::Publisher` (p. 1719) defines a best-effort policy, communication will not happen as requested.

To address this issue and maintain the desirable decoupling of publication and subscription as much as possible, the `QoSPolicy` specification follows the **subscriber-requested, publisher-offered pattern**.

In this pattern, the subscriber side can specify a "requested" value for a particular `QoSPolicy`. The publisher side specifies an "offered" value for that `QoSPolicy`. RTI Connex will then determine whether the value requested by the subscriber side is compatible with what is offered by the publisher side. If the two policies are compatible, then communication will be established. If the two policies are not compatible, RTI Connex will not establish communications between the two `dds::core::Entity` (p. 1265) objects and will record this fact by means of the `dds::core::status::StatusMask::offered_incompatible_qos()` (p. 2087) on the publisher end and `dds::core::status::StatusMask::requested_incompatible_qos()` (p. 2088) on the subscriber end. The application can detect this fact by means of a `Listener` (p. 1381) or a `dds::core::cond::Condition` (p. 729).

The following **properties** are defined on a `QoSPolicy`.

- **RxO (p. 307) property**

The `QoSPolicy` objects that need to be set in a compatible manner between the **publisher** and **subscriber** end are indicated by the setting of the **RxO** (p. 307) property:

- **RxO (p. 307) = YES**

indicates that the policy can be set both at the publishing and subscribing ends and the values must be set in a compatible manner. In this case the compatible values are explicitly defined.

- **RxO (p. 307) = NO**

indicates that the policy can be set both at the publishing and subscribing ends but the two settings are independent. That is, all combinations of values are compatible.

- **RxO (p. 307) = N/A**

indicates that the policy can only be specified at either the publishing or the subscribing end, but not at both ends. So compatibility does not apply.

- **Changeable (p. 307) property**

Determines whether a `QoSPolicy` can be changed.

- **NO (p. 307)** -- policy can only be specified at `dds::core::Entity` (p. 1265) creation time.

- **UNTIL ENABLE (p. 307)** -- policy can only be changed before the `dds::core::Entity` (p. 1265) is enabled.

- **YES (p. 307)** -- policy can be changed at any time.

6.100.4 Typedef Documentation

6.100.4.1 QosPolicyCountSeq

```
typedef std::vector< QosPolicyCount> dds::core::policy::QosPolicyCountSeq
```

A vector of **QosPolicyCount** (p. 1746).

6.100.4.2 QosPolicyId

```
typedef uint32_t dds::core::policy::QosPolicyId
```

Identifies a QoS policy.

The ID for a given policy can be obtained with **dds::core::policy::policy_id** (p. 1668).

For example, the policy ID for the **dds::core::policy::Deadline** (p.1020) policy is `dds::core::policy::policy_id<dds::core::policy::Deadline>::value`.

6.101 ASYNCHRONOUS_PUBLISHER

<<*extension*>> (p. 156) Specifies the asynchronous publishing settings of the **dds::pub::Publisher** (p. 1719) instances.

Classes

- class **rti::core::policy::AsynchronousPublisher**
 <<*extension*>> (p. 156) *Configures the mechanism to publish data using a separate thread*

6.101.1 Detailed Description

<<*extension*>> (p. 156) Specifies the asynchronous publishing settings of the **dds::pub::Publisher** (p. 1719) instances.

6.102 AVAILABILITY

<<*extension*>> (p. 156) Configures the availability of data.

Classes

- class **rti::core::EndpointGroup**
 <<*extension*>> (p. 156) Specifies a group of endpoints that can be collectively identified by a name and satisfied by a quorum.
- class **rti::core::policy::Availability**
 <<*extension*>> (p. 156) Configures data availability in the context of Collaborative DataWriters and Required Subscriptions

Typedefs

- typedef **dds::core::vector< EndpointGroup > rti::core::EndpointGroupSeq**
 A sequence of *rti::core::EndpointGroup* (p. 1259).

6.102.1 Detailed Description

<<*extension*>> (p. 156) Configures the availability of data.

6.102.2 Typedef Documentation

6.102.2.1 EndpointGroupSeq

```
typedef dds::core::vector< EndpointGroup> rti::core::EndpointGroupSeq
```

A sequence of *rti::core::EndpointGroup* (p. 1259).

In the context of Collaborative DataWriters, it can be used by a **dds::sub::DataReader** (p. 756) to define a group of remote DataWriters that the **dds::sub::DataReader** (p. 756) will wait to discover before skipping missing samples.

In the context of Durable Subscriptions, it can be used to create a set of Durable Subscriptions identified by a name and a quorum count.

See also

rti::core::EndpointGroup (p. 1259)

6.103 BATCH

<<*extension*>> (p. 156) Batch QoS policy used to enable batching in **dds::pub::DataWriter** (p. 908) instances.

Classes

- class **rti::core::policy::Batch**

<<*extension*>> (p. 156) Allows a **dds::pub::DataWriter** (p. 908) to batch multiple samples into a single network packet to increase throughput.

6.103.1 Detailed Description

<<*extension*>> (p. 156) Batch QoS policy used to enable batching in **dds::pub::DataWriter** (p. 908) instances.

6.104 DATABASE

<<*extension*>> (p. 156) Various threads and resource limits settings used by RTI Connex to control its internal database.

Classes

- class **rti::core::policy::Database**

<<*extension*>> (p. 156) Configures threads and resource limits that RTI Connex uses to control its internal database

6.104.1 Detailed Description

<<*extension*>> (p. 156) Various threads and resource limits settings used by RTI Connex to control its internal database.

6.105 DATA_READER_PROTOCOL

<<*extension*>> (p. 156) Specifies the DataReader-specific protocol QoS.

Classes

- class **rti::core::policy::DataReaderProtocol**

<<*extension*>> (p. 156) Configures DataReader-specific aspects of the RTPS protocol

- class **rti::core::RtpsReliableReaderProtocol**

<<*extension*>> (p. 156) Configures aspects of the RTPS protocol related to a reliable DataReader

6.105.1 Detailed Description

<<*extension*>> (p. 156) Specifies the DataReader-specific protocol QoS.

6.106 DATA_READER_RESOURCE_LIMITS

<<*extension*>> (p. 156) Various settings that configure how DataReaders allocate and use physical memory for internal resources.

Classes

- class `rti::core::policy::DataReaderResourceLimits`
<<*extension*>> (p. 156) Configures the memory usage of a `dds::pub::DataReader`
- struct `rti::core::policy::DataReaderInstanceRemovalKind_def`
Sets the kinds of instances that can be replaced when instance resource limits (`dds::core::policy::ResourceLimits::max_instances` (p. 1924)) are reached.
- class `rti::core::DataReaderResourceLimitsInstanceReplacementSettings`
<<*extension*>> (p. 156) How instances are replaced in the `DataReader` queue when resource limits are reached.

Typedefs

- typedef `dds::core::safe_enum< DataReaderInstanceRemovalKind_def > rti::core::policy::DataReaderInstanceRemovalKind`
<<*extension*>> (p. 156) *Safe Enumeration* (p. 229) of `DataReaderInstanceRemovalKind_def` (p. 830)

Functions

- static `DDS_Long rti::core::policy::DataReaderResourceLimits::auto_max_total_instances ()`
<<*extension*>> (p. 156) This value is used to make `rti::core::policy::DataReaderResourceLimits::max_total_instances` (p. 868) equal to `dds::core::policy::ResourceLimits::max_instances` (p. 1924).

6.106.1 Detailed Description

<<*extension*>> (p. 156) Various settings that configure how DataReaders allocate and use physical memory for internal resources.

6.106.2 Typedef Documentation

6.106.2.1 DataReaderInstanceRemovalKind

```
typedef dds::core::safe_enum< DataReaderInstanceRemovalKind_def> rti::core::policy::DataReaderInstanceRemovalKind
```

<<*extension*>> (p. 156) *Safe Enumeration* (p. 229) of `DataReaderInstanceRemovalKind_def` (p. 830)

See also

`DataReaderInstanceRemovalKind_def` (p. 830)

6.106.3 Function Documentation

6.106.3.1 auto_max_total_instances()

```
static DDS_Long rti::core::policy::DataReaderResourceLimits::auto_max_total_instances ( ) [inline],
[static]
```

<<*extension*>> (p. 156) This value is used to make `rti::core::policy::DataReaderResourceLimits::max_total_instances` (p. 868) equal to `dds::core::policy::ResourceLimits::max_instances` (p. 1924).

6.107 DATA_REPRESENTATION

A list of data representations and compression methods supported by a `dds::pub::DataWriter` (p. 908) or `dds::sub::DataReader` (p. 756).

Classes

- class `dds::core::policy::DataRepresentation`
Contains the data representations supported by entities.
- class `rti::core::CompressionIdMask`
<<*extension*>> (p. 156) *Mask that specifies which built-in compression method to used.*
- class `rti::core::CompressionSettings`
<<*extension*>> (p. 156) *Compression Settings*

Typedefs

- typedef `int16_t dds::core::policy::DataRepresentationId`
The type of the elements that `DataRepresentation` (p. 883) contains.
- typedef `std::vector< DataRepresentationId > dds::core::policy::DataRepresentationIdSeq`
A vector of `DataRepresentationId`.

Functions

- static `DataRepresentationId dds::core::policy::DataRepresentation::xcdr ()`
Extended Common Data Representation encoding version 1.
- static `DataRepresentationId dds::core::policy::DataRepresentation::xml ()`
XML Data Representation (unsupported)
- static `DataRepresentationId dds::core::policy::DataRepresentation::xcdr2 ()`
Extended Common Data Representation encoding version 2.
- static `DataRepresentationId dds::core::policy::DataRepresentation::auto_id ()`
Representation automatically chosen based on the type.

6.107.1 Detailed Description

A list of data representations and compression methods supported by a `dds::pub::DataWriter` (p. 908) or `dds::sub::DataReader` (p. 756).

6.107.2 Typedef Documentation

6.107.2.1 DataRepresentationId

```
typedef int16_t dds::core::policy::DataRepresentationId
```

The type of the elements that `DataRepresentation` (p. 883) contains.

2-byte signed integers

6.107.2.2 DataRepresentationIdSeq

```
typedef std::vector< DataRepresentationId> dds::core::policy::DataRepresentationIdSeq
```

A vector of `DataRepresentationId`.

6.107.3 Function Documentation

6.107.3.1 xcdr()

```
static DataRepresentationId dds::core::policy::DataRepresentation::xcdr ( ) [inline], [static]
```

Extended Common Data Representation encoding version 1.

6.107.3.2 xml()

```
static DataRepresentationId dds::core::policy::DataRepresentation::xml ( ) [inline], [static]
```

XML Data Representation (unsupported)

Note

This value is currently not supported.

6.107.3.3 xcdr2()

```
static DataRepresentationId dds::core::policy::DataRepresentation::xcdr2 ( ) [inline], [static]
```

Extended Common Data Representation encoding version 2.

6.107.3.4 auto_id()

```
static DataRepresentationId dds::core::policy::DataRepresentation::auto_id ( ) [inline], [static]
```

Representation automatically chosen based on the type.

For plain language binding, if the `allowed_data_representation` annotation is not specified or if it contains the value XCDR, RTI ConnexT translates this field to `dds::core::policy::DataRepresentation::xcdr()` (p. 313). Otherwise, it translates this field to `dds::core::policy::DataRepresentation::xcdr2()` (p. 313).

For the **FlatData language binding** (p.219), RTI ConnexT translates this field to `dds::core::policy::DataRepresentation::xcdr2()` (p. 313).

Examples

`Foo.hpp`.

6.108 DATA_WRITER_PROTOCOL

<<*extension*>> (p. 156) Along with `rti::core::policy::WireProtocol` (p. 2331) and `rti::core::policy::DataReaderProtocol` (p. 836), this QoS policy configures the DDS on-the-network protocol (RTPS).

Classes

- class `rti::core::policy::DataWriterProtocol`
<<*extension*>> (p. 156) Configures aspects of an the RTPS protocol related to a `dds::pub::DataWriter` (p. 908)

6.108.1 Detailed Description

<<*extension*>> (p. 156) Along with `rti::core::policy::WireProtocol` (p. 2331) and `rti::core::policy::DataReaderProtocol` (p. 836), this QoS policy configures the DDS on-the-network protocol (RTPS).

6.109 DATA_WRITER_RESOURCE_LIMITS

<<*extension*>> (p. 156) Various settings that configure how a `dds::pub::DataWriter` (p.908) allocates and uses physical memory for internal resources.

Classes

- class **rti::core::policy::DataWriterResourceLimits**
 - <<*extension*>> (p. 156) Configures the memory usage of a **dds::pub::DataWriter** (p. 908)
- struct **rti::core::policy::DataWriterResourceLimitsInstanceReplacementKind_def**
 - <<*extension*>> (p. 156) The enumeration for DataWriter Resource Limits

Typedefs

- typedef **dds::core::safe_enum< DataWriterResourceLimitsInstanceReplacementKind_def > rti::core::policy::DataWriterResourceLimitsInstanceReplacementKind**
 - <<*extension*>> (p. 156) *Safe Enumeration* (p. 229) of **DataWriterResourceLimitsInstanceReplacementKind_def** (p. 1014)

6.109.1 Detailed Description

<<*extension*>> (p. 156) Various settings that configure how a **dds::pub::DataWriter** (p. 908) allocates and uses physical memory for internal resources.

6.109.2 Typedef Documentation

6.109.2.1 DataWriterResourceLimitsInstanceReplacementKind

```
typedef dds::core::safe_enum< DataWriterResourceLimitsInstanceReplacementKind_def> rti::core::policy::DataWriterResourceLimitsInstanceReplacementKind
```

<<*extension*>> (p. 156) *Safe Enumeration* (p. 229) of **DataWriterResourceLimitsInstanceReplacementKind_def** (p. 1014)

See also

DataWriterResourceLimitsInstanceReplacementKind_def (p. 1014)

6.110 DATA_WRITER_TRANSFER_MODE

<<*extension*>> (p. 156) Specifies the DataWriter transfer mode QoS.

Classes

- class **rti::core::policy::DataWriterTransferMode**
 - <<*extension*>> (p. 156) Configures the transfer mode of a **dds::pub::DataWriter** (p. 908)
- class **rti::core::DataWriterShmemRefTransferModeSettings**
 - <<*extension*>> (p. 156) Configures aspects of the shared memory reference transfer mode related to a DataWriter

6.110.1 Detailed Description

<<*extension*>> (p. 156) Specifies the DataWriter transfer mode QoS.

6.111 DATA_TAG

Stores (name, value) pairs that can be used to determine access permissions.

Classes

- class **dds::core::policy::DataTag**
Stores name-value (string) pairs that can be used to determine access permissions.

6.111.1 Detailed Description

Stores (name, value) pairs that can be used to determine access permissions.

The `rti::core::policy::DataTag` can be used to associate a set of tags in the form of (name, value) pairs with a `dds::sub::DataReader` (p. 756) or `dds::pub::DataWriter` (p. 908). This is similar to the `rti::core::policy::Property` (p. 1695), except you cannot select whether or not a particular pair should be propagated (included in the built-in topic). Data tags are always propagated. The Access Control plugin may use the tags to determine publish and subscribe permissions.

6.112 DEADLINE

Expresses the maximum duration (deadline) within which an instance is expected to be updated.

Classes

- class **dds::core::policy::Deadline**
Expresses the maximum duration (deadline) within which an instance is expected to be updated.

6.112.1 Detailed Description

Expresses the maximum duration (deadline) within which an instance is expected to be updated.

6.113 DESTINATION_ORDER

Controls the criteria used to determine the logical order among changes made by `dds::pub::Publisher` (p. 1719) entities to the same instance of data (i.e., matching `dds::topic::Topic` (p. 2178) and key).

Classes

- struct **dds::core::policy::DestinationOrderKind_def**
*The definition of the **dds::core::safe_enum** (p. 1972) **DestinationOrderKind**.*
- class **dds::core::policy::DestinationOrder**
*Controls the logical order of updates to the same instance by a **dds::pub::Publisher** (p. 1719).*
- struct **rti::core::policy::DestinationOrderScopeKind_def**
*<<extension>> (p. 156) The definition of the **dds::core::safe_enum** (p. 1972) **DestinationOrderScopeKind***

Typedefs

- typedef **dds::core::safe_enum< DestinationOrderKind_def > dds::core::policy::DestinationOrderKind**
*Safe Enumeration (p. 229) of **DestinationOrderKind_def** (p. 1027)*
- typedef **dds::core::safe_enum< DestinationOrderScopeKind_def > rti::core::policy::DestinationOrder↔ScopeKind**
*Safe Enumeration (p. 229) of **DestinationOrderScopeKind_def** (p. 1028)*

6.113.1 Detailed Description

Controls the criteria used to determine the logical order among changes made by **dds::pub::Publisher** (p. 1719) entities to the same instance of data (i.e., matching **dds::topic::Topic** (p. 2178) and key).

6.113.2 Typedef Documentation

6.113.2.1 DestinationOrderKind

```
typedef dds::core::safe_enum< DestinationOrderKind_def> dds::core::policy::DestinationOrderKind
```

Safe Enumeration (p. 229) of **DestinationOrderKind_def** (p. 1027)

See also

DestinationOrderKind_def (p. 1027)

6.113.2.2 DestinationOrderScopeKind

```
typedef dds::core::safe_enum< DestinationOrderScopeKind_def> rti::core::policy::Destination↔OrderScopeKind
```

Safe Enumeration (p. 229) of **DestinationOrderScopeKind_def** (p. 1028)

See also

DestinationOrderScopeKind_def (p. 1028)

6.114 DISCOVERY

<<*extension*>> (p. 156) Specifies the attributes required to discover participants in the domain.

Modules

- **NDDS_DISCOVERY_PEERS**

Environment variable or a file that specifies the default values of `rti::core::policy::Discovery::initial_peers(const dds::core::StringSeq & the_initial_peers)` (p. 1031) and `rti::core::policy::Discovery::multicast_receive_addresses` (p. 1032) contained in the `dds::domain::qos::DomainParticipantQos::discovery qos` policy.

Classes

- class **rti::core::policy::Discovery**

<<*extension*>> (p. 156) *Configures entity discovery*

6.114.1 Detailed Description

<<*extension*>> (p. 156) Specifies the attributes required to discover participants in the domain.

6.115 DISCOVERY_CONFIG

<<*extension*>> (p. 156) Specifies the discovery configuration QoS.

Classes

- class **rti::core::policy::BuiltinTopicReaderResourceLimits**

<<*extension*>> (p. 156) *Configures several resource management aspects of the built-in topic DataReaders*

- class **rti::core::policy::DiscoveryConfig**

<<*extension*>> (p. 156) *Configures the discovery mechanism*

- class **rti::core::policy::DiscoveryConfigBuiltinPluginKindMask**

<<*extension*>> (p. 156) *A mask that selects the built-in discovery plugins to be used*

- class **rti::core::policy::DiscoveryConfigBuiltinChannelKindMask**

<<*extension*>> (p. 156) *A mask that selects the built-in channels to be used*

- struct **rti::core::policy::RemoteParticipantPurgeKind_def**

<<*extension*>> (p. 156) *The definition of the `dds::core::safe_enum` (p. 1972) `RemoteParticipantPurgeKind`*

Typedefs

- typedef **dds::core::safe_enum< RemoteParticipantPurgeKind_def > rti::core::policy::RemoteParticipantPurgeKind**

<<*extension*>> (p. 156) *Safe Enumeration* (p. 229) *of `RemoteParticipantPurgeKind_def`* (p. 1886)

6.115.1 Detailed Description

<<*extension*>> (p. 156) Specifies the discovery configuration QoS.

6.115.2 Typedef Documentation

6.115.2.1 RemoteParticipantPurgeKind

```
typedef dds::core::safe_enum< RemoteParticipantPurgeKind_def> rti::core::policy::RemoteParticipantPurgeKind
```

<<*extension*>> (p. 156) **Safe Enumeration** (p. 229) of **RemoteParticipantPurgeKind_def** (p. 1886)

See also

RemoteParticipantPurgeKind_def (p. 1886)

6.116 DOMAIN_PARTICIPANT_RESOURCE_LIMITS

<<*extension*>> (p. 156) Various settings that configure how a **dds::domain::DomainParticipant** (p. 1079) allocates and uses physical memory for internal resources, including the maximum sizes of various properties.

Classes

- class **rti::core::policy::DomainParticipantResourceLimits**
<<*extension*>> (p. 156) *Configures the memory usage of certain dds::domain::DomainParticipant (p. 1079) resources*
- struct **rti::core::policy::IgnoredEntityReplacementKind_def**
<<*extension*>> (p. 156) *The enumeration for DomainParticipantResourceLimits (p. 1143) ignored entity replacement kinds*
- class **rti::core::AllocationSettings**
<<*extension*>> (p. 156) *Resource allocation settings*

Typedefs

- typedef **dds::core::safe_enum< IgnoredEntityReplacementKind_def > rti::core::policy::IgnoredEntityReplacementKind**
<<*extension*>> (p. 156) **Safe Enumeration** (p. 229) of **IgnoredEntityReplacementKind_def** (p. 1351)

6.116.1 Detailed Description

<<*extension*>> (p. 156) Various settings that configure how a **dds::domain::DomainParticipant** (p. 1079) allocates and uses physical memory for internal resources, including the maximum sizes of various properties.

6.116.2 Typedef Documentation

6.116.2.1 IgnoredEntityReplacementKind

```
typedef dds::core::safe_enum< IgnoredEntityReplacementKind_def> rti::core::policy::IgnoredEntityReplacementKind
```

<<*extension*>> (p. 156) **Safe Enumeration** (p. 229) of **IgnoredEntityReplacementKind_def** (p. 1351)

See also

IgnoredEntityReplacementKind_def (p. 1351)

6.117 DURABILITY

This QoS policy specifies whether or not RTI Connext will store and deliver previously published data samples to new **dds::sub::DataReader** (p. 756) entities that join the network later.

Classes

- struct **dds::core::policy::DurabilityKind_def**
The definition of the dds::core::safe_enum (p. 1972) DurabilityKind.
- class **dds::core::policy::Durability**
Specifies whether a dds::pub::DataWriter (p. 908) will store and deliver previously published data samples to late-joining dds::sub::DataReader (p. 756) entities.
- class **rti::core::PersistentStorageSettings**
<<extension>> (p. 156) Configures the persistent storage settings for durable writer history and durable reader state.

Typedefs

- typedef **dds::core::safe_enum< DurabilityKind_def > dds::core::policy::DurabilityKind**
Safe Enumeration (p. 229) of DurabilityKind_def (p. 1188)

Enumerations

- enum class `rti::core::policy::PersistentJournalKind` {
PersistentJournalKind::delete_journal = DDS_DELETE_PERSISTENT_JOURNAL ,
PersistentJournalKind::truncate_journal = DDS_TRUNCATE_PERSISTENT_JOURNAL ,
PersistentJournalKind::persist_journal = DDS_PERSIST_PERSISTENT_JOURNAL ,
PersistentJournalKind::memory_journal = DDS_MEMORY_PERSISTENT_JOURNAL ,
PersistentJournalKind::wal_journal = DDS_WAL_PERSISTENT_JOURNAL ,
PersistentJournalKind::off = DDS_OFF_PERSISTENT_JOURNAL }
 <<*extension*>> (p. 156) The enumeration for the journal kind of the persistent storage for durable writer history and durable reader state.
- enum class `rti::core::policy::PersistentSynchronizationKind` {
PersistentSynchronizationKind::normal = DDS_NORMAL_PERSISTENT_SYNCHRONIZATION ,
PersistentSynchronizationKind::full = DDS_FULL_PERSISTENT_SYNCHRONIZATION ,
PersistentSynchronizationKind::off = DDS_OFF_PERSISTENT_SYNCHRONIZATION }
 <<*extension*>> (p. 156) The enumeration for the synchronization kind of the persistent storage for durable writer history and durable reader state.

Functions

- `int32_t rti::core::policy::auto_writer_depth ()`
 <<*extension*>> (p. 156) The default value for `dds::core::policy::Durability::writer_depth` (p. 1187)

6.117.1 Detailed Description

This QoS policy specifies whether or not RTI Connex will store and deliver previously published data samples to new `dds::sub::DataReader` (p. 756) entities that join the network later.

6.117.2 Typedef Documentation

6.117.2.1 DurabilityKind

```
typedef dds::core::safe_enum< DurabilityKind_def> dds::core::policy::DurabilityKind
```

Safe Enumeration (p. 229) of **DurabilityKind_def** (p. 1188)

See also

DurabilityKind_def (p. 1188)

6.117.3 Enumeration Type Documentation

6.117.3.1 PersistentJournalKind

```
enum class rti::core::policy::PersistentJournalKind [strong]
```

<<*extension*>> (p. 156) The enumeration for the journal kind of the persistent storage for durable writer history and durable reader state.

Enumerator

delete_journal	Deletes the rollback journal at the conclusion of each transaction.
truncate_journal	Commits transactions by truncating the rollback journal to zero-length instead of deleting it.
persist_journal	Prevents the rollback journal from being deleted at the end of each transaction. Instead, the header of the journal is overwritten with zeros.
memory_journal	Stores the rollback journal in volatile RAM. This saves disk I/O.
wal_journal	Uses a write-ahead log instead of a rollback journal to implement transactions.
off	Disables the rollback journal.

6.117.3.2 PersistentSynchronizationKind

```
enum class rti::core::policy::PersistentSynchronizationKind [strong]
```

<<**extension**>> (p. 156) The enumeration for the synchronization kind of the persistent storage for durable writer history and durable reader state.

Enumerator

normal	Data (e.g., new sample) is written to disk at critical moments.
full	Data (e.g., new sample) is written to physical disk immediately.
off	No synchronization is enforced.

6.117.4 Function Documentation

6.117.4.1 auto_writer_depth()

```
int32_t rti::core::policy::auto_writer_depth ( ) [inline]
```

<<**extension**>> (p. 156) The default value for **dds::core::policy::Durability::writer_depth** (p. 1187)

Note

This is a standalone function in the namespace `rti::core::policy`

This values resolves to the following:

- **dds::core::policy::History::depth** (p. 1349) if the history kind is `dds::core::policy::HistoryKind::KEEP_LAST`.
- **dds::core::policy::ResourceLimits::max_samples_per_instance** (p.1925) in the **dds::core::policy::ResourceLimits** (p. 1921) if the history kind is `dds::core::policy::HistoryKind::KEEP_ALL`.

Referenced by `rti::core::policy::DomainParticipantResourceLimits::local_writer_allocation()`.

6.118 DURABILITY_SERVICE

Various settings to configure the external *RTI Persistence Service* used by RTI Connext for DataWriters with a **dds::core::policy::Durability** (p. 1181) setting of **dds::core::policy::DurabilityKind::PERSISTENT** or **dds::core::policy::DurabilityKind::TRANSIENT**.

Classes

- class **dds::core::policy::DurabilityService**
Configures the external RTI Persistence Service used by persistent and transient DataWriters.

6.118.1 Detailed Description

Various settings to configure the external *RTI Persistence Service* used by RTI Connext for DataWriters with a **dds::core::policy::Durability** (p. 1181) setting of **dds::core::policy::DurabilityKind::PERSISTENT** or **dds::core::policy::DurabilityKind::TRANSIENT**.

6.119 ENTITY_FACTORY

A QoS policy for all **dds::core::Entity** (p. 1265) types that can act as factories for one or more other **dds::core::Entity** (p. 1265) types.

Classes

- class **dds::core::policy::EntityFactory**
*Configures a **dds::core::Entity** (p. 1265) that acts as factory of other entities.*

6.119.1 Detailed Description

A QoS policy for all **dds::core::Entity** (p. 1265) types that can act as factories for one or more other **dds::core::Entity** (p. 1265) types.

6.120 ENTITY_NAME

<<*extension*>> (p. 156) Assigns a name to a **dds::domain::DomainParticipant** (p. 1079), **dds::pub::Publisher** (p. 1719), **dds::sub::Subscriber** (p. 2116), **dds::pub::DataWriter** (p. 908) or **dds::sub::DataReader** (p. 756). Except for **dds::pub::Publisher** (p. 1719) and **dds::sub::Subscriber** (p. 2116), these names are visible during the discovery process and in RTI tools to help you visualize and debug your system.

Classes

- class `rti::core::policy::EntityName`
 <<*extension*>> (p. 156) Assigns a name to a `DomainParticipant`, `Publisher`, `Subscriber`, `DataWriter` or `DataReader`.

6.120.1 Detailed Description

<<*extension*>> (p. 156) Assigns a name to a `dds::domain::DomainParticipant` (p. 1079), `dds::pub::Publisher` (p. 1719), `dds::sub::Subscriber` (p. 2116), `dds::pub::DataWriter` (p. 908) or `dds::sub::DataReader` (p. 756). Except for `dds::pub::Publisher` (p. 1719) and `dds::sub::Subscriber` (p. 2116), these names are visible during the discovery process and in RTI tools to help you visualize and debug your system.

6.121 EVENT

<<*extension*>> (p. 156) Configures the internal thread in a `DomainParticipant` that handles timed events.

Classes

- class `rti::core::policy::Event`
 <<*extension*>> (p. 156) Configures the thread in a `DomainParticipant` that handles timed events.

6.121.1 Detailed Description

<<*extension*>> (p. 156) Configures the internal thread in a `DomainParticipant` that handles timed events.

6.122 HISTORY

Specifies the behavior of RTI Connex in the case where the value of an instance changes (one or more times) before it can be successfully communicated to one or more existing subscribers.

Classes

- struct `dds::core::policy::HistoryKind_def`
 The definition of the `dds::core::safe_enum` (p. 1972) `HistoryKind`.
- class `dds::core::policy::History`
 Specifies how much historical data a `dds::pub::DataWriter` (p. 908) and a `dds::sub::DataReader` (p. 756) can store.

Typedefs

- typedef `dds::core::safe_enum< HistoryKind_def > dds::core::policy::HistoryKind`
 Safe Enumeration (p. 229) of `HistoryKind_def` (p. 1350)

6.122.1 Detailed Description

Specifies the behavior of RTI Connex in the case where the value of an instance changes (one or more times) before it can be successfully communicated to one or more existing subscribers.

6.122.2 Typedef Documentation

6.122.2.1 HistoryKind

```
typedef dds::core::safe_enum< HistoryKind_def> dds::core::policy::HistoryKind
```

Safe Enumeration (p. 229) of **HistoryKind_def** (p. 1350)

See also

HistoryKind_def (p. 1350)

6.123 GROUP_DATA

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 44) during discovery.

Classes

- class **dds::core::policy::GroupData**

6.123.1 Detailed Description

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 44) during discovery.

6.124 LATENCY_BUDGET

Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.

Classes

- class **dds::core::policy::LatencyBudget**

Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.

6.124.1 Detailed Description

Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.

6.125 LIFESPAN

Specifies how long the data written by the `dds::pub::DataWriter` (p. 908) is considered valid.

Classes

- class `dds::core::policy::Lifespan`

Specifies how long the data written by a `dds::pub::DataWriter` (p. 908) is considered valid.

6.125.1 Detailed Description

Specifies how long the data written by the `dds::pub::DataWriter` (p. 908) is considered valid.

6.126 LIVELINESS

Specifies and configures the mechanism that allows `dds::sub::DataReader` (p. 756) entities to detect when `dds::pub::DataWriter` (p. 908) entities become disconnected or "dead".

Classes

- struct `dds::core::policy::LivelinessKind_def`

The definition of the `dds::core::safe_enum` (p. 1972) `LivelinessKind`.

- class `dds::core::policy::Liveliness`

Specifies and configures the mechanism that allows `dds::sub::DataReader` (p. 756)'s to detect when `dds::pub::DataWriter` (p. 908)'s become disconnected.

Typedefs

- typedef `dds::core::safe_enum< LivelinessKind_def > dds::core::policy::LivelinessKind`

Safe Enumeration (p. 229) of `LivelinessKind_def` (p. 1397)

6.126.1 Detailed Description

Specifies and configures the mechanism that allows `dds::sub::DataReader` (p. 756) entities to detect when `dds::pub::DataWriter` (p. 908) entities become disconnected or "dead".

6.126.2 Typedef Documentation

6.126.2.1 LivelinessKind

```
typedef dds::core::safe_enum< LivelinessKind_def> dds::core::policy::LivelinessKind
```

Safe Enumeration (p. 229) of **LivelinessKind_def** (p. 1397)

See also

LivelinessKind_def (p. 1397)

6.127 LOCATORFILTER

<<*extension*>> (p. 156) The QoS policy used to report the configuration of a MultiChannel DataWriter as part of **dds::topic::PublicationBuiltinTopicData** (p. 1703).

Classes

- class **rti::core::LocatorFilterElement**
 <<*extension*>> (p. 156) <<*value-type*>> (p. 152) Specifies the configuration of an individual channel within a Multi↔Channel DataWriter.
- class **rti::core::policy::LocatorFilter**
 <<*extension*>> (p. 156) Configures how the **dds::topic::PublicationBuiltinTopicData** (p. 1703) reports the configuration of a **MultiChannel** (p. 1483) DataWriter.

6.127.1 Detailed Description

<<*extension*>> (p. 156) The QoS policy used to report the configuration of a MultiChannel DataWriter as part of **dds::topic::PublicationBuiltinTopicData** (p. 1703).

6.128 LOGGING

<<*extension*>> (p. 156) Configures the RTI Connex logging facility.

<<*extension*>> (p. 156) Configures the RTI Connex logging facility.

6.129 MONITORING

Configures the use of RTI Monitoring Library 2.0 to collect and distribute RTI Connex telemetry data.

Classes

- class **rti::core::policy::Monitoring**
 <<extension>> (p. 156) Configures the use of the RTI **Monitoring** (p. 1448) Library 2.0 to collect and distribute RTI Connexx telemetry data.
- class **rti::core::MonitoringPeriodicDistributionSettings**
 <<extension>> (p. 156) Configures the distribution of periodic metrics.
- class **rti::core::MonitoringEventDistributionSettings**
 <<extension>> (p. 156) Configures the distribution of event metrics.
- class **rti::core::MonitoringLoggingDistributionSettings**
 <<extension>> (p. 156) Configures the distribution of log messages.
- class **rti::core::MonitoringDedicatedParticipantSettings**
 <<extension>> (p. 156) Configures the usage of a dedicated **dds::domain::DomainParticipant** (p. 1079) to distribute the RTI Connexx application telemetry data.
- class **rti::core::MonitoringDistributionSettings**
 <<extension>> (p. 156) Configures the distribution of telemetry data.
- class **rti::core::MonitoringMetricSelection**
 <<extension>> (p. 156) Configures event and periodic metrics collection and distribution for a specific set of observable resources.
- class **rti::core::MonitoringLoggingForwardingSettings**
 <<extension>> (p. 156) Configures the forwarding levels of log messages for the different **rti::config::LogFacility** (p. 255).
- class **rti::core::MonitoringTelemetryData**
 <<extension>> (p. 156) Configures the telemetry data that will be distributed.

6.129.1 Detailed Description

Configures the use of RTI Monitoring Library 2.0 to collect and distribute RTI Connexx telemetry data.

6.130 MULTICHANNEL

<<extension>> (p. 156) Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data.

Classes

- class **rti::core::policy::MultiChannel**
 <<extension>> (p. 156) Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data.
- class **rti::core::ChannelSettings**
 <<extension>> (p. 156) Configures the properties of a channel in **rti::core::policy::MultiChannel** (p. 1483)

Typedefs

- typedef std::vector< **ChannelSettings** > **rti::core::ChannelSettingsSeq**
 <<extension>> (p. 156) A sequence of **ChannelSettings** (p. 703)

6.130.1 Detailed Description

<<*extension*>> (p. 156) Configures the ability of a `DataWriter` to send data on different multicast groups (addresses) based on the value of the data.

6.130.2 Typedef Documentation

6.130.2.1 ChannelSettingsSeq

```
typedef std::vector< ChannelSettings> rti::core::ChannelSettingsSeq
```

<<*extension*>> (p. 156) A sequence of `ChannelSettings` (p. 703)

6.131 OWNERSHIP

Specifies whether it is allowed for multiple `dds::pub::DataWriter` (p. 908) (s) to write the same instance of the data and if so, how these modifications should be arbitrated.

Classes

- struct `dds::core::policy::OwnershipKind_def`
The definition of the `dds::core::safe_enum` (p. 1972) `OwnershipKind`.
- class `dds::core::policy::Ownership`
Specifies whether it is allowed for multiple `dds::pub::DataWriter` (p. 908)'s to write the same instance of the data and if so, how these modifications should be arbitrated.

Typedefs

- typedef `dds::core::safe_enum< OwnershipKind_def > dds::core::policy::OwnershipKind`
Safe Enumeration (p. 229) of `OwnershipKind_def` (p. 1636)

6.131.1 Detailed Description

Specifies whether it is allowed for multiple `dds::pub::DataWriter` (p. 908) (s) to write the same instance of the data and if so, how these modifications should be arbitrated.

6.131.2 Typedef Documentation

6.131.2.1 OwnershipKind

```
typedef dds::core::safe_enum< OwnershipKind_def> dds::core::policy::OwnershipKind
```

Safe Enumeration (p. 229) of **OwnershipKind_def** (p. 1636)

See also

OwnershipKind_def (p. 1636)

6.132 OWNERSHIP_STRENGTH

Specifies the value of the strength used to arbitrate among multiple **dds::pub::DataWriter** (p. 908) objects that attempt to modify the same instance of a data type (identified by **dds::topic::Topic** (p. 2178) + key).

Classes

- class **dds::core::policy::OwnershipStrength**

*Specifies the value of the strength used to arbitrate among multiple **dds::pub::DataWriter** (p. 908) objects that attempt to modify the same instance of a data type (identified by its **dds::topic::Topic** (p. 2178) and key).*

6.132.1 Detailed Description

Specifies the value of the strength used to arbitrate among multiple **dds::pub::DataWriter** (p. 908) objects that attempt to modify the same instance of a data type (identified by **dds::topic::Topic** (p. 2178) + key).

6.133 PARTITION

Set of strings that introduces logical partitions in **dds::domain::DomainParticipant** (p. 1079), **dds::pub::Publisher** (p. 1719), or **dds::sub::Subscriber** (p. 2116) entities.

Classes

- class **dds::core::policy::Partition**

*Set of strings that introduces logical partitions in **dds::domain::DomainParticipant** (p. 1079), **dds::pub::Publisher** (p. 1719), or **dds::sub::Subscriber** (p. 2116) entities.*

6.133.1 Detailed Description

Set of strings that introduces logical partitions in **dds::domain::DomainParticipant** (p. 1079), **dds::pub::Publisher** (p. 1719), or **dds::sub::Subscriber** (p. 2116) entities.

6.134 PRESENTATION

Specifies how the samples representing changes to data instances are presented to a subscribing application.

Classes

- struct **dds::core::policy::PresentationAccessScopeKind_def**
*The definition of the **dds::core::safe_enum** (p. 1972) **PresentationAccessScopeKind**.*
- class **dds::core::policy::Presentation**
Specifies how the samples representing changes to data instances are presented to a subscribing application.

Typedefs

- typedef **dds::core::safe_enum< PresentationAccessScopeKind_def > dds::core::policy::Presentation↔ AccessScopeKind**
*Safe Enumeration (p. 229) of **PresentationAccessScopeKind_def** (p. 1677)*

6.134.1 Detailed Description

Specifies how the samples representing changes to data instances are presented to a subscribing application.

6.134.2 Typedef Documentation

6.134.2.1 PresentationAccessScopeKind

```
typedef dds::core::safe_enum< PresentationAccessScopeKind_def> dds::core::policy::Presentation↔ AccessScopeKind
```

Safe Enumeration (p. 229) of **PresentationAccessScopeKind_def** (p. 1677)

See also

PresentationAccessScopeKind_def (p. 1677)

6.135 PROFILE

<<**extension**>> (p. 156) Configures the way that XML documents containing QoS profiles are loaded by RTI Connex.

Classes

- class `rti::core::QosProviderParams`

<<extension>> (p. 156) <<value-type>> (p. 152) Configure options that control the way that XML documents containing QoS profiles are loaded by a `dds::core::QosProvider` (p. 1752).

6.135.1 Detailed Description

<<extension>> (p. 156) Configures the way that XML documents containing QoS profiles are loaded by RTI Connex.

6.136 PROPERTY

<<extension>> (p. 156) Stores (name, value) pairs that can be used to configure certain parameters of RTI Connex that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.

Classes

- class `rti::core::policy::Property`

<<extension>> (p. 156) Stores key/value string pairs that can configure certain parameters of RTI Connex not exposed through QoS policies. It can also store and propagate through the discovery mechanism application-specific information associated to a `dds::core::Entity` (p. 1265).

6.136.1 Detailed Description

<<extension>> (p. 156) Stores (name, value) pairs that can be used to configure certain parameters of RTI Connex that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.

RTI Connex will automatically set some system properties in the `rti::core::policy::Property` (p. 1695) associated with a `dds::domain::qos::DomainParticipantQos` (p. 1136). See **System Properties** (p. 102) for additional details.

6.137 PUBLISH_MODE

*<<extension>> (p. 156) Specifies how RTI Connex sends application data on the network. This QoS policy can be used to tell RTI Connex to use its *own* thread to send data, instead of the user thread.*

Classes

- class `rti::core::policy::PublishMode`

<<extension>> (p. 156) Specifies whether a `dds::pub::DataWriter` (p. 908) sends data synchronously or asynchronously.

- struct `rti::core::policy::PublishModeKind_def`

*<<extension>> (p. 156) The enumeration for **PublishMode** (p. 1739) kinds*

Typedefs

- typedef `dds::core::safe_enum< PublishModeKind_def > rti::core::policy::PublishModeKind`
 <<extension>> (p. 156) *Safe Enumeration* (p. 229) of *PublishModeKind_def* (p. 1744)

Variables

- const int32_t `rti::core::PUBLICATION_PRIORITY_UNDEFINED`
Initializer value for `rti::core::policy::PublishMode::priority` (p. 1743) and/or `rti::core::ChannelSettings::priority` (p. 706).
- const int32_t `rti::core::PUBLICATION_PRIORITY_AUTOMATIC`
Constant value for `rti::core::policy::PublishMode::priority` (p. 1743) and/or `rti::core::ChannelSettings::priority` (p. 706).

6.137.1 Detailed Description

<<extension>> (p. 156) Specifies how RTI Connexx sends application data on the network. This QoS policy can be used to tell RTI Connexx to use its *own* thread to send data, instead of the user thread.

6.137.2 Typedef Documentation

6.137.2.1 PublishModeKind

```
typedef dds::core::safe_enum< PublishModeKind_def> rti::core::policy::PublishModeKind
```

<<extension>> (p. 156) *Safe Enumeration* (p. 229) of *PublishModeKind_def* (p. 1744)

See also

PublishModeKind_def (p. 1744)

6.137.3 Variable Documentation

6.137.3.1 PUBLICATION_PRIORITY_UNDEFINED

```
const int32_t rti::core::PUBLICATION_PRIORITY_UNDEFINED
```

Initializer value for `rti::core::policy::PublishMode::priority` (p. 1743) and/or `rti::core::ChannelSettings::priority` (p. 706).

When assigned this value, the publication priority of the data writer, or channel of a multi-channel data writer, will be set to the lowest possible value. For multi-channel data writers, if either the data writer or channel priority is NOT set to this value, then the publication priority of the entity will be set to the defined value.

6.137.3.2 PUBLICATION_PRIORITY_AUTOMATIC

```
const int32_t rti::core::PUBLICATION_PRIORITY_AUTOMATIC
```

Constant value for **rti::core::policy::PublishMode::priority** (p. 1743) and/or **rti::core::ChannelSettings::priority** (p. 706).

When assigned this value, the publication priority of the data writer, or channel of a multi-channel data writer, will be set to the largest priority value of any sample currently queued for publication by the data writer or data writer channel.

6.138 READER_DATA_LIFECYCLE

Controls how a DataReader manages the lifecycle of the data that it has received.

Classes

- class **dds::core::policy::ReaderDataLifecycle**
Controls how a DataReader manages the lifecycle of the data that it has received.

6.138.1 Detailed Description

Controls how a DataReader manages the lifecycle of the data that it has received.

6.139 RECEIVER_POOL

<<**extension**>> (p. 156) Configures threads used by RTI Connex to receive and process data from transports (for example, UDP sockets).

Classes

- class **rti::core::policy::ReceiverPool**
<<**extension**>> (p. 156) *Configures threads that RTI Connex uses to receive and process data from the transport modules (such as UDP)*

6.139.1 Detailed Description

<<**extension**>> (p. 156) Configures threads used by RTI Connex to receive and process data from transports (for example, UDP sockets).

6.140 RELIABILITY

Indicates the level of reliability offered/requested by RTI Connex.

Classes

- struct **dds::core::policy::ReliabilityKind_def**
*The definition of the **dds::core::safe_enum** (p. 1972) **ReliabilityKind**.*
- class **dds::core::policy::Reliability**
*Indicates the level of reliability in sample delivered that a **dds::pub::DataWriter** (p. 908) offers or a **dds::sub::DataReader** (p. 756) requests.*
- struct **rti::core::policy::AcknowledgmentKind_def**
<<extension>> (p. 156) The enumeration for Reliability acknowledgment kinds

Typedefs

- typedef **dds::core::safe_enum< ReliabilityKind_def > dds::core::policy::ReliabilityKind**
*Safe Enumeration (p. 229) of **ReliabilityKind_def** (p. 1879)*
- typedef **dds::core::safe_enum< AcknowledgmentKind_def > rti::core::policy::AcknowledgmentKind**
*<<extension>> (p. 156) **Safe Enumeration** (p. 229) of **AcknowledgmentKind_def** (p. 585)*

Enumerations

- enum class **rti::core::policy::InstanceStateConsistencyKind** {
InstanceStateConsistencyKind::none ,
InstanceStateConsistencyKind::recover_state }
<<extension>> (p. 156) The enumeration for instance state consistency kinds

6.140.1 Detailed Description

Indicates the level of reliability offered/requested by RTI Connex.

6.140.2 Typedef Documentation

6.140.2.1 ReliabilityKind

```
typedef dds::core::safe_enum< ReliabilityKind_def> dds::core::policy::ReliabilityKind
```

Safe Enumeration (p. 229) of **ReliabilityKind_def** (p. 1879)

See also

ReliabilityKind_def (p. 1879)

6.140.2.2 AcknowledgmentKind

```
typedef dds::core::safe_enum< AcknowledgmentKind_def> rti::core::policy::AcknowledgmentKind
```

<<*extension*>> (p. 156) **Safe Enumeration** (p. 229) of **AcknowledgmentKind_def** (p. 585)

See also

AcknowledgmentKind_def (p. 585)

6.140.3 Enumeration Type Documentation

6.140.3.1 InstanceStateConsistencyKind

```
enum class rti::core::policy::InstanceStateConsistencyKind [strong]
```

<<*extension*>> (p. 156) The enumeration for instance state consistency kinds

Enumerator

none	Instance states on the DataReader are not guaranteed to be correct after liveliness is regained after a disconnect. When DataReaders rediscover DataWriters, they will not request updated instance state data. DataWriters always provide instance state data alongside each sample update regardless of this setting.
recover_state	Instance states on the DataReader are guaranteed to be correct after liveliness is regained after a disconnect. When DataReaders rediscover DataWriters, they will request updated instance state data. DataWriters will respond to requests for updated instance state data and publish updates on the ServiceRequest channel. DataWriters still provide instance state data alongside each sample update regardless of this setting. The following limitation applies to using RECOVER_INSTANCE_STATE_CONSISTENCY: If the dds::core::policy::DestinationOrderKind (p. 317) is set to <code>dds::core::policy::DestinationOrderKind::BY_SOURCE_TIMESTAMP</code> , RECOVER_INSTANCE_STATE_CONSISTENCY can only be used if scope is set to <code>idref_DestinationOrderQosPolicyScopeKind_INSTANCE_SCOPE_DESTINATIONORDER_QOS</code> (the default).

6.141 RESOURCE_LIMITS

Controls the amount of physical memory allocated for DDS entities, if dynamic allocations are allowed, and how they occur. Also controls memory usage among different instance values for keyed topics.

Classes

- class `dds::core::policy::ResourceLimits`
Controls the memory usage of `dds::pub::DataWriter` (p. 908) or a `dds::sub::DataReader` (p. 756).

6.141.1 Detailed Description

Controls the amount of physical memory allocated for DDS entities, if dynamic allocations are allowed, and how they occur. Also controls memory usage among different instance values for keyed topics.

6.142 SERVICE

<<*extension*>> (p. 156) Service QoS policy is used to indicate what kind of service is associated with the DDS entity.

Classes

- class `rti::core::policy::Service`
<<*extension*>> (p. 156) Indicates if an Entity is associated with a service and if so, which one.
- struct `rti::core::policy::ServiceKind_def`
<<*extension*>> (p. 156) The definition of the `dds::core::safe_enum` (p. 1972) `ServiceKind`

Typedefs

- typedef `dds::core::safe_enum< ServiceKind_def > rti::core::policy::ServiceKind`
<<*extension*>> (p. 156) *Safe Enumeration* (p. 229) of `ServiceKind_def` (p. 2064)

6.142.1 Detailed Description

<<*extension*>> (p. 156) Service QoS policy is used to indicate what kind of service is associated with the DDS entity.

6.142.2 Typedef Documentation

6.142.2.1 ServiceKind

```
typedef dds::core::safe_enum< ServiceKind_def> rti::core::policy::ServiceKind
```

<<*extension*>> (p. 156) *Safe Enumeration* (p. 229) of `ServiceKind_def` (p. 2064)

See also

`ServiceKind_def` (p. 2064)

6.143 SYSTEM_RESOURCE_LIMITS

<<*extension*>> (p. 156) Configures DomainParticipant-independent resources used by RTI Connex.

Classes

- class **rti::core::policy::SystemResourceLimits**
<<*extension*>> (p. 156) Configures resources that RTI Connex uses

6.143.1 Detailed Description

<<*extension*>> (p. 156) Configures DomainParticipant-independent resources used by RTI Connex.

6.144 TIME_BASED_FILTER

Filter that allows a **dds::sub::DataReader** (p. 756) to specify that it is interested only in (potentially) a subset of the values of the data.

Classes

- class **dds::core::policy::TimeBasedFilter**
*Allows a **dds::sub::DataReader** (p. 756) to indicate that it is not interested in all the sample updates that occur within a time period.*

6.144.1 Detailed Description

Filter that allows a **dds::sub::DataReader** (p. 756) to specify that it is interested only in (potentially) a subset of the values of the data.

6.145 TOPIC_DATA

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 44) during discovery.

Classes

- class **dds::core::policy::TopicData**

6.145.1 Detailed Description

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 44) during discovery.

6.146 TOPIC_QUERY_DISPATCH

Configures the ability of a **dds::pub::DataWriter** (p. 908) to publish historical samples.

Classes

- class **rti::core::policy::TopicQueryDispatch**
 <<*extension*>> (p. 156) Configures the ability of a **dds::pub::DataWriter** (p. 908) to publish samples in response to a **rti::sub::TopicQuery** (p. 2220)

6.146.1 Detailed Description

Configures the ability of a **dds::pub::DataWriter** (p. 908) to publish historical samples.

6.147 TRANSPORT_BUILTIN

<<*extension*>> (p. 156) Specifies which built-in transports are used.

Classes

- class **rti::core::policy::TransportBuiltin**
 <<*extension*>> (p. 156) Specifies which built-in transports to use
- class **rti::core::policy::TransportBuiltinMask**
 <<*extension*>> (p. 156) Mask that specifies which built-in transports are used

6.147.1 Detailed Description

<<*extension*>> (p. 156) Specifies which built-in transports are used.

6.148 TRANSPORT_MULTICAST

<<*extension*>> (p. 156) Specifies the multicast address on which a **dds::sub::DataReader** (p. 756) wants to receive its data. It can also specify a port number, as well as a subset of the available (at the **dds::domain::DomainParticipant** (p. 1079) level) transports with which to receive the multicast data.

Classes

- class **rti::core::policy::TransportMulticast**
 <<*extension*>> (p. 156) Specifies the multicast address on which a **dds::sub::DataReader** (p. 756) wants to receive its data and other settings.
- struct **rti::core::policy::TransportMulticastKind_def**
 <<*extension*>> (p. 156) The definition of the **dds::core::safe_enum** (p. 1972) *TransportMulticastKind*
- class **rti::core::TransportMulticastSettings**
 <<*extension*>> (p. 156) Represents a list of multicast locators

Typedefs

- typedef **dds::core::safe_enum< TransportMulticastKind_def > rti::core::policy::TransportMulticastKind**
 <<*extension*>> (p. 156) *Safe Enumeration* (p. 229) of *TransportMulticastKind_def* (p. 2249)
- typedef **std::vector< TransportMulticastSettings > rti::core::TransportMulticastSettingsSeq**
 A sequence of *TransportMulticastSettings* (p. 2252).

6.148.1 Detailed Description

<<*extension*>> (p. 156) Specifies the multicast address on which a **dds::sub::DataReader** (p. 756) wants to receive its data. It can also specify a port number, as well as a subset of the available (at the **dds::domain::DomainParticipant** (p. 1079) level) transports with which to receive the multicast data.

6.148.2 Typedef Documentation

6.148.2.1 TransportMulticastKind

```
typedef dds::core::safe_enum< TransportMulticastKind_def> rti::core::policy::TransportMulticastKind
```

<<*extension*>> (p. 156) *Safe Enumeration* (p. 229) of *TransportMulticastKind_def* (p. 2249)

See also

TransportMulticastKind_def (p. 2249)

6.148.2.2 TransportMulticastSettingsSeq

```
typedef std::vector< TransportMulticastSettings> rti::core::TransportMulticastSettingsSeq
```

A sequence of **TransportMulticastSettings** (p. 2252).

6.149 TRANSPORT_MULTICAST_MAPPING

<<*extension*>> (p. 156) Specifies a list of topic expressions and addresses that can be used by an Entity with a specific topic name to receive data.

Classes

- class **rti::core::policy::TransportMulticastMapping**

Specifies a list of topic_expressions and multicast addresses that can be used by an Entity with a specific topic name to receive data.

6.149.1 Detailed Description

<<*extension*>> (p. 156) Specifies a list of topic expressions and addresses that can be used by an Entity with a specific topic name to receive data.

6.150 TRANSPORT_PRIORITY

This QoS policy allows the application to take advantage of transport that are capable of sending messages with different priorities.

Classes

- class **dds::core::policy::TransportPriority**

Allows applications to take advantage of transports capable of sending messages with different priorities.

6.150.1 Detailed Description

This QoS policy allows the application to take advantage of transport that are capable of sending messages with different priorities.

6.151 TRANSPORT_SELECTION

<<*extension*>> (p. 156) Specifies the physical transports that a **dds::pub::DataWriter** (p. 908) or **dds::sub::DataReader** (p. 756) may use to send or receive data.

Classes

- class **rti::core::policy::TransportSelection**

<<*extension*>> (p. 156) *Specifies the transports that a **dds::pub::DataWriter** (p. 908) or a **dds::sub::DataReader** (p. 756) may use to send or receive data*

6.151.1 Detailed Description

<<*extension*>> (p. 156) Specifies the physical transports that a **dds::pub::DataWriter** (p. 908) or **dds::sub::DataReader** (p. 756) may use to send or receive data.

6.152 TRANSPORT_UNICAST

<<*extension*>> (p. 156) Specifies a subset of transports and a port number that can be used by an Entity to receive data.

Classes

- class **rti::core::policy::TransportUnicast**
 <<*extension*>> (p. 156) Specifies a subset of transports and a port number that can be used by a **dds::core::Entity** (p. 1265) to receive data.
- class **rti::core::TransportUnicastSettings**
 <<*extension*>> (p. 156) Represents a list of unicast locators

Typedefs

- typedef std::vector< **TransportUnicastSettings** > **rti::core::TransportUnicastSettingsSeq**
 <<*extension*>> (p. 156) A sequence of **TransportUnicastSettings** (p. 2262)

6.152.1 Detailed Description

<<*extension*>> (p. 156) Specifies a subset of transports and a port number that can be used by an Entity to receive data.

6.152.2 Typedef Documentation

6.152.2.1 TransportUnicastSettingsSeq

```
typedef std::vector< TransportUnicastSettings> rti::core::TransportUnicastSettingsSeq
```

<<*extension*>> (p. 156) A sequence of **TransportUnicastSettings** (p. 2262)

6.153 TYPE_CONSISTENCY_ENFORCEMENT

Defines the rules for determining whether the type used to publish a given topic is consistent with that used to subscribe to it.

Classes

- struct **dds::core::policy::TypeConsistencyEnforcementKind_def**
*The definition of the **dds::core::safe_enum** (p. 1972) **TypeConsistencyEnforcementKind**.*
- class **dds::core::policy::TypeConsistencyEnforcement**
Defines the rules for determining whether the type used to publish a given topic is consistent with that used to subscribe to it.

Typedefs

- typedef **dds::core::safe_enum< TypeConsistencyEnforcementKind_def > dds::core::policy::TypeConsistencyEnforcementKind**
*Safe Enumeration (p. 229) of **TypeConsistencyEnforcementKind_def** (p. 2272)*

6.153.1 Detailed Description

Defines the rules for determining whether the type used to publish a given topic is consistent with that used to subscribe to it.

6.153.2 Typedef Documentation

6.153.2.1 TypeConsistencyEnforcementKind

```
typedef dds::core::safe_enum< TypeConsistencyEnforcementKind_def> dds::core::policy::TypeConsistencyEnforcementKind
```

Safe Enumeration (p. 229) of **TypeConsistencyEnforcementKind_def** (p. 2272)

See also

TypeConsistencyEnforcementKind_def (p. 2272)

6.154 TYPESUPPORT

<<*extension*>> (p. 156) Allows you to attach application-specific values to a **dds::pub::DataWriter** (p. 908) or **dds::sub::DataReader** (p. 756), which are passed to the serialization or deserialization routine of the associated data type and choose whether to set padding bytes to zero during serialization.

Classes

- class `rti::core::policy::TypeSupport`
 - <<*extension*>> (p. 156) Allows attaching application-specific information to a `dds::pub::DataWriter` (p. 908) or `dds::sub::DataReader` (p. 756) that is passed to the serialization and deserialization routines.
- struct `rti::core::policy::CdrPaddingKind_def`
 - <<*extension*>> (p. 156) The definition of the `dds::core::safe_enum` (p. 1972) `CdrPaddingKind`

Typedefs

- typedef `dds::core::safe_enum< CdrPaddingKind_def > rti::core::policy::CdrPaddingKind`
 - <<*extension*>> (p. 156) *Safe Enumeration* (p. 229) of `CdrPaddingKind_def` (p. 703)

6.154.1 Detailed Description

<<*extension*>> (p. 156) Allows you to attach application-specific values to a `dds::pub::DataWriter` (p. 908) or `dds::sub::DataReader` (p. 756), which are passed to the serialization or deserialization routine of the associated data type and choose whether to set padding bytes to zero during serialization.

6.154.2 Typedef Documentation

6.154.2.1 CdrPaddingKind

```
typedef dds::core::safe_enum< CdrPaddingKind_def> rti::core::policy::CdrPaddingKind
```

<<*extension*>> (p. 156) *Safe Enumeration* (p. 229) of `CdrPaddingKind_def` (p. 703)

See also

`CdrPaddingKind_def` (p. 703)

6.155 USER_DATA

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 44) during discovery.

Classes

- class `dds::core::policy::UserData`
 - Attaches a buffer of opaque data that is distributed by **Built-in Topics** (p. 44) during discovery.

6.155.1 Detailed Description

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 44) during discovery.

6.156 WRITER_DATA_LIFECYCLE

Controls how a DataWriter handles the lifecycle of the instances (keys) that it is registered to manage.

Classes

- class **dds::core::policy::WriterDataLifecycle**
*Controls how a **dds::pub::DataWriter** (p. 908) handles the lifecycle of the instances (keys) that it writes.*

6.156.1 Detailed Description

Controls how a DataWriter handles the lifecycle of the instances (keys) that it is registered to manage.

6.157 WIRE_PROTOCOL

<<**extension**>> (p. 156) Specifies the wire protocol related attributes for the **dds::domain::DomainParticipant** (p. 1079).

Classes

- class **rti::core::policy::WireProtocol**
<<**extension**>> (p. 156) *Configures the write protocol of a **dds::domain::DomainParticipant** (p. 1079)*
- struct **rti::core::policy::WireProtocolAutoKind_def**
<<**extension**>> (p. 156) *The definition of the **dds::core::safe_enum** (p. 1972) **WireProtocolAutoKind***
- class **rti::core::policy::RtpsReservedPortKindMask**
<<**extension**>> (p. 156) *Mask of reserved ports*
- class **rti::core::RtpsWellKnownPorts**
<<**extension**>> (p. 156) *Configures the mapping of the RTPS well-known ports*

Typedefs

- typedef **dds::core::safe_enum**< **WireProtocolAutoKind_def** > **rti::core::policy::WireProtocolAutoKind**
<<**extension**>> (p. 156) *Safe Enumeration (p. 229) of **WireProtocolAutoKind_def** (p. 2341)*

Functions

- static const **RtpsReservedPortKindMask** `rti::core::policy::RtpsReservedPortKindMask::all` ()
All bits are set.
- static const **RtpsReservedPortKindMask** `rti::core::policy::RtpsReservedPortKindMask::none` ()
No bits are set.
- static const **RtpsReservedPortKindMask** `rti::core::policy::RtpsReservedPortKindMask::default_mask` ()
The default value of `rti::core::policy::WireProtocol::rtps_reserved_port_mask` (p. 2339).
- static **RtpsWellKnownPorts** `rti::core::RtpsWellKnownPorts::Interoperable` ()
Returns an instance containing the port mapping compliant with the OMG DDS Interoperability wire protocol.
- static **RtpsWellKnownPorts** `rti::core::RtpsWellKnownPorts::BackwardsCompatible` ()
Returns an instance containing the port mapping compatible with previous versions of RTI Connext.

6.157.1 Detailed Description

<<*extension*>> (p. 156) Specifies the wire protocol related attributes for the `dds::domain::DomainParticipant` (p. 1079).

6.157.2 Typedef Documentation

6.157.2.1 WireProtocolAutoKind

```
typedef dds::core::safe_enum< WireProtocolAutoKind_def> rti::core::policy::WireProtocolAutoKind
```

<<*extension*>> (p. 156) **Safe Enumeration** (p. 229) of `WireProtocolAutoKind_def` (p. 2341)

See also

`WireProtocolAutoKind_def` (p. 2341)

6.157.3 Function Documentation

6.157.3.1 all()

```
static const RtpsReservedPortKindMask rti::core::policy::RtpsReservedPortKindMask::all ( ) [inline],  
[static]
```

All bits are set.

All of the ports that may be needed by DDS will be reserved when the participant is enabled. With this value set, failure to allocate a port that is computed based on the **rti::core::RtpsWellKnownPorts** (p. 1965) will be detected at this time, and the enable operation will fail.

Note that this will also reserve the **usertraffic** multicast port which is not actually used unless there are DataReaders that enable multicast but fail to specify a port. To avoid unnecessary resource usage for these ports, use `RTPS_↔RESERVED_PORT_MASK_DEFAULT`.

Automatic participant ID selection will be based on finding a participant index with both the discovery (metatraffic) unicast port and usertraffic unicast port available.

See also

RtpsReservedPortKindMask (p. 1963)

References **rti::core::policy::RtpsReservedPortKindMask::RtpsReservedPortKindMask()**.

6.157.3.2 none()

```
static const RtpsReservedPortKindMask rti::core::policy::RtpsReservedPortKindMask::none ( ) [inline],  
[static]
```

No bits are set.

None of the ports that are needed by DDS will be allocated until they are specifically required. With this value set, automatic participant Id selection will be based on selecting a port for discovery (metatraffic) unicast traffic on a single transport.

See also

RtpsReservedPortKindMask (p. 1963)

References **rti::core::policy::RtpsReservedPortKindMask::RtpsReservedPortKindMask()**.

6.157.3.3 default_mask()

```
static const RtpsReservedPortKindMask rti::core::policy::RtpsReservedPortKindMask::default_mask (
) [inline], [static]
```

The default value of **rti::core::policy::WireProtocol::rtps_reserved_port_mask** (p. 2339).

Most of the ports that may be needed by DDS will be reserved by the transport when the participant is enabled. With this value set, failure to allocate a port that is computed based on the **rti::core::RtpsWellKnownPorts** (p. 1965) will be detected at this time and the enable operation will fail.

This setting will avoid reserving the **usertraffic** multicast port, which is not actually used unless there are DataReaders that enable multicast but fail to specify a port.

Automatic participant ID selection will be based on finding a participant index with both the discovery (metatraffic) unicast port and usertraffic unicast port available.

See also

RtpsReservedPortKindMask (p. 1963)

References **rti::core::policy::RtpsReservedPortKindMask::RtpsReservedPortKindMask()**.

6.157.3.4 Interoperable()

```
static RtpsWellKnownPorts rti::core::RtpsWellKnownPorts::Interoperable ( ) [inline], [static]
```

Returns an instance containing the port mapping compliant with the OMG DDS Interoperability wire protocol.

Assign **rti::core::policy::WireProtocol::rtps_well_known_ports** (p. 2338) to this value to use well-known port mappings which are compliant with OMG's DDS Interoperability Wire Protocol.

The following are the `rtps_well_known_ports` values for **rti::core::RtpsWellKnownPorts::Interoperable()** (p. 348):

```
port_base = 7400
domain_id_gain = 250
participant_id_gain = 2
builtin_multicast_port_offset = 0
builtin_unicast_port_offset = 10
user_multicast_port_offset = 1
user_unicast_port_offset = 11
```

Assuming a maximum port number of 65535 (UDPv4), the above settings enable the use of about 230 domains with up to 120 Participants per node per domain.

These settings are *not* backwards compatible with previous versions of the RTI Connnext middleware that used fixed port mappings. For backwards compability, please use **rti::core::RtpsWellKnownPorts::BackwardsCompatible()** (p. 348).

See also

rti::core::policy::WireProtocol::rtps_well_known_ports (p. 2338)

rti::core::RtpsWellKnownPorts::BackwardsCompatible() (p. 348)

6.157.3.5 BackwardsCompatible()

```
static RtpsWellKnownPorts rti::core::RtpsWellKnownPorts::BackwardsCompatible ( ) [inline], [static]
```

Returns an instance containing the port mapping compatible with previous versions of RTI Connex.

Assign `rti::core::policy::WireProtocol::rtps_well_known_ports` (p. 2338) to this value to remain compatible with previous versions of the RTI Connex middleware that used fixed port mappings.

The following are the `rtps_well_known_ports` values for `rti::core::RtpsWellKnownPorts::BackwardsCompatible()` (p. 348):

```
port_base = 7400
domain_id_gain = 10
participant_id_gain = 1000
builtin_multicast_port_offset = 2
builtin_unicast_port_offset = 0
user_multicast_port_offset = 1
user_unicast_port_offset = 3
```

These settings are *not* compliant with OMG's DDS Interoperability Wire Protocol. To comply with the specification, please use `rti::core::RtpsWellKnownPorts::Interoperable()` (p. 348).

`rti::core::policy::WireProtocol::rtps_well_known_ports` (p. 2338)

`rti::core::RtpsWellKnownPorts::Interoperable()` (p. 348)

6.158 NDDS_DISCOVERY_PEERS

Environment variable or a file that specifies the default values of `rti::core::policy::Discovery::initial_peers(const dds::core::StringSeq & the_initial_peers)` (p. 1031) and `rti::core::policy::Discovery::multicast_receive_addresses` (p. 1032) contained in the `dds::domain::qos::DomainParticipantQos::discovery` qos policy.

Environment variable or a file that specifies the default values of `rti::core::policy::Discovery::initial_peers(const dds::core::StringSeq & the_initial_peers)` (p. 1031) and `rti::core::policy::Discovery::multicast_receive_addresses` (p. 1032) contained in the `dds::domain::qos::DomainParticipantQos::discovery` qos policy.

The default value of the `dds::domain::qos::DomainParticipantQos` (p. 1136) is obtained by calling `dds::domain::DomainParticipant::default_participant_qos()` (p. 1094)().

`NDDS_DISCOVERY_PEERS` specifies the default value of the `rti::core::policy::Discovery::initial_peers(const dds::core::StringSeq & the_initial_peers)` (p. 1031) and `rti::core::policy::Discovery::multicast_receive_addresses` (p. 1032) fields, when the default participant QoS policies have not been explicitly set by the user (i.e., `dds::domain::DomainParticipant::default_participant_qos()` (p. 1094)() has never been called or was called using `PARTICIPANT_QOS_DEFAULT`).

If `NDDS_DISCOVERY_PEERS` does *not* contain a multicast address, then the string sequence `rti::core::policy::Discovery::multicast_receive_addresses` (p. 1032) is cleared and the RTI discovery process will not listen for discovery messages via multicast.

If `NDDS_DISCOVERY_PEERS` contains one or more multicast addresses, the addresses will be stored in `rti::core::policy::Discovery::multicast_receive_addresses` (p. 1032), starting at element 0. They will be stored in the order in which they appear in `NDDS_DISCOVERY_PEERS`.

Note: IPv4 multicast addresses must have a prefix. Therefore, when using the UDPv6 transport: if there are any IPv4 multicast addresses in the peers list, make sure they have "udpv4://" in front of them (such as `udpv4://239.255.0.1`).

Note: Currently, RTI Connex will only listen for discovery traffic on the first multicast address (element 0) in `rti::core::policy::Discovery::multicast_receive_addresses` (p. 1032).

`NDDS_DISCOVERY_PEERS` provides a mechanism to dynamically switch the discovery configuration of an RTI Connex application without recompilation. The application programmer is free to not use the default values; instead use values supplied by other means.

`NDDS_DISCOVERY_PEERS` can be specified either in an environment variable as comma (',') separated "peer descriptors" (see **Peer Descriptor Format** (p. 350)) or in a file. These formats are described below.

6.158.1 Peer Descriptor Format

A **peer descriptor** string specifies a range of participants at a given `locator`. Peer descriptor strings are used in the `rti::core::policy::Discovery::initial_peers(const dds::core::StringSeq & the_initial_peers)` (p. 1031) field and the `dds::domain::DomainParticipant::add_peer(const std::string & peer_descr_string)` (p. 1105)() operation.

The anatomy of a `peer` descriptor is illustrated below using a UDPv4 transport and a custom "StarFabric" transport example.

A peer descriptor consists of:

optional **Participant ID Limit**. If a simple integer is specified, it indicates the maximum participant ID to be contacted by the RTI Connex discovery mechanism at the given `locator`. If that integer is enclosed in square brackets (e.g.: [2]) *only* that Participant ID will be used. You can also specify a range in the form of [a-b]: in this case only the Participant IDs in that specific range are contacted. If omitted, a default value of 4 is implied: participant IDs 0,1,2,3, and 4 will be contacted.

- **Locator** (p. 1416). See **Locator Format** (p. 351).

These are separated by the '@' character. The separator may be omitted if a participant ID limit is not explicitly specified.

Note that the "participant ID limit" only applies to unicast locators; it is ignored for multicast locators (and therefore should be omitted for multicast peer descriptors).

6.158.1.1 Locator Format

A **locator** string specifies a transport and an address in string format. Locators are used to form peer descriptors. A locator is equivalent to a peer descriptor with the default maximum participant ID.

A locator consists of:

optional **Transport name** (**alias** or **class**). This identifies the set of transport plugins (**Transport Aliases** (p. 74)) that may be used to parse the **address** portion of the locator. Note that a transport class name is an implicit alias that is used to refer to all the transport plugin instances of that class.

optional **Address**. See **Address Format** (p. 351).

These are separated by the "://" string. The separator is specified if and only if a transport name is specified.

If a transport name is specified, the address may be omitted; in that case, all the unicast addresses (across all transport plugin instances) associated with the transport class are implied. Thus, a locator string may specify several addresses.

If an address is specified, the transport name and the separator string may be omitted; in that case all the available transport plugins (for the **dds::core::Entity** (p. 1265)) may be used to parse the address string.

6.158.1.2 Address Format

An **address** string specifies a transport-independent network address that qualifies a **transport-dependent** address string. Addresses are used to form locators. Addresses are also used in **rti::core::policy::Discovery::multicast_↔receive_addresses** (p. 1032), and **rti::core::TransportMulticastSettings::receive_address** (p. 2253) fields. An address is equivalent to a locator in which the transport name and separator are omitted.

An address consists of:

optional **Network Address**. An address in IPv4 or IPv6 string notation. If omitted, the network address of the transport is implied (**Transport Network Address** (p. 77)).

optional **Transport Address**. A string that is passed to the transport for processing. The transport maps this string into **NDDS_Transport_Property_t::address_bit_count** (p. 1522) bits. If omitted the network address is used as the fully qualified address.

These are separated by the '#' character. If a separator is specified, it must be followed by a non-empty string which is passed to the transport plugin. If the separator is omitted, it is treated as a transport address with an implicit network address (of the transport plugin). The implicit network address is the address used when registering the transport: e.g., the UDPv4 implicit network address is 0.0.0.0.0.0.0.0.0.0.

The bits resulting from the transport address string are combined with the network address. The least or most significant **NDDS_Transport_Property_t::address_bit_count** (p. 1522) bits of the network address are ignored and replaced with the transport address. The sign of the **NDDS_Transport_Property_t::address_bit_count** (p. 1522) value determines whether the most significant bits (negative sign) or least significant bits (positive sign) are ignored (**Transport Network Address** (p. 77)).

6.158.2 NDDS_DISCOVERY_PEERS Environment Variable Format

NDDS_DISCOVERY_PEERS can be specified via an environment variable of the same name, consisting of a sequence of peer descriptors separated by the comma (',') character.

Examples

Multicast (maximum participant ID is irrelevant)

- 239.255.0.1

Default maximum participant ID on localhost

- localhost

Default maximum participant ID on host 192.168.1.1 (IPv4)

- 192.168.1.1

Default maximum participant ID on host FAA0::0 (IPv6)

- FAA0::1

Default maximum participant ID on host himalaya accessed using the "udpv4" transport plugin(s) (IPv4)

- udpv4://himalaya

Default maximum participant ID on localhost using the "udpv4" transport plugin(s) registered at network address FAA0::0

- udpv4://FAA0::0#localhost

Default maximum participant ID on host 0/0/R (StarFabric)

- 0/0/R
- #0/0/R

Default maximum participant ID on host 0/0/R (StarFabric) using the "starfabric" (StarFabric) transport plugin(s)

- starfabric://0/0/R
- starfabric://#0/0/R

Default maximum participant ID on host 0/0/R (StarFabric) using the "starfabric" (StarFabric) transport plugin(s) registered at network address FAA0::0

- starfabric://FBB0::0#0/0/R

Default maximum participant ID on all unicast addresses accessed via the "starfabric" (StarFabric) transport plugin(s)

- starfabric://

Default maximum participant ID on all unicast addresses accessed via the "shmem" (shared memory) transport plugin(s) registered at network address FCC0::0

- shmem://FCC0::0

Default maximum participant ID on hosts himalaya and gangotri

- himalaya,gangotri

Maximum participant ID of 1 on hosts himalaya and gangotri

- 1@himalaya,1@gangotri

Combinations of above

- 239.255.0.1,localhost,192.168.1.1,0/0/R
- FAA0::1,FAA0::0#localhost,FBB0::0#0/0/R
- udpv4://himalaya,udpv4://FAA0::0#localhost,#0/0/R
- starfabric://0/0/R,starfabric://FBB0::0#0/0/R,shmem://
- starfabric://,shmem://FCC0::0,1@himalaya,1@gangotri

6.158.3 NDDS_DISCOVERY_PEERS File Format

NDDS_DISCOVERY_PEERS can be specified via a file of the same name in the program's current working directory. A NDDS_DISCOVERY_PEERS file would contain a sequence of peer descriptors separated by whitespace or the comma (',') character. The file may also contain comments starting with a semicolon (;) character till the end of the line.

Example:

```

;; NDDS_DISCOVERY_PEERS - Discovery Configuration File

;;

;;

;; NOTE:

;; 1. This file must be in the current working directory, i.e.
;;    in the folder from which the application is launched.

;;

;; 2. This file takes precedence over the environment variable NDDS_DISCOVERY_PEERS

;;

;; Multicast

239.255.0.1           ; The default dds discovery multicast address

;; Unicast

localhost,192.168.1.1 ; A comma can be used a separator

FAA0::1 FAA0::0#localhost ; Whitespace can be used as a separator

1@himalaya           ; Maximum participant ID of 1 on 'himalaya'

1@gangotri

;; UDPv4

udpv4://himalaya     ; 'himalaya' via 'udpv4' transport plugin(s)

udpv4://FAA0::0#localhost ; 'localhost' via 'udpv4' transport
                        ; plugin registered at network address FAA0::0

;; Shared Memory

shmem://             ; All 'shmem' transport plugin(s)

builtin.shmem://     ; The builtin 'shmem' transport plugin

shmem://FCC0::0      ; Shared memory transport plugin registered
                        ; at network address FCC0::0

;; StarFabric

0/0/R                ; StarFabric node 0/0/R

starfabric://0/0/R   ; 0/0/R accessed via 'starfabric'
                        ; transport plugin(s)

starfabric://FBB0::0#0/0/R ; StarFabric transport plugin registered
                        ; at network address FBB0::0

starfabric://        ; All 'starfabric' transport plugin(s)

```

6.158.4 NDDS_DISCOVERY_PEERS Precedence

If the current working directory from which the RTI Connex application is launched contains a file called `NDDS_DISCOVERY_PEERS`, and an environment variable named `NDDS_DISCOVERY_PEERS` is also defined, the file takes precedence; the environment variable is ignored.

6.158.5 NDDS_DISCOVERY_PEERS Default Value

If `NDDS_DISCOVERY_PEERS` is not specified (either as a file in the current working directory, or as an environment variable), it implicitly defaults to the following.

```
;; Multicast (only on platforms which allow UDPv4 multicast out of the box)
;;
;; This allows any dds applications anywhere on the local network to
;; discover each other over UDPv4.
builtin.udpv4://239.255.0.1 ; dds's default discovery multicast address
                        ; This is also the default multicast receive address
;; Unicast - UDPv4 (on all platforms)
;;
;; This allows two dds applications using participant IDs up to the maximum
;; default participant ID on the local host and domain to discover each
;; other over UDP/IPv4.
builtin.udpv4://127.0.0.1
;; Unicast - Shared Memory (only on platforms that support shared memory)
;;
;; This allows two dds applications using participant IDs up to the maximum
;; default participant ID on the local host and domain to discover each
;; other over shared memory.
builtin.shmem://
```

6.158.6 Builtin Transport Class Names

The class names for the builtin transport plugins are:

- `shmem` - `ShmemTransport`
- `udpv4` - `UDPV4Transport`
- `udpv6` - `UDPV6Transport`

These may be used as the transport names in the **Locator Format** (p. 351).

6.158.7 NDDS_DISCOVERY_PEERS and Local Host Communication

Suppose you want to communicate with other RTI Connex applications on the same host and you are setting `NDDS_DISCOVERY_PEERS` explicitly (generally in order to use unicast discovery with applications on other hosts).

If the local host platform does not support the shared memory transport, then you can include the name of the local host in the `NDDS_DISCOVERY_PEERS` list.

If the local host platform supports the shared memory transport, then you can do one of the following:

- Include `"shmem://"` in the `NDDS_DISCOVERY_PEERS` list. This will cause shared memory to be used for discovery and data traffic for applications on the same host.

or:

- Include the name of the local host in the `NDDS_DISCOVERY_PEERS` list and disable the shared memory transport in the `rti::core::policy::TransportBuiltin` (p. 2237) of the `dds::domain::DomainParticipant` (p. 1079). This will cause UDP loopback to be used for discovery and data traffic for applications on the same host.

(To check if your platform supports shared memory, see the `Platform Notes`.)

6.159 SampleProcessor

`<<experimental>>` (p. 157) `<<extension>>` (p. 156) Utility to concurrently read and process the data samples received by `dds::sub::DataReader` (p. 756).

Classes

- class `rti::sub::SampleProcessor`

`<<extension>>` (p. 156) `<<reference-type>>` (p. 153) Utility to read and process the data samples that one or more `DataReaders` receive using a sample handler.

6.159.1 Detailed Description

<<*experimental*>> (p. 157) <<*extension*>> (p. 156) Utility to concurrently read and process the data samples received by `dds::sub::DataReader` (p. 756).

6.160 ServiceRequest Built-in Topic

Builtin topic for accessing requests from different services within RTI Connext.

Classes

- struct `rti::core::ServiceRequestId_def`
The definition of the `rti::core::safe_enum ServiceRequestId`.
- class `rti::topic::ServiceRequest`
<<*extension*>> (p. 156) <<*value-type*>> (p. 152) *A request coming from one of the built-in services*

Typedefs

- typedef `dds::core::safe_enum< ServiceRequestId_def > rti::core::ServiceRequestId`
Safe Enumeration (p. 229) *of `ServiceRequestId_def`* (p. 2068)

Functions

- `std::string rti::topic::service_request_topic_name ()`
ServiceRequest (p. 2065) *built-in topic name.*

6.160.1 Detailed Description

Builtin topic for accessing requests from different services within RTI Connext.

Currently, the `rti::sub::TopicQuery` (p. 2220), Locator Reachability Instance State Consistency and Controlability (part of Observability) all rely on this topic.

See also

Topic Queries (p. 66) for an explanation of how TopicQueries use ServiceRequests and how you can access the ServiceRequests for debugging purposes in the section **The Built-in ServiceRequest DataReader** (p. 68).

6.160.2 Typedef Documentation

6.160.2.1 ServiceRequestId

```
typedef dds::core::safe_enum< ServiceRequestId_def> rti::core::ServiceRequestId
```

Safe Enumeration (p. 229) of **ServiceRequestId_def** (p. 2068)

See also

ServiceRequestId_def (p. 2068)

6.160.3 Function Documentation

6.160.3.1 service_request_topic_name()

```
std::string rti::topic::service_request_topic_name ( )
```

ServiceRequest (p. 2065) built-in topic name.

Topic name of the builtin **dds::sub::DataReader** (p. 756) for the **rti::topic::ServiceRequest** (p. 2065) type

6.161 Topic-type serialization and deserialization

Provides functions to serialize and deserialize user data types to and from Common Data Representation (CDR) format.

Functions

- `template<typename TopicType >`
`void rti::topic::from_cdr_buffer_no_alloc` (TopicType &sample, const std::vector< char > &buffer)
Deserializes a sample from a buffer of bytes in CDR format.
- `template<typename TopicType >`
`TopicType rti::topic::from_cdr_buffer` (const std::vector< char > &buffer)
Creates a sample by deserializing a buffer of bytes in CDR format.
- `template<typename TopicType >`
`std::vector< char > & rti::topic::to_cdr_buffer` (std::vector< char > &buffer, const TopicType &sample, **dds::core::policy::DataRepresentationId** representation)
Serializes a sample into a buffer of octets in CDR format.
- `template<typename TopicType >`
`std::vector< char > & rti::topic::to_cdr_buffer` (std::vector< char > &buffer, const TopicType &sample)
Serializes a sample into a buffer of octets in CDR format.

6.161.1 Detailed Description

Provides functions to serialize and deserialize user data types to and from Common Data Representation (CDR) format.

CDR defines how a data sample is encoded before being sent over the network. In DDS, topic-types are serialized into bytes in CDR format to transmit them between DataWriters and DataReaders. The functions `rti::topic::to_cdr()` and `rti::topic::from_cdr()` expose this functionality so applications can take advantage of this capability. For more information, see `Data Representation` in the Core Libraries Extensible Types Guide.

6.161.2 Function Documentation

6.161.2.1 `from_cdr_buffer_no_alloc()`

```
template<typename TopicType >
void rti::topic::from_cdr_buffer_no_alloc (
    TopicType & sample,
    const std::vector< char > & buffer )
```

Deserializes a sample from a buffer of bytes in CDR format.

Precondition

`sample` must have been created by a previous call to `from_cdr_buffer()` (p. 359). This precondition doesn't apply if `TopicType` is `dds::core::xtypes::DynamicData` (p. 1208)

This function does the same as `from_cdr_buffer()` (p. 359) but it doesn't create a new sample. When deserializing multiple samples this operation will be more efficient.

Template Parameters

<i>TopicType</i>	A valid topic-type. Valid types are IDL-generated types (p. 395), the built-in types (p. 49) and <code>dds::core::xtypes::DynamicData</code> (p. 1208).
------------------	---

Parameters

<i>sample</i>	The destination (see precondition)
<i>buffer</i>	The CDR buffer to deserialize

References `rti::topic::from_cdr_buffer()`.

Referenced by `rti::topic::from_cdr_buffer()`.

6.161.2.2 from_cdr_buffer()

```
template<typename TopicType >
TopicType rti::topic::from_cdr_buffer (
    const std::vector< char > & buffer )
```

Creates a sample by deserializing a buffer of bytes in CDR format.

Template Parameters

<i>TopicType</i>	A valid topic-type. Valid types are IDL-generated types (p. 395), the built-in types (p. 49) and dds::core::xtypes::DynamicData (p. 1208).
------------------	---

Parameters

<i>buffer</i>	The CDR buffer to desrialize
---------------	------------------------------

Returns

The deserialized sample

See also

from_cdr_buffer_no_alloc() (p. 359)

References **rti::topic::from_cdr_buffer_no_alloc()**.

Referenced by **rti::topic::from_cdr_buffer_no_alloc()**.

6.161.2.3 to_cdr_buffer() [1/2]

```
template<typename TopicType >
std::vector< char > & rti::topic::to_cdr_buffer (
    std::vector< char > & buffer,
    const TopicType & sample,
    dds::core::policy::DataRepresentationId representation )
```

Serializes a sample into a buffer of octets in CDR format.

Template Parameters

<i>TopicType</i>	A valid topic-type. Valid types are IDL-generated types (p. 395), the built-in types (p. 49) and dds::core::xtypes::DynamicData (p. 1208).
------------------	---

Parameters

<i>buffer</i>	The destination buffer. It will be resized to fit the serialized sample
<i>sample</i>	The sample to serialize
<i>representation</i>	The representation to serialize the data into

Returns

A reference to the parameter `buffer`

References `rti::topic::to_cdr_buffer()`.

6.161.2.4 `to_cdr_buffer()` [2/2]

```
template<typename TopicType >
std::vector< char > & rti::topic::to_cdr_buffer (
    std::vector< char > & buffer,
    const TopicType & sample )
```

Serializes a sample into a buffer of octets in CDR format.

This overload uses `dds::core::policy::DataRepresentationId::auto_id()` as the data representation.

References `rti::topic::to_cdr_buffer()`.

Referenced by `rti::topic::to_cdr_buffer()`.

6.162 Custom Content Filters

Classes and associated types used to implement custom content filters.

Classes

- struct `rti::topic::no_compile_data_t`
 - The type to specify as the `CompileData` template parameter to your `ContentFilter` (p. 732) if your compile function does not return any data.*
- class `rti::topic::ContentFilter< T, CompileData >`
 - <<extension>> (p. 156) A class to inherit from when implementing a custom content filter*
- class `rti::topic::WriterContentFilter< T, CompileData, WriterFilterData >`
 - <<extension>> (p. 156) A class to inherit from when implementing a writer-side custom content filter*
- class `rti::topic::WriterContentFilterHelper< T, CompileData, WriterFilterData >`
 - <<extension>> (p. 156) A class to inherit from when implementing a writer-side custom content filter.*
- class `rti::topic::CustomFilter< T >`
 - <<extension>> (p. 156) <<reference-type>> (p. 153) A wrapper class for the user-defined implementation of a `ContentFilter` (p. 732).*
- class `rti::topic::ExpressionProperty`
 - <<extension>> (p. 156) <<value-type>> (p. 152) Provides additional information about the filter expression passed to the `writer_compile` method of `rti::topic::WriterContentFilter` (p. 2351)*
- class `rti::topic::FilterSampleInfo`
 - <<extension>> (p. 156) <<value-type>> (p. 152) Provides meta information associated with the sample.*

Functions

- `template<typename T >`
CustomFilter< T > `rti::topic::find_content_filter` (const `dds::domain::DomainParticipant` &participant, const `std::string` &filter_name)
Lookup a content filter previously registered with `dds::domain::DomainParticipant::register_contentfilter` (p. 1103).

Variables

- `no_compile_data_t no_compile_data`
A constant to return if your compile function does not create any compile data

6.162.1 Detailed Description

Classes and associated types used to implement custom content filters.

6.162.2 Function Documentation

6.162.2.1 find_content_filter()

```
template<typename T >
CustomFilter< T > rti::topic::find_content_filter (
    const dds::domain::DomainParticipant & participant,
    const std::string & filter_name )
```

Lookup a content filter previously registered with `dds::domain::DomainParticipant::register_contentfilter` (p. 1103).

```
#include <dds/topic/find.hpp>
```

Note

This is a standalone function in the namespace `rti::topic` (p. 558)

You cannot lookup the RTI Connexx built-in content filters.

Template Parameters

<code>T</code>	The user-defined content filter type that the CustomFilter (p. 749) was created with
----------------	---

Parameters

<i>participant</i>	The <code>dds::domain::DomainParticipant</code> (p. 1079) that the content filter is registered with.
<i>filter_name</i>	Name of the filter to lookup.

Returns

The found `rti::topic::CustomFilter` (p. 749) or `dds::core::null` (p. 238) if it is not found

References `dds::core::null`.

6.162.3 Variable Documentation

6.162.3.1 no_compile_data

```
template<typename T , typename CompileData = no_compile_data_t>
no_compile_data_t no_compile_data [related]
```

A constant to return if your compile function does not create any compile data

6.163 Discovery Snapshot

Utilities to print discovery snapshots of DDS entities.

Functions

- void `rti::util::discovery::take_snapshot (dds::domain::DomainParticipant participant)`
 <<extension>> (p. 156) Take a snapshot of the remote participants discovered by a local one.
- void `rti::util::discovery::take_snapshot (dds::domain::DomainParticipant participant, const std::string &file_name)`
 <<extension>> (p. 156) Take a snapshot of the remote participants discovered by a local one.
- void `rti::util::discovery::take_snapshot (dds::pub::AnyDataWriter writer)`
 <<extension>> (p. 156) Take a snapshot of the compatible and incompatible remote readers matched by a local writer.
- void `rti::util::discovery::take_snapshot (dds::pub::AnyDataWriter writer, const std::string &file_name)`
 <<extension>> (p. 156) Take a snapshot of the compatible and incompatible remote readers matched by a local writer.
- void `rti::util::discovery::take_snapshot (dds::sub::AnyDataReader reader)`
 <<extension>> (p. 156) Take a snapshot of the compatible and incompatible remote writers matched by a local reader.
- void `rti::util::discovery::take_snapshot (dds::sub::AnyDataReader reader, const std::string &file_name)`
 <<extension>> (p. 156) Take a snapshot of the compatible and incompatible remote writers matched by a local reader.

6.163.1 Detailed Description

Utilities to print discovery snapshots of DDS entities.

6.163.2 Function Documentation

6.163.2.1 take_snapshot() [1/6]

```
void rti::util::discovery::take_snapshot (
    dds::domain::DomainParticipant participant )
```

<<*extension*>> (p. 156) Take a snapshot of the remote participants discovered by a local one.

Note

This is a standalone function in the namespace **rti::util::discovery** (p. 565)

Parameters

<i>participant</i>	The local participant.
--------------------	------------------------

The snapshot will be printed through the **rti::config::Logger** (p. 1426). A possible output may be the following:
Remote participants that match the local participant domain=0

```
name="participantTestName" role="participantTestRole" id="1"
```

```
guid_prefix="0x0101D8D1,0x20B83C0D,0x4495246E"
```

```

```
role="participantTestRole"
```

```
unicastLocators="udp4://192.168.1.170:7411"
```

```
-----
```

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228).
------------	---

6.163.2.2 take_snapshot() [2/6]

```
void rti::util::discovery::take_snapshot (
    dds::domain::DomainParticipant participant,
    const std::string & file_name )
```

<<*extension*>> (p. 156) Take a snapshot of the remote participants discovered by a local one.

Note

This is a standalone function in the namespace **rti::util::discovery** (p. 565)

Parameters

<i>participant</i>	The local participant.
<i>file_name</i>	Name of the file where snapshot should be printed.

The snapshot will be printed in the file specified by *file_name*. A possible output may be the following:

```
Remote participants that match the local participant domain=0
```

```
name="participantTestName" role="participantTestRole" id="1"
```

```

```

```
-----
```

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228).
------------	---

6.163.2.3 take_snapshot() [3/6]

```
void rti::util::discovery::take_snapshot (
    dds::pub::AnyDataWriter writer )
```

<<*extension*>> (p. 156) Take a snapshot of the compatible and incompatible remote readers matched by a local writer.

Note

This is a standalone function in the namespace **rti::util::discovery** (p. 565)

Parameters

<i>writer</i>	The local writer.
---------------	-------------------

The snapshot will be printed through the **rti::config::Logger** (p. 1426). A possible output may be the following:

```
Remote readers that match the local writer domain=0 name="writerTestName"
guid="0x0101D8D1,0x20B83C0D,0x4495246E:0x80000003"

6.164 Network Capture

Save network traffic into a capture file for further analysis.

Classes

- class **rti::util::network_capture::ContentKindMask**
 <<*extension*>> (p. 156) Mask indicating the types of contents to remove from RTPS frames before saving them to the capture file.
- class **rti::util::network_capture::TrafficKindMask**
 <<*extension*>> (p. 156) Mask indicating the traffic direction to capture.
- class **rti::util::network_capture::NetworkCaptureParams**
 <<*extension*>> (p. 156) Input parameters for starting Network Capture.

Functions

- bool **rti::util::network_capture::enable** ()
 Enable Network Capture.
- bool **rti::util::network_capture::disable** ()
 Disable Network Capture.
- bool **rti::util::network_capture::set_default_params** (const **NetworkCaptureParams** ¶ms)
 Set the default Network Capture parameters.
- bool **rti::util::network_capture::start** (const std::string &filename)
 Start Network Capture.
- bool **rti::util::network_capture::start** (**dds::domain::DomainParticipant** participant, const std::string &filename)
 Start Network Capture for a participant.
- bool **rti::util::network_capture::start** (const std::string &filename, const **NetworkCaptureParams** ¶ms)
 Start Network Capture with parameters.
- bool **rti::util::network_capture::start** (**dds::domain::DomainParticipant** participant, const std::string &filename, const **NetworkCaptureParams** ¶ms)

- Start Network Capture with parameters for a participant.*

 - bool **rti::util::network_capture::stop** ()

Stop Network Capture.
- bool **rti::util::network_capture::stop** (**dds::domain::DomainParticipant** participant)

Stop Network Capture.
- bool **rti::util::network_capture::pause** ()

Pause Network Capture.
- bool **rti::util::network_capture::pause** (**dds::domain::DomainParticipant** participant)

Pause Network Capture.
- bool **rti::util::network_capture::resume** ()

Resume Network Capture.
- bool **rti::util::network_capture::resume** (**dds::domain::DomainParticipant** participant)

Resume Network Capture.

6.164.1 Detailed Description

Save network traffic into a capture file for further analysis.

RTI Connex allows you to capture the network traffic that one or more DomainParticipants send or receive. This feature can be used to analyze and debug communication problems between your DDS applications. When network capture is enabled, each DomainParticipant will generate a pcap-based file that can then be opened by a packet analyzer like Wireshark, provided the right dissectors are installed.

To some extent, network capture can be used as an alternative to existing pcap-based network capture software (such as Wireshark). This will be the case when you are only interested in analyzing the traffic a DomainParticipant sends/receives. In this scenario, network capture will actually have some advantages over using more general pcap-based network capture applications: RTI's network capture includes additional information such as security-related data; it also removes information that is not needed, such as user data, when you want to reduce the capture size. That said, RTI's network capture is not a replacement for other pcap-based network capture applications: it only captures the traffic exchanged by the DomainParticipants, but it does not capture any other traffic exchanged through the system network interfaces.

To capture network traffic **network_capture::enable()** (p. 371) must be invoked before creating any DomainParticipant. Similarly, **network_capture::disable()** (p. 372) must be called after deleting all participants. In between these calls, you may start, stop, pause or resume capturing traffic for one or all participants.

6.164.2 Capturing

Shared Memory Traffic

Every RTPS frame in network capture has a source and a destination associated with it. In the case of shared memory traffic, a process identifier and a port determine the source and destination endpoints.

Access to the process identifier (PID) of the source for inbound traffic requires changes in the shared memory segments. These changes would break shared memory compatibility with previous versions of RTI Connex. For this reason, by default, network capture will not populate the value of the source PID for inbound shared memory traffic.

If interoperability with previous versions of RTI Connex is not necessary, you can generate capture files containing the source PID for inbound traffic. To do so, configure the value of the `'dds.transport.minimum_compatibility_version'` property to 6.1.0. (See `rti::core::policy::Property` (p. 1695)).

```
<domain_participant_qos>
  <property>
    <value>
      <element>
        <name>dds.transport.minimum_compatibility_version</name>
        <value>6.1.0</value>
        <propagate>false</propagate>
      </element>
    </value>
  </property>
</domain_participant_qos>
```

This property is never propagated, so it must be consistently configured throughout the whole system.

Note: Changing the value of this property affects the type of shared memory segments that RTI Connex uses. For that reason, you may see the following warning, resulting from leftover shared memory segments:

```
[0xC733A001,0xB248F671,0xAEC4A0C1:0x000001C1{Domain=200}|CREATE DP|ENABLE]
  NDDS_Transport_Shmem_is_segment_compatible:incompatible shared memory protocol detected.

Current version 4.0 not compatible with 2.0.
```

The leftover shared memory segments can be removed using the `ipcrm` command. See <https://community.rti.com/kb/what-are-possible-solutions-common-shared-memory-issues> for more information.

6.164.3 Function Documentation

6.164.3.1 `enable()`

```
bool rti::util::network_capture::enable ( )
```

Enable Network Capture.

This method must be called before any other Network Capture method. It must also be called before creating the participants for which we want to capture traffic.

Use this method only for debugging purposes, since it may introduce a significant performance impact.

Returns

true if success. Otherwise, false

MT Safety:

UNSAFE. It is not safe to call this method while another thread may be simultaneously calling another Network Capture related method, including this one.

See also

network_capture::disable() (p. 372)

Note

This is a standalone function in the namespace **rti::util::network_capture** (p. 566)

Referenced by **rti::queuing::QueueConsumerParams::enable_availability()**, **rti::queuing::QueueRequesterParams::enable_availability()**, **rti::queuing::QueueReplierParams::enable_availability()**, **rti::queuing::QueueRequesterParams::enable_sample_replication()**, **rti::queuing::QueueReplierParams::enable_sample_replication()**, **rti::queuing::QueueProducerParams::enable_wait_for_ack()**, **rti::queuing::QueueRequesterParams::enable_wait_for_ack()**, and **rti::queuing::QueueReplierParams::enable_wait_for_ack()**.

6.164.3.2 disable()

```
bool rti::util::network_capture::disable ( )
```

Disable Network Capture.

This method must be the last Network Capture method to be called. It must also be called after deleting the participants for which we captured traffic. Disabling Network Capture without stopping it first is not ok!

Returns

true if success. Otherwise, false

MT Safety:

UNSAFE. It is not safe to call this method while another thread may be simultaneously calling another Network Capture related method, including this one.

See also

network_capture::enable() (p. 371)

Note

This is a standalone function in the namespace **rti::util::network_capture** (p. 566)

6.164.3.3 set_default_params()

```
bool rti::util::network_capture::set_default_params (
    const NetworkCaptureParams & params )
```

Set the default Network Capture parameters.

The default parameters are used when Network Capture is started without parameters, i.e., `network_capture::start()` (p. 373).

Precondition

This method requires first enabling Network Capture. See `network_capture::enable()` (p. 371).

Parameters

<i>params</i>	<< <i>in</i> >> (p. 157). Configuration parameters that we want to set as defaults.
---------------	---

Returns

true if success. Otherwise, false

See also

`network_capture::start()` (p. 373)

`network_capture::start(dds::domain::DomainParticipant, const std::string &)` (p. 374)

Note

This is a standalone function in the namespace `rti::util::network_capture` (p. 566)

6.164.3.4 start() [1/4]

```
bool rti::util::network_capture::start (
    const std::string & filename )
```

Start Network Capture.

Precondition

This method requires first enabling Network Capture. See `network_capture::enable()` (p. 371).

Parameters

<i>filename</i>	<< <i>in</i> >> (p. 157). The name of the output capture file will be based on this input parameter.
-----------------	--

In particular, the name for the capture file is the concatenation of the `filename` input parameter, the `"_GUID-"` string followed by the decimal representation of bytes 8-11 of the DomainParticipant's GUID, and the file extension (`".pcap"`).

Returns

true if success. Otherwise, false

See also

network_capture::stop() (p. 377)

network_capture::start(dds::domain::DomainParticipant, const std::string &) (p. 374)

Note

This is a standalone function in the namespace **rti::util::network_capture** (p. 566)

6.164.3.5 start() [2/4]

```
bool rti::util::network_capture::start (
    dds::domain::DomainParticipant participant,
    const std::string & filename )
```

Start Network Capture for a participant.

Precondition

This method requires first enabling Network Capture. See **network_capture::enable()** (p. 371).

Parameters

<i>participant</i>	<< <i>in</i> >> (p. 157). DomainParticipant for which we want to capture traffic.
<i>filename</i>	<< <i>in</i> >> (p. 157). The name of the output capture file will be based on this input parameter.

In particular, the name for the capture file is the concatenation of the `filename` input parameter, and the file extension (`".pcap"`).

Returns

true if success. Otherwise, false

See also

network_capture::stop() (p. 377)

network_capture::start(dds::domain::DomainParticipant, const std::string &, const NetworkCaptureParams &) (p. 376)

network_capture::enable() (p. 371)

Note

This is a standalone function in the namespace **rti::util::network_capture** (p. 566)

6.164.3.6 start() [3/4]

```
bool rti::util::network_capture::start (
    const std::string & filename,
    const NetworkCaptureParams & params )
```

Start Network Capture with parameters.

Precondition

This method requires first enabling Network Capture. See **network_capture::enable()** (p. 371).

Performs the same function as **network_capture::start()** (p. 373) except that it uses the provided parameters, instead of the default ones.

Parameters

<i>filename</i>	<< <i>in</i> >> (p. 157). The name of the output capture file will be based on this input parameter.
-----------------	--

In particular, the name for the capture file is the concatenation of the *filename* input parameter, the "_GUID-" string followed by the decimal representation of bytes 8-11 of the DomainParticipant's GUID, and the file extension (".pcap").

Parameters

<i>params</i>	<< <i>in</i> >> (p. 157). Configuration parameters for the capture.
---------------	---

Returns

true if success. Otherwise, false

See also

network_capture::stop() (p. 377)

network_capture::start(dds::domain::DomainParticipant, const std::string &, const NetworkCaptureParams &) (p. 376)

Note

This is a standalone function in the namespace **rti::util::network_capture** (p. 566)

6.164.3.7 start() [4/4]

```
bool rti::util::network_capture::start (
    dds::domain::DomainParticipant participant,
    const std::string & filename,
    const NetworkCaptureParams & params )
```

Start Network Capture with parameters for a participant.

Precondition

This method requires enabling first Network Capture. See **network_capture::enable()** (p. 371).

Parameters

<i>participant</i>	<< <i>in</i> >> (p. 157). DomainParticipant for which we want to capture traffic.
<i>filename</i>	<< <i>in</i> >> (p. 157). The name of the output capture file will be based on this input parameter.

In particular, the name for the capture file is the concatenation of the *filename* input parameter, and the file extension (".pcap").

Parameters

<i>params</i>	<< <i>in</i> >> (p. 157). Parameters for configuring the capture.
---------------	--

Returns

true if success. Otherwise, false

See also

network_capture::stop() (p. 377)

network_capture::start(dds::domain::DomainParticipant, const std::string &) (p. 374)

Note

This is a standalone function in the namespace **rti::util::network_capture** (p. 566)

6.164.3.8 stop() [1/2]

```
bool rti::util::network_capture::stop ( )
```

Stop Network Capture.

Precondition

This method requires enabling first Network Capture. See **network_capture::enable()** (p. 371).

This method can (and must) be called after **network_capture::start()** (p. 373), not **network_capture::start(dds::domain::DomainParticipant, const std::string &)** (p. 374). That is, if we start capturing traffic globally (for all DomainParticipants), we must stop capturing traffic also globally. It is not possible to start capturing traffic for a participant but stop it globally.

It is possible to start capturing globally and then stop capturing for a participant, as long as we eventually stop capturing traffic globally.

We must stop capturing for a participant before deleting it.

Returns

true if success. Otherwise, false

See also

network_capture::start() (p. 373)

network_capture::stop() (p. 377)

Note

This is a standalone function in the namespace **rti::util::network_capture** (p. 566)

6.164.3.9 stop() [2/2]

```
bool rti::util::network_capture::stop (
    dds::domain::DomainParticipant participant )
```

Stop Network Capture.

Precondition

This method requires first enabling Network Capture. See **network_capture::enable()** (p. 371).

Parameters

<i>participant</i>	<< <i>in</i> >> (p. 157). DomainParticipant for which we want to stop capturing traffic.
--------------------	--

Returns

true if success. Otherwise, false

See also

network_capture::start(dds::domain::DomainParticipant, const std::string &) (p. 374)

network_capture::stop() (p. 377)

Note

6.164.3.10 pause() [1/2]

```
bool rti::util::network_capture::pause ( )
```

Pause Network Capture.

Precondition

This method requires first enabling Network Capture. See **network_capture::enable()** (p. 371).

Returns

true if success. Otherwise, false

See also

network_capture::resume() (p. 379)

network_capture::pause() (p. 378)

Note

This is a standalone function in the namespace **rti::util::network_capture** (p. 566)

6.164.3.11 pause() [2/2]

```
bool rti::util::network_capture::pause (
    dds::domain::DomainParticipant participant )
```

Pause Network Capture.

Precondition

This method requires first enabling Network Capture. See **network_capture::enable()** (p. 371).

Parameters

<i>participant</i>	<< <i>in</i> >> (p. 157). DomainParticipant for which we want to pause capturing traffic.
--------------------	---

Returns

true if success. Otherwise, false

See also

network_capture::resume() (p. 379)

network_capture::pause() (p. 378)

Note

This is a standalone function in the namespace **rti::util::network_capture** (p. 566)

6.164.3.12 resume() [1/2]

```
bool rti::util::network_capture::resume ( )
```

Resume Network Capture.

Precondition

This method requires first enabling Network Capture. See **network_capture::enable()** (p. 371).

Returns

true if success. Otherwise, false

See also

network_capture::pause() (p. 378)

network_capture::resume() (p. 379)

Note

This is a standalone function in the namespace **rti::util::network_capture** (p. 566)

6.164.3.13 resume() [2/2]

```
bool rti::util::network_capture::resume (
    dds::domain::DomainParticipant participant )
```

Resume Network Capture.

Precondition

This method requires first enabling Network Capture. See **network_capture::enable()** (p. 371).

Parameters

<i>participant</i>	<< <i>in</i> >> (p. 157). DomainParticipant for which we want to resume capturing traffic.
--------------------	--

Returns

true if success. Otherwise, false

See also

network_capture::pause() (p. 378)

network_capture::resume() (p. 379)

Note

This is a standalone function in the namespace **rti::util::network_capture** (p. 566)

6.165 Heap Monitoring

Monitor memory allocations done by the middleware on the native heap.

Classes

- struct **rti::util::heap_monitoring::SnapshotOutputFormat_def**
Specify the format of the output of the snapshot. RTI Connex.
- struct **rti::util::heap_monitoring::SnapshotContentFormat_def**
Bitmap used to decide which information of the snapshot will be displayed.
- class **rti::util::heap_monitoring::HeapMonitoringParams**
Input parameters for enabling heap monitoring. They will be used for configuring the format of the snapshot.

Typedefs

- typedef **dds::core::safe_enum< SnapshotOutputFormat_def > rti::util::heap_monitoring::Snapshot↔
OutputFormat**
Specify the format of the output of the snapshot.
- typedef **dds::core::safe_enum< SnapshotContentFormat_def > rti::util::heap_monitoring::Snapshot↔
ContentFormat**
Bitmap used to decide which information of the snapshot will be displayed.

Functions

- bool `rti::util::heap_monitoring::enable ()`
Starts monitoring the heap memory used by RTI Connex.
- bool `rti::util::heap_monitoring::enable (const HeapMonitoringParams ¶ms)`
Starts monitoring the heap memory used by RTI Connex with params.
- void `rti::util::heap_monitoring::disable ()`
Stops monitoring the heap memory used by RTI Connex.
- bool `rti::util::heap_monitoring::pause ()`
Pauses heap monitoring.
- bool `rti::util::heap_monitoring::resume ()`
Resumes heap monitoring.
- bool `rti::util::heap_monitoring::take_snapshot (const std::string &filename, bool print_details=false)`
Saves the current heap memory usage in a file.

6.165.1 Detailed Description

Monitor memory allocations done by the middleware on the native heap.

RTI Connex allows you to monitor the memory allocations done by the middleware on the native heap. This feature can be used to analyze and debug unexpected memory growth.

After `heap_monitoring::enable()` is called, you may invoke `heap_monitoring::take_snapshot()` (p.384) to save the current heap memory usage to a file. By comparing two snapshots, you can tell if new memory has been allocated and, in many cases, where.

6.165.2 Typedef Documentation

6.165.2.1 SnapshotOutputFormat

```
typedef dds::core::safe_enum< SnapshotOutputFormat_def> rti::util::heap_monitoring::Snapshot↔  
OutputFormat
```

Specify the format of the output of the snapshot.

See also

`SnapshotOutputFormat_def` (p.2078)

6.165.2.2 SnapshotContentFormat

```
typedef dds::core::safe_enum< SnapshotContentFormat_def> rti::util::heap_monitoring::Snapshot↔  
ContentFormat
```

Bitmap used to decide which information of the snapshot will be displayed.

See also

[SnapshotContentFormat_def](#) (p. 2077)

6.165.3 Function Documentation

6.165.3.1 enable() [1/2]

```
bool rti::util::heap_monitoring::enable ( )
```

Starts monitoring the heap memory used by RTI Connex.

This function must be called before any other function in the RTI Connex library is called.

Once heap monitoring is enabled, you can take heap snapshots by using [heap_monitoring::take_snapshot\(\)](#) (p. 384).

Use this method only for debugging purposes, since it may introduce a significant performance impact.

MT Safety:

UNSAFE. It is not safe to call this method while another thread may be simultaneously calling another heap-related method, including this one.

Returns

true if success. Otherwise, false

See also

[heap_monitoring::disable\(\)](#) (p. 383)

Note

This is a standalone function in the namespace [rti::util::heap_monitoring](#) (p. 566)

6.165.3.2 enable() [2/2]

```
bool rti::util::heap_monitoring::enable (
    const HeapMonitoringParams & params )
```

Starts monitoring the heap memory used by RTI Connex with params.

Performs the same function as **heap_monitoring::enable()** (p. 382) except that it also provides the values in params. Those values will set the format used in the snapshot **heap_monitoring::take_snapshot()** (p. 384).

Returns

true if success. Otherwise, false

See also

heap_monitoring::disable() (p. 383)

Note

This is a standalone function in the namespace **rti::util::heap_monitoring** (p. 566)

6.165.3.3 disable()

```
void rti::util::heap_monitoring::disable ( )
```

Stops monitoring the heap memory used by RTI Connex.

This method must be the last method called from RTI Connex.

See also

heap_monitoring::enable() (p. 382)

Note

This is a standalone function in the namespace **rti::util::heap_monitoring** (p. 566)

6.165.3.4 pause()

```
bool rti::util::heap_monitoring::pause ( )
```

Pauses heap monitoring.

New memory allocations will not be monitored and they will not appear in the snapshot generated by **heap_↵
monitoring::take_snapshot()** (p.384).

Returns

true if success. Otherwise, false

See also

heap_monitoring::resume() (p.384)

Note

This is a standalone function in the namespace **rti::util::heap_monitoring** (p.566)

6.165.3.5 resume()

```
bool rti::util::heap_monitoring::resume ( )
```

Resumes heap monitoring.

Returns

true if success. Otherwise, false

See also

heap_monitoring::pause() (p.383)

Note

This is a standalone function in the namespace **rti::util::heap_monitoring** (p.566)

6.165.3.6 take_snapshot()

```
bool rti::util::heap_monitoring::take_snapshot (
    const std::string & filename,
    bool print_details = false )
```

Saves the current heap memory usage in a file.

After **heap_monitoring::enable()** (p. 382) is called, you may invoke this method periodically to save the current heap memory usage to a file.

By comparing two snapshots, you can tell if new memory has been allocated and in many cases where. This is why this operation can be used to debug unexpected memory growth.

The format of a snapshot is as follows:

First, there is a memory usage summary like this:

```
<P>
    Product Version: NDDSCORE_BUILD_6.0.0.0_20200316T123411Z_RTI_ENG
    Process virtual memory: 2552352768
    Process physical memory: 16187392
    Current application heap usage: 10532131
    Approximate total heap usage: 203331110
    High watermark: 10532131
    Alloc count: 17634
    Free count: 3518
```

- Process virtual memory: The amount of virtual memory in bytes taken by the process. This memory includes RTI Connex and non-RTI Connex memory.
- Process physical memory: The amount of physical memory in bytes taken by the process.
- Current application heap usage: The amount of heap memory in bytes used by the middleware. For Java and .NET APIs, this memory only accounts for unmanaged RTI Connex memory, not memory living in the managed heap. This value does not include overhead memory allocations that are used by the Heap Monitoring utility. It therefore provides the heap usage that is used when Heap Monitoring is disabled and does not reflect the actual amount of memory that has been allocated by the middleware. That value is accounted for in 'Approximate total heap usage'.
- Approximate total heap usage: The amount of heap memory in bytes used by the middleware, including overhead allocations from the Heap Monitoring utility. When the Heap Monitoring utility is enabled, every allocation has an additional overhead number of bytes allocated so that the middleware can keep track of the meta-data that is output in the heap snapshots. This overhead is not accounted for in the 'Current application heap usage' summary field, but is included in this field. For Java and .NET APIs, this memory only accounts for unmanaged RTI Connex memory, not memory living in the managed heap.
- High watermark: The maximum amount of heap usage by RTI Connex since **heap_monitoring::enable()** (p. 382) was invoked.
- Alloc count: The number of invocations to malloc, realloc, or calloc operations done by RTI Connex.
- Free count: The number of invocations to the free operation done by RTI Connex.

After the previous summary, and only if you set the parameter `print_details` to true, the method will print the details of every single outstanding heap allocation done by RTI Connex. For example:

```
<P>
    block_id, timestamp, block_size, alloc_method_name, type_name, pool_alloc, pool_buffer_size,
    pool_buffer_count, topic_name, function_name, activity_context

    23087, 1586943520, 16, RTIOsapiHeap_allocateArray, struct RTIEncapsulationInfo, MALLOC, 0,
    0, PRESServiceRequest, PRESWriterHistoryDriver_new,
    "0X101175A,0X76DD63D7,0X984377BC:0X1C1{Name=ShapeTypeParticipant,Domain=110}|CREATE
    Participant|ENABLE|:0X80000088{Entity=Pu,Domain=110}|CREATE Writer WITH TOPIC PRESServiceRequest"
```

- `block_id`: Block ID of the allocation. This number increases with every allocation.
- `timestamp`: Timestamp in UTC seconds corresponding to the time where the allocation was done.
- `block_size`: The number of bytes allocated.
- `alloc_method_name`: The allocation RTI Connex method name.
- `type_name`: The allocation typename.
- `pool_alloc`: Indicates if the heap allocation is a RTI Connex pool allocation (POOL) or a regular allocation (MALLOC).
- `pool_buffer_size`: For pool allocations, this number indicates the size of the elements in the pool in number of bytes. `block_size` is equal to (`pool_buffer_size * pool_buffer_count`).
- `pool_buffer_count`: For pool allocations, this number indicates the number of buffers allocated for the pool. `block_size` is equal to (`pool_buffer_size * pool_buffer_count`).
- `topic_name`: The topic name associated with the allocation or 'n/a' if it is not available.
- `function_name`: function name associated with the allocation or 'n/a' if it is not available.
- `activity_context`: **Activity Context** (p. 247)

Parameters

<code>filename</code>	<< <i>in</i> >> (p. 157). Name of file in which to store the snapshot.
<code>print_details</code>	<< <i>in</i> >> (p. 157). Indicates if the snapshot will contain only the memory usage summary or the details of the individual allocations.

Returns

true if success. Otherwise, false

Note

This is a standalone function in the namespace `rti::util::heap_monitoring` (p. 566)

6.166 Other Utilities

Other Utilities, such as `rti::util::spin()` (p. 388)

Functions

- void **rti::util::sleep** (const **dds::core::Duration** &durationIn)
Blocks the calling thread for the specified duration.
- uint64_t **rti::util::spin_per_microsecond** ()
Returns the number of spin operations needed to wait 1 microsecond.
- void **rti::util::spin** (uint64_t spin_count)
Performs a spin operation (active wait) as many times as indicated.
- bool **rti::util::activation::unload_activation_library** ()
Unloads the Activation Library (rti_activation) if it was previously loaded.

6.166.1 Detailed Description

Other Utilities, such as **rti::util::spin()** (p. 388)

6.166.2 Function Documentation

6.166.2.1 sleep()

```
void rti::util::sleep (
    const dds::core::Duration & durationIn )
```

Blocks the calling thread for the specified duration.

Note that the achievable resolution of sleep is OS-dependent. That is, do not assume that you can sleep for 1 nanosecond just because you can specify a 1-nanosecond sleep duration via the API. The sleep resolution on most operating systems is usually 10 ms or greater.

Parameters

<i>duration</i> ↔ <i>In</i>	<< in >> (p. 157) Sleep duration.
--------------------------------	--

MT Safety:

safe

Examples

Foo_publisher.cxx.

6.166.2.2 spin_per_microsecond()

```
uint64_t rti::util::spin_per_microsecond ( )
```

Returns the number of spin operations needed to wait 1 microsecond.

This utility can be used to measure how many spin operations must be performed to wait 1 microsecond. Since the time that it takes the CPU to perform 1 spin operation depends on the CPU frequency, it is recommended to use this utility before using **spin()** (p. 388).

Returns

Number of spin operations to wait 1 microsecond.

See also

rti::util::spin() (p. 388)

6.166.2.3 spin()

```
void rti::util::spin (
    uint64_t spin_count )
```

Performs a spin operation (active wait) as many times as indicated.

Spinning is the action of performing useless operations in a for loop in order to actively wait some time without yielding the CPU. Given that the resolution of sleep is in the order of ms, you can use this utility to wait times in the order of microseconds. To properly use this functionality, it is useful to measure previously the number of spin operations needed to wait the equivalent to microsecond (using the utility `get_spin_per_microsecond`) and then compute the corresponding spin count desired.

Parameters

<i>spin_count</i>	<< <i>in</i> >> (p. 157) Number of spin operations to perform.
-------------------	--

See also

rti::util::spin_per_microsecond() (p. 387)

6.166.2.4 unload_activation_library()

```
bool rti::util::activation::unload_activation_library ( )
```

Unloads the Activation Library (`rti_activation`) if it was previously loaded.

This function should be called just before your process finishes. See the License Management section in the *Installation Guide* for additional details.

Returns

true if successful. Otherwise, false

6.167 Observability Library

RTI Monitoring Library 2.0.

RTI Monitoring Library 2.0.

RTI Monitoring Library 2.0 is one component of the RTI Connex Observability Framework which allows collecting and distributing telemetry data (metrics and logs) associated with the observable resources created by an RTI Connex application.

In this release, the only Observable resources are the following entities: **dds::pub::DataWriter** (p. 908), **dds::sub::DataReader** (p. 756), **dds::pub::Publisher** (p. 1719), **dds::sub::Subscriber** (p. 2116), **dds::domain::DomainParticipant** (p. 1079), **dds::topic::Topic** (p. 2178) and Application (a process running RTI Connex).

The library also accepts remote commands to change the set of distributed telemetry data at run-time.

The data distributed by RTI Monitoring Library 2.0 is sent to an RTI Observability Collector Service instance, which forwards the data to other RTI Observability Collector Service instances or stores the data in third-party observability backends such as Prometheus or Grafana Loki.

RTI Monitoring Library 2.0 is a separate library (`rtimonitoring2`), and applications can use it in three different modes:

- **Dynamically loaded:** This is the default mode, and it requires that the `rtimonitoring2` shared library is in the library search path.
- **Dynamic linking:** The application is linked with the `rtimonitoring2` shared library.
- **Static linking:** The application is linked with the `rtimonitoring2` static library.

The last two modes require calling the API `Monitoring::RTI_Monitoring_initialize` in your application before any other RTI Connex APIs.

Dynamic and static linking are only supported in C and C++ applications.

To enable use of RTI Monitoring Library 2.0 and configure its behavior, use the **rti::core::policy::Monitoring** (p. 1448) QoS policy on the `DomainParticipantFactory`. This QoS policy can be configured programmatically or via XML.

6.168 Built-in Types Examples

Using Built-in Types.

Using Built-in Types.

RTI Connex provides a set of simple data types for you to use with the topics in your application (see **Built-in Types** (p. 49))

If you use these built-in types you do not have to generate any code using rtiddsgen.

- **StringTopicType** has one field, `data`, of type `dds::core::string` (p. 235).

```
dds::domain::DomainParticipant participant(0);
dds::topic::Topic<dds::core::StringTopicType> topic(participant, "MyTopic");
dds::pub::DataWriter<dds::core::StringTopicType> writer(
    dds::pub::Publisher(participant), topic);
// Create a StringTopicType sample with data = "Example Data"
dds::core::StringTopicType sample("Example Data");
// Change the value of data
sample.data("New Data Value");
// Write the sample
writer.write(sample);
// You can also write a sample like this, making use of an implicit
// conversion between string and StringTopicType
writer.write("Example Data 2");
```

- **KeyedStringTopicType** has two fields, `key` and `value`, both of type `dds::core::string` (p. 235).

```
dds::domain::DomainParticipant participant(0);
dds::topic::Topic<dds::core::KeyedStringTopicType> topic(
    participant, "MyTopic");
dds::pub::DataWriter<dds::core::KeyedStringTopicType> writer(
    dds::pub::Publisher(participant), topic);
// Create a StringTopicType sample with data = "Example Data"
dds::core::KeyedStringTopicType sample("Example Key", "Example Value");
// Change the value of value and key
sample.key("New Key");
sample.value("New Value");
// Write the sample
writer.write(sample);
```

- **BytesTopicType** represents an array of bytes:

```
dds::domain::DomainParticipant participant(0);
dds::topic::Topic<dds::core::BytesTopicType> topic(participant, "MyTopic");
dds::pub::DataWriter<dds::core::BytesTopicType> writer(
    dds::pub::Publisher(participant), topic);
// Create a BytesTopicType sample with some data
std::vector<uint8_t> byte_vector;
byte_vector.push_back(100);
byte_vector.push_back(200);
dds::core::BytesTopicType sample(byte_vector);
// You can modify it with the operator[]:
sample[0] = 150;
// Write the sample
writer.write(sample);
// You can also write the std::vector directly, using the implicit
// BytesTopicType constructor:
writer.write(byte_vector);
```

6.169 Exceptions

How DDS return codes map to C++ exceptions.

How DDS return codes map to C++ exceptions.

6.169.1 Exceptions

The following is a list of the exceptions that may be thrown by RTI Connex. They are a part of the `dds::core` (p. 404) namespace and can also be found in `hpp/dds/core/Exception.hpp`. The `*Error` classes can be caught simply by catching an `std::exception`.

modern C++ API Exception Class	DDS PIM Return Code	Std C++ Parent Exception
Normal return; no exception	RETCODE_OK	N/A
An informational state attached to a normal return; no exception	RETCODE_NO_DATA	N/A
Error	RETCODE_ERROR	<code>std::logic_error</code>
<code>InvalidArgumentError</code>	RETCODE_BAD_PARAMETER	<code>std::invalid_argument</code>
<code>TimeoutError</code>	RETCODE_TIMEOUT	<code>std::runtime_error</code>
<code>UnsupportedError</code>	RETCODE_UNSUPPORTED	<code>std::logic_error</code>
<code>AlreadyClosedError</code>	RETCODE_ALREADY_DELETED	<code>std::logic_error</code>
<code>IllegalOperationError</code>	RETCODE_ILLEGAL_OPERATION	<code>std::logic_error</code>
<code>NotEnabledError</code>	RETCODE_NOT_ENABLED	<code>std::logic_error</code>
<code>PreconditionNotMetError</code>	RETCODE_PRECONDITION_NOT_MET	<code>std::logic_error</code>
<code>ImmutablePolicyError</code>	RETCODE_IMMUTABLE_POLICY	<code>std::logic_error</code>
<code>InconsistentPolicyError</code>	RETCODE_INCONSISTENT_POLICY	<code>std::logic_error</code>
<code>OutOfResourcesError</code>	RETCODE_OUT_OF_RESOURCES	<code>std::runtime_error</code>
<code>InvalidDowncastError</code>	N/A	<code>std::runtime_error</code>
<code>NullReferenceError</code>	N/A	<code>std::runtime_error</code>
<code>InvalidDataError</code>	N/A	<code>std::logic_error</code>

6.170 Qos Use Cases

The different QoS classes are containers of QoS policies of a concrete `dds::core::Entity` (p. 1265). Each Entity has a `qos()` getter and setter.

- `dds::domain::qos::DomainParticipantQos` (p. 1136) is the container of the `dds::domain::DomainParticipant` (p. 1079) QoS policies.
- `dds::topic::qos::TopicQos` (p. 2213) is the container of the `dds::topic::Topic` (p. 2178) QoS policies.
- `dds::pub::qos::PublisherQos` (p. 1733) is the container of the `dds::pub::Publisher` (p. 1719) QoS policies.
- `dds::sub::qos::SubscriberQos` (p. 2129) is the container of the `dds::sub::Subscriber` (p. 2116) QoS policies.
- `dds::pub::qos::DataWriterQos` (p. 994) is the container of the `dds::pub::DataWriter` (p. 908) QoS policies.
- `dds::sub::qos::DataReaderQos` (p. 848) is the container of the `dds::sub::DataReader` (p. 756) QoS policies.

6.170.1 Setting QoS Values

There are a few different ways to set the values of a QoS policy within an entity's QoS object

- Setting a QoS policy with operator <<

```
using namespace dds::core::policy;
// Construct a Reliability QoS object with default values
dds::core::policy::Reliability reliability;
// Construct a DataReaderQoS object with default values
dds::sub::qos::DataReaderQoS reader_qos;
// Set the Reliability QoS policy field of the DataReaderQoS using operator «,
// setting the ReliabilityKind to RELIABLE inline
reader_qos « reliability.kind(ReliabilityKind::RELIABLE);
```

- Many of the QoS policies have appropriately named constructors that will construct a QoS policy object with values for some of the fields in the policy. The following code example is equivalent to the above example.

```
using namespace dds::core::policy;
// Use a named constructor to set the ReliabilityKind
reader_qos « Reliability::Reliable();
```

- You can also set a QoS policy on a QoS object using the QoS object's policy() setter which is templated on the QoS policy that it is being used to set. The following code example is equivalent to the above two examples.

```
using namespace dds::core::policy;
// Set the reliability QoS on the DataReaderQoS object
reader_qos.policy<Reliability>(Reliability::Reliable());
// Note that the above statement sets the whole policy, possibly overriding
// other fields of Reliability (such as Reliability::acknowledgment_kind())
// with their default values. If you only want to change a specific field
// of the policy, get it by reference and modify it:
reader_qos.policy<Reliability>().kind(ReliabilityKind::RELIABLE);
```

6.170.2 Getting QoS Values

There are a few different ways to get the values of a QoS policy from an entity's QoS object

- Getting a QoS policy with operator >>

```
using namespace dds::core::policy;
// Construct a Reliability QoS object with default values
dds::core::policy::Reliability reliability;
// Construct a DataReaderQoS object with default values
dds::sub::qos::DataReaderQoS reader_qos;
// Populate the Reliability QoS object with the values from the
// DataReaderQoS object using operator »
reader_qos » reliability;
```

- You can also get a QoS policy from a QoS object using the QoS object's policy() getter which is templated on the QoS policy that it is being used to get. The following code example is equivalent to the above example.

```
using namespace dds::core::policy;
// Get the reliability QoS from the DataReaderQoS object
reliability = reader_qos.policy<Reliability>();
```

6.171 Qos Provider Use Cases

How to use `dds::core::QosProvider` (p. 1752) to access XML QoS profiles.

How to use `dds::core::QosProvider` (p. 1752) to access XML QoS profiles.

6.171.1 Managing Qos Profiles

This section provides several examples on how to use a `dds::core::QosProvider` (p. 1752) to load QoS profiles from XML. The class documentation provides general usage information.

These examples use the following file, `ExampleQos.xml`, which defines only the `EntityName` QoS policy for the `DomainParticipant` and `DataWriter` to illustrate how the profiles are loaded:

```
<?xml version="1.0"?>
<dds xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
     xsi:noNamespaceSchemaLocation="https://community.rti.com/schema/current/rti_dds_profiles.xsd">
  <qos_library name="MyLibrary">
    <qos_profile name="MyProfile" is_default_qos="true">
      <domain_participant_qos>
        <participant_name>
          <name>ExampleParticipantName</name>
        </participant_name>
      </domain_participant_qos>
      <datawriter_qos>
        <publication_name>
          <name>ExamplePublicationName</name>
        </publication_name>
      </datawriter_qos>
    </qos_profile>
  </qos_library>
  <qos_library name="MySecondLibrary">
    <qos_profile name="MySecondProfile">
      <domain_participant_qos>
        <participant_name>
          <name>SecondExampleParticipantName</name>
        </participant_name>
      </domain_participant_qos>
      <datawriter_qos>
        <publication_name>
          <name>SecondExamplePublicationName</name>
        </publication_name>
      </datawriter_qos>
    </qos_profile>
  </qos_library>
</dds>
```

The example code shows how to create a `QosProvider`, load QoS profiles from the provider, and create entities with those QoS values:

```
// Load the contents of an XML file:
dds::core::QosProvider my_provider("ExampleQos.xml");
// Create a participant with the default profile:
auto participant_qos = my_provider.participant_qos();
dds::domain::DomainParticipant participant(0, participant_qos);
// This prints ExampleParticipantName because MyLibrary::MyProfile is marked
// with is_default_qos="true"
std::cout << participant_qos().policy<EntityName>().name().value()
           << std::endl;
// Load a specific profile. This time it prints SecondExampleParticipantName
participant_qos =
    my_provider.participant_qos("MySecondLibrary::MySecondProfile");
std::cout << participant_qos.policy<EntityName>().name().value()
           << std::endl;
// Change the default profile:
my_provider.extensions().default_profile("MySecondLibrary::MySecondProfile");
// Now when the profile is not specified, participant_qos() looks at
// "MySecondLibrary::MySecondProfile", printing SecondExampleParticipantName
participant_qos = my_provider.participant_qos();
std::cout << participant_qos.policy<EntityName>().name().value()
           << std::endl;
```

```

// Create a topic, publisher and writer:
dds::topic::Topic<Foo> topic(participant, "Example Foo");
dds::pub::Publisher publisher(participant);
dds::pub::DataWriter<Foo> writer(
    publisher,
    topic,
    my_provider.datawriter_qos());
// Prints SecondExamplePublicationName
std::cout << writer.qos().policy<EntityName>().name().value()
    << std::endl;
// If you don't want to specify the QoS argument for each writer you create
// you can set the default value:
publisher.default_datawriter_qos(
    my_provider.datawriter_qos("MyLibrary::MyProfile"));
dds::pub::DataWriter<Foo> other_writer(publisher, topic);
// Prints ExamplePublicationName
std::cout << writer.qos().policy<EntityName>().name().value() << std::endl;
// You can also load the QoS profiles from a string:
const char * my_xml_str =
    "str://\"<dds>"
        "<qos_library name=\"MyThirdLibrary\">"
            "<qos_profile name=\"MyThirdProfile\">"
                "<domain_participant_qos>"
                    "<participant_name>"
                        "<name>ThirdExampleParticipantName</name>"
                    "</participant_name>"
                "</domain_participant_qos>"
            "</qos_profile>"
        "</qos_library>"
    "</dds>\"";
// In this case we're also specifying which profile we want to load by
// default in the constructor
dds::core::QosProvider my_provider2(
    my_xml_str,
    "MyThirdLibrary::MyThirdProfile");
// This prints ThirdExampleParticipantName
participant_qos = my_provider2.participant_qos();
std::cout << participant_qos.policy<EntityName>().name().value()
    << std::endl;
// You can also examine which libraries and profiles that have been
// loaded:
auto libraries = my_provider.extensions().qos_profile_libraries();
for (const std::string& library : libraries) {
    std::cout << library << std::endl;
    auto profiles = my_provider.extensions().qos_profiles(library);
    for (const std::string& profile : profiles) {
        std::cout << " -" << profile << std::endl;
    }
}

```

[XML Application Creation \(p. 143\)](#)

6.171.2 The Default QoS Provider

This example shows how to configure the default QoSProvider:

```

// We're going to configure the default QoS Provider to load ExampleQos.xml
// and to ignore the NDDS_QOS_PROFILES environment variable and the file
// USER_QOS_PROFILES.xml
rti::core::QosProviderParams params;
params.url_profile({ "ExampleQos.xml" });
params.ignore_environment_profile(true);
params.ignore_user_profile(true);
// To ensure that the new configuration takes effect before any other
// profiles are loaded, set the new parameters before accessing
// QosProvider::Default().
rti::core::default_qos_provider_params(params);
dds::core::QosProvider default_provider = dds::core::QosProvider::Default();
dds::domain::DomainParticipant participant1(0, default_provider.participant_qos());
// Prints "ExampleParticipantName"
std::cout << participant1.qos().policy<EntityName>().name().value()

```

```

    << std::endl;
// Change the default profile
default_provider.extensions().default_profile("MySecondLibrary::MySecondProfile");
dds::domain::DomainParticipant participant2(1, default_provider.participant_qos());
// Prints "SecondExampleParticipantName"
std::cout << participant2.qos().policy<EntityName>().name().value()
    << std::endl;
// Reset the QosProviderParams for the default QosProvider
dds::core::QosProvider::reset_default();
// This participant will not have a participant name (the default
// RTI Connex value) because we reset the default QosProviderParams,
// meaning that the value for string_profile is empty and the above example
// XML Qos profile is not loaded.
dds::domain::DomainParticipant participant3(2, default_provider.participant_qos());
// Prints false
std::cout << std::boolalpha
    << participant2.qos().policy<EntityName>().name().has_value()
    << std::endl;

```

6.172 Working with IDL types

How IDL types map to C++ classes.

Classes

- class **Foo**

An example topic-type.

6.172.1 Detailed Description

How IDL types map to C++ classes.

6.172.2 Example IDL types

The following IDL code defines the types we will use in these examples.

```

struct Foo {
    long x; //@key
    long y;
};
struct MyType {
    long my_long;
    string<512> my_string;
    Foo my_foo;
    sequence<long, 10> my_sequence;
    Foo my_array[5];
    Foo my_optional; //@Optional
};

```

To generate C++ code for these types, see the [Code Generator User's Manual](#).

6.172.3 Constructors and operators

C++ types generated from IDL have **value semantics** (p. 152) and provide a default constructor, a copy constructor, a move constructor <<**C++11**>> (p. 155), a constructor with parameters to set all the type's members, a destructor, a copy-assignment operator, and a move-assignment operator <<**C++11**>> (p. 155). Types also include equality operators, the operator << to `std::ostream` <<**extension**>> (p. 156) and a namespace-level swap function.

```
// The default constructor recursively initializes all members of a sample
MyType default_sample;
// A copy constructor is also provided
MyType copied_sample = default_sample;
// For convenience, another constructor allows initializing all the members
MyType initialized_sample (
    7, // my_long
    std::string("Hello, World!"), // my_string
    Foo(1, 2), // my_foo (initializing its members 'x' and 'y')
    std::vector<int32_t>(3, 2), // my_sequence containing 3 times the value 2
    dds::core::array<Foo, 5>(), // my_array
    Foo(2, 3) // my_optional (initialized with a non-empty value)
);
// An assignment operator is also available
copied_sample = initialized_sample;
// Equals operator (!= also available)
if (copied_sample == initialized_sample) {
    std::cout << "Samples are equal\n";
}
// You can move a value into a member:
std::vector<int32_t> tmp_vector {1, 2, 3, 4};
copied_sample.my_sequence() = std::move(tmp_vector);
std::cout << "You can print samples to an output stream: "
    << copied_sample
    << std::endl;
```

In addition to that, a number of **traits** (p. 244) provide additional information and utilities for IDL-generated types.

6.172.4 Accessing the type members

Setters and getters allow accessing the type members.

The following table summarizes how different IDL types map to C++.

IDL type	C++ type
string	<code>std::string</code>
bounded sequence (<code>sequence<T, M></code>)	<code>rti::core::bounded_sequence<T, M></code> (p. 671)
unbounded sequence (<code>sequence<T></code>)	<code>std::vector<T></code>
array (<code>T member[N]</code>)	<code>std::array<T, N></code>
optional member (<code>@optional T member;</code>)	<code>dds::core::optional<T></code> (p. 1610)
external member (<code>@external T member;</code>)	<code>dds::core::external<T></code> (p. 1296)

The type `rti::core::bounded_sequence` (p. 671) offers similar functionality to that of a `std::vector`. But because it has an upper bound `M`, it provides two advantages:

- 1) A better memory management strategy for deserializing data samples in a `DataReader`, improving the overall performance of the middleware.
- 2) Its member functions check for out-of-bounds growth.

It is possible to use `std::vector` for bounded sequences by annotating them with `@use_vector` in IDL. For example:

```

struct SequenceExample {
    @use_vector sequence<long, 10> bounded_sequence_as_vector;
    sequence<long, 10> bounded_sequence;
    sequence<long> unbounded_sequence;
};

```

The type `dds::core::array` is just an alias of `std::array` if available, or an alias of `boost::array` otherwise.

The following example shows how to use getters and setters and work with different IDL types.

```

MyType my_sample;
// Access a primitive type
if (my_sample.my_long() == 0) { // getter
    my_sample.my_long(1); // setter
}
// Access a string
my_sample.my_string() = "Hello, World!"; // reference getter
std::cout << "my_string: " << my_sample.my_string() << std::endl;
// Access nested type
std::cout << "my_foo.x: " << my_sample.my_foo().x() << std::endl;
my_sample.my_foo().x(3); // set a member of the nested type
my_sample.my_foo() = Foo(1, 2); // or assign a full object
// Access a sequence
my_sample.my_sequence().resize(4); // by default length is zero
int my_ints[] = {3, 2, 4, 1};
std::copy(my_ints, my_ints + 4, my_sample.my_sequence().begin());
std::sort(my_sample.my_sequence().begin(), my_sample.my_sequence().end());
std::cout << "my_sequence[0]: " << my_sample.my_sequence()[0] << std::endl;
// Access an array
std::cout << "my_array[3]: " << my_sample.my_array()[3] << std::endl;
// Fill array with copies of Foo(4, 5)
std::fill(my_sample.my_array().begin(), my_sample.my_array().end(), Foo(4, 5));
// Access an optional member
if (!my_sample.my_optional().has_value()) { // by default, an optional member is unset
    my_sample.my_optional(Foo(1, 2)); // assign a value
    my_sample.my_optional() = Foo(1, 2); // this is equivalent
}
my_sample.my_optional().reset(); // make it empty
std::cout << "my_sample: " << my_sample << std::endl;

```

6.172.5 Enumerations

IDL enums map to `enum` class types in C++.

6.172.6 Unions

IDL unions map to C++ classes with getters and setters for each member, plus a special getter and setter for the discriminator, `_d()`. At any moment only one member, the one selected by the discriminator, is considered active. A member getter will throw `dds::core::PreconditionNotMetError` (p. 1669) if the discriminator selects a different member.

Member setters set the correct discriminator value automatically.

The default constructor default-constructs all the members and selects the discriminator returned by the static member function `default_discriminator()`.

The following example shows an IDL union and C++ code to manipulate it.

- IDL definition:

```
enum MyUnionDiscriminator {
    USE_LONG,
    USE_STRING,
    USE_FOO
};
union MyUnion switch (MyUnionDiscriminator) {
case USE_LONG:
    long my_long;
case USE_STRING:
    string my_string;
case USE_FOO:
    Foo my_foo;
};
```

- C++ example:

```
MyUnion my_sample;
// Set a member
my_sample.my_string("Hello, World!");
// The discriminator is automatically updated
assert (my_sample._d() == MyUnionDiscriminator::USE_STRING);
// Access that member
std::cout << my_sample.my_string() << std::endl;
// Trying to access my_long() will throw an exception:
try {
    std::cout << my_sample.my_long() << std::endl;
} catch (const dds::core::PreconditionNotMetError&) {
    std::cout << "my_long is not selected!\n";
}
// First, set it
my_sample.my_long(4);
std::cout << my_sample.my_long() << std::endl;
// Trying to access my_foo() to modify a nested member will also fail
try {
    my_sample.my_foo().x(3);
} catch (const dds::core::PreconditionNotMetError&) {
    std::cout << "my_foo is not selected!\n";
}
// First change the discriminator
my_sample._d(MyUnionDiscriminator::USE_FOO);
my_sample.my_foo().x(3); // now it works
std::cout << my_sample << std::endl;
```

6.173 DynamicType and DynamicData Use Cases

Using DynamicType and DynamicData.

Using DynamicType and DynamicData.

The following #includes are needed for the examples on this page

```
#include <dds/core/ddscore.hpp>
#include <dds/pub/ddspub.hpp>
#include <dds/sub/ddssub.hpp>
#include "Foo.hpp"
```

6.173.1 Creating a DynamicType

In this section we'll see the different ways to create a `dds::core::xtypes::DynamicType` (p. 1249) that represents the following IDL type (p. 395) `MyType` :

```
struct Foo {
    long x; //@key
    long y;
};
struct MyType {
    long my_long;
    string<512> my_string;
    Foo my_foo;
    sequence<long, 10> my_sequence;
    Foo my_array[5];
    Foo my_optional; //@Optional
};
```

6.173.1.1 Create a DynamicType by instantiating it and adding members

(Note this example uses C++11 code that can easily be converted to similar C++03 code)

```
dds::core::xtypes::StructType create_mytype()
{
    using namespace dds::core::xtypes;
    // First, let's create Foo. We're using an initializer_list of Members
    StructType foo(
        "Foo", {
            Member("x", primitive_type<int32_t>()).key(true),
            Member("y", primitive_type<int32_t>())
        }
    );
    // Create MyType and add members
    StructType mytype("MyType");
    mytype.add_member(Member("my_long", primitive_type<int32_t>()));
    mytype.add_member(Member("my_string", StringType(512)));
    mytype.add_member(Member("my_foo", foo));
    mytype.add_member(Member("my_sequence", SequenceType(primitive_type<int32_t>(), 10)));
    mytype.add_member(Member("my_array", ArrayType(foo, 5)));
    mytype.add_member(Member("my_optional", foo).optional(true));
    rti::core::xtypes::print_idl(mytype);
    return mytype;
}
```

6.173.1.2 Create a DynamicType from an XML description

We can define the type in this XML file, MyType.xml:

```
<dds xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:noNamespaceSchemaLocation="https://community.rti.com/schema/current/rti_dds_profiles.xsd">
  <types>
    <struct name="Foo">
      <member name="x" type="int32" key="true"/>
      <member name="y" type="int32"/>
    </struct>
    <struct name="MyType">
      <member name="my_long" type="int32"/>
      <member name="my_string" stringMaxLength="512" type="string"/>
      <member name="my_foo" type="nonBasic" nonBasicTypeName="Foo"/>
      <member name="my_sequence" sequenceMaxLength="10" type="int32"/>
      <member name="my_array" type="nonBasic" nonBasicTypeName="Foo" arrayDimensions="5"/>
      <member name="my_optional" type="nonBasic" nonBasicTypeName="Foo" optional="true"/>
    </struct>
  </types>
</dds>
```

And then load it as follows:

```
using namespace dds::core::xtypes;
// Create a QosProvider (or use the default one)
dds::core::QosProvider qos_provider("path/to/MyType.xml");
// Get the type called MyType
const DynamicType& mytype = qos_provider.extensions().type("MyType");
// Downcast to StructType if needed
const StructType& mytype_struct = static_cast<const StructType&>(mytype);
rti::core::xtypes::print_idl(mytype);
```

See also

Qos Provider Use Cases (p. 393)

6.173.1.3 Get the DynamicType from its equivalent IDL-generated type

<<**extension**>> (p. 156) When we have the IDL type definition at hand, obtaining its equivalent DynamicType is as simple as:

```
const dds::core::xtypes::StructType& mytype = rti::topic::dynamic_type<MyType>::get();
rti::core::xtypes::print_idl(mytype);
```

6.173.1.4 Create a DynamicType using tuples

<<**C++11**>> (p. 155) <<**experimental**>> (p. 157) <<**extension**>> (p. 156) Note this code requires the additional header `<rti/core/xtypes/DynamicDataTuples.hpp>`.

Since this feature only supports structures containing primitive types or strings, we'll create the following simpler IDL type:

```
struct MyOtherType {
    long m1;
    double m2;
    string m3;
};
```

We can create the type in a single line:

```
dds::core::xtypes::StructType mytype = rti::core::xtypes::create_type_from_tuple<
    int32_t, double, std::string>("MyOtherType");
rti::core::xtypes::print_idl(mytype);
```

For convenience, we can also use a `std::tuple`, which allows us to typedef it:

```
typedef std::tuple<int32_t, double, std::string> MyOtherTypeTuple;
mytype = rti::core::xtypes::create_type_from_tuple<MyOtherTypeTuple>("MyOtherType");
rti::core::xtypes::print_idl(mytype);
```

6.173.2 Using DynamicData

Now that we know how to create a DynamicType, we will see how to use DynamicData to publish and subscribe to data that we can manipulate reflectively.

We will use the DynamicType that we **created before** (p. 398).

6.173.2.1 Publishing data using DynamicData

Make sure you are already familiar with the regular **publication example** (p. 106).

Unlike the regular publication example, using dynamic data we can write code where the type is unknown at compilation type.

```
using namespace dds::core::xtypes;
StructType mytype = create_mytype(); // create the type as we saw before
dds::domain::DomainParticipant participant(0);
// The template parameter is DynamicData. The third argument is the
// DynamicType, instead of the type name.
dds::topic::Topic<DynamicData> topic(participant, "MyTopic", mytype);
dds::pub::DataWriter<DynamicData> writer(dds::pub::Publisher(participant), topic);
// Create a data sample and assign its values
DynamicData sample(mytype);
sample.value("my_long", 23); // my_long = 23
sample.value<std::string>("my_string", "hello"); // my_string = hello
// To set my_foo we have two options:
// 1) Create a new DynamicData and assigning it:
// We can get the DynamicType of Foo from MyType::my_foo
DynamicData foo_data(mytype.member("my_foo").type());
foo_data.value("x", 1);
foo_data.value("y", 2);
sample.value("my_foo", foo_data);
// 2) Obtain the loaned member and assign its values
rti::core::xtypes::LoanedDynamicData loaned_member = sample.loan_value("my_foo");
loaned_member.get().value("x", 2);
loaned_member.get().value("y", 3);
loaned_member.return_loan(); // The destructor would do this as well.
// To set the values of my_sequence we can use a vector
std::vector<int32_t> sequence_values;
sequence_values.push_back(10);
sequence_values.push_back(20);
```

```

sequence_values.push_back(30);
sample.set_values("my_sequence", sequence_values);
// To set the values of my_array, since the element type is another struct
// we will use a LoanedDynamicData to access the array elements. To modify
// each element we will use another LoanedDynamicData
loaned_member = sample.loan_value("my_array");
rti::core::xtypes::LoanedDynamicData array_element = loaned_member.get().loan_value(1);
array_element.get().value("x", 10);
array_element.get().value("y", 11);
loaned_member.get().loan_value(array_element, 2); // reuse array_element
array_element.get().value("x", 20);
array_element.get().value("y", 21);
array_element.return_loan();
loaned_member.return_loan();
// We're not setting the remaining 3 elements, so they will have default values
// We manipulate optional members as regular members. By setting a value
// we are implicitly asserting its presence in the sample.
sample.value("my_optional", foo_data);
// This is how we can unset it:
sample.clear_optional_member("my_optional");
// Finally we just write the sample
writer.write(sample);
std::cout << sample << std::endl;

```

6.173.2.2 Subscribing to data using DynamicData

```

using namespace dds::core::xtypes;
using namespace rti::core::xtypes;
using namespace std; // for cout and endl
StructType mytype = create_mytype(); // create the type as we saw before
dds::domain::DomainParticipant participant(0);
// The template parameter is DynamicData. The third argument is the
// DynamicType, instead of the type name.
dds::topic::Topic<DynamicData> topic(participant, "MyTopic", mytype);
dds::sub::DataReader<DynamicData> reader(dds::sub::Subscriber(participant), topic);
// ...
// Read/take samples normally
dds::sub::LoanedSamples<DynamicData> samples = reader.take();
for (auto sample : samples) {
    if (sample.info().valid()) {
        DynamicData& data = const_cast<DynamicData&>(sample.data());
        cout << data.value<int32_t>("my_long") << endl;
        // To inspect a complex member we can get a copy of it:
        DynamicData foo_copy = data.value<DynamicData>("my_foo");
        cout << foo_copy.value<int32_t>("x") << endl;
        // Or a loan:
        LoanedDynamicData loaned_member = data.loan_value("my_foo");
        cout << loaned_member.get().value<int32_t>("y") << endl;
        loaned_member.return_loan(); // Note: the destructor also returns the loan if needed
        // Note that we could have taken advantage of the destructor to save
        // the call to return_loan:
        cout << data.loan_value("my_foo").get().value<int32_t>("y") << endl;
        // To get the values of my_sequence we can use a vector:
        std::vector<int32_t> sequence_values = data.get_values<int32_t>("my_sequence");
        // We could also have reused a vector:
        data.get_values("my_sequence", sequence_values);
        // To get the values of my_array, since the element type is another
        // struct we will use a LoanedDynamicData to access the array
        // elements.
        loaned_member = data.loan_value("my_array"); // Note: this move-assignment only works in C++11
        for (size_t i = 1; i <= loaned_member.get().member_count(); i++) {
            LoanedDynamicData array_element = loaned_member.get().loan_value(i);
            cout << array_element.get().value<int32_t>("x") << endl;
            cout << array_element.get().value<int32_t>("y") << endl;
        }
        // When getting an unset optional member, value() will throw
        // dds::core::InvalidArgumentError, but we can check if it's set:
        if (data.member_exists("my_optional")) {
            foo_copy = data.value<DynamicData>("my_optional");
            cout << foo_copy.value<int32_t>("x") << endl;
            cout << foo_copy.value<int32_t>("y") << endl;
        } else {
            cout << "my_optional is not set" << endl;
        }
    }
}
}

```

6.173.2.3 Manipulating data reflectively using C++ tuples

<<**C++11**>> (p. 155) <<*experimental*>> (p. 157) <<*extension*>> (p. 156)

This feature allows publishing and subscribing to simple data types without code generation and directly using C++ types instead of the DynamicData getters and setters.

This is an example publisher:

```
using namespace dds::core::xtypes;
// Create the type
StructType mytype = rti::core::xtypes::create_type_from_tuple<
    int32_t, double, std::string>("MyType");
// Create participant, topic and writer
dds::domain::DomainParticipant participant(0);
dds::topic::Topic<DynamicData> topic(participant, "MyTopic", mytype);
dds::pub::DataWriter<DynamicData> writer(dds::pub::Publisher(participant), topic);
// Create a data sample and assign its values
DynamicData sample(mytype);
rti::core::xtypes::set_tuple(
    sample, std::make_tuple(10, 50.5, std::string("Hello")));
// Write the sample
writer.write(sample);
std::cout << sample << std::endl;
```

And this is a subscriber:

```
using namespace dds::core::xtypes;
using namespace rti::core::xtypes;
// Create the type
StructType mytype = rti::core::xtypes::create_type_from_tuple<
    int32_t, double, std::string>("MyType");
dds::domain::DomainParticipant participant(0);
dds::topic::Topic<DynamicData> topic(participant, "MyTopic", mytype);
dds::sub::DataReader<DynamicData> reader(dds::sub::Subscriber(participant), topic);
// Read/take samples normally
dds::sub::LoanedSamples<DynamicData> samples = reader.take();
for (auto sample : samples) {
    if (sample.info().valid()) {
        // We obtain a std::tuple from the DynamicData sample
        auto my_tuple = rti::core::xtypes::get_tuple<
            int32_t, double, std::string>(sample.data());
        std::cout << std::get<0>(my_tuple) << std::endl;
        std::cout << std::get<1>(my_tuple) << std::endl;
        std::cout << std::get<2>(my_tuple) << std::endl;
    }
}
```

Chapter 7

Namespace Documentation

7.1 dds Namespace Reference

The dds namespace. The dds namespace includes all of the standard types, classes, and functions.

Namespaces

- namespace **all**
<<extension>> (p. 156) A single namespace where all standard symbols are included.
- namespace **core**
The core namespace contains infrastructure types and functions.
- namespace **domain**
The domain namespace contains types, classes, and functions related to DomainParticipants.
- namespace **pub**
Contains the type and functions to support publishing topics.
- namespace **sub**
Contains the types and functions to support subscribing to topics.
- namespace **topic**
Contains topic related classes and functions, the built-in topics and topic traits used by IDL-generated types.

7.1.1 Detailed Description

The dds namespace. The dds namespace includes all of the standard types, classes, and functions.

7.2 dds::all Namespace Reference

<<extension>> (p. 156) A single namespace where all standard symbols are included.

7.2.1 Detailed Description

<<**extension**>> (p. 156) A single namespace where all standard symbols are included.

The namespace **dds::all** (p. 403) brings all symbols to a single namespace as an alternative way of using the different namespaces such as **dds::core** (p. 404), **dds::core::cond** (p. 415), **dds::sub** (p. 446), etc.

For example:

```
#include <dds/dds.hpp>
void test_namespace()
{
    using namespace dds::all;
    DomainParticipant participant(MY_DOMAIN_ID); // dds::domain
    Topic<StringTopicType> topic(participant, "My Topic"); // dds::topic and dds::core
}
```

7.3 dds::core Namespace Reference

The core namespace contains infrastructure types and functions.

Namespaces

- namespace **cond**
*Contains the **Condition** (p. 729) classes.*
- namespace **policy**
Contains the standard QoS policy classes.
- namespace **status**
Contains the Status and State classes.
- namespace **xtypes**
Contains the types and functions to support Extensible Types.

Classes

- class **AlreadyClosedError**
Indicates that an object has been closed.
- class **basic_string**
*<<**value-type**>> (p. 152) A string convertible to std::string and with similar functionality*
- class **BytesTopicType**
Built-in type consisting of a variable-length array of opaque bytes.
- class **Duration**
*<<**value-type**>> (p. 152) Represents a time interval*
- class **Entity**
*<<**reference-type**>> (p. 153) This is the abstract base class for all the DDS objects that support QoS policies, a listener and a status condition.*
- class **Error**
*A generic, unspecified **Error** (p. 1284).*
- class **Exception**

The abstract base class for all of the DDS exceptions which may be thrown by the API.

- class **external**
A managed reference to an object.
- class **IllegalOperationError**
Indicates that an operation was called under improper circumstances.
- class **ImmutablePolicyError**
Indicates that the application attempted to modify an immutable QoS policy.
- class **InconsistentPolicyError**
Indicates that the application specified a set of QoS policies that are not consistent with each other.
- class **InstanceHandle**
*<<value-type>> (p. 152) Handle to identify different instances of the same **dds::topic::Topic** (p. 2178) of a certain type.*
- class **InvalidArgumentError**
Indicates that the application passed an illegal parameter value into an operation.
- class **InvalidDowncastError**
Indicates that a downcast was incorrect.
- class **KeyedByBytesTopicType**
Built-in type consisting of a variable-length array of opaque bytes and a string that is the key.
- class **KeyedStringTopicType**
Built-in type consisting of a string payload and a second string that is the key.
- class **NotAllowedBySecurityError**
Indicates that an operation on the DDS API fails because the security plugins do not allow it.
- class **NotEnabledError**
*A **NotEnabledError** (p. 1601) is thrown when an operation is invoked on a **dds::core::Entity** (p. 1265) that is not yet enabled.*
- class **NullReferenceError**
Indicates an attempt to access a null object.
- class **optional**
<<value-type>> (p. 152) Represents an object that may not contain a valid value
- class **OutOfResourcesError**
Indicates that RTI Connexant ran out of the resources needed to complete the operation.
- class **PreconditionNotMetError**
*A **PreconditionNotMetError** (p. 1669) is thrown when a pre-condition for the operation was not met.*
- class **QosProvider**
*<<reference-type>> (p. 153) The **QosProvider** (p. 1752) class provides a way for a user to control and access the XML QoS profiles that are loaded by RTI Connexant*
- class **Reference**
Base class for all reference types.
- class **safe_enum**
<<value-type>> (p. 152) Provides a safe, scoped enumeration based on def::type
- class **StringTopicType**
Built-in type consisting of a single character string.
- class **TEntityQos**
Acts as a container for QoS policies allowing to set and retrieve all the policies of an entity as a unit.
- class **Time**
<<extension>> (p. 156) Represents a point in time
- class **TimeoutError**
Indicates that an operation has timed out.

- class **UnsupportedError**
Indicates that the application used an unsupported operation.
- class **Value**
- class **vector**
<<value-type>> (p. 152) A vector convertible to `std::vector` and with similar functionality
- class **WeakReference**

Typedefs

- typedef `std::vector< InstanceHandle > InstanceHandleSeq`
A sequence of `dds::core::InstanceHandle` (p. 1356).
- typedef `basic_string< char, rti::core::memory::OsapiAllocator< char > > string`
A string convertible to `std::string` and with similar functionality.
- typedef `basic_string< DDS_Wchar, rti::core::memory::OsapiAllocator< DDS_Wchar > > wstring`
An IDL-derived wide string.
- typedef `std::vector< uint8_t > ByteSeq`
A vector of bytes.
- typedef `std::vector< std::string > StringSeq`
A vector of strings.
- typedef `std::nullptr_t null_type`
<<C++11>> (p. 155) The type of `dds::core::null` (p. 238)

Functions

- `template<typename TO , typename FROM >`
`TO polymorphic_cast (const FROM &from)`
*Downcasts an **Entity** (p. 1265) to a subclass.*
- `Duration operator* (uint32_t lhs, const Duration &rhs)`
*Multiply a **Duration** (p. 1194) object by an unsigned integer.*
- `Duration operator* (const Duration &lhs, uint32_t rhs)`
*Multiply a **Duration** (p. 1194) object by an unsigned integer.*
- `Duration operator/ (const Duration &lhs, uint32_t rhs)`
*Divide a **Duration** (p. 1194) object by an unsigned integer.*
- `void swap (Duration &lhs, Duration &rhs) OMG_NOEXCEPT`
*Swap the contents of two **Duration** (p. 1194) objects.*
- `template<typename def , typename inner >`
`std::ostream & operator<< (std::ostream &out, const safe_enum< def, inner > &the_enum)`
Applies `operator<<` to the underlying enum.
- `template<typename CharType , typename Allocator >`
`std::ostream & operator<< (std::ostream &out, const basic_string< CharType, Allocator > &the_string)`
Prints the string.
- `Time operator+ (const Time &time, const Duration &duration)`
*Add a **Time** (p. 2162) and a **Duration** (p. 1194) together.*
- `Time operator+ (const Duration &duration, const Time &time)`
*Add a **Time** (p. 2162) and a **Duration** (p. 1194) together.*
- `Time operator- (const Time &time, const Duration &duration)`

Subtract a *Duration* (p. 1194) from a *Time* (p. 2162).

- **Duration operator-** (const **Time** &time1, const **Time** &time2)
Calculate the duration between two times.
- template<typename T >
 bool **operator==** (const **optional**< T > &a, const **optional**< T > &b)
Compares two optional values.
- template<typename T >
 bool **operator!=** (const **optional**< T > &a, const **optional**< T > &b)
Compares two optional values.
- template<typename T >
 bool **operator==** (const **optional**< T > &optional_value, const T &value)
Compares an optional member and a value of the underlying type.
- template<typename T >
 bool **operator==** (const T &value, const **optional**< T > &optional_value)
Compares an optional member and a value of the underlying type.
- template<typename T >
 bool **operator!=** (const **optional**< T > &optional_value, const T &value)
Compares an optional member and a value of the underlying type.
- template<typename T >
 bool **operator!=** (const T &value, const **optional**< T > &optional_value)
Compares an optional member and a value of the underlying type.
- template<typename T >
 std::ostream & **operator<<** (std::ostream &out, const **optional**< T > & **optional**)
*Applies operator<< to *optional or to the string "NULL" if !optional.has_value().*
- template<typename T >
 std::ostream & **operator<<** (std::ostream &out, const **vector**< T > &v)
Print a vector applying << to all of its elements.

Variables

- const int32_t **LENGTH_UNLIMITED** = -1
A special value indicating an unlimited quantity.
- const **null_type** null
Indicates an empty reference.

7.3.1 Detailed Description

The core namespace contains infrastructure types and functions.

7.3.2 Typedef Documentation

7.3.2.1 InstanceHandleSeq

```
typedef std::vector< InstanceHandle> dds::core::InstanceHandleSeq
```

A sequence of `dds::core::InstanceHandle` (p. 1356).

7.3.3 Function Documentation

7.3.3.1 polymorphic_cast()

```
template<typename TO , typename FROM >
TO polymorphic_cast (
    const FROM & from )
```

Downcasts an **Entity** (p. 1265) to a subclass.

Note

- Header: `<dds/core/ref_traits.hpp>`
- Namespace: `dds::core` (p. 404)

Template Parameters

<i>TO</i>	The type to cast to
<i>FROM</i>	The type to cast from

Parameters

<i>from</i>	The object to cast to type TO
-------------	-------------------------------

Returns

A reference to the same object `from`, but cast to the type `TO`. Both objects share ownership of the underlying entity.

For example:

```
using namespace dds::core;
using namespace dds::domain;
DomainParticipant participant(0);
Entity entity = participant; // Assignment to base
DomainParticipant participant2 = polymorphic_cast<DomainParticipant>(entity);
assert (participant == participant2); // Same reference
```

See also

Reference types (p. 153)

7.3.3.2 operator*() [1/2]

```

Duration operator* (
    uint32_t lhs,
    const Duration & rhs )

```

Multiply a **Duration** (p. 1194) object by an unsigned integer.

Parameters

<i>lhs</i>	The unsigned integer to multiply the Duration (p. 1194) object by
<i>rhs</i>	The Duration (p. 1194) object to multiply

Returns

Duration (p. 1194) The result of the multiplication

7.3.3.3 operator*() [2/2]

```

Duration operator* (
    const Duration & lhs,
    uint32_t rhs )

```

Multiply a **Duration** (p. 1194) object by an unsigned integer.

Parameters

<i>lhs</i>	The Duration (p. 1194) object to multiply
<i>rhs</i>	The unsigned integer to multiply the Duration (p. 1194) object by

Returns

Duration (p. 1194) The result of the multiplication

7.3.3.4 operator/()

```

Duration operator/ (
    const Duration & lhs,
    uint32_t rhs )

```

Divide a **Duration** (p. 1194) object by an unsigned integer.

Parameters

<i>lhs</i>	The dividend
<i>rhs</i>	The divisor

Returns

Duration (p. 1194) The result of dividing the two **Duration** (p. 1194) objects

7.3.3.5 swap()

```
void swap (
    Duration & lhs,
    Duration & rhs )
```

Swap the contents of two **Duration** (p. 1194) objects.

Parameters

<i>lhs</i>	One of the Duration (p. 1194) objects
<i>rhs</i>	One of the Duration (p. 1194) objects

7.3.3.6 operator<<() [1/4]

```
template<typename def , typename inner >
std::ostream & operator<< (
    std::ostream & out,
    const safe_enum< def, inner > & the_enum )
```

Applies `operator<<` to the underlying enum.

7.3.3.7 operator<<() [2/4]

```
template<typename CharType , typename Allocator >
std::ostream & operator<< (
    std::ostream & out,
    const basic_string< CharType, Allocator > & the_string )
```

Prints the string.

7.3.3.8 operator+() [1/2]

```
Time operator+ (
    const Time & time,
    const Duration & duration )
```

Add a **Time** (p. 2162) and a **Duration** (p. 1194) together.

Parameters

<i>time</i>	The Time (p. 2162) object to add
<i>duration</i>	The Duration (p. 1194) object to add

Returns

Time (p. 2162) The result of the addition represented as a **Time** (p. 2162) object

7.3.3.9 operator+() [2/2]

```
Time operator+ (
    const Duration & duration,
    const Time & time )
```

Add a **Time** (p. 2162) and a **Duration** (p. 1194) together.

Parameters

<i>duration</i>	The Duration (p. 1194) object to add
<i>time</i>	The Time (p. 2162) object to add

Returns

Time (p. 2162) The result of the addition represented as a **Time** (p. 2162) object

7.3.3.10 operator-() [1/2]

```
Time operator- (
    const Time & time,
    const Duration & duration )
```

Subtract a **Duration** (p. 1194) from a **Time** (p. 2162).

Parameters

<i>time</i>	The Time (p. 2162) object to subtract from
<i>duration</i>	The Duration (p. 1194) object to subtract

Returns

Time (p. 2162) The result of the subtraction represented as a **Time** (p. 2162) object

7.3.3.11 operator-() [2/2]

```
Duration operator- (
    const Time & time1,
    const Time & time2 )
```

Calculate the duration between two times.

Parameters

<i>time1</i>	The first ("before") time
<i>time2</i>	The second ("after") time

Exceptions

<i>std::overflow_error</i>	if duration exceeds the infinite limit
----------------------------	--

Returns

The duration elapsed between time1 and time2. If time1 > time2 the duration is zero. If time1 is **Time::maximum()** (p. 2164), the duration is **Duration::infinite()** (p. 1197);

7.3.3.12 operator==() [1/3]

```
template<typename T >
bool operator==(
    const optional< T > & a,
    const optional< T > & b )
```

Compares two optional values.

Returns

true if both are unset or both are set and *a == *b.

7.3.3.13 operator!=(()) [1/3]

```
template<typename T >
bool operator!=(
    const optional< T > & a,
    const optional< T > & b )
```

Compares two optional values.

Returns

false if both are unset or both are set and *a == *b.

7.3.3.14 operator==(()) [2/3]

```
template<typename T >
bool operator==(
    const optional< T > & optional_value,
    const T & value )
```

Compares an optional member and a value of the underlying type.

Returns

Return true if optional_value is set and *optional_value == value

7.3.3.15 operator==(()) [3/3]

```
template<typename T >
bool operator==(
    const T & value,
    const optional< T > & optional_value )
```

Compares an optional member and a value of the underlying type.

Returns

Return true if optional_value is set and *optional_value == value

7.3.3.16 operator"!=() [2/3]

```
template<typename T >
bool operator!= (
    const optional< T > & optional_value,
    const T & value )
```

Compares an optional member and a value of the underlying type.

Returns

Return false if *optional_value* is set and **optional_value == value*

7.3.3.17 operator"!=() [3/3]

```
template<typename T >
bool operator!= (
    const T & value,
    const optional< T > & optional_value )
```

Compares an optional member and a value of the underlying type.

Returns

Return false if *optional_value* is set and **optional_value == value*

7.3.3.18 operator<<() [3/4]

```
template<typename T >
std::ostream & operator<< (
    std::ostream & out,
    const optional< T > & optional )
```

Applies `operator<<` to **optional* or to the string "NULL" if `!optional.has_value()`.

7.3.3.19 operator<<() [4/4]

```
template<typename T >
std::ostream & operator<< (
    std::ostream & out,
    const vector< T > & v )
```

Print a vector applying `<<` to all of its elements.

7.4 dds::core::cond Namespace Reference

Contains the **Condition** (p. 729) classes.

Classes

- class **Condition**
 <<reference-type>> (p. 153) Abstract base class of all the conditions
- class **GuardCondition**
 <<reference-type>> (p. 153) A condition whose trigger value is under the control of the application.
- class **StatusCondition**
 <<reference-type>> (p. 153) A condition associated with each **dds::core::Entity** (p. 1265)
- class **WaitSet**
 <<reference-type>> (p. 153) Allows an application to wait until one or more of the attached **Condition** (p. 729) objects have a `trigger_value` of true or else until the timeout expires.

7.4.1 Detailed Description

Contains the **Condition** (p. 729) classes.

7.5 dds::core::policy Namespace Reference

Contains the standard Qos policy classes.

Classes

- class **DataRepresentation**
 Contains the data representations supported by entities.
- class **DataTag**
 Stores name-value (string) pairs that can be used to determine access permissions.
- class **Deadline**
 Expresses the maximum duration (deadline) within which an instance is expected to be updated.
- class **DestinationOrder**
 *Controls the logical order of updates to the same instance by a **dds::pub::Publisher** (p. 1719).*
- struct **DestinationOrderKind_def**
 *The definition of the **dds::core::safe_enum** (p. 1972) DestinationOrderKind.*
- class **Durability**
 *Specifies whether a **dds::pub::DataWriter** (p. 908) will store and deliver previously published data samples to late-joining **dds::sub::DataReader** (p. 756) entities.*
- struct **DurabilityKind_def**
 *The definition of the **dds::core::safe_enum** (p. 1972) DurabilityKind.*
- class **DurabilityService**
 Configures the external RTI Persistence Service used by persistent and transient DataWriters.

- class **EntityFactory**
Configures a `dds::core::Entity` (p. 1265) that acts as factory of other entities.
- class **GroupData**
- class **History**
Specifies how much historical data a `dds::pub::DataWriter` (p. 908) and a `dds::sub::DataReader` (p. 756) can store.
- struct **HistoryKind_def**
The definition of the `dds::core::safe_enum` (p. 1972) `HistoryKind`.
- class **LatencyBudget**
Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.
- class **Lifespan**
Specifies how long the data written by a `dds::pub::DataWriter` (p. 908) is considered valid.
- class **Liveliness**
Specifies and configures the mechanism that allows `dds::sub::DataReader` (p. 756)'s to detect when `dds::pub::DataWriter` (p. 908)'s become disconnected.
- struct **LivelinessKind_def**
The definition of the `dds::core::safe_enum` (p. 1972) `LivelinessKind`.
- class **Ownership**
Specifies whether it is allowed for multiple `dds::pub::DataWriter` (p. 908)'s to write the same instance of the data and if so, how these modifications should be arbitrated.
- struct **OwnershipKind_def**
The definition of the `dds::core::safe_enum` (p. 1972) `OwnershipKind`.
- class **OwnershipStrength**
Specifies the value of the strength used to arbitrate among multiple `dds::pub::DataWriter` (p. 908) objects that attempt to modify the same instance of a data type (identified by its `dds::topic::Topic` (p. 2178) and key).
- class **Partition**
Set of strings that introduces logical partitions in `dds::domain::DomainParticipant` (p. 1079), `dds::pub::Publisher` (p. 1719), or `dds::sub::Subscriber` (p. 2116) entities.
- class **policy_id**
Obtains the `QosPolicyId` of a QoS Policy.
- class **policy_name**
Obtains the policy name.
- class **Presentation**
Specifies how the samples representing changes to data instances are presented to a subscribing application.
- struct **PresentationAccessScopeKind_def**
The definition of the `dds::core::safe_enum` (p. 1972) `PresentationAccessScopeKind`.
- class **QosPolicyCount**
<<value-type>> (p. 152) Holds a counter for a `QosPolicyId`
- class **ReaderDataLifecycle**
Controls how a `DataReader` manages the lifecycle of the data that it has received.
- class **Reliability**
Indicates the level of reliability in sample delivered that a `dds::pub::DataWriter` (p. 908) offers or a `dds::sub::DataReader` (p. 756) requests.
- struct **ReliabilityKind_def**
The definition of the `dds::core::safe_enum` (p. 1972) `ReliabilityKind`.
- class **ResourceLimits**
Controls the memory usage of `dds::pub::DataWriter` (p. 908) or a `dds::sub::DataReader` (p. 756).
- class **TimeBasedFilter**

Allows a **dds::sub::DataReader** (p. 756) to indicate that it is not interested in all the sample updates that occur within a time period.

- class **TopicData**

- class **TransportPriority**

Allows applications to take advantage of transports capable of sending messages with different priorities.

- class **TypeConsistencyEnforcement**

Defines the rules for determining whether the type used to publish a given topic is consistent with that used to subscribe to it.

- struct **TypeConsistencyEnforcementKind_def**

The definition of the **dds::core::safe_enum** (p. 1972) *TypeConsistencyEnforcementKind*.

- class **UserData**

Attaches a buffer of opaque data that is distributed by **Built-in Topics** (p. 44) during discovery.

- class **WriterDataLifecycle**

Controls how a **dds::pub::DataWriter** (p. 908) handles the lifecycle of the instances (keys) that it writes.

Typedefs

- typedef **dds::core::safe_enum**< **OwnershipKind_def** > **OwnershipKind**

Safe Enumeration (p. 229) of *OwnershipKind_def* (p. 1636)

- typedef **dds::core::safe_enum**< **DurabilityKind_def** > **DurabilityKind**

Safe Enumeration (p. 229) of *DurabilityKind_def* (p. 1188)

- typedef **dds::core::safe_enum**< **PresentationAccessScopeKind_def** > **PresentationAccessScopeKind**

Safe Enumeration (p. 229) of *PresentationAccessScopeKind_def* (p. 1677)

- typedef **dds::core::safe_enum**< **ReliabilityKind_def** > **ReliabilityKind**

Safe Enumeration (p. 229) of *ReliabilityKind_def* (p. 1879)

- typedef **dds::core::safe_enum**< **DestinationOrderKind_def** > **DestinationOrderKind**

Safe Enumeration (p. 229) of *DestinationOrderKind_def* (p. 1027)

- typedef **dds::core::safe_enum**< **HistoryKind_def** > **HistoryKind**

Safe Enumeration (p. 229) of *HistoryKind_def* (p. 1350)

- typedef **dds::core::safe_enum**< **LivelinessKind_def** > **LivelinessKind**

Safe Enumeration (p. 229) of *LivelinessKind_def* (p. 1397)

- typedef **dds::core::safe_enum**< **TypeConsistencyEnforcementKind_def** > **TypeConsistencyEnforcementKind**

Safe Enumeration (p. 229) of *TypeConsistencyEnforcementKind_def* (p. 2272)

- typedef **std::vector**< **QosPolicyCount** > **QosPolicyCountSeq**

A vector of *QosPolicyCount* (p. 1746).

- typedef **int16_t** **DataRepresentationId**

The type of the elements that *DataRepresentation* (p. 883) contains.

- typedef **std::vector**< **DataRepresentationId** > **DataRepresentationIdSeq**

A vector of *DataRepresentationId*.

- typedef **uint32_t** **QosPolicyId**

Identifies a QoS policy.

7.5.1 Detailed Description

Contains the standard QoS policy classes.

7.6 dds::core::status Namespace Reference

Contains the Status and State classes.

Classes

- class **InconsistentTopicStatus**
Information about the status `dds::core::status::StatusMask::inconsistent_topic()` (p. 2086)
- class **LivelinessChangedStatus**
Information about the status `dds::core::status::StatusMask::liveliness_changed()` (p. 2090)
- class **LivelinessLostStatus**
Information about the status `dds::core::status::StatusMask::liveliness_lost()` (p. 2090)
- class **OfferedDeadlineMissedStatus**
Information about the status `dds::core::status::StatusMask::offered_deadline_missed()` (p. 2086)
- class **OfferedIncompatibleQosStatus**
Information about the status `dds::core::status::StatusMask::offered_incompatible_qos()` (p. 2087)
- class **PublicationMatchedStatus**
Information about the status `dds::core::status::StatusMask::publication_matched()` (p. 2091)
- class **RequestedDeadlineMissedStatus**
Information about the status `dds::core::status::StatusMask::requested_deadline_missed()` (p. 2087)
- class **RequestedIncompatibleQosStatus**
Information about the status `dds::core::status::StatusMask::requested_incompatible_qos()` (p. 2088)
- class **SampleLostStatus**
Information about the status `dds::core::status::StatusMask::sample_lost()` (p. 2088)
- class **SampleRejectedState**
Reasons why a sample was rejected.
- class **SampleRejectedStatus**
Information about the status `dds::core::status::StatusMask::sample_rejected()` (p. 2089)
- class **StatusMask**
A `std::bitset` (list) of statuses.
- class **SubscriptionMatchedStatus**
Information about the status `dds::core::status::StatusMask::subscription_matched()` (p. 2091)

Functions

- template<typename STATUS >
StatusMask get_status ()
*Obtains the **StatusMask** (p. 2082) mask associated to a status class.*

7.6.1 Detailed Description

Contains the Status and State classes.

7.6.2 Function Documentation

7.6.2.1 get_status()

```
template<typename STATUS >
StatusMask dds::core::status::get_status ( )
```

Obtains the **StatusMask** (p. 2082) mask associated to a status class.

For example:

```
using namespace dds::core::status;
StatusMask mask = get_status<PublicationMatchedStatus>();
assert(mask == StatusMask::publication_matched());
```

7.7 dds::core::xtypes Namespace Reference

Contains the types and functions to support Extensible Types.

Classes

- class **AbstractConstructedType**
The base class of types that have members and an extensibility kind.
- class **AliasType**
<< *value-type* >> (p. 152) *Represents and IDL typedef*
- class **ArrayType**
<< *value-type* >> (p. 152) *Represents an IDL array type.*
- class **CollectionType**
<< *value-type* >> (p. 152) *The base class of all collection types*
- class **DynamicData**
<< *value-type* >> (p. 152) *A data sample of any complex data type, which can be inspected and manipulated reflectively.*
- class **DynamicType**
<< *value-type* >> (p. 152) *Represents a runtime type.*
- class **EnumMember**
<< *value-type* >> (p. 152) *Represents a **EnumType** (p. 1280) member*
- class **EnumType**
<< *value-type* >> (p. 152) *Represents and IDL enum type*
- struct **ExtensibilityKind_def**
The definition of the dds::core::safe_enum (p. 1972) ExtensibilityKind.
- class **Member**
<< *value-type* >> (p. 152) *Represents a **StructType** (p. 2107) member*
- class **PrimitiveType**
<< *value-type* >> (p. 152) *Represents and IDL primitive type*
- class **SequenceType**

- <<**value-type**>> (p. 152) Represents an IDL *sequence type*.
- class **StringType**
 - <<**value-type**>> (p. 152) Represents an IDL *string type*.
- class **StructType**
 - <<**value-type**>> (p. 152) Represents and IDL *struct type*
- struct **TypeKind_def**
 - The definition of *TypeKind*.
- class **UnidimensionalCollectionType**
 - <<**value-type**>> (p. 152) The base class of collection types with only one dimension.
- class **UnionMember**
 - <<**value-type**>> (p. 152) Represents a **UnionType** (p. 2285) member
- class **UnionType**
 - <<**value-type**>> (p. 152) Represents and IDL *union type*
- class **WStringType**
 - <<**value-type**>> (p. 152) Represents an IDL *wstring type*.

Typedefs

- typedef **dds::core::safe_enum**< **ExtensibilityKind_def** > **ExtensibilityKind**
 - The extensibility of a type.
- typedef **dds::core::safe_enum**< **TypeKind_def** > **TypeKind**
 - The different type kinds.

Functions

- bool **is_primitive_type** (const **DynamicType** &t)
 - Determines if a **DynamicType** (p. 1249) is a **PrimitiveType** (p. 1685).
- bool **is_constructed_type** (const **DynamicType** &t)
 - Determines if a **DynamicType** (p. 1249) is a constructed type.
- bool **is_collection_type** (const **DynamicType** &t)
 - Determines if a **DynamicType** (p. 1249) is a **CollectionType** (p. 721).
- bool **is_aggregation_type** (const **DynamicType** &t)
 - Determines if a **DynamicType** (p. 1249) is an aggregation type.
- template<typename T >
 - const **PrimitiveType**< T > & **primitive_type** ()
 - Obtains a singleton of *PrimitiveType*<T>
- std::ostream & **operator**<< (std::ostream &out, const **DynamicType** &type)
 - <<**extension**>> (p. 156) Converts the **DynamicType** (p. 1249) to a string.

7.7.1 Detailed Description

Contains the types and functions to support Extensible Types.

7.7.2 Typedef Documentation

7.7.2.1 ExtensibilityKind

```
typedef dds::core::safe_enum< ExtensibilityKind_def> dds::core::xtypes::ExtensibilityKind
```

The extensibility of a type.

See also

DynamicType (p. 1249)

7.7.3 Function Documentation

7.7.3.1 is_primitive_type()

```
bool is_primitive_type (
    const DynamicType & t )
```

Determines if a **DynamicType** (p. 1249) is a **PrimitiveType** (p. 1685).

7.7.3.2 is_constructed_type()

```
bool is_constructed_type (
    const DynamicType & t )
```

Determines if a **DynamicType** (p. 1249) is a constructed type.

This includes **EnumType** (p. 1280), **AliasType** (p. 589), collection types and aggregation types.

See also

is_collection_type (p. 421)

is_aggregation_type (p. 422)

7.7.3.3 is_collection_type()

```
bool is_collection_type (
    const DynamicType & t )
```

Determines if a **DynamicType** (p. 1249) is a **CollectionType** (p. 721).

This includes **ArrayType** (p. 616), **SequenceType** (p. 2051), **StringType** (p. 2106), and **WStringType** (p. 2363).

7.7.3.4 is_aggregation_type()

```
bool is_aggregation_type (
    const DynamicType & t )
```

Determines if a **DynamicType** (p. 1249) is an aggregation type.

This includes **StructType** (p. 2107) and **UnionType** (p. 2285).

7.7.3.5 primitive_type()

```
template<typename T >
const PrimitiveType< T > & primitive_type ( )
```

Obtains a singleton of **PrimitiveType**<T>

7.7.3.6 operator<<()

```
std::ostream & operator<< (
    std::ostream & out,
    const DynamicType & type )
```

<<**extension**>> (p. 156) Converts the **DynamicType** (p. 1249) to a string.

This operator writes the **DynamicType** (p. 1249) type to the ostream out using default values for **DynamicTypePrint**↔
FormatProperty (p. 1253) and returns a reference to out.

7.8 dds::domain Namespace Reference

The domain namespace contains types, classes, and functions related to DomainParticipants.

Namespaces

- namespace **qos**
Contains *DomainParticipantQos* (p. 1136).

Classes

- class **DomainParticipant**
<<*reference-type*>> (p. 153) Container for all `dds::core::Entity` (p. 1265) objects.
- class **DomainParticipantListener**
The listener class for a *DomainParticipant* (p. 1079).
- class **NoOpDomainParticipantListener**
A convenience implementation of *DomainParticipantListener* (p. 1134) where all methods are overridden to do nothing.

Functions

- void **ignore** (const `dds::domain::DomainParticipant` &participant, const `dds::core::InstanceHandle` &handle)
Instructs RTI Connex to locally ignore a remote *dds::domain::DomainParticipant* (p. 1079).
- template<typename FwdIterator >
void **ignore** (const `dds::domain::DomainParticipant` &participant, FwdIterator begin, FwdIterator end)
Instructs RTI Connex to locally ignore a group of remote *dds::domain::DomainParticipant* (p. 1079).
- `dds::core::InstanceHandleSeq` **discovered_participants** (const `dds::domain::DomainParticipant` &participant)
Retrieves the list of other participants discovered by this participant.
- template<typename FwdIterator >
FwdIterator **discovered_participants** (const `dds::domain::DomainParticipant` &participant, FwdIterator begin, FwdIterator end)
Retrieves the list of other participants discovered by this participant.
- `dds::topic::ParticipantBuiltinTopicData` **discovered_participant_data** (const `dds::domain::DomainParticipant` &participant, const `dds::core::InstanceHandle` &participant_handle)
Retrieves the information about one participant discovered by this participant.
- `DomainParticipant` **find** (int32_t domain_id)
Locates an existing *dds::domain::DomainParticipant* (p. 1079).

7.8.1 Detailed Description

The domain namespace contains types, classes, and functions related to DomainParticipants.

7.8.2 Function Documentation

7.8.2.1 ignore() [1/2]

```
void ignore (
    const dds::domain::DomainParticipant & participant,
    const dds::core::InstanceHandle & handle )
```

Instructs RTI Connex to locally ignore a remote **dds::domain::DomainParticipant** (p. 1079).

```
#include <dds/domain/discovery.hpp>
```

Note

This is a standalone function in the namespace **dds::domain** (p. 422)

From the time of this call onwards, RTI Connex will locally behave as if the remote participant did not exist. This means it will ignore any topic, publication, or subscription that originates on that **dds::domain::DomainParticipant** (p. 1079).

There is no way to reverse this operation.

This operation can be used in conjunction with the discovery of remote participants offered by means of the **dds::topic::ParticipantBuiltinTopicData** (p. 1639) to provide access control.

Application data can be associated with a **dds::domain::DomainParticipant** (p. 1079) by means of the **USER_DATA** (p. 344) policy. This application data is propagated as a field in the built-in topic and can be used by an application to implement its own access control policy.

The **dds::domain::DomainParticipant** (p. 1079) to ignore is identified by the `handle` argument. This `handle` is the one that appears in the **dds::sub::SampleInfo** (p. 1992) retrieved when reading the data-samples available for the built-in **dds::sub::DataReader** (p. 756) to the **dds::domain::DomainParticipant** (p. 1079) topic. The built-in **dds::sub::DataReader** (p. 756) is read with the same **dds::sub::DataReader::read** (p. 773) and **dds::sub::DataReader::take** (p. 774) operations used for any **dds::sub::DataReader** (p. 756).

Parameters

<i>participant</i>	The DomainParticipant (p. 1079) for which the remote entity will be ignored.
<i>handle</i>	The dds::core::InstanceHandle (p. 1356) of the remote entity that will be ignored.

Referenced by **dds::domain::DomainParticipant::ignore()**.

7.8.2.2 ignore() [2/2]

```
template<typename FwdIterator >
void ignore (
    const dds::domain::DomainParticipant & participant,
    FwdIterator begin,
    FwdIterator end )
```

Instructs RTI Connex to locally ignore a group of remote **dds::domain::DomainParticipant** (p. 1079).

```
#include <dds/domain/discovery.hpp>
```

Note

This is a standalone function in the namespace **dds::domain** (p. 422)

The series of entities whose instance handles are made available via the provided iterators will be ignored.

Parameters

<i>participant</i>	The DomainParticipant (p. 1079) for which the remote entity will be ignored
<i>begin</i>	The begin iterator for the series of InstanceHandles to ignore
<i>end</i>	The end iterator for the series of InstanceHandles to ignore

See also

ignore(const dds::domain::DomainParticipant& participant, const dds::core::InstanceHandle& handle)
(p. 423)

7.8.2.3 discovered_participants() [1/2]

```
dds::core::InstanceHandleSeq discovered_participants (
    const dds::domain::DomainParticipant & participant )
```

Retrieves the list of other participants discovered by this participant.

```
#include <dds/domain/discovery.hpp>
```

Note

This is a standalone function in the namespace **dds::domain** (p. 422)

This operation retrieves the list of **dds::domain::DomainParticipant** (p. 1079) entities that have been discovered in the domain and that the application has not indicated should be "ignored" by means of the **dds::domain::ignore** (p. 423) operation. When using **rti::core::policy::DiscoveryConfigBuiltinPluginKindMask::SPDP2** (p. 1078), this list only includes **dds::domain::DomainParticipant** (p. 1079) entities that the application has received configuration information from.

Parameters

<i>participant</i>	The DomainParticipant (p. 1079) where to look up the discovered participants
--------------------	---

Returns

The list of `InstanceHandles` that can be passed to **dds::domain::discovered_participant_data** (p. 426).

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228) or dds::core::NotEnabledError (p. 1601)
------------	---

Referenced by **dds::domain::DomainParticipant::discovered_participants()**.

7.8.2.4 discovered_participants() [2/2]

```
template<typename FwdIterator >
FwdIterator discovered_participants (
    const dds::domain::DomainParticipant & participant,
    FwdIterator begin,
    FwdIterator end )
```

Retrieves the list of other participants discovered by this participant.

```
#include <dds/domain/discovery.hpp>
```

Note

This is a standalone function in the namespace **dds::domain** (p. 422)

Template Parameters

<i>FwdIterator</i>	A forward iterator whose value type is dds::core::InstanceHandleSeq (p. 407)
--------------------	---

This overload copies the instance handles into an iterator range.

Parameters

<i>participant</i>	The participant whose discovered participants are looked up
<i>begin</i>	The begin iterator where to copy the instance handles
<i>end</i>	One past the last position where instance handles are copied

7.8.2.5 discovered_participant_data()

```
dds::topic::ParticipantBuiltinTopicData discovered_participant_data (
    const dds::domain::DomainParticipant & participant,
    const dds::core::InstanceHandle & participant_handle )
```

Retrieves the information about one participant discovered by this participant.

```
#include <dds/domain/discovery.hpp>
```

Note

This is a standalone function in the namespace **dds::domain** (p. 422)

This operation retrieves information on a **dds::domain::DomainParticipant** (p. 1079) that has been discovered on the network. The participant must be in the same domain as the participant on which this operation is invoked and must not have been "ignored" by means of the **dds::domain::ignore** (p. 423) operation.

The `participant_handle` must correspond to such a **DomainParticipant** (p. 1079). Otherwise, the operation will fail with **dds::core::PreconditionNotMetError** (p. 1669).

Use the operation **dds::domain::discovered_participants** (p. 425) to find the **dds::domain::DomainParticipant** (p. 1079) entities that are currently discovered.

MT Safety:

Safe.

Parameters

<i>participant</i>	The DomainParticipant (p. 1079) where to look up the information
<i>participant_handle</i>	<< <i>in</i> >> (p. 157) dds::core::InstanceHandle (p. 1356) of dds::domain::DomainParticipant (p. 1079).

Returns

The participant information about `participant_handle`

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), dds::core::PreconditionNotMetError (p. 1669) or dds::core::NotEnabledError (p. 1601)
------------	--

See also

dds::topic::ParticipantBuiltinTopicData (p. 1639)

dds::domain::discovered_participants (p. 425)

7.8.2.6 find()

```
DomainParticipant find (
    int32_t domain_id )
```

Locates an existing **dds::domain::DomainParticipant** (p. 1079).

```
#include <dds/domain/find.hpp>
```

Note

This is a standalone function in the namespace **dds::domain** (p. 422)

If no such **DomainParticipant** (p. 1079) exists, the operation will return **dds::core::null** (p. 238).

If multiple DomainParticipants belonging to that domain id exist, then the operation will return one of them. It is not specified which one.

Parameters

<i>domain</i> ↔ <i>_id</i>	The domain id of the DomainParticipant (p. 1079) to find
-------------------------------	---

7.9 dds::domain::qos Namespace Reference

Contains **DomainParticipantQos** (p. 1136).

Classes

- class **DomainParticipantFactoryQos**
 << *value-type* >> (p. 152) Container of the QoS policies that do not apply to a specific entity
- class **DomainParticipantQos**
 << *value-type* >> (p. 152) Container of the QoS policies that a **dds::domain::DomainParticipant** (p. 1079) supports

Functions

- `std::string to_string` (const **DomainParticipantFactoryQos** &qos, const **rti::core::QosPrintFormat** &format= **rti::core::QosPrintFormat**())
 << *extension* >> (p. 156) Obtains a string representation of the **dds::domain::qos::DomainParticipantFactoryQos** (p. 1130)
- `std::string to_string` (const **DomainParticipantFactoryQos** &qos, const **DomainParticipantFactoryQos** &base, const **rti::core::QosPrintFormat** &format= **rti::core::QosPrintFormat**())
 << *extension* >> (p. 156) Obtains a string representation of the **dds::domain::qos::DomainParticipantFactoryQos** (p. 1130)
- `std::string to_string` (const **DomainParticipantFactoryQos** &qos, const **rti::core::qos_print_all_t** &qos_↔ print_all, const **rti::core::QosPrintFormat** &format= **rti::core::QosPrintFormat**())
 << *extension* >> (p. 156) Obtains a string representation of the **dds::domain::qos::DomainParticipantFactoryQos** (p. 1130)
- `std::ostream & operator<<` (std::ostream &out, const **rti::domain::qos::DomainParticipantFactoryQos** &qos)
 << *extension* >> (p. 156) Prints a **dds::sub::qos::DomainParticipantFactoryQos** to an output stream.
- `std::string to_string` (const **DomainParticipantQos** &qos, const **rti::core::QosPrintFormat** &format= **rti::core::QosPrintFormat**())
 << *extension* >> (p. 156) Obtains a string representation of the **dds::domain::qos::DomainParticipantQos** (p. 1136)

- `std::string to_string` (const `DomainParticipantQos` &qos, const `DomainParticipantQos` &base, const `rti::core::QosPrintFormat` &format= `rti::core::QosPrintFormat()`)
 <<*extension*>> (p. 156) Obtains a string representation of the `dds::domain::qos::DomainParticipantQos` (p. 1136)
- `std::string to_string` (const `DomainParticipantQos` &qos, const `rti::core::qos_print_all_t` &qos_print_all, const `rti::core::QosPrintFormat` &format= `rti::core::QosPrintFormat()`)
 <<*extension*>> (p. 156) Obtains a string representation of the `dds::domain::qos::DomainParticipantQos` (p. 1136)
- `std::ostream & operator<<` (std::ostream &out, const `rti::domain::qos::DomainParticipantQos` &qos)
 <<*extension*>> (p. 156) Prints a `dds::sub::qos::DomainParticipantQos` to an output stream.

7.9.1 Detailed Description

Contains `DomainParticipantQos` (p. 1136).

7.9.2 Function Documentation

7.9.2.1 to_string() [1/6]

```
std::string to_string (
    const DomainParticipantFactoryQos & qos,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() )
```

<<*extension*>> (p. 156) Obtains a string representation of the `dds::domain::qos::DomainParticipantFactoryQos` (p. 1130)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>format</i>	The optional print format used to format the output string.

The several `to_string` overloads allow formatting the output and printing only the differences with respect to another Qos object.

```
DomainParticipantFactoryQos qos;
// When no QosPrintFormat is supplied, the default is used. Similarly, since
// no base profile has been specified we will only print the differences
// with respect to the documented default for DomainParticipantFactoryQos
std::string str = to_string(qos);
// In this overload we are specifying the print format used to format the output
// string.
QosPrintFormat format; // ...;
str = to_string(qos, format);
// Here, the differences between qos and base will be included in the output
// string. If the two qos objects are the same, the resulting string will
// be empty.
DomainParticipantFactoryQos base; // ...;
str = to_string(qos, base);
// We could also specify the format at this point
str = to_string(qos, base, format);
// Instead of supplying a base profile, the sentinel value qos_print_all can
// be supplied. This will result in the entire Qos object being printed (as
// opposed to only the differences with respect to a base qos).
```

```
str = to_string(qos, qos_print_all);
```

This overload uses the default print format and only prints the differences between qos and the documented default.

Returns

The string representation of the qos

7.9.2.2 to_string() [2/6]

```
std::string to_string (
    const DomainParticipantFactoryQos & qos,
    const DomainParticipantFactoryQos & base,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() )
```

<<*extension*>> (p. 156) Obtains a string representation of the **dds::domain::qos::DomainParticipantFactoryQos** (p. 1130)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>base</i>	The base qos. Only the differences between base and qos are included in the output string. If you want to print everything within the QoS, use the overload that accepts a rti::core::qos_print_all_t (p. 1746).
<i>format</i>	The optional print format used to format the output string.

This overload prints the differences between qos and base. If no print format is specified, the default will be used.

Returns

The string representation of the qos

7.9.2.3 to_string() [3/6]

```
std::string to_string (
    const DomainParticipantFactoryQos & qos,
    const rti::core::qos_print_all_t & qos_print_all,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() )
```

<<*extension*>> (p. 156) Obtains a string representation of the **dds::domain::qos::DomainParticipantFactoryQos** (p. 1130)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>qos_print_all</i>	The sentinel value indicating that the entire QoS should be converted to a string. The other overloads of this API only print the differences with respect to a base profile, or to the documented default.
<i>format</i>	The optional print format used to format the output string.

This overload prints all of the policies within qos. If no print format is specified, the default will be used.

The only valid value for the qos_print_all argument is `rti::core::qos_print_all` (p. 238)

For example:

```
to_string(qos, rti::core::qos_print_all);
```

Returns

The string representation of the qos

7.9.2.4 operator<<() [1/2]

```
std::ostream & operator<< (
    std::ostream & out,
    const rti::domain::qos::DomainParticipantFactoryQos & qos ) [inline]
```

<<**extension**>> (p. 156) Prints a `dds::sub::qos::DomainParticipantFactoryQos` to an output stream.

7.9.2.5 to_string() [4/6]

```
std::string to_string (
    const DomainParticipantQos & qos,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() )
```

<<**extension**>> (p. 156) Obtains a string representation of the `dds::domain::qos::DomainParticipantQos` (p. 1136)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>format</i>	The optional print format used to format the output string.

The several to_string overloads allow formatting the output and printing only the differences with respect to another Qos object.

```

DomainParticipantQos qos;
// When no QosPrintFormat is supplied, the default is used. Similarly, since
// no base profile has been specified we will only print the differences
// with respect to the documented default for DomainParticipantQos
std::string str = to_string(qos);
// In this overload we are specifying the print format used to format the output
// string.
QosPrintFormat format; // ...;
str = to_string(qos, format);
// Here, the differences between qos and base will be included in the output
// string. If the two qos objects are the same, the resulting string will
// be empty.
DomainParticipantQos base; // ...;
str = to_string(qos, base);
// We could also specify the format at this point
str = to_string(qos, base, format);
// Instead of supplying a base profile, the sentinel value qos_print_all can
// be supplied. This will result in the entire QoS object being printed (as
// opposed to only the differences with respect to a base qos).
str = to_string(qos, qos_print_all);

```

This overload uses the default print format and only prints the differences between qos and the documented default.

Returns

The string representation of the qos

7.9.2.6 to_string() [5/6]

```

std::string to_string (
    const DomainParticipantQos & qos,
    const DomainParticipantQos & base,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() )

```

<<*extension*>> (p. 156) Obtains a string representation of the **dds::domain::qos::DomainParticipantQos** (p. 1136)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>base</i>	The base qos. Only the differences between base and qos are included in the output string. If you want to print everything within the QoS, use the overload that accepts a rti::core::qos_print_all_t (p. 1746).
<i>format</i>	The optional print format used to format the output string.

This overload prints the differences between qos and base. If no print format is specified, the default will be used.

Returns

The string representation of the qos

7.9.2.7 to_string() [6/6]

```
std::string to_string (
    const DomainParticipantQos & qos,
    const rti::core::qos_print_all_t & qos_print_all,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() )
```

<<**extension**>> (p. 156) Obtains a string representation of the **dds::domain::qos::DomainParticipantQos** (p. 1136)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>qos_print_all</i>	The sentinel value indicating that the entire QoS should be converted to a string. The other overloads of this API only print the differences with respect to a base profile, or to the documented default.
<i>format</i>	The optional print format used to format the output string.

This overload prints all of the policies within qos. If no print format is specified, the default will be used.

The only valid value for the qos_print_all argument is **rti::core::qos_print_all** (p. 238)

For example:

```
to_string(qos, rti::core::qos_print_all);
```

Returns

The string representation of the qos

7.9.2.8 operator<<() [2/2]

```
std::ostream & operator<< (
    std::ostream & out,
    const rti::domain::qos::DomainParticipantQos & qos ) [inline]
```

<<**extension**>> (p. 156) Prints a **dds::sub::qos::DomainParticipantQos** to an output stream.

7.10 dds::pub Namespace Reference

Contains the type and functions to support publishing topics.

Namespaces

- namespace **qos**

Contains **PublisherQos** (p. 1733) and **DataWriterQos** (p. 994).

Classes

- class **AnyDataWriter**
 <<reference-type>> (p. 153) This class provides an non-template holder for representing a **DataWriter** (p. 908) of any type
- class **AnyDataWriterListener**
 The listener to notify status changes for a **dds::pub::DataWriter** (p. 908) of a generic type.
- class **CoherentSet**
 <<value-type>> (p. 152) A publishing application can request that a set of DDS data-sample changes be propagated in such a way that they are interpreted at the receivers' side as a cohesive set of modifications.
- class **DataWriter**
 <<reference-type>> (p. 153) Allows an application to publish data for a **dds::topic::Topic** (p. 2178)
- class **DataWriterListener**
 The **Listener** (p. 1381) to notify status changes for a **dds::pub::DataWriter** (p. 908).
- class **NoOpDataWriterListener**
 A convenience implementation of **DataWriterListener** (p. 972) where all methods are overridden to do nothing.
- class **NoOpPublisherListener**
 A convenience implementation of **PublisherListener** (p. 1732) where all methods are overridden to do nothing.
- class **Publisher**
 <<reference-type>> (p. 153) A publisher is the object responsible for the actual dissemination of publications.
- class **PublisherListener**
 The listener to notify status changes for a **dds::pub::Publisher** (p. 1719).
- class **SuspendedPublication**
 <<value-type>> (p. 152) Indicates that the application is about to make multiple modifications using several **dds::pub::DataWriter** (p. 908)'s belonging to the same **dds::pub::Publisher** (p. 1719)

Functions

- template<typename T >
DataWriter< T > **get** (const **AnyDataWriter** &any_writer)
 Same as **AnyDataWriter::get()** (p. 607)
- void **ignore** (**dds::domain::DomainParticipant** &participant, const **dds::core::InstanceHandle** &handle)
 Instructs RTI Connex to locally ignore a publication.
- template<typename FwdIterator >
 void **ignore** (**dds::domain::DomainParticipant** &participant, FwdIterator begin, FwdIterator end)
 Instructs RTI Connex to locally ignore several publications.
- template<typename T >
dds::core::InstanceHandleSeq **matched_subscriptions** (const **dds::pub::DataWriter**< T > &writer)
 Retrieve the list of subscriptions currently associated with a **dds::pub::DataWriter** (p. 908).
- template<typename T , typename FwdIterator >
 FwdIterator **matched_subscriptions** (const **dds::pub::DataWriter**< T > &writer, FwdIterator begin, FwdIterator end)
 Retrieve the list of subscriptions currently associated with a **dds::pub::DataWriter** (p. 908).
- template<typename T >
 const **dds::topic::SubscriptionBuiltinTopicData** **matched_subscription_data** (const **dds::pub::DataWriter**< T > &writer, const **dds::core::InstanceHandle** &subscription_handle)
 Retrieves information on a subscription that is currently associated with a **dds::pub::DataWriter** (p. 908).

- `template<typename WRITER , typename FwdIterator >`
`uint32_t find (const dds::pub::Publisher &publisher, RTI_STRING_IN topic_name, FwdIterator begin, uint32_t↔`
`_t max_size)`
*Retrieves the **dds::pub::DataWriter** (p. 908) for a specific topic name.*
- `template<typename WRITER , typename BinIterator >`
`uint32_t find (const dds::pub::Publisher &publisher, RTI_STRING_IN topic_name, BinIterator begin)`
*Retrieves the **dds::pub::DataWriter** (p. 908) for a specific topic name.*

7.10.1 Detailed Description

Contains the type and functions to support publishing topics.

7.10.2 Function Documentation

7.10.2.1 `get()`

```
template<typename T >
DataWriter< T > get (
    const AnyDataWriter & any_writer )
```

Same as **AnyDataWriter::get()** (p. 607)

7.10.2.2 `ignore()` [1/2]

```
void ignore (
    dds::domain::DomainParticipant & participant,
    const dds::core::InstanceHandle & handle )
```

Instructs RTI Connext to locally ignore a publication.

A publication is defined by the association of a topic name, user data, and partition set on the **dds::pub::Publisher** (p. 1719) (see **dds::topic::PublicationBuiltinTopicData** (p. 1703)). After this call, any data written by that publication's **dds::pub::DataWriter** (p. 908) will be ignored.

This operation can be used to ignore local *and* remote DataWriters.

The publication (**DataWriter** (p. 908)) to ignore is identified by the `handle` argument.

- To ignore a *remote* **DataWriter** (p. 908), the `handle` can be obtained from the **dds::sub::SampleInfo** (p. 1992) retrieved when reading data samples from the built-in **dds::sub::DataReader** (p. 756) for the publication topic.
- To ignore a *local* **DataWriter** (p. 908), the `handle` can be obtained by calling **dds::core::Entity::instance_↔**
handle() (p. 1270) for the local **DataWriter** (p. 908).

There is no way to reverse this operation.

Parameters

<i>participant</i>	The DomainParticipant where the publication will be ignored
<i>handle</i>	<< <i>in</i> >> (p. 157) Handle of the dds::pub::DataWriter (p. 908) to be ignored.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), dds::core::OutOfResourcesError (p. 1629) or dds::core::NotEnabledError (p. 1601)
------------	--

See also

dds::topic::PublicationBuiltinTopicData (p. 1703)

dds::topic::publication_topic_name() (p. 243)

dds::sub::builtin_subscriber (p. 459)

Referenced by **dds::pub::DataWriter< T >::ignore()**.

7.10.2.3 ignore() [2/2]

```
template<typename FwdIterator >
void ignore (
    dds::domain::DomainParticipant & participant,
    FwdIterator begin,
    FwdIterator end )
```

Instructs RTI Connex to locally ignore several publications.

Template Parameters

<i>FwdIterator</i>	A forward iterator whose value type is dds::core::InstanceHandle (p. 1356)
--------------------	---

See also

ignore(dds::domain::DomainParticipant&, const dds::core::InstanceHandle&) (p. 435);

7.10.2.4 matched_subscriptions() [1/2]

```
template<typename T >
dds::core::InstanceHandleSeq matched_subscriptions (
    const dds::pub::DataWriter< T > & writer )
```

Retrieve the list of subscriptions currently associated with a `dds::pub::DataWriter` (p. 908).

A subscription is considered to be matching if all of the following criteria are true:

- The subscription is within the same domain as this publication.
- The subscription has a matching `dds::topic::Topic` (p. 2178).
- The subscription has compatible QoS.
- If the applications are using partitions, the subscription shares a common partition with this publication.
- The `dds::domain::DomainParticipant` (p. 1079) has not indicated that the subscription's `dds::domain::DomainParticipant` (p. 1079) should be "ignored" by means of the `dds::pub::ignore` (p. 435) API.
- If the publication is using the `rti::core::policy::MultiChannel` (p. 1483) and the subscription is using a `dds::topic::ContentFilteredTopic` (p. 735), there is an intersection between at least one of the associated filters.
- If the endpoints need to exchange key material to communicate (i.e., they are securing their communications), the writer has completed the key exchange with reader.

The handles returned list are the ones that RTI Connex uses to locally identify the corresponding matched `dds::sub::DataReader` (p. 756) entities. These handles match the ones that appear in the `dds::sub::SampleInfo::instance_handle` (p. 1997) field of the `dds::sub::SampleInfo` (p. 1992) when reading the `dds::topic::subscription_topic_name()` (p. 243) builtin topic.

This API may return the subscription handles of subscriptions that are inactive. `dds::pub::DataWriter::is_matched_subscription_active` (p. 961) can be used to check this.

The maximum number of matches possible is configured with `rti::core::policy::DomainParticipantResourceLimits` (p. 1143).

Exceptions

One	of the <code>Standard Exceptions</code> (p. 228), or <code>dds::core::NotEnabledError</code> (p. 1601)
-----	--

Referenced by `dds::pub::DataWriter< T >::matched_subscriptions()`.

7.10.2.5 `matched_subscriptions()` [2/2]

```
template<typename T , typename FwdIterator >
FwdIterator matched_subscriptions (
    const dds::pub::DataWriter< T > & writer,
    FwdIterator begin,
    FwdIterator end )
```

Retrieve the list of subscriptions currently associated with a `dds::pub::DataWriter` (p. 908).

This operation is similar to `matched_subscriptions(const dds::pub::DataWriter<T>&)` (p. 436) but it copies the instance handles into an iterator range.

Template Parameters

<i>FwdIterator</i>	A forward iterator whose value type is dds::core::InstanceHandle (p. 1356)
--------------------	---

7.10.2.6 `matched_subscription_data()`

```
template<typename T >
const dds::topic::SubscriptionBuiltinTopicData matched_subscription_data (
    const dds::pub::DataWriter< T > & writer,
    const dds::core::InstanceHandle & subscription_handle )
```

Retrieves information on a subscription that is currently associated with a **dds::pub::DataWriter** (p. 908).

The `subscription_handle` must correspond to a subscription currently associated with the **dds::pub::DataWriter** (p. 908). Otherwise, the operation will fail and fail with **dds::core::InvalidArgumentError** (p. 1363). Use **dds::pub::←::matched_subscriptions()** (p. 436) to find the subscriptions that are currently matched with the **dds::pub::DataWriter** (p. 908).

The above information is also available through **dds::sub::DataReaderListener::on_data_available()** (p. 835) (if a reader listener is installed on the `dds::sub::DataReader<dds::topic::SubscriptionBuiltinTopicData>`).

When the subscription data is updated, for example when the content filter property changes, there is a small window of time in between when the **DataWriter** (p. 908) is made aware of these changes and when they actually take effect. Taking effect in this example means that the **DataWriter** (p. 908) will perform writer-side filtering using the new filter property values (filter expression and/or parameters).

When the **DataWriter** (p. 908) is made aware of the changes they will first be seen in the **dds::sub::DataReader←Listener::on_data_available()** (p. 835) of the `dds::sub::DataReader<dds::topic::SubscriptionBuiltinTopicData>`. When these changes are applied, they will be seen in the output of this API because this API blocks until the most recent changes known to the **DataWriter** (p. 908) have taken effect. This API will only block when called outside of a listener callback, in order to not block the internal threads from making progress.

If application behavior depends on being made aware of information about a subscription only after it has taken effect on the **DataWriter** (p. 908), the recommended pattern for usage of this API is to wait for subscription data to be received either through polling this API or by installing a listener on the `dds::sub::DataReader<dds::topic::SubscriptionBuiltin←TopicData>`. When a new sample is received by the builtin DataReader, this API may be called in a separate thread and will return the expected matched subscription data once it has been applied to the **DataWriter** (p. 908).

Because this API blocks, it is possible for this API to time out while waiting for the changes to be applied. A timeout may happen if the DataReader's subscription data is changing rapidly, preventing the **DataWriter** (p. 908) from returning valid information before newer data has been received, or if an application is performing a task in a listener callback, thereby preventing the middleware's threads from executing events in a timely manner.

Note: This operation does not retrieve the **dds::topic::SubscriptionBuiltinTopicData::type** (p. 2140). This information is available through **dds::sub::DataReaderListener::on_data_available()** (p. 835) (if a reader listener is installed on the `dds::sub::DataReader<dds::topic::SubscriptionBuiltinTopicData>`).

Parameters

<i>writer</i>	The DataWriter (p. 908) to which the subscription is associated
<i>subscription_handle</i>	<< <i>in</i> >> (p. 157). Handle to a specific subscription associated with the dds::sub::DataReader (p. 756). Must correspond to a subscription currently associated with the dds::pub::DataWriter (p. 908).

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), dds::core::NotEnabledError (p. 1601), or dds::core::TimeoutError (p. 2177)
------------	--

7.10.2.7 `find()` [1/2]

```
template<typename WRITER , typename FwdIterator >
uint32_t find (
    const dds::pub::Publisher & publisher,
    RTI_STRING_IN topic_name,
    FwdIterator begin,
    uint32_t max_size )
```

Retrieves the **dds::pub::DataWriter** (p. 908) for a specific topic name.

This returned **dds::pub::DataWriter** (p. 908) is either enabled or disabled.

If more than one **dds::pub::DataWriter** (p.908) is attached to the **dds::pub::Publisher** (p.1719) with the same `topic_name`, then this operation may return any one of them.

MT Safety:

UNSAFE. It is not safe to lookup a **dds::pub::DataWriter** (p. 908) in one thread while another thread is simultaneously creating or destroying that **dds::pub::DataWriter** (p. 908).

This function retrieves a previously-created **DataWriter** (p.908) belonging to the **dds::pub::Publisher** (p.1719) that is attached to a **dds::topic::Topic** (p.2178) with a matching topic name. If no such **DataWriter** (p.908) exists, the operation will return an empty container. The use of this operation on the built-in **Publisher** (p.1719) allows access to the built-in **DataWriter** (p. 908) entities for the built-in topics

Template Parameters

<i>Writer</i>	The type of the writer. It can be dds::pub::AnyDataWriter (p. 603), or an instantiation of dds::pub::DataWriter<T> (if T is not the correct type, this function throws dds::core::InvalidDowncastError (p. 1364))
<i>FwdIterator</i>	The type of forward iterator passed to this function

Parameters

<i>publisher</i>	The dds::pub::Publisher (p. 1719) the DataWriter (p. 908) belongs to
<i>topic_name</i>	Name of the dds::topic::Topic (p. 2178) associated with the DataWriter (p. 908) that is to be looked up.
<i>begin</i>	A forward iterator to the position in the destination container to insert the found DataWriter (p. 908) in
<i>max_size</i>	Only 1 DataWriter (p. 908) will be returned from this function

Returns

The number of DataWriters that were found (either 0 or 1)

7.10.2.8 find() [2/2]

```
template<typename WRITER , typename BinIterator >
uint32_t find (
    const dds::pub::Publisher & publisher,
    RTI_STRING_IN topic_name,
    BinIterator begin )
```

Retrieves the **dds::pub::DataWriter** (p. 908) for a specific topic name.

This returned **dds::pub::DataWriter** (p. 908) is either enabled or disabled.

If more than one **dds::pub::DataWriter** (p.908) is attached to the **dds::pub::Publisher** (p. 1719) with the same *topic_name*, then this operation may return any one of them.

MT Safety:

UNSAFE. It is not safe to lookup a **dds::pub::DataWriter** (p. 908) in one thread while another thread is simultaneously creating or destroying that **dds::pub::DataWriter** (p. 908).

This function retrieves a previously created **DataWriter** (p. 908) belonging to the **dds::pub::Publisher** (p. 1719) that is attached to a **dds::topic::Topic** (p. 2178) with a matching topic name. If no such **DataWriter** (p. 908) exists, the operation will return an empty container. The use of this operation on the built-in **Publisher** (p. 1719) allows access to the built-in **DataWriter** (p. 908) entities for the built-in topics

Template Parameters

<i>Writer</i>	The type of the writer. It can be dds::pub::AnyDataWriter (p. 603), or an instantiation of dds::pub::DataWriter<T> (if T is not the correct type, this function throws dds::core::InvalidDowncastError (p. 1364))
<i>BinIterator</i>	BinIterator The type of back-inserting iterator passed to this function

Parameters

<i>publisher</i>	The dds::pub::Publisher (p. 1719) the DataWriter (p. 908) belongs to
<i>topic_name</i>	Name of the dds::topic::Topic (p. 2178) associated with the DataWriter (p. 908) that is to be looked up.
<i>begin</i>	A back-inserting iterator to the position in the destination container to insert the found DataWriter (p. 908) into

Returns

The number of DataWriters that were found (either 0 or 1)

7.11 dds::pub::qos Namespace Reference

Contains **PublisherQos** (p. 1733) and **DataWriterQos** (p. 994).

Classes

- class **DataWriterQos**
 << *value-type* >> (p. 152) Container of the QoS policies that a **dds::pub::DataWriter** (p. 908) supports
- class **PublisherQos**
 << *value-type* >> (p. 152) Container of the QoS policies that a **dds::pub::Publisher** (p. 1719) supports

Functions

- std::string **to_string** (const **DataWriterQos** &qos, const **rti::core::QosPrintFormat** &format= **rti::core::QosPrintFormat**())
 << *extension* >> (p. 156) Obtains a string representation of the **dds::pub::qos::DataWriterQos** (p. 994)
- std::string **to_string** (const **DataWriterQos** &qos, const **DataWriterQos** &base, const **rti::core::QosPrintFormat** &format= **rti::core::QosPrintFormat**())
 << *extension* >> (p. 156) Obtains a string representation of the **dds::pub::qos::DataWriterQos** (p. 994)
- std::string **to_string** (const **DataWriterQos** &qos, const **rti::core::qos_print_all_t** &qos_print_all, const **rti::core::QosPrintFormat** &format= **rti::core::QosPrintFormat**())
 << *extension* >> (p. 156) Obtains a string representation of the **dds::sub::qos::DataWriterQos**
- std::ostream & **operator**<< (std::ostream &out, const **rti::pub::qos::DataWriterQos** &qos)
 << *extension* >> (p. 156) Prints a **dds::pub::qos::DataWriterQos** (p. 994) to an output stream.
- void **swap** (**PublisherQosImpl** &left, **PublisherQosImpl** &right) **OMG_NOEXCEPT**
 Swap the contents of two **PublisherQos** (p. 1733) objects.
- std::string **to_string** (const **PublisherQos** &qos, const **rti::core::QosPrintFormat** &format= **rti::core::QosPrintFormat**())
 << *extension* >> (p. 156) Obtains a string representation of the **dds::pub::qos::PublisherQos** (p. 1733)
- std::string **to_string** (const **PublisherQos** &qos, const **PublisherQos** &base, const **rti::core::QosPrintFormat** &format= **rti::core::QosPrintFormat**())
 << *extension* >> (p. 156) Obtains a string representation of the **dds::pub::qos::PublisherQos** (p. 1733)
- std::string **to_string** (const **PublisherQos** &qos, const **rti::core::qos_print_all_t** &qos_print_all, const **rti::core::QosPrintFormat** &format= **rti::core::QosPrintFormat**())
 << *extension* >> (p. 156) Obtains a string representation of the **dds::pub::qos::PublisherQos** (p. 1733)
- std::ostream & **operator**<< (std::ostream &out, const **rti::pub::qos::PublisherQos** &qos)
 << *extension* >> (p. 156) Prints a **dds::pub::qos::PublisherQos** (p. 1733) to an output stream.

7.11.1 Detailed Description

Contains **PublisherQos** (p. 1733) and **DataWriterQos** (p. 994).

7.11.2 Function Documentation

7.11.2.1 to_string() [1/6]

```
std::string to_string (
    const DataWriterQos & qos,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() )
```

<<**extension**>> (p. 156) Obtains a string representation of the **dds::pub::qos::DataWriterQos** (p. 994)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>format</i>	The optional print format used to format the output string.

The several `to_string` overloads allow formatting the output and printing only the differences with respect to another Qos object.

```
DataWriterQos qos;
// When no QosPrintFormat is supplied, the default is used. Similarly, since
// no base profile has been specified we will only print the differences
// with respect to the documented default for DataWriterQos
std::string str = to_string(qos);
// In this overload we are specifying the print format used to format the output
// string.
QosPrintFormat format; // ...;
str = to_string(qos, format);
// Here, the differences between qos and base will be included in the output
// string. If the two qos objects are the same, the resulting string will
// be empty.
DataWriterQos base; // ...;
str = to_string(qos, base);
// We could also specify the format at this point
str = to_string(qos, base, format);
// Instead of supplying a base profile, the sentinel value qos_print_all can
// be supplied. This will result in the entire Qos object being printed (as
// opposed to only the differences with respect to a base qos).
str = to_string(qos, qos_print_all);
```

This overload uses the default print format and only prints the differences between qos and the documented default.

Returns

The string representation of the qos

7.11.2.2 to_string() [2/6]

```
std::string to_string (
    const DataWriterQos & qos,
    const DataWriterQos & base,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() )
```

<<**extension**>> (p. 156) Obtains a string representation of the **dds::pub::qos::DataWriterQos** (p. 994)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>base</i>	The base qos. Only the differences between base and qos are included in the output string. If you want to print everything within the QoS, use the overload that accepts a rti::core::qos_print_all_t (p. 1746).
<i>format</i>	The optional print format used to format the output string.

This overload prints the differences between qos and base. If no print format is specified, the default will be used.

Returns

The string representation of the qos

7.11.2.3 to_string() [3/6]

```
std::string to_string (
    const DataWriterQos & qos,
    const rti::core::qos_print_all_t & qos_print_all,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() )
```

<<**extension**>> (p. 156) Obtains a string representation of the **dds::sub::qos::DataWriterQos**

Parameters

<i>qos</i>	The qos object to convert to a string
<i>qos_print_all</i>	The sentinel value indicating that the entire QoS should be converted to a string. The other overloads of this API only print the differences with respect to a base profile, or to the documented default.
<i>format</i>	The optional print format used to format the output string.

This overload prints all of the policies within qos. If no print format is specified, the default will be used.

The only valid value for the qos_print_all argument is **rti::core::qos_print_all** (p. 238)

For example:

```
to_string(qos, rti::core::qos_print_all);
```

Returns

The string representation of the qos

7.11.2.4 operator<<() [1/2]

```
std::ostream & operator<< (
    std::ostream & out,
    const rti::pub::qos::DataWriterQos & qos ) [inline]
```

<<**extension**>> (p. 156) Prints a **dds::pub::qos::DataWriterQos** (p. 994) to an output stream.

7.11.2.5 swap()

```
void swap (
    PublisherQosImpl & left,
    PublisherQosImpl & right )
```

Swap the contents of two **PublisherQos** (p. 1733) objects.

Parameters

<i>left</i>	A PublisherQos (p. 1733)
<i>right</i>	The other PublisherQos (p. 1733)

7.11.2.6 to_string() [4/6]

```
std::string to_string (
    const PublisherQos & qos,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() )
```

<<**extension**>> (p. 156) Obtains a string representation of the **dds::pub::qos::PublisherQos** (p. 1733)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>format</i>	The optional print format used to format the output string.

The several to_string overloads allow formatting the output and printing only the differences with respect to another Qos

object.

```

PublisherQos qos;
// When no QosPrintFormat is supplied, the default is used. Similarly, since
// no base profile has been specified we will only print the differences
// with respect to the documented default for PublisherQos
std::string str = to_string(qos);
// In this overload we are specifying the print format used to format the output
// string.
QosPrintFormat format; // ...;
str = to_string(qos, format);
// Here, the differences between qos and base will be included in the output
// string. If the two qos objects are the same, the resulting string will
// be empty.
PublisherQos base; // ...;
str = to_string(qos, base);
// We could also specify the format at this point
str = to_string(qos, base, format);
// Instead of supplying a base profile, the sentinel value qos_print_all can
// be supplied. This will result in the entire QoS object being printed (as
// opposed to only the differences with respect to a base qos).
str = to_string(qos, qos_print_all);

```

This overload uses the default print format and only prints the differences between qos and the documented default.

Returns

The string representation of the qos

7.11.2.7 to_string() [5/6]

```

std::string to_string (
    const PublisherQos & qos,
    const PublisherQos & base,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() )

```

<<**extension**>> (p. 156) Obtains a string representation of the **dds::pub::qos::PublisherQos** (p. 1733)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>base</i>	The base qos. Only the differences between base and qos are included in the output string. If you want to print everything within the QoS, use the overload that accepts a rti::core::qos_print_all_t (p. 1746).
<i>format</i>	The optional print format used to format the output string.

This overload prints the differences between qos and base. If no print format is specified, the default will be used.

Returns

The string representation of the qos

7.11.2.8 to_string() [6/6]

```
std::string to_string (
    const PublisherQos & qos,
    const rti::core::qos_print_all_t & qos_print_all,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() )
```

<<*extension*>> (p. 156) Obtains a string representation of the **dds::pub::qos::PublisherQos** (p. 1733)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>qos_print_all</i>	The sentinel value indicating that the entire QoS should be converted to a string. The other overloads of this API only print the differences with respect to a base profile, or to the documented default.
<i>format</i>	The optional print format used to format the output string.

This overload prints all of the policies within qos. If no print format is specified, the default will be used.

The only valid value for the qos_print_all argument is **rti::core::qos_print_all** (p. 238)

For example:

```
to_string(qos, rti::core::qos_print_all);
```

Returns

The string representation of the qos

7.11.2.9 operator<<() [2/2]

```
std::ostream & operator<< (
    std::ostream & out,
    const rti::pub::qos::PublisherQos & qos ) [inline]
```

<<*extension*>> (p. 156) Prints a **dds::pub::qos::PublisherQos** (p. 1733) to an output stream.

7.12 dds::sub Namespace Reference

Contains the types and functions to support subscribing to topics.

Namespaces

- namespace **cond**
Contains Conditions specific to DataReaders.
- namespace **qos**
Contains **DataReaderQos** (p. 848) and **SubscriberQos** (p. 2129).
- namespace **status**
Contains **DataState** (p. 888).

Classes

- class **AnyDataReader**
<<reference-type>> (p. 153) This class provides an non-template holder for representing a **DataReader** (p. 756) of any type
- class **AnyDataReaderListener**
The listener to notify status changes for a **dds::sub::DataReader** (p. 756) of a generic type.
- class **CoherentAccess**
<<value-type>> (p. 152) Controls whether RTI Connexx will preserve the groupings of changes made by the publishing application by means of `begin_coherent_changes` and `end_coherent_changes`.
- class **DataReader**
<<reference-type>> (p. 153) Allows the application to: (1) declare the data it wishes to receive (i.e. make a subscription) and (2) access the data received by the attached **dds::sub::Subscriber** (p. 2116).
- class **DataReaderListener**
The **Listener** (p. 1381) to notify status changes for a **dds::sub::DataReader** (p. 756).
- class **GenerationCount**
<<value-type>> (p. 152)
- class **LoanedSamples**
<<move-only-type>> (p. 155) Provides temporary access to a collection of samples (data and info) from a **DataReader** (p. 756).
- class **NoOpDataReaderListener**
A convenience implementation of **DataReaderListener** (p. 832) where all methods are overridden to do nothing.
- class **NoOpSubscriberListener**
A convenience implementation of **SubscriberListener** (p. 2128) where all methods are overridden to do nothing.
- class **Query**
<<value-type>> (p. 152) Encapsulates a query for a **dds::sub::cond::QueryCondition** (p. 1784).
- class **Rank**
<<value-type>> (p. 152) Contains the sample and generation ranks of a data-sample
- class **ReadModeDummyType**
- class **Sample**
<<value-type>> (p. 152) This class encapsulate the data and meta-data associated with DDS samples.
- class **SampleInfo**
<<value-type>> (p. 152) Information that accompanies each sample received by a **DataReader** (p. 756)
- class **SharedSamples**
<<reference-type>> (p. 153) A sharable and container-safe version of **LoanedSamples** (p. 1406).
- class **Subscriber**
<<reference-type>> (p. 153) A subscriber is the object responsible for actually receiving data from a subscription.
- class **SubscriberListener**
The listener to notify status changes for a **dds::sub::Subscriber** (p. 2116).

Functions

- `template<typename T >`
DataReader< T > get (const **AnyDataReader** &any_reader)
*Same as **AnyDataReader::get()** (p. 598)*
- `bool read` (**dds::sub::ReadModeDummyType**)
The stream manipulator to indicate that the reader should read samples as opposed to taking the samples.
- `bool take` (**dds::sub::ReadModeDummyType**)
The stream manipulator to indicate that the reader should take samples as opposed to reading the samples.
- `dds::sub::functors::MaxSamplesManipulatorFuncor` **max_samples** (uint32_t n)
Stream manipulator to set the maximum number of samples to read or take.
- `dds::sub::functors::ContentFilterManipulatorFuncor` **content** (const **dds::sub::Query** &query)
*Stream manipulator to set a **Query** (p. 1778) to use during the subsequent read/take operation.*
- `dds::sub::functors::ConditionManipulatorFuncor` **condition** (const **dds::sub::cond::ReadCondition** &condition)
*Stream manipulator to set a **QueryCondition** to use during the subsequent read/take operation.*
- `dds::sub::functors::StateFilterManipulatorFuncor` **state** (const **dds::sub::status::DataState** &s)
*Stream manipulator to specify the **DataState** of the samples that should be read/taken.*
- `dds::sub::functors::InstanceManipulatorFuncor` **instance** (const **dds::core::InstanceHandle** &h)
Stream manipulator to specify the instance whose samples should be read or taken.
- `dds::sub::functors::NextInstanceManipulatorFuncor` **next_instance** (const **dds::core::InstanceHandle** &h)
Stream manipulator to specify the samples belonging to the 'next' instance after the provided instance handle should be accessed.
- `void ignore` (**dds::domain::DomainParticipant** &participant, const **dds::core::InstanceHandle** &handle)
Instructs RTI Connex to locally ignore a subscription.
- `template<typename FwdIterator >`
void ignore (**dds::domain::DomainParticipant** &participant, FwdIterator **begin**, FwdIterator **end**)
Instructs RTI Connex to locally ignore subscriptions.
- `template<typename T >`
const ::dds::core::InstanceHandleSeq matched_publications (const **dds::sub::DataReader< T >** &reader)
*Retrieve the list of publications currently "associated" with a **DataReader** (p. 756).*
- `template<typename T , typename FwdIterator >`
FwdIterator matched_publications (const **dds::sub::DataReader< T >** &reader, FwdIterator **begin**, FwdIterator **end**)
*Retrieve the list of publications currently "associated" with a **DataReader** (p. 756).*
- `template<typename T >`
const dds::topic::PublicationBuiltinTopicData matched_publication_data (const **dds::sub::DataReader< T >** &reader, const **dds::core::InstanceHandle** &handle)
*This operation retrieves the information on a publication that is currently "associated" with the **DataReader** (p. 756).*
- **dds::sub::Subscriber builtin_subscriber** (const **dds::domain::DomainParticipant** &dp)
*Access the built-in **Subscriber** (p. 2116).*
- `template<typename READER , typename FwdIterator >`
uint32_t find (const **dds::sub::Subscriber** &subscriber, RTI_STRING_IN topic_name, FwdIterator **begin**, uint32_t max_size)
*This function retrieves a previously-created **DataReader** (p. 756) belonging to the **Subscriber** (p. 2116) that is attached to a **Topic** with a matching topic name.*
- `template<typename READER , typename BinIterator >`
uint32_t find (const **dds::sub::Subscriber** &subscriber, RTI_STRING_IN topic_name, BinIterator **begin**)
*This function retrieves a previously-created **DataReader** (p. 756) belonging to the **Subscriber** (p. 2116) that is attached to a **Topic** with a matching topic name.*

- `template<typename READER, typename T, typename FwdIterator >`
`uint32_t find (const dds::sub::Subscriber &sub, const dds::topic::TopicDescription< T > &topic_↔`
`description, FwdIterator begin, uint32_t max_size)`
- `template<typename READER, typename T, typename BinIterator >`
`uint32_t find (const dds::sub::Subscriber &subscriber, const dds::topic::TopicDescription< T > &topic_↔`
`description, BinIterator begin)`
*This function retrieves a previously-created **DataReader** (p. 756) belonging to the **Subscriber** (p. 2116) that is attached to a Topic with a matching TopicDescription.*
- `template<typename AnyDataReaderFwdIterator >`
`uint32_t find (const dds::sub::Subscriber &subscriber, const dds::sub::status::DataState &data_state,`
`AnyDataReaderFwdIterator begin, uint32_t max_size)`
*Allows the application to access the AnyDataReaders that contain samples with the specified **dds::sub::status::Data↔***
***State** (p. 888).*
- `template<typename AnyDataReaderBackInsertIterator >`
`uint32_t find (const dds::sub::Subscriber &subscriber, const dds::sub::status::DataState &data_state,`
`AnyDataReaderBackInsertIterator begin)`
*Allows the application to access the AnyDataReaders that contain samples with the specified **dds::sub::status::Data↔***
***State** (p. 888).*
- `template<typename T >`
`LoanedSamples< T > move (LoanedSamples< T > &ls) OMG_NOEXCEPT`
*Creates a new **LoanedSamples** (p. 1406) instance by moving the contents of an existing one.*
- `template<typename T >`
`LoanedSamples< T >::iterator begin (LoanedSamples< T > &ls)`
- `template<typename T >`
`LoanedSamples< T >::const_iterator begin (const LoanedSamples< T > &ls)`
- `template<typename T >`
`LoanedSamples< T >::iterator end (LoanedSamples< T > &ls)`
- `template<typename T >`
`LoanedSamples< T >::const_iterator end (const LoanedSamples< T > &ls)`
- `template<typename T >`
`void swap (LoanedSamples< T > &ls1, LoanedSamples< T > &ls2) throw ()`

7.12.1 Detailed Description

Contains the types and functions to support subscribing to topics.

7.12.2 Function Documentation

7.12.2.1 get()

```
template<typename T >
DataReader< T > get (
    const AnyDataReader & any_reader )
```

Same as **AnyDataReader::get()** (p. 598)

7.12.2.2 read()

```
bool read (
    dds::sub::ReadModeDummyType )
```

The stream manipulator to indicate that the reader should read samples as opposed to taking the samples.

Usage:

```
reader » read » loaned_samples;
```

See also

`dds::sub::DataReader::operator >>(bool(*manipulator)(ReadModeDummyType (p. 1868)))`

7.12.2.3 take()

```
bool take (
    dds::sub::ReadModeDummyType )
```

The stream manipulator to indicate that the reader should take samples as opposed to reading the samples.

Usage:

```
reader » take » loaned_samples;
```

The default mode to access samples is to take, so the above is equivalent to:

```
reader » loaned_samples;
```

See also

`dds::sub::DataReader::operator >>(bool(*manipulator)(ReadModeDummyType (p. 1868)))`

7.12.2.4 max_samples()

```
dds::sub::functors::MaxSamplesManipulatorFunctor max_samples (
    uint32_t n ) [inline]
```

Stream manipulator to set the maximum number of samples to read or take.

Use this function to set the maximum number of samples to read/take by passing it to the `DataReader::operator >>(Functor f) (p. 772)` operator.

Parameters

<i>n</i>	The maximum number of samples to take
----------	---------------------------------------

See also

dds::sub::DataReader::operator >>(Functor f) (p. 772)

7.12.2.5 content()

```
dds::sub::functors::ContentFilterManipulatorFunctor content (
    const dds::sub::Query & query ) [inline]
```

Stream manipulator to set a **Query** (p. 1778) to use during the subsequent read/take operation.

The effect of using this manipulator is that the subsequent read/take will filter the samples based on the **Query** (p. 1778)'s expression. If the **DataReader** (p. 756) has no samples that meet the constraints, the read/take will not return any data.

If this stream manipulator comes before a call to the `condition(const dds::sub::cond::QueryCondition& query_condition)` manipulator then it will be overridden and will not have any effect on the read or take operation. Similarly, if this operation follows a call to **condition()** (p. 451), then the previously set `QueryCondition` will be cleared.

Parameters

<i>query</i>	The Query (p. 1778) to use during the read/take
--------------	--

See also

dds::sub::DataReader::operator >>(Functor f) (p. 772)

`dds::sub::condition(const dds::sub::cond::QueryCondition& query_condition)`

7.12.2.6 condition()

```
dds::sub::functors::ConditionManipulatorFunctor condition (
    const dds::sub::cond::ReadCondition & condition ) [inline]
```

Stream manipulator to set a `QueryCondition` to use during the subsequent read/take operation.

The effect of using this manipulator is that the subsequent read/take will filter the samples based on the `Query`↔`Conditions`'s expression and state. If the `DataReader` (p. 756) has no samples that meet the constraints, the read/take will not return any data.

If this stream manipulator comes before a call to the `content(const dds::sub::Query& query)` (p. 451) manipulator then it will be overridden and will not have any effect on the read or take operation. Similarly, if this operation follows a call to `content()` (p. 451) and/or `state(const dds::sub::status::DataState& s)` (p. 452), then the previously set `Query` (p. 1778) and `DataState` will be cleared.

This manipulator is effectively a combination of the `content` and `state` manipulators.

For example:

```
reader » read
      » content(dds::sub::Query(system.reader, "foo = 7"))
      » state(dds::sub::status::DataState::new_data())
      » samples;
```

is equivalent to:

```
reader » read
      » condition(Query(system.reader, "foo = 7"), DataState()::new_data())
      » samples;
```

Parameters

<i>condition</i>	The <code>QueryCondition</code> to use during the read/take
------------------	---

See also

`dds::sub::DataReader::operator >>(Functor f)` (p. 772)

`content(const dds::sub::Query& query)` (p. 451)

Referenced by `dds::sub::DataReader< T >::condition()`, and `dds::sub::cond::ReadCondition::create_read_↔condition_ex()`.

7.12.2.7 state()

```
dds::sub::functors::StateFilterManipulatorFunctor state (
    const dds::sub::status::DataState & s ) [inline]
```

Stream manipulator to specify the `DataState` of the samples that should be read/taken.

By setting the `dds::sub::status::DataState` (p. 888) you can specify the state of the samples that should be read or taken. The `DataState` of a sample encapsulates the `dds::sub::status::SampleState` (p. 2023), `dds::sub::status::↔ViewState` (p. 2315), and `dds::sub::status::InstanceState` (p. 1359) of a sample.

If this stream manipulator comes before a call to the `condition(const dds::sub::cond::QueryCondition& query_condition)` manipulator then it will be overridden and will not have any effect on the read or take operation.

Parameters

<code>s</code>	The DataState of the samples to be read or taken
----------------	--

See also

dds::sub::DataReader::operator >>(Functor f) (p. 772)

7.12.2.8 instance()

```
dds::sub::functors::InstanceManipulatorFunctor instance (
    const dds::core::InstanceHandle & h ) [inline]
```

Stream manipulator to specify the instance whose samples should be read or taken.

This operation causes the subsequent read or take operation to access only samples belonging the single specified instance whose handle is `h`.

Upon successful completion, the data collection will contain samples all belonging to the same instance. The corresponding **SampleInfo** (p. 1992) verifies **SampleInfo.instance_handle()** (p. 1997) == `h`.

The subsequent read/take operation will be semantically equivalent to a read or take without specifying the instance, except in building the collection, the **DataReader** (p. 756) will check that the sample belongs to the specified instance and otherwise it will not place the sample in the returned collection.

The subsequent read/take may operation may fail with **dds::core::InvalidArgumentError** (p. 1363) if the InstanceHandle does not correspond to an existing data-object known to the **DataReader** (p. 756).

Parameters

<code>h</code>	The handle of the instance to access
----------------	--------------------------------------

See also

dds::sub::DataReader::operator >>(Functor f) (p. 772)

7.12.2.9 next_instance()

```
dds::sub::functors::NextInstanceManipulatorFunctor next_instance (
    const dds::core::InstanceHandle & h ) [inline]
```

Stream manipulator to specify the samples belonging to the 'next' instance after the provided instance handle should be accessed.

This operation causes the subsequent read or take operation to access only samples belonging a single instance whose handle is considered 'next' after the provided InstanceHandle `h`.

The accessed samples will all belong to the 'next' instance with InstanceHandle 'greater' than the specified previous handle that has available samples.

This operation implies the existence of a total order 'greater-than' relationship between the instance handles. The specifics of this relationship are not all important and are implementation specific. The important thing is that, according to the middleware, all instances are ordered relative to each other. This ordering is between the instance handles; It should not depend on the state of the instance (e.g. whether it has data or not) and must be defined even for instance handles that do not correspond to instances currently managed by the `dds::sub::DataReader` (p. 756). For the purposes of the ordering, it should be 'as if' each instance handle was represented as unique integer.

The behavior of `dds::sub::DataReader::Selector::next_instance` (p. 2029) is 'as if' the `dds::sub::DataReader` (p. 756) invoked `dds::sub::instance(const dds::core::InstanceHandle& h)` (p. 453), passing the smallest `instance_handle` among all the ones that: (a) are greater than `previous_handle`, and (b) have available samples (i.e. samples that meet the constraints imposed by the specified states).

The special value `dds::core::InstanceHandle::nil()` (p. 1358) is guaranteed to be 'less than' any valid `instance_handle`. So the use of the parameter value `previous_handle == dds::core::InstanceHandle::nil()` (p. 1358) will return the samples for the instance which has the smallest `instance_handle` among all the instances that contain available samples.

Note

The operation `dds::sub::DataReader::Selector::next_instance` (p. 2029) is intended to be used in an application-driven iteration, where the application starts by passing `previous_handle == dds::core::InstanceHandle::nil()` (p. 1358), examines the samples returned, and then uses the `instance_handle` returned in the `dds::sub::SampleInfo` (p. 1992) as the value of the `previous_handle` argument to the next call to `dds::sub::DataReader::Selector::next_instance` (p. 2029). The iteration continues until the read/take operation doesn't return any more samples. This application-driven iteration is required to ensure that all samples on the reader queue are read.

Note that it is possible to call the `dds::sub::DataReader::Selector::next_instance` (p. 2029) operation with a `previous_handle` that does not correspond to an instance currently managed by the `dds::sub::DataReader` (p. 756). This is because as stated earlier the 'greater-than' relationship is defined even for handles not managed by the `dds::sub::DataReader` (p. 756). One practical situation where this may occur is when an application is iterating though all the instances, takes all the samples of a `dds::sub::status::InstanceState::not_alive_no_writers()` (p. 1361) instance, returns the loan (at which point the instance information may be removed, and thus the handle becomes invalid), and tries to read the next instance.

Parameters

<code>h</code>	The reference instance. The instance after this one will be selected
----------------	--

dds::sub::DataReader::operator >>(Functor f) (p. 772)

7.12.2.10 ignore() [1/2]

```
void ignore (
    dds::domain::DomainParticipant & participant,
    const dds::core::InstanceHandle & handle )
```

Instructs RTI Connex to locally ignore a subscription.

A subscription is defined by the association of a topic name, user data, and partition set on the **dds::sub::Subscriber** (p. 2116) (see **dds::topic::SubscriptionBuiltinTopicData** (p. 2133)). After this call, any data received related to that subscription's **dds::sub::DataReader** (p. 756) will be ignored.

This operation can be used to ignore local *and* remote DataReaders.

The subscription to ignore is identified by the `handle` argument.

- To ignore a *remote* **DataReader** (p. 756), the `handle` can be obtained from the **dds::sub::SampleInfo** (p. 1992) retrieved when reading data samples from the built-in **dds::sub::DataReader** (p. 756) for the subscription topic.
- To ignore a *local* **DataReader** (p. 756), the `handle` can be obtained by calling **dds::core::Entity::instance_↔handle()** (p. 1270) for the local **DataReader** (p. 756).

There is no way to reverse this operation.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), dds::core::OutOfResourcesError (p. 1629) or dds::core::NotEnabledError (p. 1601)
------------	--

See also

dds::topic::SubscriptionBuiltinTopicData (p. 2133)

dds::topic::subscription_topic_name() (p. 243)

dds::sub::builtin_subscriber (p. 459)

Parameters

<i>participant</i>	The DomainParticipant for which the remote entity will be ignored
<i>handle</i>	The InstanceHandle of the remote entity that has to be ignored

Referenced by `dds::sub::DataReader< T >::ignore()`.

7.12.2.11 ignore() [2/2]

```
template<typename FwdIterator >
void ignore (
    dds::domain::DomainParticipant & participant,
    FwdIterator begin,
    FwdIterator end )
```

Instructs RTI Connex to locally ignore subscriptions.

Parameters

<i>participant</i>	The DomainParticipant for which the remote entity will be ignored
<i>begin</i>	A forward iterator to the initial position in a <code>dds::core::InstanceHandleSeq</code> (p. 407) holding the handles to the remote DataReaders to be ignored.
<i>end</i>	A forward iterator to the final position in a <code>dds::core::InstanceHandleSeq</code> (p. 407) holding the handles to the remote DataReaders to be ignored.

See also

`ignore(dds::domain::DomainParticipant&, const dds::core::InstanceHandle&)` (p. 455);

7.12.2.12 matched_publications() [1/2]

```
template<typename T >
const ::dds::core::InstanceHandleSeq matched_publications (
    const dds::sub::DataReader< T > & reader )
```

Retrieve the list of publications currently "associated" with a `DataReader` (p. 756).

A publication is considered to be matching if all of the following criteria are true:

- The publication is within the same domain as this subscription.
- The publication has a matching `dds::topic::Topic` (p. 2178).
- The publication has compatible QoS.
- If the applications are using partitions, the publication shares a common partition with this subscription.
- The `dds::domain::DomainParticipant` (p. 1079) has not indicated that the publication's `dds::domain::↔ DomainParticipant` (p. 1079) should be "ignored" by means of the `dds::pub::ignore` (p. 435) API.

- If the subscription is using a `dds::topic::ContentFilteredTopic` (p. 735) and the publication is using the `rti::core::policy::MultiChannel` (p. 1483), there is an intersection between at least one of the associated filters.
- If the endpoints need to exchange key material to communicate (i.e., they are securing their communications), the reader has completed the key exchange with the writer.

The handles returned in the `publication_handles` list are the ones that are used by the RTI Connext implementation to locally identify the corresponding matched `dds::pub::DataWriter` (p. 908) entities. These handles match the ones that appear in the `instance_handle` field of the `dds::sub::SampleInfo` (p. 1992) when reading the `dds::topic::publication_topic_name()` (p. 243) builtin topic.

This API may return the publication handles of publications that are not alive. `dds::sub::DataReader::is_matched_publication_alive` (p. 812) can be used to check the liveness of the remote publication.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), or <code>dds::core::OutOfResourcesError</code> (p. 1629) if the sequence is too small and the system cannot resize it, or <code>dds::core::NotEnabledError</code> (p. 1601)
------------	---

Template Parameters

<i>T</i>	The topic-type that the DataReader (p. 756) subscribes to
----------	--

Parameters

<i>reader</i>	The reader whose publications are being retrieved
---------------	---

Returns

An `InstanceHandleSeq` containing the `InstanceHandles` of the matched publications for the provided **DataReader** (p. 756)

Referenced by `dds::sub::DataReader< T >::matched_publications()`.

7.12.2.13 `matched_publications()` [2/2]

```
template<typename T , typename FwdIterator >
FwdIterator matched_publications (
    const dds::sub::DataReader< T > & reader,
    FwdIterator begin,
    FwdIterator end )
```

Retrieve the list of publications currently "associated" with a **DataReader** (p. 756).

A publication is considered to be matching if all of the following criteria are true:

- The publication is within the same domain as this subscription.
- The publication has a matching **dds::topic::Topic** (p. 2178).
- The publication has compatible QoS.
- If the applications are using partitions, the publication shares a common partition with this subscription.
- The **dds::domain::DomainParticipant** (p. 1079) has not indicated that the publication's **dds::domain::DomainParticipant** (p. 1079) should be "ignored" by means of the **dds::pub::ignore** (p. 435) API.
- If the subscription is using a **dds::topic::ContentFilteredTopic** (p. 735) and the publication is using the **rti::core::policy::MultiChannel** (p. 1483), there is an intersection between at least one of the associated filters.
- If the endpoints need to exchange key material to communicate (i.e., they are securing their communications), the reader has completed the key exchange with the writer.

The handles returned in the `publication_handles` list are the ones that are used by the RTI Connext implementation to locally identify the corresponding matched **dds::pub::DataWriter** (p. 908) entities. These handles match the ones that appear in the `instance_handle` field of the **dds::sub::SampleInfo** (p. 1992) when reading the **dds::topic::publication_topic_name()** (p. 243) builtin topic.

This API may return the publication handles of publications that are not alive. **dds::sub::DataReader::is_matched_publication_alive** (p. 812) can be used to check the liveness of the remote publication.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), or dds::core::OutOfResourcesError (p. 1629) if the sequence is too small and the system cannot resize it, or dds::core::NotEnabledError (p. 1601)
------------	---

Template Parameters

<i>T</i>	The topic-type that the DataReader (p. 756) subscribes to
<i>FwdIterator</i>	A forward iterator whose value type is dds::core::InstanceHandle (p. 1356)

Parameters

<i>reader</i>	The reader whose publications are being retrieved
<i>begin</i>	A forward iterator to the beginning position in the destination container of matching InstanceHandles
<i>end</i>	A forward iterator to the ending position in the destination container of matching InstanceHandles

Returns

An iterator placed at the last position in the container where a InstanceHandle was inserted

7.12.2.14 matched_publication_data()

```
template<typename T >
const dds::topic::PublicationBuiltinTopicData matched_publication_data (
```

```
const dds::sub::DataReader< T > & reader,
const dds::core::InstanceHandle & handle )
```

This operation retrieves the information on a publication that is currently "associated" with the **DataReader** (p. 756).

The `publication_handle` must correspond to a publication currently associated with the **dds::sub::DataReader** (p. 756). Otherwise, the operation will fail with **dds::core::InvalidArgumentError** (p. 1363). Use the operation **dds::sub::matched_publications** (p. 456) to find the publications that are currently matched with the **dds::sub::DataReader** (p. 756).

Note: This operation does not retrieve the **dds::topic::PublicationBuiltinTopicData::type** (p. 1712). This information is available through **dds::sub::DataReaderListener::on_data_available()** (p. 835) (if a reader listener is installed on the `dds::sub::DataReader<dds::topic::PublicationBuiltinTopicData>`).

Exceptions

One	of the Standard Exceptions (p. 228) or dds::core::NotEnabledError (p. 1601)
-----	---

Template Parameters

<i>T</i>	The topic-type that the DataReader (p. 756) subscribes to
----------	--

Parameters

<i>reader</i>	The reader associated with the publication whose data is being retrieved
<i>handle</i>	The InstanceHandle Handle to a specific publication associated with the DataWriter. Must correspond to a publication currently associated with the DataReader (p. 756).

Returns

The **dds::topic::PublicationBuiltinTopicData** (p. 1703) of the publication that is associated with the provided handle

7.12.2.15 builtin_subscriber()

```
dds::sub::Subscriber builtin_subscriber (
    const dds::domain::DomainParticipant & dp )
```

Access the built-in **Subscriber** (p. 2116).

Each **dds::domain::DomainParticipant** (p. 1079) contains several built-in **dds::topic::Topic** (p. 2178) objects as well as corresponding **dds::sub::DataReader** (p. 756) objects to access them. All of these **dds::sub::DataReader** (p. 756) objects belong to a single built-in **dds::sub::Subscriber** (p. 2116).

The built-in Topics are used to communicate information about other **dds::domain::DomainParticipant** (p. 1079), **dds::topic::Topic** (p. 2178), **dds::sub::DataReader** (p. 756), and **dds::pub::DataWriter** (p. 908) objects.

The built-in subscriber is created when this operation is called for the first time. The built-in subscriber is deleted automatically when the **dds::domain::DomainParticipant** (p. 1079) is deleted.

Returns

The built-in **dds::sub::Subscriber** (p. 2116) singleton.

See also

dds::topic::SubscriptionBuiltinTopicData (p. 2133)

dds::topic::PublicationBuiltinTopicData (p. 1703)

dds::topic::ParticipantBuiltinTopicData (p. 1639)

dds::topic::TopicBuiltinTopicData (p. 2197)

Parameters

<i>dp</i>	The DomainParticipant that the built-in subscriber belongs to.
-----------	--

7.12.2.16 find() [1/6]

```
template<typename READER , typename FwdIterator >
uint32_t find (
    const dds::sub::Subscriber & subscriber,
    RTI_STRING_IN topic_name,
    FwdIterator begin,
    uint32_t max_size )
```

This function retrieves a previously-created **DataReader** (p. 756) belonging to the **Subscriber** (p. 2116) that is attached to a Topic with a matching topic name.

Use this operation on the built-in **dds::sub::Subscriber** (p. 2116) (**Built-in Topics** (p. 44)) to access the built-in **dds::sub::DataReader** (p. 756) entities for the built-in topics.

The built-in **dds::sub::DataReader** (p. 756) is created when this operation is called on a built-in topic for the first time. The built-in **dds::sub::DataReader** (p. 756) is deleted automatically when the **dds::domain::DomainParticipant** (p. 1079) is deleted.

To ensure that builtin **dds::sub::DataReader** (p. 756) entities receive all the discovery traffic, it is suggested that you lookup the builtin **dds::sub::DataReader** (p. 756) before the **dds::domain::DomainParticipant** (p. 1079) is enabled. Looking up builtin **dds::sub::DataReader** (p. 756) may implicitly register builtin transports due to creation of **dds::sub::DataReader** (p. 756) (see **Built-in Transport Plugins** (p. 81) for details on when a builtin transport is registered). Therefore, if you are want to modify builtin transport properties, do so *before* using this operation.

Therefore the suggested sequence when looking up builtin DataReaders is:

- Create a disabled **dds::domain::DomainParticipant** (p. 1079).
- (optional) Modify builtin transport properties
- Call **dds::sub::builtin_subscriber()** (p. 459).

- Call `dds::sub::find()` (p. 460).
- Call `enable()` (p. 371) on the `DomainParticipant`.

The returned `dds::sub::DataReader` (p. 756) may be enabled or disabled.

If more than one `dds::sub::DataReader` (p. 756) is attached to the `dds::sub::Subscriber` (p. 2116), this operation may return any one of them.

MT Safety:

UNSAFE. It is not safe to lookup a `dds::sub::DataReader` (p. 756) in one thread while another thread is simultaneously creating or destroying that `dds::sub::DataReader` (p. 756).

Template Parameters

<i>Reader</i>	The type of the reader. It can be <code>dds::sub::AnyDataReader</code> (p. 595), or an instantiation of <code>dds::sub::DataReader<T></code> (if T is not the correct type, this function throws <code>dds::core::InvalidDowncastError</code> (p. 1364))
<i>FwdIterator</i>	The type of forward iterator passed to this function

Parameters

<i>subscriber</i>	The <code>dds::sub::Subscriber</code> (p. 2116) the <code>DataReader</code> (p. 756) belongs to
<i>topic_name</i>	Name of the <code>dds::topic::Topic</code> (p. 2178) associated with the <code>DataReader</code> (p. 756) that is to be looked up.
<i>begin</i>	A forward iterator to the position in the destination container where the <code>DataReaders</code> will be copied into
<i>max_size</i>	Only 1 <code>DataReader</code> (p. 756) will be returned from this function

Returns

The number of `DataReaders` that were found (either 0 or 1)

Referenced by `dds::sub::DataReader< T >::find()`.

7.12.2.17 `find()` [2/6]

```
template<typename READER , typename BinIterator >
uint32_t find (
    const dds::sub::Subscriber & subscriber,
    RTI_STRING_IN topic_name,
    BinIterator begin )
```

This function retrieves a previously-created `DataReader` (p. 756) belonging to the `Subscriber` (p. 2116) that is attached to a `Topic` with a matching topic name.

Use this operation on the built-in **dds::sub::Subscriber** (p. 2116) (**Built-in Topics** (p. 44)) to access the built-in **dds::sub::DataReader** (p. 756) entities for the built-in topics.

The built-in **dds::sub::DataReader** (p. 756) is created when this operation is called on a built-in topic for the first time. The built-in **dds::sub::DataReader** (p. 756) is deleted automatically when the **dds::domain::DomainParticipant** (p. 1079) is deleted.

To ensure that builtin **dds::sub::DataReader** (p. 756) entities receive all the discovery traffic, it is suggested that you lookup the builtin **dds::sub::DataReader** (p. 756) before the **dds::domain::DomainParticipant** (p. 1079) is enabled. Looking up builtin **dds::sub::DataReader** (p. 756) may implicitly register builtin transports due to creation of **dds::sub::DataReader** (p. 756) (see **Built-in Transport Plugins** (p. 81) for details on when a builtin transport is registered). Therefore, if you are want to modify builtin transport properties, do so *before* using this operation.

Therefore the suggested sequence when looking up builtin DataReaders is:

- Create a disabled **dds::domain::DomainParticipant** (p. 1079).
- (optional) Modify builtin transport properties
- Call **dds::sub::builtin_subscriber()** (p. 459).
- Call **dds::sub::find()** (p. 460).
- Call **enable()** (p. 371) on the DomainParticipant.

The returned **dds::sub::DataReader** (p. 756) may be enabled or disabled.

If more than one **dds::sub::DataReader** (p. 756) is attached to the **dds::sub::Subscriber** (p. 2116), this operation may return any one of them.

MT Safety:

UNSAFE. It is not safe to lookup a **dds::sub::DataReader** (p. 756) in one thread while another thread is simultaneously creating or destroying that **dds::sub::DataReader** (p. 756).

Template Parameters

<i>Reader</i>	The type of the reader. It can be dds::sub::AnyDataReader (p. 595), or an instantiation of dds::sub::DataReader<T> (if T is not the correct type, this function throws dds::core::InvalidDowncastError (p. 1364))
<i>BinIterator</i>	The type of back-inserting iterator passed to this function

Parameters

<i>subscriber</i>	The dds::sub::Subscriber (p. 2116) the DataReader (p. 756) belongs to
<i>topic_name</i>	Name of the dds::topic::Topic (p. 2178) associated with the DataReader (p. 756) that is to be looked up.
<i>begin</i>	A back-inserting iterator to the position in the destination container to insert the found DataReader (p. 756) into

Returns

The number of DataReaders that were found (either 0 or 1)

7.12.2.18 find() [3/6]

```
template<typename READER , typename T , typename FwdIterator >
uint32_t find (
    const dds::sub::Subscriber & subscriber,
    const dds::topic::TopicDescription< T > & topic_description,
    FwdIterator begin,
    uint32_t max_size )
```

This function retrieves a previously-created **DataReader** (p. 756) belonging to the **Subscriber** (p. 2116) that is attached to a Topic with a matching TopicDescription.

See also

find(const dds::sub::Subscriber& subscriber,RTI_STRING_IN topic_name,FwdIterator begin,uint32_t max_size) (p. 460)

7.12.2.19 find() [4/6]

```
template<typename READER , typename T , typename BinIterator >
uint32_t find (
    const dds::sub::Subscriber & subscriber,
    const dds::topic::TopicDescription< T > & topic_description,
    BinIterator begin )
```

This function retrieves a previously-created **DataReader** (p. 756) belonging to the **Subscriber** (p. 2116) that is attached to a Topic with a matching TopicDescription.

See also

uint32_t find(const dds::sub::Subscriber& subscriber,RTI_STRING_IN topic_name,BinIterator begin) (p. 461)

7.12.2.20 find() [5/6]

```
template<typename AnyDataReaderFwdIterator >
uint32_t dds::sub::find (
    const dds::sub::Subscriber & subscriber,
    const dds::sub::status::DataState & data_state,
    AnyDataReaderFwdIterator begin,
    uint32_t max_size )
```

Allows the application to access the AnyDataReaders that contain samples with the specified **dds::sub::status::DataState** (p. 888).

Allows the application to access the **dds::sub::DataReader** (p. 756) objects that contain samples with the specified `sample_states`, `view_states` and `instance_states`.

If the application is outside a `begin_access()/end_access()` block, or if the **dds::core::policy::Presentation::access_scope** (p. 1674) of the **dds::sub::Subscriber** (p. 2116) is **dds::core::policy::PresentationAccessScopeKind_def::INSTANCE** (p. 1677) or **dds::core::policy::PresentationAccessScopeKind_def::TOPIC** (p. 1677), or if the **dds::core::policy::Presentation::ordered_access** (p. 1675) of the **dds::sub::Subscriber** (p. 2116) is false, the returned collection is a 'set' containing each **dds::sub::DataReader** (p. 756) at most once, in no specified order.

If the application is within a `begin_access()/end_access()` block, and the **PRESENTATION** (p. 331) policy of the **dds::sub::Subscriber** (p. 2116) is **dds::core::policy::PresentationAccessScopeKind_def::GROUP** (p. 1677) or **dds::core::policy::PresentationAccessScopeKind_def::HIGHEST_OFFERED** (p. 1677), and **dds::core::policy::Presentation::ordered_access** (p. 1675) in the **dds::sub::Subscriber** (p. 2116) is true, the returned collection is a 'list' of DataReaders where a **DataReader** (p. 756) may appear more than one time.

To retrieve the samples in the order they were published across DataWriters of the same group (**dds::pub::Publisher** (p. 1719) configured with **dds::core::policy::PresentationAccessScopeKind_def::GROUP** (p. 1677)), the application should **read()** (p. 449)/**take()** from each **DataReader** (p. 756) in the same order as it appears in the output sequence. The application will move to the next **DataReader** (p. 756) when the **read()** (p. 449)/**take()** operation does not return any data.

- Access to data samples** (p. 61)
- dds::sub::CoherentAccess::CoherentAccess()** (p. 712)
- dds::sub::CoherentAccess::end()** (p. 714)
- PRESENTATION** (p. 331)

Template Parameters

<i>AnyDataReaderFwdIterator</i>	A forward iterator whose <code>value_type</code> is dds::sub::AnyDataReader (p. 595)
---------------------------------	---

Parameters

<i>subscriber</i>	The dds::sub::Subscriber (p. 2116) the DataReaders belong to
<i>data_state</i>	The DataState describing what kinds of samples the returned DataReaders must contain

Parameters

<i>begin</i>	A forward iterator to the position in the destination container where the DataReaders will be copied into. This container should be a container of AnyDataReaders, not typed DataReaders
<i>max_size</i>	The maximum number of DataReaders to return

Returns

The number of DataReaders that were found with a matching DataState

References [begin\(\)](#), [dds::sub::status::DataState::instance_state\(\)](#), [dds::sub::status::DataState::sample_state\(\)](#), and [dds::sub::status::DataState::view_state\(\)](#).

7.12.2.21 find() [6/6]

```
template<typename AnyDataReaderBackInsertIterator >
uint32_t dds::sub::find (
    const dds::sub::Subscriber & subscriber,
    const dds::sub::status::DataState & data_state,
    AnyDataReaderBackInsertIterator begin )
```

Allows the application to access the AnyDataReaders that contain samples with the specified **dds::sub::status::DataState** (p. 888).

Allows the application to access the **dds::sub::DataReader** (p. 756) objects that contain samples with the specified `sample_states`, `view_states` and `instance_states`.

If the application is outside a `begin_access()/end_access()` block, or if the **dds::core::policy::Presentation::access_scope** (p. 1674) of the **dds::sub::Subscriber** (p. 2116) is **dds::core::policy::PresentationAccessScopeKind_def::INSTANCE** (p. 1677) or **dds::core::policy::PresentationAccessScopeKind_def::TOPIC** (p. 1677), or if the **dds::core::policy::Presentation::ordered_access** (p. 1675) of the **dds::sub::Subscriber** (p. 2116) is false, the returned collection is a 'set' containing each **dds::sub::DataReader** (p. 756) at most once, in no specified order.

If the application is within a `begin_access()/end_access()` block, and the **PRESENTATION** (p. 331) policy of the **dds::sub::Subscriber** (p. 2116) is **dds::core::policy::PresentationAccessScopeKind_def::GROUP** (p. 1677) or **dds::core::policy::PresentationAccessScopeKind_def::HIGHEST_OFFERED** (p. 1677), and **dds::core::policy::Presentation::ordered_access** (p. 1675) in the **dds::sub::Subscriber** (p. 2116) is true, the returned collection is a 'list' of DataReaders where a **DataReader** (p. 756) may appear more than one time.

To retrieve the samples in the order they were published across DataWriters of the same group (**dds::pub::Publisher** (p. 1719) configured with **dds::core::policy::PresentationAccessScopeKind_def::GROUP** (p. 1677)), the application should **read()** (p. 449)/**take()** from each **DataReader** (p. 756) in the same order as it appears in the output sequence. The application will move to the next **DataReader** (p. 756) when the **read()** (p. 449)/**take()** operation does not return any data.

See also

Access to data samples (p. 61)

dds::sub::CoherentAccess::CoherentAccess() (p. 712)

dds::sub::CoherentAccess::end() (p. 714)

PRESENTATION (p. 331)

Template Parameters

<i>AnyDataReaderBackInsertIterator</i>	A back-inserting iterator whose <code>value_type</code> is <code>dds::sub::AnyDataReader</code> (p. 595)
--	--

Parameters

<i>subscriber</i>	The <code>dds::sub::Subscriber</code> (p. 2116) the DataReaders belong to
<i>data_state</i>	The DataState describing what kinds of samples the returned DataReaders must contain
<i>begin</i>	A back-inserting iterator to the position in the destination container to insert the found DataReaders into. This container should be a container of AnyDataReaders, not typed DataReaders

Returns

The number of DataReaders that were found with a matching DataState

References `begin()`, `dds::sub::status::DataState::instance_state()`, `dds::sub::status::DataState::sample_↔state()`, and `dds::sub::status::DataState::view_state()`.

7.12.2.22 `move()`

```
template<typename T >
LoanedSamples< T > move (
    LoanedSamples< T > & ls )
```

Creates a new **LoanedSamples** (p. 1406) instance by moving the contents of an existing one.

Note: in <<**C++11**>> (p. 155) you can directly use `std::move`.

The parameter object loses the ownership of the underlying samples and its state is reset as if it was default initialized. This function must be used to move any named **LoanedSamples** (p. 1406) instance (lvalue) in and out of a function by-value. Using this function is not necessary if the original **LoanedSamples** (p. 1406) is an rvalue. Moving is a very efficient operation and is guaranteed to not throw any exception.

Parameters

<i>ls</i>	The LoanedSamples (p. 1406) object that transfers its ownership of the contained samples into the returned object. After this call, <code>ls</code> is empty.
-----------	--

Returns

A new **LoanedSamples** (p. 1406) object, the new loan owner, with the same contents as `ls` had.

See also

LoanedSamples (p. 1406)

Referenced by **dds::sub::LoanedSamples< T >::move()**.

7.12.2.23 begin() [1/2]

```
template<typename T >
LoanedSamples< T >::iterator begin (
    LoanedSamples< T > & ls )
```

7.13 dds::sub::cond Namespace Reference

Contains Conditions specific to DataReaders.

Classes

- class **QueryCondition**
 - <<**reference-type**>> (p. 153) Specialized **ReadCondition** (p. 1858) that allows applications to also specify a filter on the data available in a **dds::sub::DataReader** (p. 756)
- class **ReadCondition**
 - <<**reference-type**>> (p. 153) Condition specifically dedicated to read operations and attached to one **dds::sub::DataReader** (p. 756).

7.13.1 Detailed Description

Contains Conditions specific to DataReaders.

See also

dds::core::cond (p. 415)

7.14 dds::sub::qos Namespace Reference

Contains **DataReaderQos** (p. 848) and **SubscriberQos** (p. 2129).

Classes

- class **DataReaderQos**
 <<value-type>> (p. 152) Container of the QoS policies that a **dds::sub::DataReader** (p. 756) supports
- class **SubscriberQos**
 <<value-type>> (p. 152) Container of the QoS policies that a **dds::sub::Subscriber** (p. 2116) supports

Functions

- std::string **to_string** (const **DataReaderQos** &qos, const **rti::core::QosPrintFormat** &format= **rti::core::QosPrintFormat**())
 <<extension>> (p. 156) Obtains a string representation of the **dds::sub::qos::DataReaderQos** (p. 848)
- std::string **to_string** (const **DataReaderQos** &qos, const **DataReaderQos** &base, const **rti::core::QosPrintFormat** &format= **rti::core::QosPrintFormat**())
 <<extension>> (p. 156) Obtains a string representation of the **dds::sub::qos::DataReaderQos** (p. 848)
- std::string **to_string** (const **DataReaderQos** &qos, const **rti::core::qos_print_all_t** &qos_print_all, const **rti::core::QosPrintFormat** &format= **rti::core::QosPrintFormat**())
 <<extension>> (p. 156) Obtains a string representation of the **dds::sub::qos::DataReaderQos** (p. 848)
- std::ostream & **operator**<< (std::ostream &out, const **rti::sub::qos::DataReaderQos** &qos)
 <<extension>> (p. 156) Prints a **dds::sub::qos::DataReaderQos** (p. 848) to an output stream.
- std::string **to_string** (const **SubscriberQos** &qos, const **rti::core::QosPrintFormat** &format= **rti::core::QosPrintFormat**())
 <<extension>> (p. 156) Obtains a string representation of the **dds::sub::qos::SubscriberQos** (p. 2129)
- std::string **to_string** (const **SubscriberQos** &qos, const **SubscriberQos** &base, const **rti::core::QosPrintFormat** &format= **rti::core::QosPrintFormat**())
 <<extension>> (p. 156) Obtains a string representation of the **dds::sub::qos::SubscriberQos** (p. 2129)
- std::string **to_string** (const **SubscriberQos** &qos, const **rti::core::qos_print_all_t** &qos_print_all, const **rti::core::QosPrintFormat** &format= **rti::core::QosPrintFormat**())
 <<extension>> (p. 156) Obtains a string representation of the **dds::sub::qos::SubscriberQos** (p. 2129)
- std::ostream & **operator**<< (std::ostream &out, const **rti::sub::qos::SubscriberQos** &qos)
 <<extension>> (p. 156) Prints a **dds::sub::qos::SubscriberQos** (p. 2129) to an output stream.

7.14.1 Detailed Description

Contains **DataReaderQos** (p. 848) and **SubscriberQos** (p. 2129).

7.14.2 Function Documentation

7.14.2.1 to_string() [1/6]

```
std::string to_string (  
    const DataReaderQos & qos,  
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() )
```

<<**extension**>> (p. 156) Obtains a string representation of the **dds::sub::qos::DataReaderQos** (p. 848)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>format</i>	The optional print format used to format the output string.

The several `to_string` overloads allow formatting the output and printing only the differences with respect to another Qos object.

```
DataReaderQos qos;
// When no QosPrintFormat is supplied, the default is used. Similarly, since
// no base profile has been specified we will only print the differences
// with respect to the documented default for DataReaderQos
std::string str = to_string(qos);
// In this overload we are specifying the print format used to format the output
// string.
QosPrintFormat format; // ...;
str = to_string(qos, format);
// Here, the differences between qos and base will be included in the output
// string. If the two qos objects are the same, the resulting string will
// be empty.
DataReaderQos base; // ...;
str = to_string(qos, base);
// We could also specify the format at this point
str = to_string(qos, base, format);
// Instead of supplying a base profile, the sentinel value qos_print_all can
// be supplied. This will result in the entire Qos object being printed (as
// opposed to only the differences with respect to a base qos).
str = to_string(qos, qos_print_all);
```

This overload uses the default print format and only prints the differences between qos and the documented default.

Returns

The string representation of the qos

7.14.2.2 `to_string()` [2/6]

```
std::string to_string (
    const DataReaderQos & qos,
    const DataReaderQos & base,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() )
```

<<*extension*>> (p. 156) Obtains a string representation of the `dds::sub::qos::DataReaderQos` (p. 848)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>base</i>	The base qos. Only the differences between base and qos are included in the output string. If you want to print everything within the QoS, use the overload that accepts a <code>rti::core::qos_print_all_t</code> (p. 1746).
<i>format</i>	The optional print format used to format the output string.

This overload prints the differences between qos and base. If no print format is specified, the default will be used.

Returns

The string representation of the qos

7.14.2.3 to_string() [3/6]

```
std::string to_string (
    const DataReaderQos & qos,
    const rti::core::qos_print_all_t & qos_print_all,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() )
```

<<**extension**>> (p. 156) Obtains a string representation of the **dds::sub::qos::DataReaderQos** (p. 848)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>qos_print_all</i>	The sentinel value indicating that the entire QoS should be converted to a string. The other overloads of this API only print the differences with respect to a base profile, or to the documented default.
<i>format</i>	The optional print format used to format the output string.

This overload prints all of the policies within qos. If no print format is specified, the default will be used.

The only valid value for the qos_print_all argument is **rti::core::qos_print_all** (p. 238)

For example:

```
to_string(qos, rti::core::qos_print_all);
```

Returns

The string representation of the qos

7.14.2.4 operator<<() [1/2]

```
std::ostream & operator<< (
    std::ostream & out,
    const rti::sub::qos::DataReaderQos & qos ) [inline]
```

<<**extension**>> (p. 156) Prints a **dds::sub::qos::DataReaderQos** (p. 848) to an output stream.

7.14.2.5 to_string() [4/6]

```
std::string to_string (
    const SubscriberQos & qos,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() )
```

<<**extension**>> (p. 156) Obtains a string representation of the **dds::sub::qos::SubscriberQos** (p. 2129)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>format</i>	The optional print format used to format the output string.

The several `to_string` overloads allow formatting the output and printing only the differences with respect to another Qos object.

```
SubscriberQos qos;
// When no QosPrintFormat is supplied, the default is used. Similarly, since
// no base profile has been specified we will only print the differences
// with respect to the documented default for SubscriberQos
std::string str = to_string(qos);
// In this overload we are specifying the print format used to format the output
// string.
QosPrintFormat format; // ...;
str = to_string(qos, format);
// Here, the differences between qos and base will be included in the output
// string. If the two qos objects are the same, the resulting string will
// be empty.
SubscriberQos base; // ...;
str = to_string(qos, base);
// We could also specify the format at this point
str = to_string(qos, base, format);
// Instead of supplying a base profile, the sentinel value qos_print_all can
// be supplied. This will result in the entire Qos object being printed (as
// opposed to only the differences with respect to a base qos).
str = to_string(qos, qos_print_all);
```

This overload uses the default print format and only prints the differences between qos and the documented default.

Returns

The string representation of the qos

7.14.2.6 `to_string()` [5/6]

```
std::string to_string (
    const SubscriberQos & qos,
    const SubscriberQos & base,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() )
```

<<*extension*>> (p. 156) Obtains a string representation of the `dds::sub::qos::SubscriberQos` (p. 2129)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>base</i>	The base qos. Only the differences between base and qos are included in the output string. If you want to print everything within the QoS, use the overload that accepts a <code>rti::core::qos_print_all_t</code> (p. 1746).
<i>format</i>	The optional print format used to format the output string.

This overload prints the differences between qos and base. If no print format is specified, the default will be used.

Returns

The string representation of the qos

7.14.2.7 to_string() [6/6]

```
std::string to_string (
    const SubscriberQos & qos,
    const rti::core::qos_print_all_t & qos_print_all,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() )
```

<<**extension**>> (p. 156) Obtains a string representation of the **dds::sub::qos::SubscriberQos** (p. 2129)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>qos_print_all</i>	The sentinel value indicating that the entire QoS should be converted to a string. The other overloads of this API only print the differences with respect to a base profile, or to the documented default.
<i>format</i>	The optional print format used to format the output string.

This overload prints all of the policies within qos. If no print format is specified, the default will be used.

The only valid value for the qos_print_all argument is **rti::core::qos_print_all** (p. 238)

For example:

```
to_string(qos, rti::core::qos_print_all);
```

Returns

The string representation of the qos

7.14.2.8 operator<<() [2/2]

```
std::ostream & operator<< (
    std::ostream & out,
    const rti::sub::qos::SubscriberQos & qos ) [inline]
```

<<**extension**>> (p. 156) Prints a **dds::sub::qos::SubscriberQos** (p. 2129) to an output stream.

7.15 dds::sub::status Namespace Reference

Contains **DataState** (p. 888).

Classes

- class **DataState**

The **DataState** (p. 888) class describes the state of a sample and includes the information about the sample's **InstanceState** (p. 1359), **ViewState** (p. 2315), and **SampleState** (p. 2023).

- class **InstanceState**

Indicates if the samples are from a live **dds::pub::DataWriter** (p. 908) or not.

- class **SampleState**

Indicates whether or not a sample has ever been read.

- class **ViewState**

Indicates whether or not an instance is new.

Functions

- `std::ostream & operator<< (std::ostream &os, const SampleState &s)`

Prints a sample state as a readable string.

- `std::ostream & operator<< (std::ostream &os, const ViewState &s)`

Prints a view state as a readable string.

- `std::ostream & operator<< (std::ostream &os, const InstanceState &s)`

Prints an instance state as a readable string.

- `std::ostream & operator<< (std::ostream &os, const DataState &s)`

Prints a data state as a readable string.

7.15.1 Detailed Description

Contains **DataState** (p. 888).

7.15.2 Function Documentation

7.15.2.1 `operator<<()` [1/4]

```
std::ostream & operator<< (  
    std::ostream & os,  
    const SampleState & s )
```

Prints a sample state as a readable string.

7.15.2.2 operator<<() [2/4]

```
std::ostream & operator<< (
    std::ostream & os,
    const ViewState & s )
```

Prints a view state as a readable string.

7.15.2.3 operator<<() [3/4]

```
std::ostream & operator<< (
    std::ostream & os,
    const InstanceState & s )
```

Prints an instance state as a readable string.

7.15.2.4 operator<<() [4/4]

```
std::ostream & operator<< (
    std::ostream & os,
    const DataState & s )
```

Prints a data state as a readable string.

7.16 dds::topic Namespace Reference

Contains topic related classes and functions, the built-in topics and topic traits used by IDL-generated types.

Namespaces

- namespace **qos**

*Contains **TopicQos** (p. 2213).*

Classes

- class **AnyTopic**
 <<reference-type>> (p. 153) This class provides an non-template holder for representing a **Topic** (p. 2178) of any type
- class **BuiltinTopicKey**
 The key of the built-in topics.
- class **ContentFilteredTopic**
 <<reference-type>> (p. 153) Specialization of **TopicDescription** (p. 2207) that allows for content-based subscriptions.
- class **Filter**
 Defines the filter to create a **ContentFilteredTopic** (p. 735).
- struct **is_topic_type**
 Trait that indicates if a type is suitable to be the type of a **dds::topic::Topic** (p. 2178).
- class **NoOpTopicListener**
 A convenience implementation of **TopicListener** (p. 2212) where all methods are overridden to do nothing.
- class **ParticipantBuiltinTopicData**
 Entry created when a **dds::domain::DomainParticipant** (p. 1079) is discovered.
- class **PublicationBuiltinTopicData**
 Entry created when a **dds::pub::DataWriter** (p. 908) is discovered in association with its **dds::pub::Publisher** (p. 1719).
- class **SubscriptionBuiltinTopicData**
 Entry created when a **dds::sub::DataReader** (p. 756) is discovered in association with its **dds::sub::Subscriber** (p. 2116).
- class **Topic**
 <<reference-type>> (p. 153) **Topic** (p. 2178) is the most basic description of the data to be published and subscribed.
- struct **topic_type_name**
 Provides the name of a topic-type.
- struct **topic_type_support**
 Provides convenience operations for a topic-type.
- class **TopicBuiltinTopicData**
 Entry created when a **dds::topic::Topic** (p. 2178) object is discovered.
- class **TopicDescription**
 Abstract base class of **Topic** (p. 2178) and **ContentFilteredTopic** (p. 735).
- class **TopicInstance**
 Encapsulates a sample and its associated instance handle.
- class **TopicListener**
 The listener to notify status changes for a **dds::topic::Topic** (p. 2178).

Functions

- template<typename T >
Topic< T > **get** (const **AnyTopic** &any_topic)
 Same as **AnyTopic::get()** (p. 615)
- template<typename FwdIterator >
 int32_t **discover_any_topic** (const **dds::domain::DomainParticipant** &participant, FwdIterator begin, int32_t max_size)
 Retrieves the topics discovered in a **DomainParticipant**.
- template<typename BinIterator >
 int32_t **discover_any_topic** (const **dds::domain::DomainParticipant** &participant, BinIterator begin)

Retrieves the topics discovered in a DomainParticipant.

- **dds::topic::TopicBuiltinTopicData discover_topic_data** (const **dds::domain::DomainParticipant** &participant, const **dds::core::InstanceHandle** &topic_handle)

Gets the information about a discovered topic.

- template<typename FwdIterator >
int32_t **discover_topic_data** (const **dds::domain::DomainParticipant** &participant, FwdIterator begin, const **dds::core::InstanceHandleSeq** &handles)

Gets the information about several topics.

- template<typename FwdIterator >
int32_t **discover_topic_data** (const **dds::domain::DomainParticipant** &participant, FwdIterator begin, int32_t max_size)

Gets the information about all topics.

- template<typename BinIterator >
int32_t **discover_topic_data** (const **dds::domain::DomainParticipant** &participant, BinIterator begin)

Gets the information about all topics.

- void **ignore** (**dds::domain::DomainParticipant** &participant, const **dds::core::InstanceHandle** &handle)

Instructs a DomainParticipant to ignore a topic.

- template<typename FwdIterator >
void **ignore** (**dds::domain::DomainParticipant** &participant, FwdIterator begin, FwdIterator end)

Ignores a range of topics.

- template<typename TOPIC >
TOPIC **find** (const **dds::domain::DomainParticipant** &participant, const std::string &topic_name)

*Looks up a **Topic** (p. 2178) from a DomainParticipant.*

- std::string **participant_topic_name** ()

Participant builtin topic name.

- std::string **topic_topic_name** ()

***Topic** (p. 2178) topic name.*

- std::string **publication_topic_name** ()

Publication topic name.

- std::string **subscription_topic_name** ()

Subscription topic name.

7.16.1 Detailed Description

Contains topic related classes and functions, the built-in topics and topic traits used by IDL-generated types.

7.16.2 Function Documentation

7.16.2.1 get()

```
template<typename T >
Topic< T > get (
    const AnyTopic & any_topic )
```

Same as **AnyTopic::get()** (p. 615)

7.16.2.2 `discover_any_topic()` [1/2]

```
template<typename FwdIterator >
int32_t discover_any_topic (
    const dds::domain::DomainParticipant & participant,
    FwdIterator begin,
    int32_t max_size )
```

Retrieves the topics discovered in a `DomainParticipant`.

Template Parameters

<i>FwdIterator</i>	A forward iterator whose value type is <code>dds::core::InstanceHandle</code> (p. 1356)
--------------------	---

Parameters

<i>participant</i>	The <code>DomainParticipant</code> where to look up the discovered topics
<i>begin</i>	The beginning of the range where to insert the <code>InstanceHandles</code> that correspond to the discovered topics
<i>max_size</i>	The maximum number of topics to insert or <code>dds::core::LENGTH_UNLIMITED</code> (p. 238)

Referenced by `dds::topic::Topic< T >::discover_any_topic()`.

7.16.2.3 `discover_any_topic()` [2/2]

```
template<typename BinIterator >
int32_t discover_any_topic (
    const dds::domain::DomainParticipant & participant,
    BinIterator begin )
```

Retrieves the topics discovered in a `DomainParticipant`.

This is equivalent to `discover_any_topic(participant, begin, dds::core::LENGTH_UNLIMITED)`

7.16.2.4 `discover_topic_data()` [1/4]

```
dds::topic::TopicBuiltinTopicData dds::topic::discover_topic_data (
    const dds::domain::DomainParticipant & participant,
    const dds::core::InstanceHandle & topic_handle )
```

Gets the information about a discovered topic.

Returns `dds::topic::TopicBuiltinTopicData` (p. 2197) for the specified `dds::topic::Topic` (p. 2178).

This operation retrieves information on a `dds::topic::Topic` (p. 2178) that has been discovered by the local `Participant` and must not have been "ignored" by means of the `dds::topic::ignore()` (p. 481) operation.

The `topic_handle` must correspond to such a topic. Otherwise, the operation will fail with `dds::core::PreconditionNotMetError` (p. 1669).

This call is not supported for remote topics. If a remote `topic_handle` is used, the operation will fail with `dds::core::UnsupportedError` (p. 2291).

Use the operation `dds::topic::discover_any_topic()` (p. 478) to find the topics that are currently discovered.

Parameters

<i>participant</i>	The DomainParticipant where to look up the topic information
<i>topic_handle</i>	<< <i>in</i> >> (p. 157) dds::core::InstanceHandle (p. 1356) of dds::topic::Topic (p. 2178).

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), dds::core::PreconditionNotMetError (p. 1669) or dds::core::NotEnabledError (p. 1601)
------------	--

dds::topic::TopicBuiltinTopicData (p. 2197)

dds::topic::discover_any_topic() (p. 478)

Referenced by **dds::topic::Topic< T >::discover_topic_data()**.

7.16.2.5 discover_topic_data() [2/4]

```
template<typename FwdIterator >
int32_t discover_topic_data (
    const dds::domain::DomainParticipant & participant,
    FwdIterator begin,
    const dds::core::InstanceHandleSeq & handles )
```

Gets the information about several topics.

7.16.2.6 discover_topic_data() [3/4]

```
template<typename FwdIterator >
int32_t discover_topic_data (
    const dds::domain::DomainParticipant & participant,
    FwdIterator begin,
    int32_t max_size )
```

Gets the information about all topics.

Template Parameters

<i>A</i>	forward iterator whose value type is dds::topic::TopicBuiltinTopicData (p. 2197)
----------	---

Parameters

<i>participant</i>	The DomainParticipant where to look up all the topics
<i>begin</i>	The beginning of a range where to copy the topic data
<i>max_size</i>	The maximum number of items to copy or <code>dds::core::LENGTH_UNLIMITED</code> (p. 238)

7.16.2.7 discover_topic_data() [4/4]

```
template<typename BinIterator >
int32_t discover_topic_data (
    const dds::domain::DomainParticipant & participant,
    BinIterator begin )
```

Gets the information about all topics.

7.16.2.8 ignore() [1/2]

```
void ignore (
    dds::domain::DomainParticipant & participant,
    const dds::core::InstanceHandle & handle )
```

Instructs a DomainParticipant to ignore a topic.

Instructs RTI Connext to locally ignore a `dds::topic::Topic` (p. 2178).

This means it will locally ignore any publication, or subscription to the `dds::topic::Topic` (p. 2178).

There is no way to reverse this operation.

This operation can be used to save local resources when the application knows that it will never publish or subscribe to data under certain topics.

The `dds::topic::Topic` (p. 2178) to ignore is identified by the `handle` argument. This is the handle of a `dds::topic::Topic` (p. 2178) that appears in the `dds::sub::SampleInfo` (p. 1992) retrieved when reading data samples from the built-in `dds::sub::DataReader` (p. 756) for the `dds::topic::Topic` (p. 2178).

Parameters

<i>participant</i>	The DomainParticipant where to ignore the topic
<i>handle</i>	<code><<in>></code> (p. 157) Handle of the <code>dds::topic::Topic</code> (p. 2178) to be ignored.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), dds::core::OutOfResourcesError (p. 1629) or dds::core::NotEnabledError (p. 1601)
------------	--

See also

dds::topic::TopicBuiltinTopicData (p. 2197)

dds::topic::topic_topic_name() (p. 242)

dds::sub::builtin_subscriber (p. 459)

Referenced by **dds::topic::Topic< T >::ignore()**.

7.16.2.9 ignore() [2/2]

```
template<typename FwdIterator >
void ignore (
    dds::domain::DomainParticipant & participant,
    FwdIterator begin,
    FwdIterator end )
```

Ignores a range of topics.

See also

ignore(dds::domain::DomainParticipant&, const dds::core::InstanceHandle&) (p. 481)

7.16.2.10 find()

```
template<typename TOPIC >
TOPIC find (
    const dds::domain::DomainParticipant & participant,
    const std::string & topic_name )
```

Looks up a **Topic** (p. 2178) from a DomainParticipant.

Template Parameters

<i>TOPIC</i>	<p>The topic to find; it can be one of the following:</p> <ul style="list-style-type: none"> • A typed TopicDescription (p. 2207), such as <code>dds::topic::TopicDescription<Foo></code>, • A typed Topic (p. 2178), such as <code>dds::topic::Topic<Foo></code> • A typed ContentFilteredTopic (p. 735), such as <code>dds::topic::ContentFilteredTopic<Foo></code> • dds::topic::AnyTopic (p. 612)
--------------	---

Parameters

<i>participant</i>	The DomainParticipant that contains the Topic (p. 2178)
<i>topic_name</i>	The topic name

Returns

A reference to an existing **Topic** (p. 2178) in this participant or an empty reference (i.e. equals to **dds::core::null** (p. 238)) if it doesn't exist.

Exceptions

dds::core::InvalidDowncastError (p. 1364)	If the concrete type of the topic description identified by <code>topic_name</code> is not <code>TOPIC</code> . For example, if the <code>topic_name</code> identifies a topic of type <code>Bar</code> , but the template parameter was <code>dds::topic::Topic<Foo></code> .
--	--

The participant doesn't need to be enabled. The returned topic may be enabled or disabled.

7.17 dds::topic::qos Namespace Reference

Contains **TopicQos** (p. 2213).

Classes

- class **TopicQos**

<< *value-type* >> (p. 152) Container of the QoS policies that a **dds::topic::Topic** (p. 2178) supports

Functions

- `std::string to_string` (const `TopicQos` &qos, const `rti::core::QosPrintFormat` &format= `rti::core::QosPrintFormat()`)
 <<*extension*>> (p. 156) Obtains a string representation of the `dds::topic::qos::TopicQos` (p. 2213)
- `std::string to_string` (const `TopicQos` &qos, const `TopicQos` &base, const `rti::core::QosPrintFormat` &format= `rti::core::QosPrintFormat()`)
 <<*extension*>> (p. 156) Obtains a string representation of the `dds::topic::qos::TopicQos` (p. 2213)
- `std::string to_string` (const `TopicQos` &qos, const `rti::core::qos_print_all_t` &qos_print_all, const `rti::core::QosPrintFormat` &format= `rti::core::QosPrintFormat()`)
 <<*extension*>> (p. 156) Obtains a string representation of the `dds::topic::qos::TopicQos` (p. 2213)
- `std::ostream & operator<<` (std::ostream &out, const `rti::topic::qos::TopicQos` &qos)
 <<*extension*>> (p. 156) Prints a `dds::topic::qos::TopicQos` (p. 2213) to an output stream.

7.17.1 Detailed Description

Contains `TopicQos` (p. 2213).

7.17.2 Function Documentation

7.17.2.1 to_string() [1/3]

```
std::string to_string (
    const TopicQos & qos,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() )
```

<<*extension*>> (p. 156) Obtains a string representation of the `dds::topic::qos::TopicQos` (p. 2213)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>format</i>	The optional print format used to format the output string.

The several `to_string` overloads allow formatting the output and printing only the differences with respect to another Qos object.

```
TopicQos qos;
// When no QosPrintFormat is supplied, the default is used. Similarly, since
// no base profile has been specified we will only print the differences
// with respect to the documented default for TopicQos
std::string str = to_string(qos);
// In this overload we are specifying the print format used to format the output
// string.
QosPrintFormat format; // ...;
str = to_string(qos, format);
// Here, the differences between qos and base will be included in the output
// string. If the two qos objects are the same, the resulting string will
// be empty.
```

```

TopicQos base; // ...;
str = to_string(qos, base);
// We could also specify the format at this point
str = to_string(qos, base, format);
// Instead of supplying a base profile, the sentinel value qos_print_all can
// be supplied. This will result in the entire QoS object being printed (as
// opposed to only the differences with respect to a base qos).
str = to_string(qos, qos_print_all);

```

This overload uses the default print format and only prints the differences between qos and the documented default.

Returns

The string representation of the qos

7.17.2.2 to_string() [2/3]

```

std::string to_string (
    const TopicQos & qos,
    const TopicQos & base,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() )

```

<<**extension**>> (p. 156) Obtains a string representation of the **dds::topic::qos::TopicQos** (p. 2213)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>base</i>	The base qos. Only the differences between base and qos are included in the output string. If you want to print everything within the QoS, use the overload that accepts a rti::core::qos_print_all_t (p. 1746).
<i>format</i>	The optional print format used to format the output string.

This overload prints the differences between qos and base. If no print format is specified, the default will be used.

Returns

The string representation of the qos

7.17.2.3 to_string() [3/3]

```

std::string to_string (
    const TopicQos & qos,
    const rti::core::qos_print_all_t & qos_print_all,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() )

```

<<**extension**>> (p. 156) Obtains a string representation of the **dds::topic::qos::TopicQos** (p. 2213)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>qos_print_all</i>	The sentinel value indicating that the entire QoS should be converted to a string. The other overloads of this API only print the differences with respect to a base profile, or to the documented default.
<i>format</i>	The optional print format used to format the output string.

This overload prints all of the policies within qos. If no print format is specified, the default will be used.

The only valid value for the qos_print_all argument is `rti::core::qos_print_all` (p. 238)

For example:

```
to_string(qos, rti::core::qos_print_all);
```

Returns

The string representation of the qos

7.17.2.4 operator<<()

```
std::ostream & operator<< (
    std::ostream & out,
    const rti::topic::qos::TopicQos & qos ) [inline]
```

<<*extension*>> (p. 156) Prints a `dds::topic::qos::TopicQos` (p. 2213) to an output stream.

7.18 rti Namespace Reference

<<*extension*>> (p. 156) The namespace that contains the extension types and functions to the DDS standard.

Namespaces

- namespace **all**
 - <<*extension*>> (p. 156) A single namespace where all symbols are included.
- namespace **config**
 - <<*extension*>> (p. 156) Logging configuration and version information.
- namespace **core**
 - <<*extension*>> (p. 156) Extensions to `dds::core` (p. 404)
- namespace **domain**
 - <<*extension*>> (p. 156) Extensions to `dds::domain` (p. 422)
- namespace **flat**
 - <<*extension*>> (p. 156) Support for *FlatData Topic-Types* (p. 219)
- namespace **pub**
 - <<*extension*>> (p. 156) Extensions to `dds::pub` (p. 433)
- namespace **sub**
 - <<*extension*>> (p. 156) Extensions to `dds::sub` (p. 446)
- namespace **topic**
 - <<*extension*>> (p. 156) Extensions to `dds::topic` (p. 476)
- namespace **util**
 - <<*extension*>> (p. 156) Contains general-purpose utilities

7.18.1 Detailed Description

<<**extension**>> (p. 156) The namespace that contains the extension types and functions to the DDS standard.

The rti namespace mirrors the structure of the dds namespace with the same sub-namespaces and two more: **rti::config** (p. 487) and **rti::util** (p. 564).

7.19 rti::all Namespace Reference

<<**extension**>> (p. 156) A single namespace where all symbols are included.

7.19.1 Detailed Description

<<**extension**>> (p. 156) A single namespace where all symbols are included.

This is similar to **dds::all** (p. 403) but it also includes the extension symbols. This namespace is defined in "rti/rti.hpp".

See also

dds::all (p. 403)

7.20 rti::config Namespace Reference

<<**extension**>> (p. 156) Logging configuration and version information.

Classes

- class **LibraryVersion**
 <<**extension**>> (p. 156) <<**value-type**>> (p. 152) *The version of a single library shipped as part of an RTI Connex distribution.*
- struct **LogCategory_def**
 *The definition of the **dds::core::safe_enum** (p. 1972) LogCategory.*
- class **Logger**
 The singleton type used to configure RTI Connex logging.
- struct **LogLevel_def**
 *The definition of the **dds::core::safe_enum** (p. 1972) LogLevel;.*
- struct **LogMessage**
 A log message, including the text and additional information.
- struct **PrintFormat_def**
 *The definition of the **dds::core::safe_enum** (p. 1972) PrintFormat.*
- class **ScopedLoggerVerbosity**
 Changes the logger verbosity temporarily during the scope of a variable.
- struct **Verbosity_def**
 *The definition of the **dds::core::safe_enum** (p. 1972) Verbosity.*

Typedefs

- typedef **dds::core::safe_enum**< **LogLevel_def** > **LogLevel**
The log level at which RTI Connex diagnostic information is logged.
- typedef **dds::core::safe_enum**< **Verbosity_def** > **Verbosity**
The verbosity at which RTI Connex diagnostic information is logged.
- typedef **dds::core::safe_enum**< **LogCategory_def** > **LogCategory**
Categories of logged messages.
- typedef **dds::core::safe_enum**< **PrintFormat_def** > **PrintFormat**
The format used to output RTI Connex diagnostic information.

Enumerations

- enum class **SyslogLevel** {
SyslogLevel::emergency ,
SyslogLevel::alert ,
SyslogLevel::critical ,
SyslogLevel::error ,
SyslogLevel::warning ,
SyslogLevel::notice ,
SyslogLevel::informational ,
SyslogLevel::debug }
- enum class **SyslogVerbosity** {
SyslogVerbosity::silent ,
SyslogVerbosity::emergency ,
SyslogVerbosity::alert ,
SyslogVerbosity::critical ,
SyslogVerbosity::error ,
SyslogVerbosity::warning ,
SyslogVerbosity::notice ,
SyslogVerbosity::informational ,
SyslogVerbosity::debug }
- enum class **LogFacility** {
LogFacility::user ,
LogFacility::security_event ,
LogFacility::service ,
LogFacility::middleware }

Functions

- XMQCPP2DIIExport **rti::core::ProductVersion request_reply_api_version** ()
Get the version of the C++ API library.
- XMQCPP2DIIExport **std::string request_reply_build_number** ()
Get the build number of the C++ API library.
- **LibraryVersion core_version** ()
Get the version of the core library.
- **std::string core_build_number** ()
Get the build number of the core library.
- **LibraryVersion c_api_version** ()

Get the version of the C API library.

- `std::string c_build_number ()`

Get the build number of the C API library.

- **LibraryVersion** `cpp_api_version ()`

Get the version of the C++ API library.

- `std::string cpp_build_number ()`

Get the build number of the C++ API library.

- **rti::core::ProductVersion** `product_version ()`

Get the RTI Connex product version.

7.20.1 Detailed Description

<<*extension*>> (p. 156) Logging configuration and version information.

7.21 rti::core Namespace Reference

<<*extension*>> (p. 156) Extensions to **dds::core** (p. 404)

Namespaces

Classes

- class **AllocationSettings**
 - <<*extension*>> (p. 156) Resource allocation settings
- class **bounded_sequence**
 - <<*value-type*>> (p. 152) A bounded sequence of elements
- class **ChannelSettings**
 - <<*extension*>> (p. 156) Configures the properties of a channel in **rti::core::policy::MultiChannel** (p. 1483)
- class **CoherentSetInfo**
 - <<*extension*>> (p. 156) <<*value-type*>> (p. 152) A **CoherentSampleInfo** provides information about the coherent set associated with a sample.
- class **CompressionIdMask**
 - <<*extension*>> (p. 156) Mask that specifies which built-in compression method to used.
- class **CompressionSettings**
 - <<*extension*>> (p. 156) Compression Settings
- class **ContentFilterProperty**
 - <<*extension*>> (p. 156) <<*value-type*>> (p. 152) Provides all the required information to enable content filtering.
- class **Cookie**

Unique identifier for a written data sample in the form of a sequence of bytes.

- class **DataReaderResourceLimitsInstanceReplacementSettings**
 <<extension>> (p. 156) *How instances are replaced in the DataReader queue when resource limits are reached.*
- class **DataWriterShmemRefTransferModeSettings**
 <<extension>> (p. 156) *Configures aspects of the shared memory reference transfer mode related to a DataWriter*
- class **EndpointGroup**
 <<extension>> (p. 156) *Specifies a group of endpoints that can be collectively identified by a name and satisfied by a quorum.*
- class **Guid**
 <<extension>> (p. 156) <<value-type>> (p. 152) *Class for GUID (Global Unique Identifier) representation*
- class **ListenerBinder**
 <<reference-type>> (p. 153) *Automatically manages the association of an Entity and a **Listener** (p. 1381)*
- class **Locator**
 <<extension>> (p. 156) <<value-type>> (p. 152) *Type used to represent the addressing information needed to send a message to an RTPS Endpoint using one of the supported transports.*
- class **LocatorFilterElement**
 <<extension>> (p. 156) <<value-type>> (p. 152) *Specifies the configuration of an individual channel within a Multi-Channel DataWriter.*
- struct **LocatorKind_def**
*The definition of the **dds::core::safe_enum** (p. 1972) **LocatorKind**.*
- class **LongDouble**
 <<extension>> (p. 156) <<value-type>> (p. 152) *Encapsulates an IDL long double*
- class **MonitoringDedicatedParticipantSettings**
 <<extension>> (p. 156) *Configures the usage of a dedicated **dds::domain::DomainParticipant** (p. 1079) to distribute the RTI Connex application telemetry data.*
- class **MonitoringDistributionSettings**
 <<extension>> (p. 156) *Configures the distribution of telemetry data.*
- class **MonitoringEventDistributionSettings**
 <<extension>> (p. 156) *Configures the distribution of event metrics.*
- class **MonitoringLoggingDistributionSettings**
 <<extension>> (p. 156) *Configures the distribution of log messages.*
- class **MonitoringLoggingForwardingSettings**
 <<extension>> (p. 156) *Configures the forwarding levels of log messages for the different **rti::config::LogFacility** (p. 255).*
- class **MonitoringMetricSelection**
 <<extension>> (p. 156) *Configures event and periodic metrics collection and distribution for a specific set of observable resources.*
- class **MonitoringPeriodicDistributionSettings**
 <<extension>> (p. 156) *Configures the distribution of periodic metrics.*
- class **MonitoringTelemetryData**
 <<extension>> (p. 156) *Configures the telemetry data that will be distributed.*
- class **optional_value**
 <<extension>> (p. 156) *Represents a value that can be initialized or not*
- class **PersistentStorageSettings**
 <<extension>> (p. 156) *Configures the persistent storage settings for durable writer history and durable reader state.*
- class **pointer**
- class **ProductVersion**

- <<*extension*>> (p. 156) <<*value-type*>> (p. 152) Represents the current version of RTI Connext
- class **ProtocolVersion**
 - <<*extension*>> (p. 156) Represents the current version of RTI Connext
- struct **qos_print_all_t**
 - A tag type that selects the *to_string* overload that prints all the values of a QoS object.
- class **QosPrintFormat**
 - <<*extension*>> (p. 156) <<*value-type*>> (p. 152) A collection of attributes used to configure how QoS will be formatted when converted to strings.
- class **QosProviderParams**
 - <<*extension*>> (p. 156) <<*value-type*>> (p. 152) Configure options that control the way that XML documents containing QoS profiles are loaded by a *dds::core::QosProvider* (p. 1752).
- class **Result**
 - A result from an operation that doesn't throw exceptions containing a return code and (if successful) a value.
- class **RtpsReliableReaderProtocol**
 - <<*extension*>> (p. 156) Configures aspects of the RTPS protocol related to a reliable *DataReader*
- class **RtpsWellKnownPorts**
 - <<*extension*>> (p. 156) Configures the mapping of the RTPS well-known ports
- class **SampleFlag**
 - <<*extension*>> (p. 156) A set of flags that can be associated with a sample.
- class **SampleIdentity**
 - <<*extension*>> (p. 156) <<*value-type*>> (p. 152) A **SampleIdentity** (p. 1989) defines a pair (*Virtual Writer Guid* (p. 1340), *SequenceNumber* (p. 2042)) that uniquely identifies a sample within a DDS domain and a *Topic*.
- class **SequenceNumber**
 - <<*extension*>> (p. 156) <<*value-type*>> (p. 152) A class representing the DDS 64-bit Sequence Number
- struct **ServiceRequestId_def**
 - The definition of the *rti::core::safe_enum ServiceRequestId*.
- class **ThreadSettings**
 - <<*extension*>> (p. 156) The properties of a thread of execution.
- struct **ThreadSettingsCpuRotationKind_def**
 - Determines how *rti::core::ThreadSettings::cpu_list* (p. 2156) affects processor affinity for thread-related QoS policies that apply to multiple threads.
- class **ThreadSettingsKindMask**
 - <<*extension*>> (p. 156) A collection of flags used to configure threads of execution
- struct **TransportClassId_def**
 - The definition of the *dds::core::safe_enum* (p. 1972) *TransportClassId*.
- class **TransportInfo**
 - <<*extension*>> (p. 156) <<*value-type*>> (p. 152) Contains the class id and message max size of an installed transport
- class **TransportMulticastSettings**
 - <<*extension*>> (p. 156) Represents a list of multicast locators
- class **TransportUnicastSettings**
 - <<*extension*>> (p. 156) Represents a list of unicast locators
- class **UnregisterThreadOnExit**
 - <<*extension*>> (p. 156) Utility that calls *rti::core::unregister_thread* (p. 237) when leaving scope
- class **VendorId**
 - <<*extension*>> (p. 156) Represents the vendor of the service implementing the RTPS protocol.

Typedefs

- typedef **dds::core::vector**< **EndpointGroup** > **EndpointGroupSeq**
A sequence of *rti::core::EndpointGroup* (p. 1259).
- typedef **dds::core::safe_enum**< **LocatorKind_def** > **LocatorKind**
Safe Enumeration (p. 229) of *LocatorKind_def* (p. 1424)
- typedef std::vector< **TransportUnicastSettings** > **TransportUnicastSettingsSeq**
<<*extension*>> (p. 156) A sequence of *TransportUnicastSettings* (p. 2262)
- typedef std::vector< **TransportMulticastSettings** > **TransportMulticastSettingsSeq**
A sequence of *TransportMulticastSettings* (p. 2252).
- typedef std::vector< **ChannelSettings** > **ChannelSettingsSeq**
<<*extension*>> (p. 156) A sequence of *ChannelSettings* (p. 703)
- typedef std::vector< **MonitoringMetricSelection** > **MonitoringMetricSelectionSeq**
<<*extension*>> (p. 156) A sequence of *rti::core::MonitoringMetricSelection* (p. 1475).
- typedef **dds::core::safe_enum**< **ServiceRequestId_def** > **ServiceRequestId**
Safe Enumeration (p. 229) of *ServiceRequestId_def* (p. 2068)
- typedef **dds::core::safe_enum**< **ThreadSettingsCpuRotationKind_def** > **ThreadSettingsCpuRotationKind**
Safe Enumeration (p. 229) of *ThreadSettingsCpuRotationKind_def* (p. 2158)
- typedef **dds::core::safe_enum**< **TransportClassId_def** > **TransportClassId**
Safe Enumeration (p. 229) of *TransportClassId_def* (p. 2244)
- typedef **dds::core::vector**< **TransportInfo** > **TransportInfoSeq**
A sequence of *TransportInfo* (p. 2245).

Functions

- template<typename T , size_t N>
void **fill_array** (dds::core::array< T, N > &array, const T &value)
- template<typename FinalType , typename ArrayType , size_t N, size_t M>
void **fill_array** (dds::core::array< dds::core::array< ArrayType, N >, M > &multi_array, const FinalType &value)
- template<typename CType , typename T , size_t N, typename InitFunc >
void **initialize_native_array** (dds::core::array< T, N > &array, InitFunc init_func)
- template<typename T , size_t N>
std::ostream & **operator**<< (std::ostream &out, const **bounded_sequence**< T, N > &v)
Print a vector applying << to all of its elements.
- template<typename Entity , typename **Listener** >
ListenerBinder< Entity, **Listener** > **bind_listener** (Entity entity, **Listener** *the_listener, **dds::core::status**<↳
::StatusMask mask)
*Sets the listener and creates a **ListenerBinder** (p. 1384) that automatically resets it when all references go out of scope.*
- template<typename Entity , typename **Listener** >
ListenerBinder< Entity, **Listener** > **bind_listener** (Entity entity, **Listener** *the_listener)
*Sets the listener and creates a **ListenerBinder** (p. 1384) that automatically resets it when all references go out of scope.*
- template<typename Entity , typename **Listener** >
ListenerBinder< Entity, **Listener** > **bind_and_manage_listener** (Entity entity, **Listener** *the_listener, **dds**<↳
::core::status::StatusMask mask)
*Sets the listener and creates a **ListenerBinder** (p. 1384) that automatically resets and deletes it when all references go out of scope.*

- `template<typename Entity , typename Listener >`
ListenerBinder< Entity, Listener > **bind_and_manage_listener** (Entity entity, Listener *the_listener)
*Sets the listener and creates a **ListenerBinder** (p. 1384) that automatically resets and deletes it when all references go out of scope.*
- `template<typename T >`
`std::ostream & operator<< (std::ostream &out, const pointer< T > &ptr)`
- **QosProviderParams default_qos_provider_params** ()
 <<*extension*>> (p. 156) Get the **rti::core::QosProviderParams** (p. 1773) for the default QosProvider
- `void default_qos_provider_params` (const **rti::core::QosProviderParams** ¶ms)
 <<*extension*>> (p. 156) Set the **rti::core::QosProviderParams** (p. 1773) for the default QosProvider
- `void unregister_thread` ()
 <<*extension*>> (p. 156) Releases resources that RTI Connnext keeps for this thread

Variables

- `constexpr int32_t length_auto = -2`
A special value indicating an auto quantity.
- `const int32_t PUBLICATION_PRIORITY_UNDEFINED`
*Initializer value for **rti::core::policy::PublishMode::priority** (p. 1743) and/or **rti::core::ChannelSettings::priority** (p. 706).*
- `const int32_t PUBLICATION_PRIORITY_AUTOMATIC`
*Constant value for **rti::core::policy::PublishMode::priority** (p. 1743) and/or **rti::core::ChannelSettings::priority** (p. 706).*
- `const qos_print_all_t qos_print_all`
Sentinel value that selects the `to_string` overload that prints all of the values of a Qos object.

7.21.1 Detailed Description

<<*extension*>> (p. 156) Extensions to **dds::core** (p. 404)

7.21.2 Typedef Documentation

7.21.2.1 LocatorKind

```
typedef dds::core::safe_enum< LocatorKind_def> rti::core::LocatorKind
```

Safe Enumeration (p. 229) of **LocatorKind_def** (p. 1424)

See also

LocatorKind_def (p. 1424)

7.21.2.2 MonitoringMetricSelectionSeq

```
typedef std::vector< MonitoringMetricSelection> rti::core::MonitoringMetricSelectionSeq
```

<<*extension*>> (p. 156) A sequence of [rti::core::MonitoringMetricSelection](#) (p. 1475).

7.21.2.3 ThreadSettingsCpuRotationKind

```
typedef dds::core::safe_enum< ThreadSettingsCpuRotationKind_def> rti::core::ThreadSettingsCpuRotationKind
```

Safe Enumeration (p. 229) of [ThreadSettingsCpuRotationKind_def](#) (p. 2158)

See also

[ThreadSettingsCpuRotationKind_def](#) (p. 2158)

7.21.2.4 TransportClassId

```
typedef dds::core::safe_enum< TransportClassId_def> rti::core::TransportClassId
```

Safe Enumeration (p. 229) of [TransportClassId_def](#) (p. 2244)

See also

[TransportClassId_def](#) (p. 2244)

7.21.2.5 TransportInfoSeq

```
typedef dds::core::vector< TransportInfo> rti::core::TransportInfoSeq
```

A sequence of [TransportInfo](#) (p. 2245).

7.21.3 Function Documentation

7.21.3.1 fill_array() [1/2]

```
template<typename T , size_t N>
void rti::core::fill_array (
    dds::core::array< T, N > & array,
    const T & value )
```

Initializes all the elements of an array to a value

Referenced by **fill_array()**.

7.21.3.2 fill_array() [2/2]

```
template<typename FinalType , typename ArrayType , size_t N, size_t M>
void rti::core::fill_array (
    dds::core::array< dds::core::array< ArrayType, N >, M > & multi_array,
    const FinalType & value )
```

Initializes all the elements of an array of arbitrary dimensions

References **fill_array()**.

7.21.3.3 initialize_native_array()

```
template<typename CType , typename T , size_t N, typename InitFunc >
void rti::core::initialize_native_array (
    dds::core::array< T, N > & array,
    InitFunc init_func )
```

Initializes all the elements of an array using a C function

7.21.3.4 operator<<() [1/2]

```
template<typename T , size_t N>
std::ostream & rti::core::operator<< (
    std::ostream & out,
    const bounded_sequence< T, N > & v )
```

Print a vector applying << to all of its elements.

7.21.3.5 bind_listener() [1/2]

```
template<typename Entity , typename Listener >
ListenerBinder< Entity, Listener > bind_listener (
    Entity entity,
    Listener * the_listener,
    dds::core::status::StatusMask mask )
```

Sets the listener and creates a **ListenerBinder** (p. 1384) that automatically resets it when all references go out of scope.

[DEPRECATED] The use of **ListenerBinder** (p. 1384) is no longer required as long as the a `std::shared_ptr` is used to set an Entity's listener.

The **ListenerBinder** (p. 1384) created from this function does not delete the listener, it simply sets the listener back to NULL in the Entity. The application is responsible for the life-cycle of the listener.

To also delete the listener when all references go out of scope, see **bind_and_manage_listener()** (p. 496).

```
MyListener my_listener;
dds::sub::DataReader<Foo> reader(subscriber, topic);
// reader will have no listener after scoped_listener (and any other
// references created from scoped_listener) go out of scope--note that
// my_listener is a stack variable so scoped_listener should not delete it
auto scoped_listener = bind_listener(
    reader, &my_listener, dds::core::status::StatusMask::data_available());
```

7.21.3.6 bind_listener() [2/2]

```
template<typename Entity , typename Listener >
ListenerBinder< Entity, Listener > bind_listener (
    Entity entity,
    Listener * the_listener )
```

Sets the listener and creates a **ListenerBinder** (p. 1384) that automatically resets it when all references go out of scope.

[DEPRECATED] The use of **ListenerBinder** (p. 1384) is no longer required as long as the a `std::shared_ptr` is used to set an Entity's listener.

This overload works for listeners that don't use a mask

See also

bind_listener(Entity, Listener*, dds::core::status::StatusMask) (p. 495)

7.21.3.7 bind_and_manage_listener() [1/2]

```
template<typename Entity , typename Listener >
ListenerBinder< Entity, Listener > bind_and_manage_listener (
    Entity entity,
    Listener * the_listener,
    dds::core::status::StatusMask mask )
```

Sets the listener and creates a **ListenerBinder** (p. 1384) that automatically resets and deletes it when all references go out of scope.

[DEPRECATED] The use of **ListenerBinder** (p. 1384) is no longer required as long as the a `std::shared_ptr` is used to set an Entity's listener.

Example:

```
dds::sub::DataReader<Foo> reader(subscriber, topic);
// The instance of MyListener we are creating and attaching to reader will be
// unset and deleted when scoped_listener (and any other references create
// from
// scoped_listener) go out of scope
auto scoped_listener = bind_and_manage_listener(
    reader, new MyListener(),
    dds::core::status::StatusMask::data_available());
```

See also

bind_listener() (p. 495)

7.21.3.8 bind_and_manage_listener() [2/2]

```
template<typename Entity , typename Listener >
ListenerBinder< Entity, Listener > bind_and_manage_listener (
    Entity entity,
    Listener * the_listener )
```

Sets the listener and creates a **ListenerBinder** (p. 1384) that automatically resets and deletes it when all references go out of scope.

[DEPRECATED] The use of **ListenerBinder** (p. 1384) is no longer required as long as the a `std::shared_ptr` is used to set an Entity's listener.

This overload works for listeners that don't use a mask

See also

bind_and_manage_listener(Entity, Listener*, dds::core::status::StatusMask) (p. 496)

7.21.3.9 operator<<() [2/2]

```
template<typename T >
std::ostream & rti::core::operator<< (
    std::ostream & out,
    const pointer< T > & ptr )
```

Write pointer contents or the string "NULL"

References **dds::core::null**.

7.21.3.10 default_qos_provider_params() [1/2]

```
QosProviderParams rti::core::default_qos_provider_params ( )
```

<<**extension**>> (p. 156) Get the **rti::core::QosProviderParams** (p. 1773) for the default QosProvider

Note

This is a standalone function in the namespace **rti::core** (p. 489)

Returns

rti::core::QosProviderParams (p. 1773)

7.21.3.11 default_qos_provider_params() [2/2]

```
void rti::core::default_qos_provider_params (
    const rti::core::QosProviderParams & params )
```

<<**extension**>> (p. 156) Set the **rti::core::QosProviderParams** (p. 1773) for the default QosProvider

Note

This is a standalone function in the namespace **rti::core** (p. 489)

Use this function to configure the profiles that **dds::core::QosProvider::Default()** (p. 1761) loads.

```
rti::core::QosProviderParams params;
params.url_profile({"my_profiles.xml"});
rti::core::default_qos_provider_params(params);
auto participant_qos =
    dds::core::QosProvider::Default().participant_qos("my_library::my_profile");
```

Parameters

<i>params</i>	The QosProviderParams (p. 1773) to set
---------------	---

7.22 rti::core::builtin_profiles Namespace Reference

<<**extension**>> (p. 156) Contains the names of the built-in profiles

Namespaces

- namespace **qos_lib**
 <<**extension**>> (p. 156) Contains the names of the built-in profiles in the regular (non-experimental) qos library
- namespace **qos_lib_exp**
 <<**extension**>> (p. 156) <<**experimental**>> (p. 157) Contains the names of the built-in profiles in the experimental qos library.
- namespace **qos_snippet_lib**
 <<**extension**>> (p. 156) Contains the names of the built-in QoS Snippets

7.22.1 Detailed Description

<<**extension**>> (p. 156) Contains the names of the built-in profiles

See also

BuiltinQosProfilesGroupDocs

7.23 rti::core::builtin_profiles::qos_lib Namespace Reference

<<**extension**>> (p. 156) Contains the names of the built-in profiles in the regular (non-experimental) qos library

Functions

- std::string **library_name** ()
 A library of non-experimental QoS profiles.
- std::string **baseline** ()
 The most up-to-date QoS default values.
- std::string **baseline_5_0_0** ()
 The QoS default values for version 5.0.0.
- std::string **baseline_5_1_0** ()
 The QoS default values for version 5.1.0.
- std::string **baseline_5_2_0** ()

- The QoS default values for version 5.2.0.*

 - std::string **baseline_5_3_0** ()
- The QoS default values for version 5.3.0.*

 - std::string **baseline_6_0_0** ()
- The QoS default values for version 6.0.0.*

 - std::string **baseline_6_1_0** ()
- The QoS default values for version 6.1.0.*

 - std::string **baseline_7_0_0** ()
- The QoS default values for version 7.0.0.*

 - std::string **baseline_7_1_0** ()
- The QoS default values for version 7.1.0.*

 - std::string **generic_common** ()

A common Participant base profile.

 - std::string **generic_monitoring_common** ()

Enables RTI Monitoring Library.

 - std::string **generic_connex_micro_compatibility** ()

Sets the values necessary to communicate with RTI Connex Micro.

 - std::string **generic_connex_micro_compatibility_2_4_9** ()

Sets the values necessary to communicate with RTI Connex Micro versions 2.4.4 through at least 2.4.9.

 - std::string **generic_connex_micro_compatibility_2_4_3** ()

Sets the values necessary to communicate with RTI Connex Micro versions 2.4.3 and ealier.

 - std::string **generic_other_dds_vendor_compatibility** ()

Sets the values necessary to interoperate with other DDS vendors.

 - std::string **generic_510_transport_compatibility** ()

Sets the values necessary to interoperate with RTI Connex 5.1.0 using the UDPv6 and/or SHMEM transports.

 - std::string **generic_security** ()

Loads the DDS Secure builtin plugins.

 - std::string **generic_strict_reliable** ()

Enables strict reliability.

 - std::string **generic_keep_last_reliable** ()

Enables keep-last reliability.

 - std::string **generic_best_effort** ()

Enables best-effort reliability kind.

 - std::string **generic_strict_reliable_high_throughput** ()

A profile that can be used to achieve high throughput.

 - std::string **generic_strict_reliable_low_latency** ()

A profile that can be used to achieve low latency.

 - std::string **generic_participant_large_data** ()

A common Participant base profile to facilitate sending large data.

 - std::string **generic_participant_large_data_monitoring** ()

Configures Participants for large data and monitoring.

 - std::string **generic_strict_reliable_large_data** ()

Configures endpoints for sending large data with strict reliability.

 - std::string **generic_keep_last_reliable_large_data** ()

Configures endpoints for sending large data with keep-last reliability.

 - std::string **generic_strict_reliable_large_data_fast_flow** ()

Configures strictly reliable communication for large data with a fast flow controller.

- std::string **generic_strict_reliable_large_data_medium_flow** ()
Configures strictly reliable communication for large data with a medium flow controller.
- std::string **generic_strict_reliable_large_data_slow_flow** ()
Configures strictly reliable communication for large data with a slow flow controller.
- std::string **generic_keep_last_reliable_large_data_fast_flow** ()
Configures keep-last reliable communication for large data with a fast flow controller.
- std::string **generic_keep_last_reliable_large_data_medium_flow** ()
Configures keep-last reliable communication for large data with a medium flow controller.
- std::string **generic_keep_last_reliable_large_data_slow_flow** ()
Configures keep-last reliable communication for large data with a slow flow controller.
- std::string **generic_keep_last_reliable_transient_local** ()
Persists the samples of a DataWriter as long as the entity exists.
- std::string **generic_keep_last_reliable_transient** ()
Persists samples using RTI Persistence Service.
- std::string **generic_keep_last_reliable_persistent** ()
Persists samples in permanent storage, like a disk, using RTI Persistence Service.
- std::string **generic_auto_tuning** ()
Enables the Turbo Mode batching and Auto Throttle experimental features.
- std::string **generic_minimal_memory_footprint** ()
Uses a set of QoS which reduces the memory footprint of the application.
- std::string **generic_monitoring2** ()
The default QoS profile that the DDS entities created by the RTI Monitoring Library 2.0 use.
- std::string **pattern_periodic_data** ()
Used for applications that expect periodic data.
- std::string **pattern_streaming** ()
Used for applications that stream data.
- std::string **pattern_reliable_streaming** ()
Used for applications that stream data and require reliable communication.
- std::string **pattern_event** ()
Used for applications that handle events.
- std::string **pattern_alarm_event** ()
Used for applications that handle alarm events.
- std::string **pattern_status** ()
Used for applications whose samples represent statuses.
- std::string **pattern_alarm_status** ()
Used for applications in which samples represent alarm statuses.
- std::string **pattern_last_value_cache** ()
Used for applications that only need the last published value.

 - Used for applications that only need the last published value.*

7.24.1 Detailed Description

<<**extension**>> (p. 156) <<**experimental**>> (p. 157) Contains the names of the built-in profiles in the experimental qos library.

This qos library is deprecated. These profiles have been moved to **qos_lib** (p. 499).

The library name is **rti::core::builtin_profiles::qos_lib_exp::library_name()** (p. 278)

7.25 rti::core::builtin_profiles::qos_snippet_lib Namespace Reference

<<**extension**>> (p. 156) Contains the names of the built-in QoS Snippets

Functions

- std::string **library_name** ()
 - A library of QoS Snippets.*
- std::string **snippet_optimization_reliability_protocol_common** ()
 - QoS Snippet that configures the reliability protocol with a common configuration.*
- std::string **snippet_optimization_reliability_protocol_keep_all** ()
 - QoS Snippet that configures the reliability protocol for KEEP_ALL.*
- std::string **snippet_optimization_reliability_protocol_keep_last** ()
 - QoS Snippet that configures the reliability protocol for KEEP_LAST.*
- std::string **snippet_optimization_reliability_protocol_high_rate** ()

- QoS Snippet that configures the reliability protocol for sending data at a high rate.*

 - `std::string snippet_optimization_reliability_protocol_low_latency ()`
- QoS Snippet that configures the reliability protocol for sending data at low latency.*

 - `std::string snippet_optimization_reliability_protocol_large_data ()`
- QoS Snippet that configures the reliability protocol for large data.*

 - `std::string snippet_optimization_reliability_protocol_dynamicmemalloc ()`
- Configures the DataWriter and DataReader caches to use dynamic memory allocation for Large Data samples.*

 - `std::string snippet_optimization_discovery_common ()`
- QoS Snippet that optimizes discovery with a common configuration.*

 - `std::string snippet_optimization_discovery_participant_compact ()`
- QoS Snippet that optimizes the Participant QoS to send less discovery information.*

 - `std::string snippet_optimization_discovery_endpoint_fast ()`
- QoS Snippet that optimizes the Endpoint Discovery to be faster.*

 - `std::string snippet_optimization_transport_large_buffers ()`
- QoS Snippet that increases the Participant default buffer that shmem and udpv4 use.*

 - `std::string snippet_qos_policy_reliability_reliable ()`
- QoS Snippet that sets RELIABILITY QoS to RELIABLE.*

 - `std::string snippet_qos_policy_reliability_best_effort ()`
- QoS Snippet that sets RELIABILITY QoS to BEST_EFFORT.*

 - `std::string snippet_qos_policy_history_keep_last_1 ()`
- QoS Snippet that sets HISTORY QoS to KEEP_LAST kind with depth 1.*

 - `std::string snippet_qos_policy_history_keep_all ()`
- QoS Snippet that sets HISTORY QoSPolicy to KEEP_ALL kind.*

 - `std::string snippet_qos_policy_publish_mode_asynchronous ()`
- QoS Snippet that sets PUBLISH_MODE QoSPolicy to ASYNCHRONOUS kind.*

 - `std::string snippet_qos_policy_durability_transient_local ()`
- QoS Snippet that sets DURABILITY QoSPolicy to TRANSIENT_LOCAL kind.*

 - `std::string snippet_qos_policy_durability_transient ()`
- QoS Snippet that sets DURABILITY QoSPolicy to TRANSIENT kind.*

 - `std::string snippet_qos_policy_durability_persistent ()`
- QoS Snippet that sets DURABILITY QoSPolicy to PERSISTENT kind.*

 - `std::string snippet_qos_policy_batching_enable ()`
- QoS Snippet that sets BATCH QoSPolicy to true.*

 - `std::string snippet_qos_policy_flow_controller_838mbps ()`
- QoS Snippet that configures and set a FlowController of 838 Mbps.*

 - `std::string snippet_qos_policy_flow_controller_209mbps ()`
- QoS Snippet that configures and sets a FlowController of 209 Mbps.*

 - `std::string snippet_qos_policy_flow_controller_52mbps ()`
- QoS Snippet that configures and sets a FlowController of 52 Mbps.*

 - `std::string snippet_feature_auto_tuning_enable ()`
- QoS Snippet that enables auto_throttle and turbo_mode to true.*

 - `std::string snippet_feature_monitoring_enable ()`
- QoS Snippet that enables the use of the RTI Monitoring Library.*

 - `std::string snippet_feature_monitoring2_enable ()`
- QoS Snippet that enables the use of the RTI Monitoring Library 2.0.*

 - `std::string snippet_feature_security_enable ()`
- QoS Snippet that enables security using the Builtin Security Plugins.*

- std::string **snippet_feature_topic_query_enable** ()
QoS Snippet that enables Topic Query.
- std::string **snippet_transport_tcp_lan_client** ()
QoS Snippet that configures a TCP LAN Client over DDS.
- std::string **snippet_transport_tcp_wan_symmetric_client** ()
QoS Snippet that configures a symmetric WAN TCP Client over DDS.
- std::string **snippet_transport_tcp_wan_asymmetric_server** ()
QoS Snippet that an asymmetric WAN TCP Server over DDS.
- std::string **snippet_transport_tcp_wan_asymmetric_client** ()
QoS Snippet that configures an asymmetric WAN TCP Client over DDS.
- std::string **snippet_transport_udp_avoid_ip_fragmentation** ()
QoS Snippet that configures RTI Connex and the UDP built-in transports (UDPv4, UDPv6, UDPv4_WAN) to avoid IP fragmentation.
- std::string **snippet_transport_udp_wan** ()
QoS Snippet that enables the RTI Real-Time WAN Transport (UDPv4_WAN).
- std::string **snippet_compatibility_connex_micro_version_2_4_3** ()
QoS Snippet that configures sets LIVELINESS QoS to be compatible with RTI Connex Micro 2.4.3.
- std::string **snippet_compatibility_other_dds_vendors_enable** ()
QoS Snippet that configures RTI Connex to interoperate with other DDS vendors.
- std::string **snippet_compatibility_5_1_0_transport_enable** ()
QoS Snippet that configures RTI Connex to interoperate with RTI Connex 5.1.0 and below for UDPv6 and SHMEM transports.

7.25.1 Detailed Description

<<**extension**>> (p. 156) Contains the names of the built-in QoS Snippets

See also

7.26 rti::core::xtypes Namespace Reference

<<**extension**>> (p. 156) Extensions to **dds::core::xtypes** (p. 419)

Classes

- class **DynamicDataInfo**
Contains information about a DynamicData sample.
- class **DynamicDataMemberInfo**
Contains information about a DynamicData member.
- class **DynamicDataProperty**
<<**extension**>> (p. 156) <<**value-type**>> (p. 152) *Specifies the properties of a DynamicData object*
- class **DynamicDataTypeSerializationProperty**

<<**extension**>> (p. 156) <<**value-type**>> (p. 152) Configures aspects of the memory management in the serialization of `dds::core::xtypes::DynamicData` (p. 1208) samples.

- class **DynamicTypePrintFormatProperty**

<<**extension**>> (p. 156) <<**value-type**>> (p. 152) A collection of attributes used to configure how DynamicTypes will be formatted when converted to strings.

- class **LoanedDynamicData**

<<**move-only-type**>> (p. 155) Gives temporary access to a member of another DynamicData object.

Enumerations

- enum class **DynamicTypePrintKind** {
 idl ,
 xml }

The different formats to print a `dds::core::xtypes::DynamicType` (p. 1249).

Functions

- template<typename TopicType >
 DynamicDataImpl **convert** (const TopicType &sample)
 <<**extension**>> (p. 156) Creates a DynamicData sample from a typed sample
- const `dds::core::xtypes::DynamicType` & **resolve_alias** (const `dds::core::xtypes::DynamicType` &type)
 <<**extension**>> (p. 156) If the type is an alias returns its related type recursively until it is not an alias.
- `std::vector< char >` & **to_cdr_buffer** (`std::vector< char >` &buffer, const DynamicData &sample, `dds::core::policy::DataRepresentationId` representation_id= `dds::core::policy::DataRepresentation::auto_id()`)
 <<**extension**>> (p. 156) Serializes a DynamicData sample into CDR format
- DynamicData & **from_cdr_buffer** (DynamicData &sample, const `std::vector< char >` &buffer)
 <<**extension**>> (p. 156) Creates a DynamicData sample by deserializing a CDR buffer'
- template<typename TopicType >
 TopicType **convert** (const DynamicData &sample)
 <<**extension**>> (p. 156) Creates a typed sample from a DynamicData sample.
- template<typename TopicType >
 DynamicData **convert** (const TopicType &sample)
 <<**extension**>> (p. 156) Creates a DynamicData sample from a typed sample
- template<typename TopicType >
 bool **can_convert** (const DynamicData &sample)
 <<**extension**>> (p. 156) Determines if the DynamicType of this sample is equal to the DynamicType of TopicType
- template<typename... Types>
 std::tuple< Types... > **get_tuple** (const `dds::core::xtypes::DynamicData` &data)
 <<**C++11**>> (p. 155) <<**experimental**>> (p. 157) <<**extension**>> (p. 156) Retrieves all the values of a DynamicData object into an `std::tuple` at once
- template<typename... Types>
 void **set_tuple** (`dds::core::xtypes::DynamicData` &data, const `std::tuple< Types... >` &value)

- template<typename... Types>
 dds::core::xtypes::StructType **create_type_from_tuple** (const `std::string` &name)
 <<**C++11**>> (p. 155) <<**experimental**>> (p. 157) <<**extension**>> (p. 156) Creates a StructType from a list of types or a `std::tuple`

- void **print_idl** (const DynamicType &type, unsigned int indent=0)
 <<*extension*>> (p. 156) Prints the IDL representation of this DynamicType to the standard output
- std::ostream & **to_string** (std::ostream &out, const DynamicType &type, const rti::core::xtypes::DynamicTypePrintFormatProperty &format= DynamicTypePrintFormatProperty())
 <<*extension*>> (p. 156) Writes the string representation of this DynamicType to an output stream.
- std::string **to_string** (const DynamicType &type, const rti::core::xtypes::DynamicTypePrintFormatProperty &format= DynamicTypePrintFormatProperty())
 <<*extension*>> (p. 156) Creates the string representation of this DynamicType to a string.

7.26.1 Detailed Description

<<*extension*>> (p. 156) Extensions to **dds::core::xtypes** (p. 419)

7.26.2 Enumeration Type Documentation

7.26.2.1 DynamicTypePrintKind

```
enum class rti::core::xtypes::DynamicTypePrintKind [strong]
```

The different formats to print a **dds::core::xtypes::DynamicType** (p. 1249).

Enumerator

idl	Indicates that a dds::core::xtypes::DynamicType (p. 1249) is to be printed in IDL format.
xml	Indicates that a dds::core::xtypes::DynamicType (p. 1249) is to be printed in XML format.

7.26.3 Function Documentation

7.26.3.1 convert() [1/3]

```
template<typename TopicType >
DynamicDataImpl rti::core::xtypes::convert (
    const TopicType & sample )
```

<<*extension*>> (p. 156) Creates a DynamicData sample from a typed sample

Note

This is a standalone function in the namespace **rti::core::xtypes** (p. 505)

Template Parameters

<i>TopicType</i>	An IDL topic-type
------------------	-------------------

Parameters

<i>sample</i>	The typed sample to convert to DynamicData
---------------	--

Returns

A new DynamicData object whose type is `rti::topic::dynamic_type<TopicType>` and contains the data from `sample`

7.26.3.2 `resolve_alias()`

```
const dds::core::xtypes::DynamicType & rti::core::xtypes::resolve_alias (
    const dds::core::xtypes::DynamicType & type )
```

<<*extension*>> (p. 156) If the type is an alias returns its related type recursively until it is not an alias.

7.26.3.3 `to_cdr_buffer()`

```
std::vector< char > & rti::core::xtypes::to_cdr_buffer (
    std::vector< char > & buffer,
    const DynamicData & sample,
    dds::core::policy::DataRepresentationId representation_id = dds::core::policy::↔
DataRepresentation::auto_id() )
```

<<*extension*>> (p. 156) Serializes a DynamicData sample into CDR format

Note

This is a standalone function in the namespace `rti::core::xtypes` (p. 505)

Parameters

<i>buffer</i>	The output buffer, which will be resized to the correct size
<i>sample</i>	The sample to serialize
<i>representation↔ _id</i>	The data representation used to serialize the data

Returns

A reference to `buffer`

7.26.3.4 from_cdr_buffer()

```
DynamicData & rti::core::xtypes::from_cdr_buffer (
    DynamicData & sample,
    const std::vector< char > & buffer )
```

<<**extension**>> (p. 156) Creates a DynamicData sample by deserializing a CDR buffer'

Note

This is a standalone function in the namespace `rti::core::xtypes` (p. 505)

Parameters

<i>sample</i>	The sample to deserialize.
<i>buffer</i>	The buffer containing the CDR data

Returns

A reference to `sample`

7.26.3.5 convert() [2/3]

```
template<typename TopicType >
TopicType rti::core::xtypes::convert (
    const DynamicData & sample )
```

<<**extension**>> (p. 156) Creates a typed sample from a DynamicData sample.

Note

This is a standalone function in the namespace `rti::core::xtypes` (p. 505)

This function is useful when an application uses DynamicData and regular typed Topics at the same time.

For example, given this IDL type:

```
struct Foo {
    long x;
};
```

We can convert from **Foo** (p. 1332) and DynamicData:

```
using dds::core::xtypes::DynamicData;
// Receive a DynamicData sample
dds::sub::DataReader<DynamicData> reader = // ...;
dds::sub::LoanedSamples<DynamicData> samples = reader.take();
assert (samples.size() > 0);
// Create a Foo sample
const DynamicData& dynamic_data = samples[0].data();
assert (rti::core::xtypes::can_convert<Foo>(dynamic_data));
Foo typed_data = rti::core::xtypes::convert<Foo>(dynamic_data);
assert (typed_data.x() == dynamic_data.value<int32_t>("x"));
```

Precondition

`can_convert<TopicType>(sample)`, otherwise the behavior is undefined.

Template Parameters

<i>TopicType</i>	An IDL topic-type
------------------	-------------------

Parameters

<i>sample</i>	The DynamicData sample to convert to type <code>TopicType</code>
---------------	--

Returns

An instance of `TopicType` containing the data in `sample`.

7.26.3.6 `convert()` [3/3]

```
template<typename TopicType >
DynamicData rti::core::xtypes::convert (
    const TopicType & sample )
```

<<**extension**>> (p. 156) Creates a DynamicData sample from a typed sample

Note

This is a standalone function in the namespace `rti::core::xtypes` (p. 505)

Template Parameters

<i>TopicType</i>	An IDL topic-type
------------------	-------------------

Parameters

<i>sample</i>	The typed sample to convert to DynamicData
---------------	--

Returns

A new `DynamicData` object whose type is `rti::topic::dynamic_type<TopicType>` and contains the data from `sample`

7.26.3.7 can_convert()

```
template<typename TopicType >
bool rti::core::xtypes::can_convert (
    const DynamicData & sample )
```

<<**extension**>> (p. 156) Determines if the `DynamicType` of this sample is equal to the `DynamicType` of `TopicType`

Note

This is a standalone function in the namespace `rti::core::xtypes` (p. 505)

Template Parameters

<i>TopicType</i>	An IDL topic-type
------------------	-------------------

Returns

True if the `DynamicType` of `TopicType` is the same as this sample's and therefore it is possible to create an instance of `TopicType` from this `DynamicData` object.

See also

convert() (p. 1236)

7.26.3.8 get_tuple()

```
template<typename... Types>
std::tuple< Types... > rti::core::xtypes::get_tuple (
    const dds::core::xtypes::DynamicData & data )
```

<<**C++11**>> (p. 155) <<**experimental**>> (p. 157) <<**extension**>> (p. 156) Retrieves all the values of a `DynamicData` object into an `std::tuple` at once

Note

This is a standalone function in the namespace `rti::core::xtypes` (p. 505)

See also

Manipulating data reflectively using C++ tuples (p. 402)

7.26.3.9 set_tuple()

```
template<typename... Types>
void rti::core::xtypes::set_tuple (
    dds::core::xtypes::DynamicData & data,
    const std::tuple< Types... > & value )
```

<<**C++11**>> (p. 155) <<**experimental**>> (p. 157) <<**extension**>> (p. 156) Assigns the values of a std::tuple to a DynamicData object at once

Note

This is a standalone function in the namespace **rti::core::xtypes** (p. 505)

See also

Manipulating data reflectively using C++ tuples (p. 402)

7.26.3.10 create_type_from_tuple()

```
template<typename... Types>
dds::core::xtypes::StructType rti::core::xtypes::create_type_from_tuple (
    const std::string & name )
```

<<**C++11**>> (p. 155) <<**experimental**>> (p. 157) <<**extension**>> (p. 156) Creates a StructType from a list of types or a std::tuple

Note

This is a standalone function in the namespace **rti::core::xtypes** (p. 505)

Template Parameters

<i>Types</i>	A list of types or a std::tuple. The types must be primitive (see dds::core::xtypes::PrimitiveType (p. 1685)) or <code>std::string</code> .
--------------	--

The StructType members are all default-created (i.e. non-key, non-optional, with default IDs...) and their names are m0, m1, m2, etc.

See also

Create a DynamicType using tuples (p. 400)

7.26.3.11 print_idl()

```
void rti::core::xtypes::print_idl (
    const DynamicType & type,
    unsigned int indent = 0 )
```

<<**extension**>> (p. 156) Prints the IDL representation of this DynamicType to the standard output

7.26.3.12 to_string() [1/2]

```
std::ostream & rti::core::xtypes::to_string (
    std::ostream & out,
    const DynamicType & type,
    const rti::core::xtypes::DynamicTypePrintFormatProperty & format = DynamicType↵
PrintFormatProperty() )
```

<<**extension**>> (p. 156) Writes the string representation of this DynamicType to an output stream.

Parameters

<i>out</i>	The output stream to which the string representation of the DynamicType should be printed.
<i>type</i>	The DynamicType to be printed.
<i>format</i>	The DynamicTypePrintFormatProperty (p. 1253) used to define the format of the string.

Returns

A reference to out.

7.26.3.13 to_string() [2/2]

```
std::string rti::core::xtypes::to_string (
    const DynamicType & type,
    const rti::core::xtypes::DynamicTypePrintFormatProperty & format = DynamicType↵
PrintFormatProperty() )
```

<<**extension**>> (p. 156) Creates the string representation of this DynamicType to a string.

Parameters

<i>type</i>	The DynamicType to be printed.
<i>format</i>	The DynamicTypePrintFormatProperty (p. 1253) used to define the format of the string.

Returns

The string representation of the DynamicType.

7.27 rti::domain Namespace Reference

<<*extension*>> (p. 156) Extensions to **dds::domain** (p. 422)

Classes

- class **DomainParticipantConfigParams**
 - <<*extension*>> (p. 156) <<*value-type*>> (p. 152) Input paramaters for creating a participant from xml configuration. It allows modification of some of the properties of the entities defined in the configuration.

Functions

- void **banish_ignored_participants** (const **dds::domain::DomainParticipant** &participant)
 - <<*extension*>> (p. 156) Prevents ignored remote DomainParticipants from receiving traffic from the local DomainParticipant.
- **rti::core::optional_value**< std::string > **discovered_participant_subject_name** (const **dds::domain::DomainParticipant** &participant, const **dds::core::InstanceHandle** &participant_handle)
 - <<*extension*>> (p. 156) Returns **rti::core::policy::EntityName::name** (p. 1276) for the specified DomainParticipant.
- **dds::core::InstanceHandleSeq** **discovered_participants_from_subject_name** (const **dds::domain::DomainParticipant** &participant, const **rti::core::optional_value**< std::string > &subject_name)
 - <<*extension*>> (p. 156) Returns a list of discovered DomainParticipant entities that have the given **rti::core::policy::EntityName::name** (p. 1276).
- **dds::domain::DomainParticipant** **find_participant_by_name** (const std::string &participant_name)
 - <<*extension*>> (p. 156) Locates an existing **dds::domain::DomainParticipant** (p. 1079) by name.
- template<typename ParticipantFwdIterator >
 uint32_t find_participants (ParticipantFwdIterator begin, uint32_t max_size)
 - <<*extension*>> (p. 156) Retrieves all the participants created by the application up to a maximum number.
- template<typename ParticipantFwdIterator >
 uint32_t find_participants (ParticipantFwdIterator begin)
 - <<*extension*>> (p. 156) Retrieves all the participants created by the application.
- const **dds::core::xtypes::DynamicType** & **find_type** (const **dds::domain::DomainParticipant** &participant, const std::string &type_name)
 - <<*extension*>> (p. 156) Retrieves a type registered with this participant
- void **register_type** (**dds::domain::DomainParticipant** &participant, const std::string &name, const **dds::core::xtypes::DynamicType** &type, const **rti::core::xtypes::DynamicDataTypeSerializationProperty** &serialization_property= **rti::core::xtypes::DynamicDataTypeSerializationProperty::DEFAULT**)
 - <<*extension*>> (p. 156) Registers a DynamicType with specific serialization properties
- template<typename T >
 void **register_type** (const std::string ®istered_type_name= **dds::topic::topic_type_name**< T >::value())
 - <<*extension*>> (p. 156) Registers a User-Generated Type with RTI Connex. This function is used along with XML Application Creation.

7.27.1 Detailed Description

<<*extension*>> (p. 156) Extensions to **dds::domain** (p. 422)

7.27.2 Function Documentation

7.27.2.1 banish_ignored_participants()

```
void rti::domain::banish_ignored_participants (
    const dds::domain::DomainParticipant & participant )
```

<<*extension*>> (p. 156) Prevents ignored remote DomainParticipants from receiving traffic from the local DomainParticipant.

```
#include <rti/domain/discovery.hpp>
```

Note

This is a standalone function in the namespace **rti::domain** (p. 514)

This method complements **dds::domain::ignore** (p.423): `ignore_participant` prevents the local **dds::domain::DomainParticipant** (p. 1079) from processing traffic from the remote DomainParticipant, while this method prevents already ignored remote DomainParticipants from processing traffic from the local DomainParticipant.

Note: this method is currently only supported when enabling the RTI Security Plugins. Please refer to the `RTI Security Plugins User's Manual` for more information.

MT Safety:

Safe.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), dds::core::PreconditionNotMetError (p. 1669), dds::core::NotEnabledError (p. 1601)
------------	--

See also

dds::domain::ignore (p. 423)

7.27.2.2 discovered_participant_subject_name()

```
rti::core::optional_value< std::string > rti::domain::discovered_participant_subject_name (
    const dds::domain::DomainParticipant & participant,
    const dds::core::InstanceHandle & participant_handle )
```

<<*extension*>> (p. 156) Returns **rti::core::policy::EntityName::name** (p. 1276) for the specified DomainParticipant.

```
#include <rti/domain/discovery.hpp>
```

Note

This is a standalone function in the namespace **rti::domain** (p. 514)

This operation retrieves the **rti::core::policy::EntityName::name** (p. 1276) of a **dds::domain::DomainParticipant** (p. 1079) that has been discovered on the network. The participant must be in the same domain as the participant on which this operation is invoked and must not have been "ignored" by means of the **dds::domain::ignore** (p. 423) operation.

The `participant_handle` must correspond to such a DomainParticipant. If the `participant_handle` is **dds::core::InstanceHandle::nil()** (p. 1358) or is not a valid **dds::core::InstanceHandle** (p. 1356) for a DomainParticipant, then the operation will fail with **dds::core::InvalidArgumentError** (p. 1363). If the `participant_handle` corresponds to a DomainParticipant that has not been discovered, then the operation will fail with **dds::core::PreconditionNotMetError** (p. 1669).

Use the operation **dds::domain::discovered_participants** (p. 425) to find the **dds::domain::DomainParticipant** (p. 1079) entities that are currently discovered.

Note: this method has different functionality when enabling the RTI Security Plugins. Please refer to the RTI Security Plugins User's Manual for more information.

MT Safety:

Safe.

Parameters

<i>participant</i>	The DomainParticipant that has discovered the discovered participant.
<i>participant_handle</i>	<< <i>in</i> >> (p. 157) dds::core::InstanceHandle (p. 1356) of dds::domain::DomainParticipant (p. 1079).

Returns

The **rti::core::policy::EntityName::name** (p. 1276) for the `participant_handle`

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), dds::core::PreconditionNotMetError (p. 1669) or dds::core::NotEnabledError (p. 1601)
------------	--

See also

rti::core::policy::EntityName::name (p. 1276)
dds::domain::discovered_participants (p. 425)

7.27.2.3 discovered_participants_from_subject_name()

```
dds::core::InstanceHandleSeq rti::domain::discovered_participants_from_subject_name (
    const dds::domain::DomainParticipant & participant,
    const rti::core::optional_value< std::string > & subject_name )
```

<<*extension*>> (p. 156) Returns a list of discovered DomainParticipant entities that have the given **rti::core::policy::EntityName::name** (p. 1276).

```
#include <rti/domain/discovery.hpp>
```

Note

This is a standalone function in the namespace **rti::domain** (p. 514)

This operation retrieves the same list as **dds::domain::discovered_participants** (p. 425), except this list contains only the participants that have the given **rti::core::policy::EntityName::name** (p. 1276).

Note: this method has different functionality when enabling the RTI Security Plugins. Please refer to the [RTI Security Plugins User's Manual](#) for more information.

MT Safety:

Safe.

Parameters

<i>participant</i>	The DomainParticipant whose discovered participants this operation will look up.
<i>subject_name</i>	<< <i>in</i> >> (p. 157) The rti::core::policy::EntityName::name (p. 1276) by which to filter the list.

Returns

The list of InstanceHandles corresponding to participants with the given **rti::core::policy::EntityName::name** (p. 1276).

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228) or dds::core::NotEnabledError (p. 1601)
------------	---

7.27.2.4 find_participant_by_name()

```
dds::domain::DomainParticipant rti::domain::find_participant_by_name (
    const std::string & participant_name )
```

<<**extension**>> (p. 156) Locates an existing **dds::domain::DomainParticipant** (p. 1079) by name.

Note

#include <rti/domain/find.hpp> This function is in the **rti::domain** (p. 514) namespace

If no such DomainParticipant exists, the operation will return **dds::core::null** (p. 238).

7.27.2.5 find_participants() [1/2]

```
template<typename ParticipantFwdIterator >
uint32_t rti::domain::find_participants (
    ParticipantFwdIterator begin,
    uint32_t max_size )
```

<<**extension**>> (p. 156) Retrieves all the participants created by the application up to a maximum number.

Note

#include <rti/domain/find.hpp> This function is in the **rti::domain** (p. 514) namespace

If no such DomainParticipant exists, the operation will return **dds::core::null** (p. 238).

DomainParticipants are ordered in the output sequence from the most recently created to the oldest.

MT Safety:

Unsafe. Creating or deleting DomainParticipants at the same time as calling this operation is not safe.

Template Parameters

<i>ParticipantFwdIterator</i>	A forward iterator whose value type is dds::domain::DomainParticipant (p. 1079)
-------------------------------	--

Parameters

<i>begin</i>	The iterator where to begin adding DomainParticipants.
<i>max_size</i>	The maximum number of elements to add

Returns

The number of elements added

7.27.2.6 find_participants() [2/2]

```
template<typename ParticipantFwdIterator >
uint32_t rti::domain::find_participants (
    ParticipantFwdIterator begin )
```

<<**extension**>> (p. 156) Retrieves all the participants created by the application.

Note

#include <rti/domain/find.hpp> This function is in the **rti::domain** (p. 514) namespace

If no such DomainParticipant exists, the operation will return **dds::core::null** (p. 238).

DomainParticipants are ordered in the output sequence from the most recently created to the oldest.

MT Safety:

Unsafe. Creating or deleting DomainParticipants at the same time as calling this operation is not safe.

Template Parameters

<i>ParticipantFwdIterator</i>	A forward iterator whose value type is dds::domain::DomainParticipant (p. 1079)
-------------------------------	--

Parameters

<i>begin</i>	The iterator where to begin adding DomainParticipants.
--------------	--

Returns

The number of elements added

7.27.2.7 find_type()

```
const dds::core::xtypes::DynamicType & rti::domain::find_type (
    const dds::domain::DomainParticipant & participant,
    const std::string & type_name )
```

<<**extension**>> (p. 156) Retrieves a type registered with this participant

```
#include <rti/domain/find.hpp>
```

Note

This is a standalone function in the namespace `rti::domain` (p. 514)

Every data type used in a `DomainParticipant` has a registered type name, which in most cases is the same as the type's name (the name used to define the type), but it can be different.

Types are registered by the creation of a `dds::topic::Topic` (p. 2178), whose constructors optionally receive a registered type name different from the type's name.

Types can also be registered when parsing an XML configuration and calling `dds::core::QosProvider::create_participant_from_config()` (p. 1771).

Parameters

<code>participant</code>	The <code>DomainParticipant</code> where the type is registered
<code>type_name</code>	The name used to register the type in this participant

Returns

If `type_name` exists in this `participant`, this function returns the `DynamicType` describing the type. It can be cast down to `dds::core::xtypes::StructType` (p. 2107) or `dds::core::xtypes::UnionType` (p. 2285), depending on whether the type is a struct or a union.

Exceptions

<code>dds::core::Error</code> (p. 1284)	If the type doesn't exist or the operation fails for any other reason
---	---

Example:

```
dds::domain::DomainParticipant participant(0);
dds::topic::Topic<Foo> topic1(participant, "Foo Topic"); // registered as "Foo"
dds::topic::Topic<Foo> topic2(participant, "MyFoo Topic", "MyFoo"); // registered as "MyFoo"
const auto& type1 = rti::domain::find_type(participant, "Foo");
const auto& type2 = rti::domain::find_type(participant, "MyFoo");
std::cout << type1 << std::endl;
std::cout << type2 << std::endl;
assert(type1 == type2); // Same type registered with different names
// Cast to StructType to access more information about the type
const auto& type1_struct =
    static_cast<const dds::core::xtypes::StructType&>(type1);
std::cout << type1_struct.member(0).name() << std::endl;
```

7.27.2.8 register_type() [1/2]

```
void rti::domain::register_type (
    dds::domain::DomainParticipant & participant,
    const std::string & name,
    const dds::core::xtypes::DynamicType & type,
    const rti::core::xtypes::DynamicDataTypeSerializationProperty & serialization_↔
property = rti::core::xtypes::DynamicDataTypeSerializationProperty::DEFAULT )
```

<<**extension**>> (p. 156) Registers a DynamicType with specific serialization properties

Typically you don't need to call this function, since the topic constructor takes care of that automatically. You do need to call this function before creating the topic if you want to change the default data-serialization property.

Calling this function also allows to change the registered name of the type, which by default is `type.name()`.

Parameters

<i>participant</i>	The participant where to register this type
<i>name</i>	The name to use to register this type
<i>type</i>	The type definition
<i>serialization_property</i>	The data-serialization property

See also

dds::core::xtypes::DynamicType (p. 1249)

dds::core::xtypes::DynamicData (p. 1208)

7.27.2.9 register_type() [2/2]

```
template<typename T >
void rti::domain::register_type (
    const std::string & registered_type_name = dds::topic::topic_type_name<T>::value()
)
```

<<**extension**>> (p. 156) Registers a User-Generated Type with RTI Connext. This function is used along with XML Application Creation.

When using XML Application creation, you must use this function to register any user-generated types with RTI Connext before creating your system.

When you don't use XML Application creation, you don't typically need to call this function, since the topic constructor takes care of that automatically.

Template Parameters

<i>T</i>	The user-generated type that is being registered
----------	--

Parameters

<i>registered_type_name</i>	The name to use when registering the type. This is the name that will be used in your XML configuration file to refer to the type.
-----------------------------	--

Builds a sequence member of variable-size elements.
- class **OffsetBase**
Base class of all Offset types.
- class **PrimitiveArrayOffset**
Offset to an array of primitive elements.

- struct **PrimitiveConstOffset**
A const Offset to an optional primitive member.
- struct **PrimitiveOffset**
An Offset to an optional primitive member.
- class **PrimitiveSequenceBuilder**
Builds a sequence of primitive members.
- class **PrimitiveSequenceOffset**
Offset to a sequence of primitive elements.
- class **Sample**
The generic definition of FlatData topic-types.
- class **SequenceIterator**
Iterator for collections of Offsets.
- class **SequenceOffset**
Offset to a sequence of non-primitive elements.
- class **StringBuilder**
Builds a string.
- class **StringOffset**
Offset to a string.
- class **UnionBuilder**
Base class of builders for user-defined mutable unions.

Functions

- template<typename OffsetType >
flat_type_traits< OffsetType >::plain_type * **plain_cast** (OffsetType &offset)
Casts into an equivalent plain C++ type.
- template<typename OffsetType >
const **flat_type_traits**< OffsetType >::plain_type * **plain_cast** (const OffsetType &offset)
Const version of plain_cast.
- template<typename TopicType >
rti::flat::flat_type_traits< TopicType >::builder **build_data** (**dds::pub::DataWriter**< TopicType > &writer)
Begins building a new sample.
- template<typename TopicType >
void **discard_builder** (**dds::pub::DataWriter**< TopicType > &writer, typename **rti::flat::flat_type_traits**< TopicType >::builder &builder)
Discards a sample builder.

7.28.1 Detailed Description

<<**extension**>> (p. 156) Support for **FlatData Topic-Types** (p. 219)

7.29 rti::pub Namespace Reference

<<**extension**>> (p. 156) Extensions to **dds::pub** (p. 433)

Classes

- class **AcknowledgmentInfo**
 <<extension>> (p. 156) <<value-type>> (p. 152) Information about an application-acknowledged sample
- class **FlowController**
 <<extension>> (p. 156) <<reference-type>> (p. 153) A flow controller is the object responsible for shaping the network traffic by determining when attached asynchronous **dds::pub::DataWriter** (p. 908) instances are allowed to write data.
- class **FlowControllerProperty**
 <<extension>> (p. 156) <<value-type>> (p. 152) Configures a **FlowController** (p. 1316)
- struct **FlowControllerSchedulingPolicy_def**
 <<extension>> (p. 156) Kinds of flow controller scheduling policy
- class **FlowControllerTokenBucketProperty**
 <<extension>> (p. 156) <<value-type>> (p. 152) Configures a **FlowController** (p. 1316) based on a token-bucket mechanism
- class **WriteParams**
 <<extension>> (p. 156) <<value-type>> (p. 152) Advanced parameters for writing with a **DataWriter**

Typedefs

- typedef **dds::core::safe_enum< FlowControllerSchedulingPolicy_def > FlowControllerSchedulingPolicy**
 <<extension>> (p. 156) The safe enumeration for **FlowControllerSchedulingPolicy_def::type** (p. 1325)

Functions

- **dds::pub::Publisher implicit_publisher** (const **dds::domain::DomainParticipant** &dp)
 <<extension>> (p. 156) Get the implicit **dds::pub::Publisher** (p. 1719) for a given **dds::domain::DomainParticipant** (p. 1079).
- template<typename T >
dds::topic::ParticipantBuiltinTopicData matched_subscription_participant_data (const **dds::pub::DataWriter**< T > &writer, const **dds::core::InstanceHandle** &handle)
 <<extension>> (p. 156) This operation retrieves the information on the discovered **dds::domain::DomainParticipant** (p. 1079) associated with the subscription that is currently matching with the **dds::pub::DataWriter** (p. 908).
- template<typename T >
rti::core::LocatorSeq matched_subscriptions_locators (const **dds::pub::DataWriter**< T > &writer)
 <<extension>> (p. 156) Retrieve the list of locators for subscriptions currently associated with this **DataWriter**.
- template<typename T >
bool is_matched_subscription_active (const **dds::pub::DataWriter**< T > &writer, const **dds::core::InstanceHandle** &handle)
 <<extension>> (p. 156) Check if a matched subscription is active.
- template<typename T >
std::vector< dds::topic::SubscriptionBuiltinTopicData > matched_subscription_data (const **dds::pub::DataWriter**< T > &writer)
 <<extension>> (p. 156) Obtain the **SubscriptionBuiltinTopicData** for all of the subscriptions matched with a **DataWriter**.
- template<typename PublisherForwardIterator >
uint32_t find_publishers (const **dds::domain::DomainParticipant** participant, **PublisherForwardIterator** begin, **uint32_t** max_size)

<<*extension*>> (p. 156) Retrieve all of the **dds::pub::Publisher** (p. 1719) created from this **dds::domain::DomainParticipant** (p. 1079)

- template<typename PublisherBackInsertIterator >
uint32_t **find_publishers** (const **dds::domain::DomainParticipant** participant, PublisherBackInsertIterator begin)

Retrieve all the **dds::pub::Publisher** (p. 1719) created from this **dds::domain::DomainParticipant** (p. 1079).

- **dds::pub::Publisher find_publisher** (const **dds::domain::DomainParticipant** participant, const std::string &publisher_name)

<<*extension*>> (p. 156) Looks up a **dds::pub::Publisher** (p. 1719) by its entity name within the **dds::domain::DomainParticipant** (p. 1079).

- template<typename AnyDataWriterBackInsertIterator >
uint32_t **find_datawriters** (**dds::pub::Publisher** publisher, AnyDataWriterBackInsertIterator begin)

Retrieve all the **dds::pub::DataWriter** (p. 908) created from this **dds::pub::Publisher** (p. 1719).

- template<typename AnyDataWriterForwardIterator >
uint32_t **find_datawriters** (**dds::pub::Publisher** publisher, AnyDataWriterForwardIterator begin, uint32_t max_size)

Retrieve all the **dds::pub::DataWriter** (p. 908) created from this **dds::pub::Publisher** (p. 1719).

- template<typename Writer >
Writer **find_datawriter_by_topic_name** (**dds::pub::Publisher** publisher, const std::string &topic_name)

<<*extension*>> (p. 156) Retrieves a **dds::pub::DataWriter** (p. 908) with the given name within the **dds::pub::Publisher** (p. 1719)

- template<typename Writer >
Writer **find_datawriter_by_name** (**dds::pub::Publisher** publisher, const std::string &datawriter_name)

<<*extension*>> (p. 156) Retrieves a **dds::pub::DataWriter** (p. 908) with the given name within the **dds::pub::Publisher** (p. 1719)

- template<typename Writer >
Writer **find_datawriter_by_name** (**dds::domain::DomainParticipant** participant, const std::string &datawriter_name)

<<*extension*>> (p. 156) Retrieves a **dds::pub::DataWriter** (p. 908) within the **dds::domain::DomainParticipant** (p. 1079) with the given name

- **FlowController find_flow_controller** (**dds::domain::DomainParticipant** participant, const std::string &name)
Retrieves an existing **FlowController** (p. 1316).

7.29.1 Detailed Description

<<*extension*>> (p. 156) Extensions to **dds::pub** (p. 433)

7.29.2 Function Documentation

7.29.2.1 implicit_publisher()

```
dds::pub::Publisher rti::pub::implicit_publisher (
    const dds::domain::DomainParticipant & dp )
```

<<*extension*>> (p. 156) Get the implicit **dds::pub::Publisher** (p. 1719) for a given **dds::domain::DomainParticipant** (p. 1079).

Note

This is a standalone function in the namespace **rti::pub** (p. 523)

If an implicit Publisher does not already exist, this creates one.

The implicit Publisher is created with default **dds::pub::qos::PublisherQos** (p. 1733) and no listener. When a DomainParticipant is deleted, if there are no attached **dds::pub::DataWriter** (p. 908) that belong to the implicit Publisher, the implicit Publisher will be implicitly deleted.

MT Safety:

UNSAFE. It is not safe to create an implicit Publisher while another thread may be simultaneously calling **dds::domain::DomainParticipant::default_publisher_qos** (p. 1095).

Parameters

<i>dp</i>	The DomainParticipant that the implicit publisher belongs to
-----------	--

Returns

The implicit publisher

7.29.2.2 matched_subscription_participant_data()

```
template<typename T >
dds::topic::ParticipantBuiltinTopicData rti::pub::matched_subscription_participant_data (
    const dds::pub::DataWriter< T > & writer,
    const dds::core::InstanceHandle & handle )
```

<<*extension*>> (p. 156) This operation retrieves the information on the discovered **dds::domain::DomainParticipant** (p. 1079) associated with the subscription that is currently matching with the **dds::pub::DataWriter** (p. 908).

Note

This is a standalone function in the namespace **rti::pub** (p. 523)

The `subscription_handle` must correspond to a subscription currently associated with the **dds::pub::DataWriter** (p. 908). Otherwise, the operation will fail with **dds::core::InvalidArgumentError** (p. 1363). The operation may also fail with **dds::core::PreconditionNotMetError** (p. 1669) if the subscription corresponds to the same **dds::domain::↔DomainParticipant** (p. 1079) that the DataWriter belongs to. Use **dds::pub::matched_subscriptions()** (p. 436) to find the subscriptions that are currently matched with the **dds::pub::DataWriter** (p. 908).

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), or dds::core::NotEnabledError (p. 1601)
------------	--

Template Parameters

<i>T</i>	The topic-type that the DataWriter subscribes to
----------	--

Parameters

<i>writer</i>	The writer to lookup the matched participant data of
<i>handle</i>	The InstanceHandle to a specific subscription. Must correspond to a subscription currently associated with the DataWriter.

Returns

The **dds::topic::ParticipantBuiltinTopicData** (p. 1639) of the DomainParticipant of a matched subscription of a **dds::pub::DataWriter** (p. 908)

7.29.2.3 `matched_subscriptions_locators()`

```
template<typename T >
rti::core::LocatorSeq rti::pub::matched_subscriptions_locators (
    const dds::pub::DataWriter< T > & writer )
```

<<**extension**>> (p. 156) Retrieve the list of locators for subscriptions currently associated with this DataWriter.

The locators returned are the ones that are used by the DDS implementation to communicate with the corresponding matched DataReaders.

Template Parameters

<i>T</i>	The topic-type that the DataWriter publishes.
----------	---

Parameters

<i>writer</i>	The DataWriter.
---------------	-----------------

Returns

The list of locators

7.29.2.4 is_matched_subscription_active()

```
template<typename T >
bool rti::pub::is_matched_subscription_active (
    const dds::pub::DataWriter< T > & writer,
    const dds::core::InstanceHandle & handle )
```

<<**extension**>> (p. 156) Check if a matched subscription is active.

Note

This is a standalone function in the namespace **rti::pub** (p. 523)

Template Parameters

<i>T</i>	The topic-type that the DataWriter publishes.
----------	---

Parameters

<i>writer</i>	The DataWriter.
<i>handle</i>	The dds::core::InstanceHandle (p. 1356) of the matched subscription.

This API is used for querying the endpoint liveliness of a matched subscription. A matched subscription will be marked as inactive when it becomes nonprogressing (e.g., not responding to a DataWriter's heartbeats, or letting its internal queue fill up without taking the available data). Note that if the participant associated with the matched subscription loses liveliness, the **dds::core::InstanceHandle** (p. 1356) will become invalid and this function will fail with **dds::core::InvalidArgumentError** (p. 1363).

Returns

A boolean indicating whether or not the matched subscription is active.

7.29.2.5 matched_subscription_data()

```
template<typename T >
std::vector< dds::topic::SubscriptionBuiltinTopicData > rti::pub::matched_subscription_data (
    const dds::pub::DataWriter< T > & writer )
```

<<**extension**>> (p. 156) Obtain the SubscriptionBuiltinTopicData for all of the subscriptions matched with a DataWriter.

Note

This is a standalone function in the namespace **rti::pub** (p. 523)

This API retrieves the matched publication data from all of the subscriptions currently matched a DataWriter.

Template Parameters

<i>T</i>	The topic-type that the DataWriter publishes.
----------	---

Parameters

<i>writer</i>	The DataWriter.
---------------	-----------------

Returns

A `std::vector` containing all of the matched subscription data.

7.29.2.6 find_publishers() [1/2]

```
template<typename PublisherForwardIterator >
uint32_t rti::pub::find_publishers (
    const dds::domain::DomainParticipant participant,
    PublisherForwardIterator begin,
    uint32_t max_size )
```

<<**extension**>> (p. 156) Retrieve all of the **dds::pub::Publisher** (p. 1719) created from this **dds::domain::DomainParticipant** (p. 1079) [↔](#)

Note

This is a standalone function in the namespace **rti::pub** (p. 523)

Template Parameters

<i>PublisherForwardIterator</i>	A forward iterator whose value type is dds::pub::Publisher (p. 1719)
---------------------------------	---

Parameters

<i>participant</i>	The dds::domain::DomainParticipant (p. 1079) the Publishers belong to
<i>begin</i>	A forward iterator to the position in the destination container to insert the found Publishers into
<i>max_size</i>	The maximum number of Publishers to add

Returns

The number of found Publishers

See also

[Looking up DataWriters](#) (p. 115)

7.29.2.7 find_publishers() [2/2]

```
template<typename PublisherBackInsertIterator >
uint32_t rti::pub::find_publishers (
    const dds::domain::DomainParticipant participant,
    PublisherBackInsertIterator begin )
```

Retrieve all the **dds::pub::Publisher** (p. 1719) created from this **dds::domain::DomainParticipant** (p. 1079).

Template Parameters

<i>PublisherBackInsertIterator</i>	A back-inserting iterator whose value type is dds::pub::Publisher (p. 1719)
------------------------------------	--

Parameters

<i>participant</i>	The dds::domain::DomainParticipant (p. 1079) the Publishers belong to
<i>begin</i>	A back-inserting iterator to the position in the destination container to insert the found Publishers in

Returns

The number of found Publishers

See also

[Looking up DataWriters](#) (p. 115)

7.29.2.8 find_publisher()

```
dds::pub::Publisher rti::pub::find_publisher (
    const dds::domain::DomainParticipant participant,
    const std::string & publisher_name )
```

<<*extension*>> (p. 156) Looks up a **dds::pub::Publisher** (p. 1719) by its entity name within the **dds::domain::DomainParticipant** (p. 1079).

Note

This is a standalone function in the namespace **rti::pub** (p. 523)

Every **dds::pub::Publisher** (p. 1719) in the system has an entity name which is configured and stored in the EntityName policy, **ENTITY_NAME** (p. 323).

This operation retrieves a **dds::pub::Publisher** (p. 1719) within the **dds::domain::DomainParticipant** (p. 1079) given the entity's name. If there are several **dds::pub::Publisher** (p. 1719) with the same name within the **dds::domain::↔DomainParticipant** (p. 1079), this function returns the first matching occurrence.

Parameters

<i>participant</i>	The dds::domain::DomainParticipant (p. 1079) to look for the dds::pub::Publisher (p. 1719) in.
<i>publisher_name</i>	Entity name of the Publisher

Returns

The first Publisher found with the specified name or **dds::core::null** (p. 238) if it is not found.

See also

Looking up DataWriters (p. 115)

7.29.2.9 find_datawriters() [1/2]

```
template<typename AnyDataWriterBackInsertIterator >
uint32_t rti::pub::find_datawriters (
    dds::pub::Publisher publisher,
    AnyDataWriterBackInsertIterator begin )
```

Retrieve all the **dds::pub::DataWriter** (p. 908) created from this **dds::pub::Publisher** (p. 1719).

Note

This is a standalone function in the namespace **rti::pub** (p. 523)

Template Parameters

<i>AnyDataWriterBackInsertIterator</i>	An iterator whose <code>value_type</code> is dds::pub::AnyDataWriter (p. 603)
--	--

Parameters

<i>publisher</i>	The dds::pub::Publisher (p. 1719) the DataWriters belong to
<i>begin</i>	A back-inserting iterator to the position in the destination container to insert the found DataWriters into

Returns

The number of found DataWriters

See also

Looking up DataWriters (p. 115)

7.29.2.10 find_datawriters() [2/2]

```
template<typename AnyDataWriterForwardIterator >
uint32_t rti::pub::find_datawriters (
    dds::pub::Publisher publisher,
    AnyDataWriterForwardIterator begin,
    uint32_t max_size )
```

Retrieve all the **dds::pub::DataWriter** (p. 908) created from this **dds::pub::Publisher** (p. 1719).

Note

This is a standalone function in the namespace **rti::pub** (p. 523)

Template Parameters

<i>AnyDataWriterForwardIterator</i>	An iterator whose <code>value_type</code> is dds::pub::AnyDataWriter (p. 603)
-------------------------------------	--

Parameters

<i>publisher</i>	The dds::pub::Publisher (p. 1719) the DataWriters belong to
<i>begin</i>	A forward iterator to the first position in the destination container to copy the found DataWriters into
<i>max_size</i>	The maximum number of DataWriters to return

Returns

The number of found DataWriters

See also

Looking up DataWriters (p. 115)

7.29.2.11 find_datawriter_by_topic_name()

```
template<typename Writer >
Writer rti::pub::find_datawriter_by_topic_name (
    dds::pub::Publisher publisher,
    const std::string & topic_name )
```

<<**extension**>> (p. 156) Retrieves a **dds::pub::DataWriter** (p. 908) with the given name within the **dds::pub::Publisher** (p. 1719)

Note

This is a standalone function in the namespace **rti::pub** (p. 523)

Every **dds::pub::DataWriter** (p. 908) in the system has an entity name which is configured and stored in the `<<extension>>` (p. 156) EntityName policy, **ENTITY_NAME** (p. 323).

This operation retrieves the **dds::pub::DataWriter** (p. 908) within the **dds::pub::Publisher** (p. 1719) whose name matches the one specified. If there are several **dds::pub::DataWriter** (p. 908) with the same name within the **dds::pub::Publisher** (p. 1719), the operation returns the first matching occurrence.

Template Parameters

<i>Writer</i>	The type of the writer. It can be dds::pub::AnyDataWriter (p. 603), or an instantiation of dds::pub::DataWriter<T> (if T is not the correct type, this function throws dds::core::InvalidDowncastError (p. 1364))
---------------	--

Parameters

<i>publisher</i>	The dds::pub::Publisher (p. 1719) that created the DataWriter to find
<i>topic_name</i>	Entity name of the DataWriter to find

Returns

The AnyDataWriter with the given name

See also

Looking up DataWriters (p. 115)

7.29.2.12 find_datawriter_by_name() [1/2]

```
template<typename Writer >
Writer rti::pub::find_datawriter_by_name (
    dds::pub::Publisher publisher,
    const std::string & datawriter_name )
```

`<<extension>>` (p. 156) Retrieves a **dds::pub::DataWriter** (p. 908) with the given name within the **dds::pub::Publisher** (p. 1719)

Note

This is a standalone function in the namespace **rti::pub** (p. 523)

Every **dds::pub::DataWriter** (p. 908) in the system has an entity name which is configured and stored in the `<<extension>>` (p. 156) EntityName policy, **ENTITY_NAME** (p. 323).

This operation retrieves the **dds::pub::DataWriter** (p. 908) within the **dds::pub::Publisher** (p. 1719) whose name matches the one specified. If there are several **dds::pub::DataWriter** (p. 908) with the same name within the **dds::pub::Publisher** (p. 1719), the operation returns the first matching occurrence.

Template Parameters

<i>Writer</i>	The type of the writer. It can be dds::pub::AnyDataWriter (p. 603), or an instantiation of dds::pub::DataWriter<T> (if T is not the correct type, this function throws dds::core::InvalidDowncastError (p. 1364))
---------------	--

Parameters

<i>publisher</i>	The dds::pub::Publisher (p. 1719) that created the DataWriter to find
<i>datawriter_name</i>	Entity name of the DataWriter to find

Returns

The WRITER with the given name

See also

Looking up DataWriters (p. 115)

7.29.2.13 find_datawriter_by_name() [2/2]

```
template<typename Writer >
Writer rti::pub::find_datawriter_by_name (
    dds::domain::DomainParticipant participant,
    const std::string & datawriter_name )
```

<<*extension*>> (p. 156) Retrieves a **dds::pub::DataWriter** (p. 908) within the **dds::domain::DomainParticipant** (p. 1079) with the given name

Note

This is a standalone function in the namespace **rti::pub** (p. 523)

Every **dds::pub::DataWriter** (p. 908) in the system has an entity name which is configured and stored in the EntityName policy, **ENTITY_NAME** (p. 323).

Every **dds::pub::Publisher** (p. 1719) in the system has an entity name which is also configured and stored in the EntityName policy.

This operation retrieves a **dds::pub::DataWriter** (p. 908) within a **dds::pub::Publisher** (p. 1719) given the specified name which encodes both to the **dds::pub::DataWriter** (p. 908) and the **dds::pub::Publisher** (p. 1719) name.

If there are several **dds::pub::DataWriter** (p. 908) with the same name within the corresponding **dds::pub::Publisher** (p. 1719) this function returns the first matching occurrence.

The specified name might be given as a fully-qualified entity name or as a plain name.

The fully qualified entity name is a concatenation of the **dds::pub::Publisher** (p. 1719) to which the **dds::pub::DataWriter** (p. 908) belongs and the entity name of the **dds::pub::DataWriter** (p. 908) itself, separated by a double colon "::". For example: MyPublisherName::MyDataWriterName

The plain name contains the **dds::pub::DataWriter** (p. 908) name only. In this situation it is implied that the **dds::pub::DataWriter** (p. 908) belongs to the implicit **dds::pub::Publisher** (p. 1719) so the use of a plain name is equivalent to specifying a fully qualified name with the **dds::pub::Publisher** (p. 1719) name part being "implicit". For example: the plain name "MyDataWriterName" is equivalent to specifying the fully qualified name "implicit::MyDataWriterName"

The **dds::pub::DataWriter** (p. 908) is only looked up within the **dds::pub::Publisher** (p. 1719) specified in the fully qualified name, or within the implicit **dds::pub::Publisher** (p. 1719) if the name was not fully qualified.

Template Parameters

<i>Writer</i>	The type of the writer. It can be dds::pub::AnyDataWriter (p. 603), or an instantiation of dds::pub::DataWriter<T> (if T is not the correct type, this function throws dds::core::InvalidDowncastError (p. 1364))
---------------	--

Parameters

<i>participant</i>	The dds::domain::DomainParticipant (p. 1079) within which the dds::pub::DataWriter (p. 908) exists
<i>datawriter_name</i>	EntityName (p. 1275) of the DataWriter to find

Returns

The WRITER with the given name

See also

implicit_publisher(const dds::domain::DomainParticipant& dp) (p. 525);

Looking up DataWriters (p. 115)

7.29.2.14 find_flow_controller()

```
FlowController find_flow_controller (
    dds::domain::DomainParticipant participant,
    const std::string & name )
```

Retrieves an existing **FlowController** (p. 1316).

Note

This is a standalone function in the namespace **rti::pub** (p. 523)

Parameters

<i>participant</i>	The DomainParticipant associated to the FlowController (p. 1316)
<i>name</i>	The name used to create the FlowController (p. 1316) or the name of one of the built-in FlowControllers (FlowController::DEFAULT_NAME (p. 57), FlowController::FIXED_RATE_NAME (p. 58), FlowController::ON_DEMAND_NAME (p. 59))

Returns

The flow controller with that name in that participant or an empty reference (equals to **dds::core::null** (p. 238)) if it doesn't exist

See also

FlowController::retain() (p. 1320)

7.30.1 Detailed Description

<<*extension*>> (p. 156) Extensions to `dds::sub` (p. 446)

7.30.2 Function Documentation

7.30.2.1 implicit_subscriber()

```
dds::sub::Subscriber rti::sub::implicit_subscriber (
    const dds::domain::DomainParticipant & dp )
```

<<*extension*>> (p. 156) Retrieves the implicit `dds::sub::Subscriber` (p.2116) for the given `dds::domain::↔ DomainParticipant` (p. 1079).

Note

This is a standalone function in the namespace `rti::sub` (p. 538)

If an implicit Subscriber does not already exist, this creates one.

The implicit Subscriber is created with default `dds::sub::qos::SubscriberQos` (p.2129) and no listener. When a DomainParticipant is deleted, if there are no attached `dds::sub::DataReader` (p. 756) that belong to the implicit Subscriber, the implicit Subscriber will be implicitly deleted.

MT Safety:

UNSAFE. it is not safe to create the implicit subscriber while another thread may be simultaneously calling `dds::domain::DomainParticipant::default_subscriber_qos(const dds::sub::qos::SubscriberQos & qos)` (p. 1097).

Parameters

<i>dp</i>	The DomainParticipant that the implicit subscriber belongs to.
-----------	--

Returns

The implicit Subscriber

7.30.2.2 matched_publication_participant_data()

```
template<typename T >
dds::topic::ParticipantBuiltinTopicData rti::sub::matched_publication_participant_data (
    const dds::sub::DataReader< T > & reader,
    const dds::core::InstanceHandle & handle )
```

<<*extension*>> (p. 156) This operation retrieves the information on the discovered **dds::domain::Domain**↔**Participant** (p. 1079) associated with the publication that is currently matching with the **dds::sub::DataReader** (p. 756).

Note

This is a standalone function in the namespace **rti::sub** (p. 538)

The `publication_handle` must correspond to a publication currently associated with the **dds::sub::DataReader** (p. 756). Otherwise, the operation will fail with **dds::core::InvalidArgumentError** (p. 1363). The operation may also fail with **dds::core::PreconditionNotMetError** (p. 1669) if the publication corresponds to the same **dds::domain::DomainParticipant** (p. 1079) that the DataReader belongs to. Use the operation **dds::sub::matched_publications** (p. 456) to find the publications that are currently matched with the **dds::sub::DataReader** (p. 756).

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228) or dds::core::NotEnabledError (p. 1601)
------------	---

Template Parameters

<i>T</i>	The topic-type that the DataReader subscribes to
----------	--

Parameters

<i>reader</i>	The reader to lookup the matched participant data of
<i>handle</i>	The InstanceHandle to a specific publication. Must correspond to a publication currently associated with the DataReader. This handle is available in the dds::sub::SampleInfo::publication_handle() (p. 1997)

Returns

The **dds::topic::ParticipantBuiltinTopicData** (p. 1639) of the DomainParticipant of a matched publication of a **dds::sub::DataReader** (p. 756)

7.30.2.3 is_matched_publication_alive()

```
template<typename T >
bool rti::sub::is_matched_publication_alive (
    const dds::sub::DataReader< T > & reader,
    const dds::core::InstanceHandle & handle )
```

<<**extension**>> (p. 156) Check if a matched publication is alive.

Note

This is a standalone function in the namespace **rti::sub** (p. 538)

Template Parameters

<i>T</i>	The topic-type that the DataReader subscribes to.
----------	---

Parameters

<i>reader</i>	The DataReader.
<i>handle</i>	The dds::core::InstanceHandle (p. 1356) of the matched publication.

This API is used for querying the endpoint liveliness of a matched publication. A matched publication will be marked as not alive if the liveliness that it committed to through its **LIVELINESS** (p. 326) QoS policy was not respected. Note that if the participant associated with the matched publication loses liveliness, the **dds::core::InstanceHandle** (p. 1356) will become invalid and this function will fail with **dds::core::InvalidArgumentError** (p. 1363).

of the matched publication. See **dds::sub::matched_publications** (p. 456) for a description of what is considered a matched publication.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

Returns

A boolean indicating whether or not the matched publication is alive.

7.30.2.4 matched_publication_data()

```
template<typename T >
std::vector< dds::topic::PublicationBuiltinTopicData > rti::sub::matched_publication_data (
    const dds::sub::DataReader< T > & reader )
```

<<**extension**>> (p. 156) Obtain the PublicationBuiltinTopicData for all of the publications matched with a DataReader.

Note

This is a standalone function in the namespace **rti::sub** (p. 538)

This API retrieves the matched subscription data from all of the publications currently matched a DataReader.

Template Parameters

<i>T</i>	The topic-type that the DataReader subscribes to.
----------	---

Parameters

<i>reader</i>	The DataReader.
---------------	-----------------

Returns

A `std::vector` containing all of the matched publication data.

7.30.2.5 find_subscribers() [1/2]

```
template<typename SubscriberForwardIterator >
uint32_t rti::sub::find_subscribers (
    const dds::domain::DomainParticipant participant,
    SubscriberForwardIterator begin,
    uint32_t max_size )
```

<<**extension**>> (p. 156) Retrieve all of the **dds::sub::Subscriber** (p.2116) created from this **dds::domain::↔ DomainParticipant** (p. 1079)

Note

This is a standalone function in the namespace **rti::sub** (p. 538)

Template Parameters

<i>SubscriberForwardIterator</i>	Type of the forward iterator passed into this function, whose <code>value_type</code> must be dds::sub::Subscriber (p. 2116).
----------------------------------	--

Parameters

<i>participant</i>	The dds::domain::DomainParticipant (p. 1079) the Publishers belong to
<i>begin</i>	A forward iterator to the position in the destination container where to begin copying the found Subscribers into
<i>max_size</i>	The maximum size of Subscribers to add

Returns

The number of found Subscribers

7.30.2.6 find_subscribers() [2/2]

```
template<typename SubscriberBackInsertIterator >
uint32_t rti::sub::find_subscribers (
    const dds::domain::DomainParticipant participant,
    SubscriberBackInsertIterator begin )
```

<<*extension*>> (p. 156) Retrieve all of the **dds::sub::Subscriber** (p.2116) created from this **dds::domain::↔DomainParticipant** (p. 1079)

Note

This is a standalone function in the namespace **rti::sub** (p. 538)

Template Parameters

<i>AnyDataReaderBackInsertIterator</i>	Type of the back-inserting iterator passed into this function, whose value_type must be dds::sub::Subscriber (p. 2116).
--	--

Parameters

<i>participant</i>	The dds::domain::DomainParticipant (p. 1079) the Subscribers belong to
<i>begin</i>	A back-inserting iterator to the position in the destination container to insert the found Subscribers into

Returns

The number of found Subscribers

7.30.2.7 find_subscriber()

```
dds::sub::Subscriber rti::sub::find_subscriber (
    const dds::domain::DomainParticipant participant,
    const std::string & subscriber_name )
```

<<*extension*>> (p. 156) Finds a Subscriber by name

Note

This is a standalone function in the namespace **rti::sub** (p. 538)

Template Parameters

<i>AnyDataReaderBackInsertIterator</i>	Type of the back-inserting iterator passed into this function, whose <code>value_type</code> must be dds::sub::AnyDataReader (p. 595).
--	---

Parameters

<i>participant</i>	The dds::domain::DomainParticipant (p. 1079) the Subscribers belong to
<i>subscriber_name</i>	The name of the Subscriber

Returns

A valid reference if the a subscriber with that name exists or a reference equals to **dds::core::null** (p. 238) otherwise.

7.30.2.8 `find_datareaders()` [1/2]

```
template<typename AnyDataReaderBackInsertIterator >
uint32_t rti::sub::find_datareaders (
    dds::sub::Subscriber subscriber,
    AnyDataReaderBackInsertIterator begin )
```

<<*extension*>> (p. 156) Retrieve all the **dds::sub::DataReader** (p. 756) created from this **dds::sub::Subscriber** (p. 2116)

Note

This is a standalone function in the namespace **rti::sub** (p. 538)

Template Parameters

<i>AnyDataReaderBackInsertIterator</i>	Type of the back-inserting iterator passed into this function, whose <code>value_type</code> must be dds::sub::AnyDataReader (p. 595).
--	---

Parameters

<i>subscriber</i>	The dds::sub::Subscriber (p. 2116) the DataReaders belong to
<i>begin</i>	A back-inserting iterator to the position in the destination container to insert the found DataReaders into

Returns

The number of found DataReaders

See also

Looking up DataReaders (p. 123)

7.30.2.9 find_datareaders() [2/2]

```
template<typename AnyDataReaderForwardIterator >
uint32_t rti::sub::find_datareaders (
    dds::sub::Subscriber subscriber,
    AnyDataReaderForwardIterator begin,
    uint32_t max_size )
```

<<**extension**>> (p. 156) Retrieve all the readers created from a subscriber.

Note

This is a standalone function in the namespace **rti::sub** (p. 538)

Template Parameters

<i>AnyDataReaderForwardIterator</i>	A forward iterator whose <code>value_type</code> is dds::sub::AnyDataReader (p. 595)
-------------------------------------	---

Parameters

<i>subscriber</i>	The dds::sub::Subscriber (p. 2116) the readers belong to
<i>begin</i>	A forward iterator to the position in the destination container where to begin copying the found readers into.
<i>max_size</i>	The maximum number of readers to return

Returns

The number of found readers

See also

Looking up DataReaders (p. 123)

7.30.2.10 find_datareader_by_topic_name()

```
template<typename Reader >
Reader rti::sub::find_datareader_by_topic_name (
```

```

    dds::sub::Subscriber subscriber,
    const std::string & topic_name )

```

<<*extension*>> (p. 156) Retrieves a **dds::sub::DataReader** (p. 756) with the given topic name within the **dds::sub::Subscriber** (p. 2116)

Note

This is a standalone function in the namespace **rti::sub** (p. 538)

Use this operation on the built-in **dds::sub::Subscriber** (p. 2116) (**Built-in Topics** (p. 44)) to access the built-in **dds::sub::DataReader** (p. 756) entities for the built-in topics.

The built-in **dds::sub::DataReader** (p. 756) is created when this operation is called on a built-in topic for the first time. The built-in **dds::sub::DataReader** (p. 756) is deleted automatically when the **dds::domain::DomainParticipant** (p. 1079) is deleted.

To ensure that builtin **dds::sub::DataReader** (p. 756) entities receive all the discovery traffic, it is suggested that you lookup the builtin **dds::sub::DataReader** (p. 756) before the **dds::domain::DomainParticipant** (p. 1079) is enabled. Looking up builtin **dds::sub::DataReader** (p. 756) may implicitly register builtin transports due to creation of **dds::sub::DataReader** (p. 756) (see **Built-in Transport Plugins** (p. 81) for details on when a builtin transport is registered). Therefore, if you are want to modify builtin transport properties, do so *before* using this operation.

Therefore the suggested sequence when looking up builtin DataReaders is:

- Create a disabled **dds::domain::DomainParticipant** (p. 1079).
- (optional) Modify builtin transport properties
- Call **dds::sub::builtin_subscriber()** (p. 459).
- Call **dds::sub::find()** (p. 460).
- Call **enable()** (p. 371) on the DomainParticipant.

The returned **dds::sub::DataReader** (p. 756) may be enabled or disabled.

If more than one **dds::sub::DataReader** (p. 756) is attached to the **dds::sub::Subscriber** (p. 2116), this operation may return any one of them.

MT Safety:

UNSAFE. It is not safe to lookup a **dds::sub::DataReader** (p. 756) in one thread while another thread is simultaneously creating or destroying that **dds::sub::DataReader** (p. 756).

Template Parameters

<i>Reader</i>	The type of the reader. It can be dds::sub::AnyDataReader (p. 595), or an instantiation of dds::sub::DataReader<T> (if T is not the correct type, this function throws dds::core::InvalidDowncastError (p. 1364))
---------------	--

Parameters

<i>subscriber</i>	The dds::sub::Subscriber (p. 2116) that created the DataReader to find
<i>topic_name</i>	Topic name of the DataReader to find

Returns

The DataReader with the given topic name, or **dds::core::null** (p. 238) if it doesn't exist

See also

Looking up DataReaders (p. 123)

7.30.2.11 find_datareader_by_name() [1/2]

```
template<typename Reader >
Reader rti::sub::find_datareader_by_name (
    dds::sub::Subscriber subscriber,
    const std::string & datareader_name )
```

<<**extension**>> (p. 156) Retrieves a **dds::sub::DataReader** (p. 756) with the given name within the **dds::sub::Subscriber** (p. 2116)

Note

This is a standalone function in the namespace **rti::sub** (p. 538)

Template Parameters

<i>Reader</i>	The type of the reader. It can be dds::sub::AnyDataReader (p. 595), or an instantiation of dds::sub::DataReader<T> (if T is not the correct type, this function throws dds::core::InvalidDowncastError (p. 1364))
---------------	--

Every **dds::sub::DataReader** (p. 756) in the system has an entity name which is configured and stored in the <<**extension**>> (p. 156) EntityName policy, **ENTITY_NAME** (p. 323).

This operation retrieves the **dds::sub::DataReader** (p. 756) within the **dds::sub::Subscriber** (p. 2116) whose name matches the one specified. If there are several **dds::sub::DataReader** (p. 756) with the same name within the **dds::sub::Subscriber** (p. 2116), the operation returns the first matching occurrence.

Parameters

<i>subscriber</i>	The dds::sub::Subscriber (p. 2116) that created the DataReader to find
<i>datareader_name</i>	Entity name of the DataReader to find

Returns

The DataReader with the given name, or **dds::core::null** (p. 238) if it doesn't exist

See also

Looking up DataReaders (p. 123)

7.30.2.12 find_datareader_by_topic_description()

```
template<typename Reader , typename T >
Reader rti::sub::find_datareader_by_topic_description (
    const dds::sub::Subscriber & subscriber,
    const dds::topic::TopicDescription< T > & topic_description )
```

<<**extension**>> (p. 156) Retrieves a **dds::sub::DataReader** (p. 756) with the given TopicDescription within the **dds::sub::Subscriber** (p. 2116)

Note

This is a standalone function in the namespace **rti::sub** (p. 538)

Template Parameters

<i>Reader</i>	The type of the reader returned, for example, dds::sub::DataReader <Foo>, or dds::sub::AnyDataReader (p. 595)
<i>T</i>	The topic-type

Parameters

<i>subscriber</i>	The Subscriber to which the DataReader belongs
<i>topic_description</i>	The TopicDescription identifying the DataReader to find

Returns

The found DataReader, or **dds::core::null** (p. 238) if it doesn't exist

7.30.2.13 find_datareader_by_name() [2/2]

```
template<typename Reader >
Reader rti::sub::find_datareader_by_name (
```

```

    dds::domain::DomainParticipant participant,
    const std::string & datareader_name )

```

<<**extension**>> (p. 156) Retrieves a **dds::sub::DataReader** (p. 756) within the **dds::domain::DomainParticipant** (p. 1079) with the given name

Note

This is a standalone function in the namespace **rti::sub** (p. 538)

Template Parameters

<i>Reader</i>	The type of the reader. It can be dds::sub::AnyDataReader (p. 595), or an instantiation of dds::sub::DataReader<T> (if T is not the correct type, this function throws dds::core::InvalidDowncastError (p. 1364))
---------------	--

Every **dds::sub::DataReader** (p. 756) in the system has an entity name which is configured and stored in the EntityName policy, **ENTITY_NAME** (p. 323).

Every **dds::sub::Subscriber** (p. 2116) in the system has an entity name which is also configured and stored in the EntityName policy, **ENTITY_NAME** (p. 323).

This operation retrieves a **dds::sub::DataReader** (p. 756) within a **dds::sub::Subscriber** (p. 2116) given the specified name which encodes both to the **dds::sub::DataReader** (p. 756) and the **dds::sub::Subscriber** (p. 2116) name.

If there are several **dds::sub::DataReader** (p. 756) with the same name within the corresponding **dds::sub::Subscriber** (p. 2116) this function returns the first matching occurrence.

The specified name might be given as a fully-qualified entity name or as a plain name.

The fully qualified entity name is a concatenation of the **dds::sub::Subscriber** (p. 2116) to which the **dds::sub::DataReader** (p. 756) belongs and the entity name of of the **dds::sub::DataReader** (p. 756) itself, separated by a double colon "::". For example: MySubscriberName::MyDataReaderName

The plain name contains the **dds::sub::DataReader** (p. 756) name only. In this situation it is implied that the **dds::sub::DataReader** (p. 756) belongs to the implicit **dds::sub::Subscriber** (p. 2116) so the use of a plain name is equivalent to specifying a fully qualified name with the **dds::sub::Subscriber** (p. 2116) name part being "implicit". For example: the plain name "MyDataReaderName" is equivalent to specifying the fully qualified name "implicit::MyDataReaderName"

The **dds::sub::DataReader** (p. 756) is only looked up within the **dds::sub::Subscriber** (p. 2116) specified in the fully qualified name, or within the implicit **dds::sub::Subscriber** (p. 2116) if the name was not fully qualified.

Parameters

<i>participant</i>	The dds::domain::DomainParticipant (p. 1079) within which the dds::sub::DataReader (p. 756) exists
<i>datareader_name</i>	EntityName of the DataReader to find

Returns

The first reader with the given name or **dds::core::null** (p. 238) if it is not found.

See also

rti::sub::find_datareader_by_name(const dds::sub::Subscriber&, const std::string&)

7.30.2.14 copy_to_sample()

```
template<typename T >
dds::sub::Sample< T > copy_to_sample (
    const rti::sub::LoanedSample< T > & ls )
```

Copies the contents of a **rti::sub::LoanedSample** (p. 1402) into a **dds::sub::Sample** (p. 1977).

Example:

```
dds::sub::LoanedSamples<Foo> samples = reader.take();
std::vector<Sample<Foo> > sample_vector;
std::transform(
    rti::sub::valid_data(samples.begin()),
    rti::sub::valid_data(samples.end()),
    std::back_inserter(sample_vector),
    rti::sub::copy_to_sample<Foo>);
```

7.30.2.15 operator<<()

```
template<typename T >
std::ostream & operator<< (
    std::ostream & out,
    const LoanedSample< T > & sample )
```

Calls the operator on the data or prints [invalid data].

7.30.2.16 begin() [1/2]

```
template<typename T >
ValidLoanedSamples< T >::iterator begin (
    ValidLoanedSamples< T > & ls )
```

See also

ValidLoanedSamples::begin() (p. 2299)

Referenced by **dds::sub::DataReader< T >::find_datareaders()**, and **dds::sub::Subscriber::find_subscribers()**.

7.30.2.17 begin() [2/2]

```
template<typename T >
ValidLoanedSamples< T >::const_iterator begin (
    const ValidLoanedSamples< T > & ls )
```

See also

ValidLoanedSamples::begin() (p. 2299)

7.30.2.18 end() [1/2]

```
template<typename T >
ValidLoanedSamples< T >::iterator end (
    ValidLoanedSamples< T > & ls )
```

See also

ValidLoanedSamples::end() (p. 2300)

7.30.2.19 end() [2/2]

```
template<typename T >
ValidLoanedSamples< T >::const_iterator end (
    const ValidLoanedSamples< T > & ls )
```

See also

ValidLoanedSamples::end() (p. 2300)

7.30.2.20 swap()

```
template<typename T >
void swap (
    ValidLoanedSamples< T > & ls1,
    ValidLoanedSamples< T > & ls2 ) throw ( )
```

See also

ValidLoanedSamples::swap() (p. 2301)

7.30.2.21 valid_data() [1/2]

```
template<typename T >
ValidLoanedSamples< T > rti::sub::valid_data (
    LoanedSamples< T > && samples )
```

<<**C++11**>> (p. 155) <<**extension**>> (p. 156) Returns a collection that provides access only to samples with valid data

Template Parameters

<i>T</i>	The topic-type. It has to match the type of the DataReader.
----------	---

This function transforms a `LoanedSamples` collection into another collection whose iterators only access valid-data samples, skipping any sample such that `!sample.info().valid()`.

This operation is $O(1)$ and will not copy the data samples or allocated any additional memory.

The typical way to use this function is to directly call it on the return value of a `read()` (p. 801)/`take()` operation and use it in a for-loop. For example:

```
auto valid_samples = rti::sub::valid_data(reader.read());
for (auto sample : valid_samples) {
    // no need to check sample.info().valid()
    std::cout << sample.data() << std::endl;
}
```

Parameters

<i>samples</i>	<p>The collection of <code>LoanedSamples</code> to transform into a ValidLoanedSamples (p. 2296). It must be an rvalue, so valid actual parameters are the result of one of the read/take operations:</p> <pre>auto vs = rti::sub::valid_data(reader.take());</pre> <p>Or an <code>std::move</code>'d existing collection:</p> <pre>auto ls = reader.take(); auto vs = rti::sub::valid_data(std::move(ls)); // 'ls' is now invalid and can't be further used</pre>
----------------	---

Returns

A forward-iterable collection that provides access only to samples with valid data. Note that this collection doesn't provide random access.

Postcondition

`samples` is invalid cannot be used after this call

See also

`rti::sub::valid_data(const SampleIterator<T>&)` (p. 554), which applies to an iterator rather to the whole collection

Reading data samples (p. 119)

7.30.2.22 operator==()

```
bool rti::sub::operator== (
    const SampleInfoImpl & other ) const
```

Compare two **`dds::sub::SampleInfo`** (p. 1992) objects for equality.

7.30.2.23 valid_data() [2/2]

```
template<typename T >
ValidSampleIterator< T > rti::sub::valid_data (
    const SampleIterator< T > & sample_iterator )
```

<<**extension**>> (p. 156) Returns an iterator that skips invalid samples

Given a regular sample iterator, this functions creates another iterator `it` that behaves exactly the same except that `it++` moves to the next valid sample (or to the end of the collection). That is, if `it` doesn't point to the end of the collection, `it->info.valid()` is always true.

This is useful when your application doesn't need to deal with samples containing meta-information only.

For example, the following code copies all the data in a `LoanedSamples` collection skipping any invalid samples (otherwise, attempting to copy the data from an invalid sample would throw an exception, see `rti::sub::LoanedSample::operator const DataType& ()`).

```
dds::sub::LoanedSamples<KeyedType> samples = reader.take();
std::vector<KeyedType> data_vector;
std::copy(
    rti::sub::valid_data(samples.begin()),
    rti::sub::valid_data(samples.end()),
    std::back_inserter(data_vector));
```

Note that `valid_data(samples.begin())` won't point to the first element if that element is not a valid sample.

A similar utility is the functor `rti::sub::IsValidData` (p. 1368).

See also

dds::sub::LoanedSamples (p. 1406)

rti::sub::IsValidData (p. 1368)

dds::sub::SampleInfo::valid() (p. 1996)

rti::sub::valid_data(LoanedSamples<T>&&) (p. 553), which applies to the whole collection instead of an iterator

Reading data samples (p. 119)

7.30.2.24 create_topic_query_data_from_service_request()

```
TopicQueryData create_topic_query_data_from_service_request (
    const rti::topic::ServiceRequest & service_request )
```

Creates a **TopicQueryData** (p. 2224) from a `ServiceRequest`.

This operation will extract the content from the request body of the **rti::topic::ServiceRequest** (p. 2065) to create a **rti::sub::TopicQueryData** (p. 2224) object.

The specified **rti::topic::ServiceRequest** (p. 2065) must be a valid sample associated with the service id **rti::core::ServiceRequestId_def::TOPIC_QUERY** (p. 2069). Otherwise this operation will return false.

This operation can be called within the context of a **dds::pub::DataWriterListener::on_service_request_accepted** (p. 978) to retrieve the **rti::sub::TopicQueryData** (p. 2224) of a **rti::topic::ServiceRequest** (p. 2065) that has been received with service id **rti::core::ServiceRequestId_def::TOPIC_QUERY** (p. 2069)

Parameters

<i>service_request</i>	The rti::topic::ServiceRequest (p. 2065) that contains the rti::sub::TopicQueryData (p. 2224) as part of its request body.
------------------------	--

Returns

A **rti::sub::TopicQueryData** (p. 2224) object where the content from the service request is extracted.

7.30.2.25 find_topic_query()

```
TopicQuery find_topic_query (
    dds::sub::AnyDataReader datareader,
    const rti::core::Guid & guid )
```

Looks up a **TopicQuery** (p. 2220) by its GUID.

Parameters

<i>datareader</i>	The DataReader used to create the TopicQuery (p. 2220)
<i>guid</i>	The TopicQuery (p. 2220)'s GUID

Returns

The **TopicQuery** (p. 2220) if it exists or a **dds::core::null** (p. 238) reference otherwise.

See also

rti::sub::TopicQuery::guid() (p. 2222)

7.30.2.26 unpack() [1/3]

```
template<typename T >
void rti::sub::unpack (
    const dds::sub::SharedSamples< T > & samples,
    std::vector< std::shared_ptr< const T > > & sample_vector )
```

<<**extension**>> (p. 156) <<**C++11**>> (p. 155) Unpacks a **SharedSamples** (p.2074) collection into individual **shared_ptr**'s in a vector

Note

```
#include <rti/sub/unpack.hpp>
```

This is a standalone function in the namespace **rti::sub** (p. 538)

This function creates a reference (not a copy) to each sample with valid data in a **SharedSamples** (p. 2074) container and pushes it back into a vector.

Each individual sample in the vector retains a reference to the original **SharedSamples** (p. 2074) that controls when the loan is returned. These references can be further shared. When all the references go out of scope, the loan is returned.

This can be also useful to insert samples from different calls to **read()** (p. 801)/**take()** into the same vector. It is however recommended to not hold these samples indefinitely, since they use internal resources.

Example:

```
dds::sub::SharedSamples<Foo> shared_samples = reader.take();
std::vector<std::shared_ptr<const Foo> sample_vector;
rti::sub::unpack(shared_samples, sample_vector);
std::cout << *sample_vector[0] << std::endl;
// ...
// Read more samples, unpack them at the end of the same vector
shared_samples = reader.take();
rti::sub::unpack(shared_samples, sample_vector);
// References to the samples can be shared freely
std::shared_ptr<const Foo> sample = sample_vector[3];
// ...
// The loans will be returned automatically
```

Note

To finalize a DataReader, all the shared_ptr obtained via **unpack()** (p. 556) need to have been released. Otherwise DataReader::close() will fail with **dds::core::PreconditionNotMetError** (p. 1669).

Template Parameters

<i>T</i>	The topic-type
----------	----------------

Parameters

<i>samples</i>	The collection of samples obtained from the DataReader
<i>sample_vector</i>	The destination where the samples are pushed back.

Referenced by **dds::sub::SharedSamples< T, DELEGATE >::unpack()**.

7.30.2.27 unpack() [2/3]

```
template<typename T >
std::vector< std::shared_ptr< const T > > rti::sub::unpack (
    const dds::sub::SharedSamples< T > & samples )
```

<<**extension**>> (p. 156) <<**C++11**>> (p. 155) Unpacks a **SharedSamples** (p. 2074) collection into individual shared_ptr's in a vector

Note

This is a standalone function in the namespace **rti::sub** (p. 538)

This overload returns a new vector instead of adding into an existing one.

See also

unpack(const dds::sub::SharedSamples<T>&, std::vector<std::shared_ptr<const T> >&) (p. 556)

7.30.2.28 unpack() [3/3]

```
template<typename T >
std::vector< std::shared_ptr< const T > > rti::sub::unpack (
    dds::sub::LoanedSamples< T > && samples )
```

<<*extension*>> (p. 156) <<**C++11**>> (p. 155) Unpacks a LoanedSamples collection into individual shared_ptr's in a vector

Note

This is a standalone function in the namespace **rti::sub** (p. 538)

This overload is a shortcut for `unpack(SharedSamples<T>(loaned_samples))` to simplify code like the following:

```
auto sample_vector = unpack(reader.take());
```

See also

unpack(const dds::sub::SharedSamples<T>&, std::vector<std::shared_ptr<const T> >&) (p. 556)

7.31 rti::topic Namespace Reference

<<*extension*>> (p. 156) Extensions to **dds::topic** (p. 476)

Classes

- class **ContentFilter**
 <<extension>> (p. 156) A class to inherit from when implementing a custom content filter
- class **CustomFilter**
 <<extension>> (p. 156) <<reference-type>> (p. 153) A wrapper class for the user-defined implementation of a **ContentFilter** (p. 732).
- struct **dynamic_type**
 Provides a *DynamicType* that represents an IDL-generated type.
- class **ExpressionProperty**
 <<extension>> (p. 156) <<value-type>> (p. 152) Provides additional information about the filter expression passed to the *writer_compile* method of **rti::topic::WriterContentFilter** (p. 2351)
- struct **extensibility**
 <<extension>> (p. 156) Indicates the extensibility kind of a topic-type
- class **FilterSampleInfo**
 <<extension>> (p. 156) <<value-type>> (p. 152) Provides meta information associated with the sample.
- struct **no_compile_data_t**
 The type to specify as the *CompileData* template parameter to your **ContentFilter** (p. 732) if your compile function does not return any data.
- struct **PrintFormatKind_def**
 The definition of the **dds::core::safe_enum** (p. 1972) *PrintFormatKind*.
- class **PrintFormatProperty**
 <<extension>> (p. 156) <<value-type>> (p. 152) A collection of attributes used to configure how data samples will be formatted when converted to a string.
- class **ServiceRequest**
 <<extension>> (p. 156) <<value-type>> (p. 152) A request coming from one of the built-in services
- struct **topic_type_disabled_copy**
 <<extension>> (p. 156) Indicates whether a *TopicType* is uncopyable
- struct **topic_type_has_external_members**
 <<extension>> (p. 156) Indicates if a topic type contains directly or indirectly IDL external members.
- class **WriterContentFilter**
 <<extension>> (p. 156) A class to inherit from when implementing a writer-side custom content filter
- class **WriterContentFilterHelper**
 <<extension>> (p. 156) A class to inherit from when implementing a writer-side custom content filter.

Typedefs

- typedef **dds::core::safe_enum< PrintFormatKind_def > PrintFormatKind**
Safe Enumeration (p. 229) of **PrintFormatKind_def** (p. 1687) Format kinds available when converting data samples to string representations.

Functions

- template<typename TopicType >
void **from_cdr_buffer_no_alloc** (TopicType &sample, const std::vector< char > &buffer)
Deserializes a sample from a buffer of bytes in CDR format.
- template<typename TopicType >
TopicType **from_cdr_buffer** (const std::vector< char > &buffer)
Creates a sample by deserializing a buffer of bytes in CDR format.
- template<typename TopicType >
std::vector< char > & **to_cdr_buffer** (std::vector< char > &buffer, const TopicType &sample, **dds::core**↔
::policy::DataRepresentationId representation)
Serializes a sample into a buffer of octets in CDR format.
- template<typename TopicType >
std::vector< char > & **to_cdr_buffer** (std::vector< char > &buffer, const TopicType &sample)
Serializes a sample into a buffer of octets in CDR format.
- std::string **sql_filter_name** ()
<<extension>> (p. 156) The name of the built-in SQL filter
- std::string **stringmatch_filter_name** ()
<<extension>> (p. 156) The name of the built-in StringMatch filter
- template<typename AnyTopicBackInsertIterator >
uint32_t **find_topics** (**dds::domain::DomainParticipant** participant, AnyTopicBackInsertIterator begin)
*<<extension>> (p. 156) Retrieve all the **dds::topic::Topic** (p.2178) created from this **dds::domain::Domain**↔
Participant (p. 1079)*
- template<typename AnyTopicForwardIterator >
uint32_t **find_topics** (**dds::domain::DomainParticipant** participant, AnyTopicForwardIterator begin, uint32_t
max_size)
*<<extension>> (p. 156) Retrieve all the **dds::topic::Topic** (p.2178) created from this **dds::domain::Domain**↔
Participant (p. 1079)*
- template<typename T >
CustomFilter< T > **find_content_filter** (const **dds::domain::DomainParticipant** &participant, const std↔
::string &filter_name)
*Lookup a content filter previously registered with **dds::domain::DomainParticipant::register_contentfilter** (p. 1103).*
- template<typename FwdIterator >
uint32_t **find_registered_content_filters** (const **dds::domain::DomainParticipant** &participant, FwdIterator
begin, uint32_t max_size)
*<<extension>> (p. 156) Lookup the names of up to max_size number of the custom content filters registered to a
dds::domain::DomainParticipant (p. 1079)*
- template<typename BinIterator >
uint32_t **find_registered_content_filters** (const **dds::domain::DomainParticipant** &participant, BinIterator
begin)
*Lookup the names of all of the custom content filters registered to a **dds::domain::DomainParticipant** (p. 1079).*
- template<typename TopicType >
std::ostream & **to_string** (std::ostream &out, const TopicType &sample, const **PrintFormatProperty** &print↔
format= **PrintFormatProperty::Default**())
Prints a data sample to an output stream.
- template<typename TopicType >
std::string **to_string** (const TopicType &sample, const **PrintFormatProperty** &print_format= **PrintFormat**↔
Property::Default())
Transforms a data sample into a human-readable string format.
- template<typename TopicType >
TopicType **from_string** (RTI_STRING_IN str, **PrintFormatKind** format_kind=PrintFormatKind::JSON)

Creates a data sample from a JSON string representation.

- `std::string service_request_topic_name ()`
ServiceRequest (p. 2065) built-in topic name.

7.31.1 Detailed Description

<<*extension*>> (p. 156) Extensions to `dds::topic` (p. 476)

7.31.2 Function Documentation

7.31.2.1 `find_topics()` [1/2]

```
template<typename AnyTopicBackInsertIterator >
uint32_t rti::topic::find_topics (
    dds::domain::DomainParticipant participant,
    AnyTopicBackInsertIterator begin )
```

<<*extension*>> (p. 156) Retrieve all the `dds::topic::Topic` (p.2178) created from this `dds::domain::DomainParticipant` (p. 1079)

```
#include <dds/topic/find.hpp>
```

Note

This is a standalone function in the namespace `rti::topic` (p. 558)

Template Parameters

<i>AnyTopicBackInsertIterator</i>	Type of the back-inserting iterator, whose <code>value_type</code> is <code>dds::topic::AnyTopic</code> (p. 612).
-----------------------------------	---

Parameters

<i>participant</i>	The <code>dds::domain::DomainParticipant</code> (p. 1079) the Topics belong to
<i>begin</i>	A back-inserting iterator to the position in the destination container to insert the found Topics into

Returns

The number of found Topics

7.31.2.2 find_topics() [2/2]

```
template<typename AnyTopicForwardIterator >
uint32_t rti::topic::find_topics (
    dds::domain::DomainParticipant participant,
    AnyTopicForwardIterator begin,
    uint32_t max_size )
```

<<**extension**>> (p. 156) Retrieve all the **dds::topic::Topic** (p.2178) created from this **dds::domain::DomainParticipant** (p.1079)

```
#include <dds/topic/find.hpp>
```

Note

This is a standalone function in the namespace **rti::topic** (p. 558)

Template Parameters

<i>AnyTopicBackInsertIterator</i>	Type of the back-inserting iterator, whose value_type is dds::topic::AnyTopic (p. 612).
-----------------------------------	--

Parameters

<i>participant</i>	The dds::domain::DomainParticipant (p. 1079) the Topics belong to
<i>begin</i>	A forward iterator to the position in the destination container to insert the found Topics in
<i>max_size</i>	The maximum number of Topics to return

Returns

The number of found Topics

7.31.2.3 find_registered_content_filters() [1/2]

```
template<typename FwdIterator >
uint32_t rti::topic::find_registered_content_filters (
    const dds::domain::DomainParticipant & participant,
    FwdIterator begin,
    uint32_t max_size )
```

<<**extension**>> (p. 156) Lookup the names of up to max_size number of the custom content filters registered to a **dds::domain::DomainParticipant** (p. 1079)

Note

This is a standalone function in the namespace **rti::topic** (p. 558)

The names of the RTI Connex built-in content filters will not be returned as part of the list.

Template Parameters

<i>FwdIterator</i>	A forward iterator whose value type is <code>std::string</code> (or convertible to)
--------------------	---

Parameters

<i>participant</i>	The dds::domain::DomainParticipant (p. 1079) that the content filters are registered with
<i>begin</i>	A forward iterator to the position in the destination container to insert the names of the found content filters into
<i>max_size</i>	The maximum number of filters to lookup

Returns

The number of found content filters

Referenced by **dds::topic::ContentFilteredTopic< T >::find_registered_content_filters()**.

7.31.2.4 find_registered_content_filters() [2/2]

```
template<typename BinIterator >
uint32_t rti::topic::find_registered_content_filters (
    const dds::domain::DomainParticipant & participant,
    BinIterator begin )
```

Lookup the names of all of the custom content filters registered to a **dds::domain::DomainParticipant** (p. 1079).

```
#include <dds/topic/find.hpp>
```

Note

This is a standalone function in the namespace **rti::topic** (p. 558)

The names of the RTI Connex built-in content filters will not be returned as part of the list.

Template Parameters

<i>BinIterator</i>	A back-inserting iterator whose value type is <code>std::string</code> (or convertible to)
--------------------	--

Parameters

<i>participant</i>	The dds::domain::DomainParticipant (p. 1079) that the content filters are registered with
<i>begin</i>	A back-inserting iterator to the position in the destination container to insert the the names of the found content filters into

Returns

The number of found content filters

7.32 rti::util Namespace Reference

<<**extension**>> (p. 156) Contains general-purpose utilities

Namespaces

- namespace **activation**
 <<**extension**>> (p. 156) Contains the necessary functions related to Activation.
- namespace **discovery**
 <<**extension**>> (p. 156) Contains the functions to take discovery snapshot for DomainParticipant, DataWriter and DataReader entities.
- namespace **function_history**
 <<**extension**>> (p. 156) Contains the functions to enable Function History feature.
- namespace **heap_monitoring**
 <<**extension**>> (p. 156) Contains the functions to enable and use the heap-monitoring utility.
- namespace **network_capture**
 <<**extension**>> (p. 156) Contains the functions to enable and use the Network Capture utility.

Classes

- class **StreamFlagSaver**

Functions

- void **sleep** (const **dds::core::Duration** &durationIn)
 Blocks the calling thread for the specified duration.
- uint64_t **spin_per_microsecond** ()
 Returns the number of spin operations needed to wait 1 microsecond.
- void **spin** (uint64_t spin_count)
 Performs a spin operation (active wait) as many times as indicated.

7.32.1 Detailed Description

<<**extension**>> (p. 156) Contains general-purpose utilities

7.33 rti::util::activation Namespace Reference

<<**extension**>> (p. 156) Contains the necessary functions related to Activation.

Functions

- bool **unload_activation_library** ()
Unloads the Activation Library (rti_activation) if it was previously loaded.

7.33.1 Detailed Description

<<*extension*>> (p. 156) Contains the necessary functions related to Activation.

7.34 rti::util::discovery Namespace Reference

<<*extension*>> (p. 156) Contains the functions to take discovery snapshot for DomainParticipant, DataWriter and DataReader entities.

Functions

- void **take_snapshot** (**dds::domain::DomainParticipant** participant)
<<*extension*>> (p. 156) *Take a snapshot of the remote participants discovered by a local one.*
- void **take_snapshot** (**dds::domain::DomainParticipant** participant, const std::string &file_name)
<<*extension*>> (p. 156) *Take a snapshot of the remote participants discovered by a local one.*
- void **take_snapshot** (**dds::pub::AnyDataWriter** writer)
<<*extension*>> (p. 156) *Take a snapshot of the compatible and incompatible remote readers matched by a local writer.*
- void **take_snapshot** (**dds::pub::AnyDataWriter** writer, const std::string &file_name)
<<*extension*>> (p. 156) *Take a snapshot of the compatible and incompatible remote readers matched by a local writer.*
- void **take_snapshot** (**dds::sub::AnyDataReader** reader)
<<*extension*>> (p. 156) *Take a snapshot of the compatible and incompatible remote writers matched by a local reader.*
- void **take_snapshot** (**dds::sub::AnyDataReader** reader, const std::string &file_name)
<<*extension*>> (p. 156) *Take a snapshot of the compatible and incompatible remote writers matched by a local reader.*

7.34.1 Detailed Description

<<*extension*>> (p. 156) Contains the functions to take discovery snapshot for DomainParticipant, DataWriter and DataReader entities.

7.35 rti::util::function_history Namespace Reference

<<*extension*>> (p. 156) Contains the functions to enable Function History feature.

7.35.1 Detailed Description

<<*extension*>> (p. 156) Contains the functions to enable Function History feature.

7.36 rti::util::heap_monitoring Namespace Reference

<<*extension*>> (p. 156) Contains the functions to enable and use the heap-monitoring utility.

Classes

- class **HeapMonitoringParams**
Input parameters for enabling heap monitoring. They will be used for configuring the format of the snapshot.
- struct **SnapshotContentFormat_def**
Bitmap used to decide which information of the snapshot will be displayed.
- struct **SnapshotOutputFormat_def**
Specify the format of the output of the snapshot. RTI Connex.

Typedefs

- typedef **dds::core::safe_enum**< **SnapshotOutputFormat_def** > **SnapshotOutputFormat**
Specify the format of the output of the snapshot.
- typedef **dds::core::safe_enum**< **SnapshotContentFormat_def** > **SnapshotContentFormat**
Bitmap used to decide which information of the snapshot will be displayed.

Functions

- bool **enable** ()
Starts monitoring the heap memory used by RTI Connex.
- bool **enable** (const **HeapMonitoringParams** ¶ms)
Starts monitoring the heap memory used by RTI Connex with params.
- void **disable** ()
Stops monitoring the heap memory used by RTI Connex.
- bool **pause** ()
Pauses heap monitoring.
- bool **resume** ()
Resumes heap monitoring.
- bool **take_snapshot** (const std::string &filename, bool print_details=false)
Saves the current heap memory usage in a file.

7.36.1 Detailed Description

<<*extension*>> (p. 156) Contains the functions to enable and use the heap-monitoring utility.

7.37 rti::util::network_capture Namespace Reference

<<*extension*>> (p. 156) Contains the functions to enable and use the Network Capture utility.

Classes

- class **ContentKindMask**
 <<*extension*>> (p. 156) Mask indicating the types of contents to remove from RTPS frames before saving them to the capture file.
- class **NetworkCaptureParams**
 <<*extension*>> (p. 156) Input parameters for starting Network Capture.
- class **TrafficKindMask**
 <<*extension*>> (p. 156) Mask indicating the traffic direction to capture.

Functions

- bool **enable** ()
 Enable Network Capture.
- bool **disable** ()
 Disable Network Capture.
- bool **set_default_params** (const **NetworkCaptureParams** ¶ms)
 Set the default Network Capture parameters.
- bool **start** (const std::string &filename)
 Start Network Capture.
- bool **start** (**dds::domain::DomainParticipant** participant, const std::string &filename)
 Start Network Capture for a participant.
- bool **start** (const std::string &filename, const **NetworkCaptureParams** ¶ms)
 Start Network Capture with parameters.
- bool **start** (**dds::domain::DomainParticipant** participant, const std::string &filename, const **NetworkCaptureParams** ¶ms)
 Start Network Capture with parameters for a participant.
- bool **stop** ()
 Stop Network Capture.
- bool **stop** (**dds::domain::DomainParticipant** participant)
 Stop Network Capture.
- bool **pause** ()
 Pause Network Capture.
- bool **pause** (**dds::domain::DomainParticipant** participant)
 Pause Network Capture.
- bool **resume** ()
 Resume Network Capture.
- bool **resume** (**dds::domain::DomainParticipant** participant)
 Resume Network Capture.

7.37.1 Detailed Description

<<*extension*>> (p. 156) Contains the functions to enable and use the Network Capture utility.

Class Documentation

8.1 rti::flat::AbstractAlignedList< ElementOffset > Class Template Reference

Base class of Offsets to sequences and arrays of non-primitive members.

```
#include <SequenceOffsets.hpp>
```

Inheritance diagram for rti::flat::AbstractAlignedList< ElementOffset >:

Public Types

- typedef **Sequenceliterator**< ElementOffset, typename ElementOffset::offset_kind > **iterator**
*The iterator type, **Sequenceliterator** (p. 2035).*

Public Member Functions

- **iterator begin ()**
Gets an iterator to the first Offset.
- **iterator end ()**
Gets an iterator to the past-the-end element.

8.1.1 Detailed Description

```
template<typename ElementOffset>
class rti::flat::AbstractAlignedList< ElementOffset >
```

Base class of Offsets to sequences and arrays of non-primitive members.

Template Parameters

<i>ElementOffset</i>	The Offset type of the elements
----------------------	---------------------------------

8.1.2 Member Typedef Documentation

8.1.2.1 iterator

```
template<typename ElementOffset >
typedef SequenceIterator<ElementOffset, typename ElementOffset::offset_kind> rti::flat::↔
AbstractAlignedList< ElementOffset >::iterator
```

The iterator type, **Sequenceliterator** (p. 2035).

8.1.3 Member Function Documentation

8.1.3.1 begin()

```
template<typename ElementOffset >
iterator rti::flat::AbstractAlignedList< ElementOffset >::begin ( ) [inline]
```

Gets an iterator to the first Offset.

begin() (p. 570) and **end()** (p. 570) enable the use of range-for loops, for example:

```
SequenceOffset<MyFlatMutableOffset> sequence_offset = my_type_offset.my_sequence();
for (auto element : sequence_offset) {
    std::cout << element.x() << std::endl;
}
```

References **rti::flat::OffsetBase::get_buffer_size()**.

8.1.3.2 end()

```
template<typename ElementOffset >
iterator rti::flat::AbstractAlignedList< ElementOffset >::end ( ) [inline]
```

Gets an iterator to the past-the-end element.

References **rti::flat::OffsetBase::get_buffer_size()**.

8.2 rti::flat::AbstractBuilder Class Reference

Base class of all **Builders** (p. 209).

```
#include <Builder.hpp>
```

Inheritance diagram for rti::flat::AbstractBuilder:

Public Member Functions

- void **discard** ()
Discards a member in process of being built.
- bool **is_nested** () const
Returns whether this is a member Builder.
- bool **is_valid** () const
Whether this Builder is valid.
- rti::xcdr::length_t **capacity** () const
Returns the total capacity in bytes.

Protected Member Functions

- virtual **~AbstractBuilder** ()
If this is a member Builder, it calls finish().

8.2.1 Detailed Description

Base class of all **Builders** (p. 209).

8.2.2 Constructor & Destructor Documentation

8.2.2.1 ~AbstractBuilder()

```
virtual rti::flat::AbstractBuilder::~~AbstractBuilder ( ) [inline], [protected], [virtual]
```

If this is a member Builder, it calls finish().

If this Builder is building a member (that is, **is_nested()** (p. 572) is true), and the object goes out of scope before finish() has been called, its destructor calls finish(). Note, however, that it won't report any error.

If this Builder is building a sample (is_nested()), its destructor doesn't do anything.

8.2.3 Member Function Documentation

8.2.3.1 discard()

```
void rti::flat::AbstractBuilder::discard ( ) [inline]
```

Discards a member in process of being built.

This function ends the creation of a member, returning the Builder of the type that contains the member to its previous state, as if this member had never been built.

Precondition

This object must be a member Builder, not a sample Builder.

This method is useful when during the building of a member an error occurs and the application wants to roll back, instead of finishing an incomplete member.

8.2.3.2 is_nested()

```
bool rti::flat::AbstractBuilder::is_nested ( ) const [inline]
```

Returns whether this is a member Builder.

A member Builder is a Builder that has been created by calling a "build_<member>" function on another Builder (for example, **MyFlatMutableBuilder::build_my_mutable()** (p. 1503)).

Returns

True if this is a member Builder, or false if this is a sample Builder.

8.2.3.3 is_valid()

```
bool rti::flat::AbstractBuilder::is_valid ( ) const [inline]
```

Whether this Builder is valid.

A Builder is not valid when it is default-constructed, or after any of these functions is called: **finish()**, **finish_sample()**, **discard()** (p. 572).

8.2.3.4 capacity()

```
rti::xcdr::length_t rti::flat::AbstractBuilder::capacity ( ) const [inline]
```

Returns the total capacity in bytes.

The capacity is the total number of bytes this Builder can contain. For a sample Builder (that is, one such that `is_nested()` (p. 572) returns false), `rti::flat::build_data` (p. 211) reserves enough bytes to accommodate any sample of a given type.

8.3 dds::core::xtypes::AbstractConstructedType< MemberType > Class Template Reference

The base class of types that have members and an extensibility kind.

```
#include <DynamicTypeImpl.hpp>
```

Inheritance diagram for `dds::core::xtypes::AbstractConstructedType< MemberType >`:

Public Types

- typedef MemberType **Member**
The member type (specified by the subclasses of this class)
- typedef uint32_t **MemberIndex**
The member index type.

Public Member Functions

- **dds::core::xtypes::ExtensibilityKind** `extensibility_kind () const`
Gets the extensibility kind.
- `size_t` **member_count () const**
Gets the number of members.
- `const MemberType &` **member (MemberIndex index) const**
Gets a member by its index.
- `const MemberType &` **member (const std::string & name) const**
Gets a member by its name.
- **MemberIndex** `find_member_by_name (const std::string & name) const`
Obtains the member index from its name.
- `std::vector< MemberType >` **members () const**

Gets a copy of all the members.

- `uint32_t cdr_serialized_sample_max_size (dds::core::policy::DataRepresentationId representation_↔ id=DDS_AUTO_DATA_REPRESENTATION) const`

Gets the maximum serialized size of samples of this type.

- `uint32_t cdr_serialized_sample_min_size (dds::core::policy::DataRepresentationId representation_↔ id=DDS_AUTO_DATA_REPRESENTATION) const`

Gets the minimum serialized size of samples of this type.

- `uint32_t cdr_serialized_sample_key_max_size (dds::core::policy::DataRepresentationId representation_↔ id=DDS_AUTO_DATA_REPRESENTATION) const`

Gets the maximum serialized size of sample keys of this type.

Static Public Attributes

- static `OMG_DDS_API_CLASS_VARIABLE const MemberIndex INVALID_INDEX`

Indicates that a member doesn't exist.

Additional Inherited Members

8.3.1 Detailed Description

```
template<typename MemberType>
class dds::core::xtypes::AbstractConstructedType< MemberType >
```

The base class of types that have members and an extensibility kind.

Template Parameters

<i>MemberType</i>	The concrete member type, specified by the subclasses, can be Member (p. 1443), UnionMember (p. 2279) and EnumMember (p. 1278)
-------------------	---

This is the base class of **StructType** (p. 2107), **UnionType** (p. 2285) and **EnumType** (p. 1280).

8.3.2 Member Typedef Documentation

8.3.2.1 Member

```
template<typename MemberType >
typedef MemberType dds::core::xtypes::AbstractConstructedType< MemberType >::Member
```

The member type (specified by the subclasses of this class)

8.3.2.2 MemberIndex

```
template<typename MemberType >
typedef uint32_t dds::core::xtypes::AbstractConstructedType< MemberType >::MemberIndex
```

The member index type.

8.3.3 Member Function Documentation

8.3.3.1 extensibility_kind()

```
template<typename MemberType >
dds::core::xtypes::ExtensibilityKind dds::core::xtypes::AbstractConstructedType< MemberType >↔
::extensibility_kind ( ) const
```

Gets the extensibility kind.

8.3.3.2 member_count()

```
template<typename MemberType >
size_t dds::core::xtypes::AbstractConstructedType< MemberType >::member_count ( ) const
```

Gets the number of members.

8.3.3.3 member() [1/2]

```
template<typename MemberType >
const MemberType & dds::core::xtypes::AbstractConstructedType< MemberType >::member (
    MemberIndex index ) const
```

Gets a member by its index.

Parameters

<i>index</i>	The index of the member (0 to <code>member_count()</code> (p. 575) - 1)
--------------	---

8.3.3.4 member() [2/2]

```
template<typename MemberType >
const MemberType & dds::core::xtypes::AbstractConstructedType< MemberType >::member (
    const std::string & name ) const
```

Gets a member by its name.

8.3.3.5 find_member_by_name()

```
template<typename MemberType >
MemberIndex dds::core::xtypes::AbstractConstructedType< MemberType >::find_member_by_name (
    const std::string & name ) const
```

Obtains the member index from its name.

This method is applicable to **dds::core::xtypes::DynamicType** (p. 1249) objects representing structs (**dds::core::xtypes::TypeKind_def::STRUCTURE_TYPE** (p. 2275)) and union (**dds::core::xtypes::TypeKind_def::UNION_TYPE** (p. 2275)) types.

Parameters

<i>name</i>	<< <i>in</i> >> (p. 157) The member name.
-------------	---

Returns

The index of the member of the given name or **dds::core::xtypes::AbstractConstructedType::INVALID_INDEX** (p. 578) if the member is not found.

MT Safety:

SAFE.

8.3.3.6 members()

```
template<typename MemberType >
std::vector< MemberType > dds::core::xtypes::AbstractConstructedType< MemberType >::members ( )
const
```

Gets a copy of all the members.

8.3.3.7 cdr_serialized_sample_max_size()

```
template<typename MemberType >
uint32_t dds::core::xtypes::AbstractConstructedType< MemberType >::cdr_serialized_sample_max_size (
    dds::core::policy::DataRepresentationId representation_id = DDS_AUTO_DATA_REPRESENTATION
) const
```

Gets the maximum serialized size of samples of this type.

Obtains the maximum possible size in bytes of any serialized data sample of this type.

Precondition

The type is an aggregation type (struct, union)

Parameters

<i>representation_id</i>	The serialized data representation for which we calculate the maximum size.
--------------------------	---

Returns

The maximum size

8.3.3.8 cdr_serialized_sample_min_size()

```
template<typename MemberType >
uint32_t dds::core::xtypes::AbstractConstructedType< MemberType >::cdr_serialized_sample_min_size (
    dds::core::policy::DataRepresentationId representation_id = DDS_AUTO_DATA_REPRESENTATION
) const
```

Gets the minimum serialized size of samples of this type.

Obtains the minimum possible size in bytes of any serialized data sample of this type.

Precondition

The type is an aggregation type (struct, union)

Parameters

<i>representation_id</i>	The serialized data representation for which we calculate the minimum size.
--------------------------	---

Returns

The minimum size

8.3.3.9 cdr_serialized_sample_key_max_size()

```
template<typename MemberType >
uint32_t dds::core::xtypes::AbstractConstructedType< MemberType >::cdr_serialized_sample_key_↔
max_size (
    dds::core::policy::DataRepresentationId representation_id = DDS_AUTO_DATA_REPRESENTATION
) const
```

Gets the maximum serialized size of sample keys of this type.

Obtains the maximum possible size in bytes of the serialized keys of any data sample of this type

Precondition

The type is an aggregation type (struct, union)

Parameters

<i>representation_↔ _id</i>	The serialized data representation for which we calculate the maximum key size.
---------------------------------	---

Returns

The maximum key size

8.3.4 Member Data Documentation**8.3.4.1 INVALID_INDEX**

```
template<typename MemberType >
OMG_DDS_API_CLASS_VARIABLE const MemberIndex dds::core::xtypes::AbstractConstructedType< Member↔
Type >::INVALID_INDEX [static]
```

Indicates that a member doesn't exist.

8.4 rti::flat::AbstractListBuilder< DHeaderGen > Class Template Reference

Base class of all array and sequence builders.

```
#include <SequenceBuilders.hpp>
```

Inheritance diagram for rti::flat::AbstractListBuilder< DHeaderGen >:

Protected Member Functions

- unsigned int **element_count** () const
Returns the current number of elements that have been added.

Additional Inherited Members

8.4.1 Detailed Description

```
template<typename DHeaderGen>
class rti::flat::AbstractListBuilder< DHeaderGen >
```

Base class of all array and sequence builders.

8.4.2 Member Function Documentation

8.4.2.1 element_count()

```
template<typename DHeaderGen >
unsigned int rti::flat::AbstractListBuilder< DHeaderGen >::element_count ( ) const [inline],
[protected]
```

Returns the current number of elements that have been added.

8.5 rti::flat::AbstractPrimitiveList< T > Class Template Reference

Base class for Offsets to sequences and arrays of primitive types.

```
#include <SequenceOffsets.hpp>
```

Inheritance diagram for rti::flat::AbstractPrimitiveList< T >:

Public Member Functions

- T **get_element** (unsigned int i) const
Returns an element by index.
- bool **set_element** (unsigned int i, T value)
Sets an element by index.

8.5.1 Detailed Description

```
template<typename T>
class rti::flat::AbstractPrimitiveList< T >
```

Base class for Offsets to sequences and arrays of primitive types.

Template Parameters

<i>T</i>	The primitive type
----------	--------------------

8.5.2 Member Function Documentation

8.5.2.1 get_element()

```
template<typename T >
T rti::flat::AbstractPrimitiveList< T >::get_element (
    unsigned int i ) const [inline]
```

Returns an element by index.

Parameters

<i>i</i>	The zero-based index of the element
----------	-------------------------------------

See also

`rti::flat::plain_cast()` (p. 217) for a method to access **all** (p. 487) the elements at once

8.5.2.2 `set_element()`

```
template<typename T >
bool rti::flat::AbstractPrimitiveList< T >::set_element (
    unsigned int i,
    T value ) [inline]
```

Sets an element by index.

Parameters

<i>i</i>	The zero-based index of the element to set
<i>value</i>	The value to set

Returns

true if it was possible to set the element, or false if this collection has less than $i - 1$ elements.

See also

`rti::flat::plain_cast()` (p. 217) for a method to access **all** (p. 487) the elements at once

8.6 `rti::flat::AbstractSequenceBuilder< DHeaderGen >` Class Template Reference

Base class of Builders for sequence members.

```
#include <SequenceBuilders.hpp>
```

Inheritance diagram for `rti::flat::AbstractSequenceBuilder< DHeaderGen >`:

Public Member Functions

- unsigned int **element_count** () const
Returns the current number of elements that have been added.

Additional Inherited Members

8.6.1 Detailed Description

```
template<typename DHeaderGen>
class rti::flat::AbstractSequenceBuilder< DHeaderGen >
```

Base class of Builders for sequence members.

This class contains only implementation details and doesn't add any public function to **AbstractListBuilder** (p. 579).

8.6.2 Member Function Documentation

8.6.2.1 element_count()

```
template<typename DHeaderGen >
unsigned int rti::flat::AbstractListBuilder< DHeaderGen >::element_count ( ) const [inline]
```

Returns the current number of elements that have been added.

8.7 rti::pub::AcknowledgmentInfo Class Reference

<<**extension**>> (p. 156) <<**value-type**>> (p. 152) Information about an application-acknowledged sample

```
#include <AcknowledgmentInfo.hpp>
```

Public Member Functions

- **dds::core::InstanceHandle** **subscription_handle** () const
*Gets the subscription handle of the acknowledging **dds::sub::DataReader** (p. 756).*
- **rti::core::SampleIdentity** **sample_identity** () const
Gets the identity of the sample being acknowledged.
- bool **valid_response_data** () const
Flag indicating validity of the user response data in the acknowledgment.
- **rti::sub::AckResponseData** **response_data** () const
User data payload of application-level acknowledgment message.

8.7.1 Detailed Description

<<*extension*>> (p. 156) <<*value-type*>> (p. 152) Information about an application-acknowledged sample

When acknowledging a sample, the reader provides the writer with information about the sample being acknowledged. The **AcknowledgmentInfo** (p. 583) structure provides the identity and cookie of the sample being acknowledged, as well as user data payload provided by the reader.

8.7.2 Member Function Documentation

8.7.2.1 subscription_handle()

```
dds::core::InstanceHandle rti::pub::AcknowledgmentInfo::subscription_handle ( ) const
```

Gets the subscription handle of the acknowledging **dds::sub::DataReader** (p. 756).

8.7.2.2 sample_identity()

```
rti::core::SampleIdentity rti::pub::AcknowledgmentInfo::sample_identity ( ) const
```

Gets the identity of the sample being acknowledged.

See also

rti::core::SampleIdentity (p. 1989)

8.7.2.3 valid_response_data()

```
bool rti::pub::AcknowledgmentInfo::valid_response_data ( ) const
```

Flag indicating validity of the user response data in the acknowledgment.

This flag is true when the `rti::core::RtpsReliableReaderProtocol::min_app_ack_response_keep_duration` has not yet elapsed for the acknowledgment's response data.

The flag is false when that duration has elapsed for the response data.

8.7.2.4 response_data()

```
rti::sub::AckResponseData rti::pub::AcknowledgmentInfo::response_data ( ) const
```

User data payload of application-level acknowledgment message.

Response data set by `dds::sub::DataReader` (p. 756) when sample was acknowledged.

8.8 rti::core::policy::AcknowledgmentKind_def Struct Reference

<<*extension*>> (p. 156) The enumeration for Reliability acknowledgment kinds

```
#include <PolicyKind.hpp>
```

Public Types

- enum `type` {
PROTOCOL ,
APPLICATION_AUTO ,
APPLICATION_ORDERED ,
APPLICATION_EXPLICIT }

The underlying enum type.

8.8.1 Detailed Description

<<*extension*>> (p. 156) The enumeration for Reliability acknowledgment kinds

8.8.2 Member Enumeration Documentation

8.8.2.1 type

```
enum rti::core::policy::AcknowledgmentKind_def::type
```

The underlying enum type.

Enumerator

PROTOCOL	Samples are acknowledged by RTPS protocol. Samples are acknowledged according to the Real-Time Publish-Subscribe (RTPS) interoperability protocol.
----------	--

Enumerator

APPLICATION_AUTO	<p>Samples are acknowledged automatically after a subscribing application has accessed them. The DataReader automatically acknowledges a sample after it has been taken and the loan returned.</p> <p>See also</p> <p>dds::sub::DataReader::take() (p. 774)</p> <p>dds::sub::LoanedSamples::~~LoanedSamples() (p. 1409).</p>
APPLICATION_ORDERED	<p>Samples up to a specified sequence number are acknowledged.</p>
APPLICATION_EXPLICIT	<p>Samples are acknowledged after the subscribing application explicitly calls acknowledge on the samples. Samples received by a dds::sub::DataReader (p. 756) are explicitly acknowledged by the subscribing application, after it calls either dds::sub::DataReader::acknowledge_all (p. 790) or dds::sub::DataReader::acknowledge_sample (p. 792).</p>

8.9 rti::sub::AckResponseData Class Reference

<<*extension*>> (p. 156) Data payload associated to an application-level acknowledgment

```
#include <rti/sub/AckResponseData.hpp>
```

Public Member Functions

- **AckResponseData** ()
Creates an empty sequence of bytes.
- **AckResponseData** (const **dds::core::ByteSeq** &sequence)
Creates an instance by copying a sequence of bytes.
- **dds::core::ByteSeq value** () const
Gets the sequence of bytes.
- **dds::core::ByteSeq & value** (**dds::core::ByteSeq** &dst) const
Sets the sequence of bytes.
- const uint8_t * **begin** () const
Provides access to the beginning of the sequence of bytes.
- const uint8_t * **end** () const
Gets the end of the sequence.

8.9.1 Detailed Description

<<*extension*>> (p. 156) Data payload associated to an application-level acknowledgment

When a **dds::sub::DataReader** (p. 756) explicitly acknowledges samples with **dds::sub::DataReader::acknowledge_↔_sample** (p. 792) or **dds::sub::DataReader::acknowledge_all** (p. 790), it may specify opaque data to send as payload in the acknowledgment message sent to the **dds::pub::DataWriter** (p. 908).

8.9.2 Constructor & Destructor Documentation

8.9.2.1 AckResponseData() [1/2]

```
rti::sub::AckResponseData::AckResponseData ( ) [inline]
```

Creates an empty sequence of bytes.

8.9.2.2 AckResponseData() [2/2]

```
rti::sub::AckResponseData::AckResponseData (
    const dds::core::ByteSeq & sequence ) [inline], [explicit]
```

Creates an instance by copying a sequence of bytes.

8.9.3 Member Function Documentation

8.9.3.1 value() [1/2]

```
dds::core::ByteSeq rti::sub::AckResponseData::value ( ) const [inline]
```

Gets the sequence of bytes.

8.9.3.2 value() [2/2]

```
dds::core::ByteSeq & rti::sub::AckResponseData::value (
    dds::core::ByteSeq & dst ) const
```

Sets the sequence of bytes.

8.9.3.3 begin()

```
const uint8_t * rti::sub::AckResponseData::begin ( ) const
```

Provides access to the beginning of the sequence of bytes.

8.9.3.4 end()

```
const uint8_t * rti::sub::AckResponseData::end ( ) const
```

Gets the end of the sequence.

8.10 rti::flat::AggregationBuilder Class Reference

Base class of struct and union builders.

```
#include <AggregationBuilders.hpp>
```

Inheritance diagram for rti::flat::AggregationBuilder:

Additional Inherited Members

8.10.1 Detailed Description

Base class of struct and union builders.

This class contains implementation details and doesn't add any public function to **AbstractBuilder** (p. 571). See **MyFlatMutableBuilder** (p. 1497) for a concrete example of a struct builder.

8.11 dds::core::xtypes::AliasType Class Reference

<<*value-type*>> (p. 152) Represents and IDL typedef

```
#include <dds/core/xtypes/AliasType.hpp>
```

Inheritance diagram for dds::core::xtypes::AliasType:

Public Member Functions

- **AliasType** (const std::string & **name**, const DynamicTypeImpl & **related_type**, bool **is_pointer**=false)
Creates an alias with a name and a related type.
- const **dds::core::xtypes::DynamicType & related_type** () const
Gets the related type.
- bool **is_pointer** () const
<<*extension*>> (p. 156) *Gets whether this alias makes related_type a pointer.*

Related Functions

(Note that these are not member functions.)

- const **dds::core::xtypes::DynamicType & resolve_alias** (const **dds::core::xtypes::DynamicType** &type)
<<*extension*>> (p. 156) *If the type is an alias returns its related type recursively until it is not an alias.*

8.11.1 Detailed Description

<<*value-type*>> (p. 152) Represents and IDL typedef

8.11.2 Constructor & Destructor Documentation

8.11.2.1 AliasType()

```
dds::core::xtypes::AliasType::AliasType (
    const std::string & name,
    const DynamicTypeImpl & related_type,
    bool is_pointer = false )
```

Creates an alias with a name and a related type.

Parameters

<i>name</i>	The name of this alias
<i>related_type</i>	The aliased type
<i>is_pointer</i>	Whether this alias makes the type a pointer

For example, to create the following two IDL aliases:

```
typedef long my_long;
typedef long * my_long_ptr;
```

We can use the following code:

```
AliasType my_long("my_long", primitive_type<int32_t>());
AliasType my_long_ptr("my_long_ptr", primitive_type<int32_t>(), true);
```

8.11.3 Member Function Documentation

8.11.3.1 related_type()

```
const dds::core::xtypes::DynamicType & dds::core::xtypes::AliasType::related_type ( ) const
```

Gets the related type.

8.11.3.2 is_pointer()

```
bool dds::core::xtypes::AliasType::is_pointer ( ) const
```

<<*extension*>> (p. 156) Gets whether this alias makes related_type a pointer.

8.11.4 Friends And Related Function Documentation

8.11.4.1 resolve_alias()

```
const dds::core::xtypes::DynamicType & resolve_alias (
    const dds::core::xtypes::DynamicType & type ) [related]
```

<<*extension*>> (p. 156) If the type is an alias returns its related type recursively until it is not an alias.

8.12 rti::core::AllocationSettings Class Reference

<<*extension*>> (p. 156) Resource allocation settings

```
#include <rti/core/PolicySettings.hpp>
```

Public Member Functions

- **AllocationSettings** ()
Creates an instance with an initial, max and incremental count set to zero.
- **AllocationSettings** (int32_t the_initial_count, int32_t the_max_count, int32_t the_incremental_count)
Creates an instance with the given initial, maximum and incremental values.
- int32_t **initial_count** () const
Getter (see setter with the same name)
- **AllocationSettings & initial_count** (int32_t the_initial_count)
Sets the initial count of resources.
- int32_t **max_count** () const
Getter (see setter with the same name)
- **AllocationSettings & max_count** (int32_t the_max_count)
Sets the maximum count of resources.
- int32_t **incremental_count** () const
Getter (see setter with the same name)
- **AllocationSettings & incremental_count** (int32_t the_incremental_count)
Sets the incremental count of resources.

Static Public Attributes

- static const int32_t **AUTO_COUNT** = -2
A special value indicating that the quantity is derived from a different QoS value.

8.12.1 Detailed Description

<<*extension*>> (p. 156) Resource allocation settings

QoS:

rti::core::policy::DomainParticipantResourceLimits (p. 1143)

8.12.2 Constructor & Destructor Documentation

8.12.2.1 AllocationSettings() [1/2]

```
rti::core::AllocationSettings::AllocationSettings ( ) [inline]
```

Creates an instance with an initial, max and incremental count set to zero.

8.12.2.2 AllocationSettings() [2/2]

```
rti::core::AllocationSettings::AllocationSettings (
    int32_t the_initial_count,
    int32_t the_max_count,
    int32_t the_incremental_count ) [inline]
```

Creates an instance with the given initial, maximum and incremental values.

8.12.3 Member Function Documentation

8.12.3.1 initial_count() [1/2]

```
int32_t rti::core::AllocationSettings::initial_count ( ) const [inline]
```

Getter (see setter with the same name)

8.12.3.2 initial_count() [2/2]

```
AllocationSettings & rti::core::AllocationSettings::initial_count (
    int32_t the_initial_count ) [inline]
```

Sets the initial count of resources.

The initial resources to be allocated.

[default] It depends on the case.

[range] [0, 1 million], < max_count, (or = max_count only if increment_count == 0)

8.12.3.3 max_count() [1/2]

```
int32_t rti::core::AllocationSettings::max_count ( ) const [inline]
```

Getter (see setter with the same name)

8.12.3.4 max_count() [2/2]

```
AllocationSettings & rti::core::AllocationSettings::max_count (
    int32_t the_max_count ) [inline]
```

Sets the maximum count of resources.

The maximum resources to be allocated.

[default] Depends on the case.

[range] [1, 1 million] or **dds::core::LENGTH_UNLIMITED** (p. 238), > initial_count (or = initial_count only if increment↔_count == 0)

8.12.3.5 incremental_count() [1/2]

```
int32_t rti::core::AllocationSettings::incremental_count ( ) const [inline]
```

Getter (see setter with the same name)

8.12.3.6 incremental_count() [2/2]

```
AllocationSettings & rti::core::AllocationSettings::incremental_count (
    int32_t the_incremental_count ) [inline]
```

Sets the incremental count of resources.

The resource to be allocated when more resources are needed.

[default] Depends on the case.

[range] -1 (Double the amount of extra memory allocated each time memory is needed) or [1,1 million] (or = 0 only if initial_count == max_count)

8.12.4 Member Data Documentation

8.12.4.1 AUTO_COUNT

```
const int32_t rti::core::AllocationSettings::AUTO_COUNT = -2 [static]
```

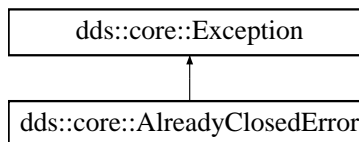

A special value indicating that the quantity is derived from a different Qos value.

8.13 dds::core::AlreadyClosedError Class Reference

Indicates that an object has been closed.

```
#include <Exception.hpp>
```

Inheritance diagram for dds::core::AlreadyClosedError:

Public Member Functions

- virtual const char * **what** () const throw ()
*Access the message contained in this **AlreadyClosedError** (p. 594) exception.*

8.13.1 Detailed Description

Indicates that an object has been closed.

Inherits also from `std::logic_error`

See also

Tearing Down An Entity (p. 129)

8.13.2 Member Function Documentation

8.13.2.1 what()

```
virtual const char * dds::core::AlreadyClosedError::what ( ) const throw ( ) [virtual]
```

Access the message contained in this **AlreadyClosedError** (p. 594) exception.

Returns

The message.

Implements **dds::core::Exception** (p. 1292).

8.14 dds::sub::AnyDataReader Class Reference

<<**reference-type**>> (p. 153) This class provides an non-template holder for representing a **DataReader** (p. 756) of any type

8.14.1 Detailed Description

<<*reference-type*>> (p. 153) This class provides an non-template holder for representing a **DataReader** (p. 756) of any type

This class is useful for code that uses DataReaders of different types. It provides access to type-independent **DataReader** (p. 756) functions.

An **AnyDataReader** (p. 595) is always created from a typed **DataReader** (p. 756), increasing its reference count. The member function **get()** (p. 598) allows getting the typed **DataReader** (p. 756) back.

8.14.2 Constructor & Destructor Documentation

8.14.2.1 AnyDataReader()

```
template<typename T >
dds::sub::AnyDataReader::AnyDataReader (
    const dds::sub::DataReader< T > & reader ) [inline]
```

Create an **AnyDataReader** (p. 595) that represents a generic, untyped **DataReader** (p. 756).

Template Parameters

<i>T</i>	The type of the DataReader (p. 756) that this AnyDataReader (p. 595) is being created from
----------	--

Parameters

<i>reader</i>	The typed DataReader (p. 756) that this AnyDataReader (p. 595) will represent
---------------	---

Referenced by **operator=()**.

8.14.3 Member Function Documentation

8.14.3.1 qos() [1/2]

```
const dds::sub::qos::DataReaderQos dds::sub::AnyDataReader::qos ( ) const [inline]
```

Get the QoS for this **AnyDataReader** (p. 595).

Returns

dds::sub::qos::DataReaderQos (p. 848) The DataReaderQos

8.14.3.2 qos() [2/2]

```
void dds::sub::AnyDataReader::qos (
    const dds::sub::qos::DataReaderQos & the_qos ) [inline]
```

Set the QoS for this **AnyDataReader** (p. 595).

Parameters

<i>the_qos</i>	The QoS to set
----------------	----------------

8.14.3.3 topic_name()

```
const std::string & dds::sub::AnyDataReader::topic_name ( ) const [inline]
```

Get the topic name for this **AnyDataReader** (p. 595).

Returns

The topic name

8.14.3.4 type_name()

```
const std::string & dds::sub::AnyDataReader::type_name ( ) const [inline]
```

Get the type name for this **AnyDataReader** (p. 595).

Returns

The type name

8.14.3.5 subscriber()

```
const dds::sub::Subscriber & dds::sub::AnyDataReader::subscriber ( ) const [inline]
```

Get the publisher for this **AnyDataReader** (p. 595).

Returns

The subscriber

8.14.3.6 operator=()

```
template<typename T >  
AnyDataReader & dds::sub::AnyDataReader::operator= (  
    const DataReader< T > & other ) [inline]
```

Assign a different **DataReader** (p. 756).

Replaces the reference to the current reader with a new one, whose type T can be different.

References **AnyDataReader**().

8.14.3.7 get()

```
template<typename T >  
dds::sub::DataReader< T > dds::sub::AnyDataReader::get ( ) const [inline]
```

Gets the typed **DataReader** (p. 756) from this **AnyDataReader** (p. 595).

Template Parameters

<i>T</i>	The type of the DataReader (p. 756) to extract
----------	---

Returns

The typed **DataReader** (p. 756) that this **AnyDataReader** (p. 595) represents

Exceptions

dds::core::InvalidDowncastError (p. 1364)	If this AnyDataReader (p. 595) doesn't represent a <code>DataReader<T></code> .
--	--

Referenced by `get()`.

8.14.3.8 close()

```
void dds::sub::AnyDataReader::close ( ) [inline]
```

Close this **AnyDataReader** (p. 595).

See also

DataReader::close() (p. 801)

8.14.3.9 retain()

```
void dds::sub::AnyDataReader::retain ( ) [inline]
```

Retain this **AnyDataReader** (p. 595).

See also

DataReader::retain() (p. 1271)

8.14.4 Friends And Related Function Documentation

8.14.4.1 get()

```
template<typename T >
DataReader< T > get (
    const AnyDataReader & any_reader ) [related]
```

Same as `AnyDataReader::get()` (p. 598)

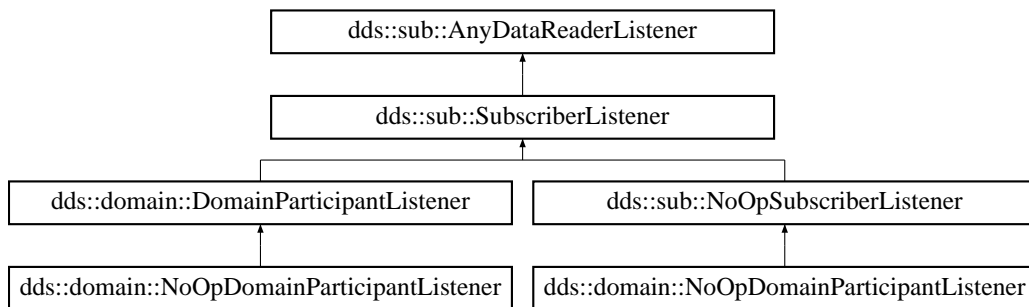

References `get()`.

8.15 dds::sub::AnyDataReaderListener Class Reference

The listener to notify status changes for a `dds::sub::DataReader` (p. 756) of a generic type.

```
#include <dds/sub/AnyDataReaderListener.hpp>
```

Inheritance diagram for `dds::sub::AnyDataReaderListener`:

Public Member Functions

- virtual void `on_requested_deadline_missed` (`AnyDataReader &the_reader`, const `dds::core::status::RequestedDeadlineMissedStatus &status`)=0
Handles the `dds::core::status::RequestedDeadlineMissedStatus` (p. 1904) status.
- virtual void `on_requested_incompatible_qos` (`AnyDataReader &the_reader`, const `dds::core::status::RequestedIncompatibleQosStatus &status`)=0
Handles the `dds::core::status::RequestedIncompatibleQosStatus` (p. 1905) status.
- virtual void `on_sample_rejected` (`AnyDataReader &the_reader`, const `dds::core::status::SampleRejectedStatus &status`)=0
Handles the `dds::core::status::SampleRejectedStatus` (p. 2022) status.
- virtual void `on_liveliness_changed` (`AnyDataReader &the_reader`, const `dds::core::status::LivelinessChangedStatus &status`)=0
Handles the `dds::core::status::LivelinessChangedStatus` (p. 1395) status.
- virtual void `on_data_available` (`AnyDataReader &the_reader`)=0
Handles the `dds::core::status::DataAvailableStatus` status.
- virtual void `on_subscription_matched` (`AnyDataReader &the_reader`, const `dds::core::status::SubscriptionMatchedStatus &status`)=0
Handles the `dds::core::status::SubscriptionMatchedStatus` (p. 2144) status.
- virtual void `on_sample_lost` (`AnyDataReader &the_reader`, const `dds::core::status::SampleLostStatus &status`)=0
Handles the `dds::core::status::SampleLostStatus` (p. 2010) status.

8.15.1 Detailed Description

The listener to notify status changes for a **dds::sub::DataReader** (p. 756) of a generic type.

This class is only intended to act as the base of **SubscriberListener** (p. 2128).

See also

DataReaderListener (p. 832)

SubscriberListener (p. 2128)

8.15.2 Member Function Documentation

8.15.2.1 on_requested_deadline_missed()

```
virtual void dds::sub::AnyDataReaderListener::on_requested_deadline_missed (
    AnyDataReader & the_reader,
    const dds::core::status::RequestedDeadlineMissedStatus & status ) [pure virtual]
```

Handles the **dds::core::status::RequestedDeadlineMissedStatus** (p. 1904) status.

Implemented in **dds::sub::NoOpSubscriberListener** (p. 1597), and **dds::domain::NoOpDomainParticipant←
Listener** (p. 1582).

8.15.2.2 on_requested_incompatible_qos()

```
virtual void dds::sub::AnyDataReaderListener::on_requested_incompatible_qos (
    AnyDataReader & the_reader,
    const dds::core::status::RequestedIncompatibleQosStatus & status ) [pure virtual]
```

Handles the **dds::core::status::RequestedIncompatibleQosStatus** (p. 1905) status.

Implemented in **dds::sub::NoOpSubscriberListener** (p. 1597), and **dds::domain::NoOpDomainParticipant←
Listener** (p. 1582).

8.15.2.3 on_sample_rejected()

```
virtual void dds::sub::AnyDataReaderListener::on_sample_rejected (
    AnyDataReader & the_reader,
    const dds::core::status::SampleRejectedStatus & status ) [pure virtual]
```

Handles the **dds::core::status::SampleRejectedStatus** (p.2022) status.

Implemented in **dds::sub::NoOpSubscriberListener** (p.1597), and **dds::domain::NoOpDomainParticipantListener** (p.1582).

8.15.2.4 on_liveliness_changed()

```
virtual void dds::sub::AnyDataReaderListener::on_liveliness_changed (
    AnyDataReader & the_reader,
    const dds::core::status::LivelinessChangedStatus & status ) [pure virtual]
```

Handles the **dds::core::status::LivelinessChangedStatus** (p.1395) status.

Implemented in **dds::sub::NoOpSubscriberListener** (p.1598), and **dds::domain::NoOpDomainParticipantListener** (p.1583).

8.15.2.5 on_data_available()

```
virtual void dds::sub::AnyDataReaderListener::on_data_available (
    AnyDataReader & the_reader ) [pure virtual]
```

Handles the **dds::core::status::DataAvailableStatus** status.

Implemented in **dds::sub::NoOpSubscriberListener** (p.1598), and **dds::domain::NoOpDomainParticipantListener** (p.1583).

8.15.2.6 on_subscription_matched()

```
virtual void dds::sub::AnyDataReaderListener::on_subscription_matched (
    AnyDataReader & the_reader,
    const dds::core::status::SubscriptionMatchedStatus & status ) [pure virtual]
```

Handles the **dds::core::status::SubscriptionMatchedStatus** (p.2144) status.

Implemented in **dds::sub::NoOpSubscriberListener** (p.1598), and **dds::domain::NoOpDomainParticipantListener** (p.1583).

8.15.2.7 on_sample_lost()

```
virtual void dds::sub::AnyDataReaderListener::on_sample_lost (
    AnyDataReader & the_reader,
    const dds::core::status::SampleLostStatus & status ) [pure virtual]
```

Handles the `dds::core::status::SampleLostStatus` (p. 2010) status.

Implemented in `dds::sub::NoOpSubscriberListener` (p. 1598), and `dds::domain::NoOpDomainParticipantListener` (p. 1583).

8.16 dds::pub::AnyDataWriter Class Reference

<<*reference-type*>> (p. 153) This class provides a non-template holder for representing a `DataWriter` (p. 908) of any type

```
#include "dds/pub/AnyDataWriter.hpp"

8.16.1 Detailed Description

<<*reference-type*>> (p. 153) This class provides a non-template holder for representing a **DataRow** (p. 908) of any type

This class is useful for code that uses DataWriters of different types. It provides access to type-independent **DataRow** (p. 908) functions.

An **AnyDataRow** (p. 603) is always created from a typed **DataRow** (p. 908), increasing its reference count. The member function **get()** (p. 607) allows getting the typed **DataRow** (p. 908) back.

8.16.2 Constructor & Destructor Documentation

8.16.2.1 AnyDataRow()

```
template<typename T >
dds::pub::AnyDataRow::AnyDataRow (
    const dds::pub::DataRow< T > & dw ) [inline]
```

Create an **AnyDataRow** (p. 603) that represents a generic, untyped **DataRow** (p. 908).

Template Parameters

<i>T</i>	The type of the DataRow (p. 908) that this AnyDataRow (p. 603) is being created from
----------	--

Parameters

<i>dw</i>	The typed DataRow (p. 908) that this AnyDataRow (p. 603) will represent
-----------	---

Referenced by **operator=()**.

8.16.3 Member Function Documentation

8.16.3.1 qos() [1/2]

```
const dds::pub::qos::DataWriterQos dds::pub::AnyDataWriter::qos ( ) const [inline]
```

Get the QoS for this **AnyDataWriter** (p. 603).

Returns

dds::pub::qos::DataWriterQos (p. 994) The DataWriterQos

8.16.3.2 qos() [2/2]

```
void dds::pub::AnyDataWriter::qos (
    const dds::pub::qos::DataWriterQos & the_qos ) [inline]
```

Set the QoS for this **AnyDataWriter** (p. 603).

Parameters

<i>the_qos</i>	The QoS to set
----------------	----------------

8.16.3.3 topic_name()

```
const std::string & dds::pub::AnyDataWriter::topic_name ( ) const [inline]
```

Get the topic name for this **AnyDataWriter** (p. 603).

Returns

The topic name

8.16.3.4 type_name()

```
const std::string & dds::pub::AnyDataWriter::type_name ( ) const [inline]
```

Get the type name for this **AnyDataWriter** (p. 603).

Returns

The type name

8.16.3.5 publisher()

```
const dds::pub::Publisher & dds::pub::AnyDataWriter::publisher ( ) const [inline]
```

Get the publisher for this **AnyDataWriter** (p. 603).

Returns

The publisher

8.16.3.6 wait_for_acknowledgments()

```
void dds::pub::AnyDataWriter::wait_for_acknowledgments (
    const dds::core::Duration & timeout ) [inline]
```

See also

DataWriter::wait_for_acknowledgments (p. 938)

8.16.3.7 close()

```
void dds::pub::AnyDataWriter::close ( ) [inline]
```

Close the **DataWriter** (p. 908).

See also

DataWriter::close() (p. 1270)

8.16.3.8 retain()

```
void dds::pub::AnyDataWriter::retain ( ) [inline]
```

Retain this **AnyDataWriter** (p. 603).

See also

DataWriter::retain() (p. 1271)

8.16.3.9 operator=()

```
template<typename T >
AnyDataWriter & dds::pub::AnyDataWriter::operator= (
    const dds::pub::DataWriter< T > & other ) [inline]
```

Assign a different **DataWriter** (p. 908).

Replaces the reference to the current writer with a new one, whose type T can be different.

References **AnyDataWriter()**.

8.16.3.10 get()

```
template<typename T >
DataWriter< T > dds::pub::AnyDataWriter::get ( ) [inline]
```

Gets the typed **DataWriter** (p. 908) from this **AnyDataWriter** (p. 603).

Template Parameters

<i>T</i>	The type of the DataWriter (p. 908) to extract
----------	---

Returns

The typed **DataWriter** (p. 908) that this **AnyDataWriter** (p. 603) represents

Exceptions

dds::core::InvalidDowncastError (p. 1364)	If this AnyDataWriter (p. 603) doesn't represent a DataWriter <T>.
--	--

Referenced by `get()`.

8.16.4 Friends And Related Function Documentation

8.16.4.1 `get()`

```
template<typename T >
DataWriter< T > get (
    const AnyDataWriter & any_writer ) [related]
```

Same as `AnyDataWriter::get()` (p. 607)

Examples

`Foo.hpp`.

References `get()`.

8.17 `dds::pub::AnyDataWriterListener` Class Reference

The listener to notify status changes for a `dds::pub::DataWriter` (p. 908) of a generic type.

```
#include <dds/pub/AnyDataWriterListener.hpp>
```

Inheritance diagram for `dds::pub::AnyDataWriterListener`:

Public Member Functions

- virtual void **on_offered_deadline_missed** (dds::pub::AnyDataWriter &writer, const ::dds::core::status::OfferedDeadlineMissedStatus &status)=0
Handles the `dds::core::status::OfferedDeadlineMissedStatus` (p. 1603) status.
- virtual void **on_offered_incompatible_qos** (dds::pub::AnyDataWriter &writer, const ::dds::core::status::OfferedIncompatibleQosStatus &status)=0
Handles the `dds::core::status::OfferedIncompatibleQosStatus` (p. 1604) status.
- virtual void **on_liveliness_lost** (dds::pub::AnyDataWriter &writer, const ::dds::core::status::LivelinessLostStatus &status)=0
Handles the `dds::core::status::LivelinessLostStatus` (p. 1398) status.
- virtual void **on_publication_matched** (dds::pub::AnyDataWriter &writer, const ::dds::core::status::PublicationMatchedException &status)=0
Handles the `dds::core::status::PublicationMatchedException` (p. 1717) status.
- virtual void **on_reliable_writer_cache_changed** (dds::pub::AnyDataWriter &writer, const rti::core::status::ReliableWriterCacheChangedStatus &status)=0
<<extension>> (p. 156) Handles the `dds::core::status::ReliableWriterCacheChangedStatus` status
- virtual void **on_reliable_reader_activity_changed** (dds::pub::AnyDataWriter &writer, const rti::core::status::ReliableReaderActivityChangedStatus &status)=0
<<extension>> (p. 156) Handles the `dds::core::status::ReliableReaderActivityChangedStatus` status
- virtual void **on_sample_removed** (dds::pub::AnyDataWriter &writer, const rti::core::Cookie &cookie)=0
<<extension>> (p. 156) Notifies when a sample is removed from `DataWriter` (p. 908) queue.
- virtual void **on_instance_replaced** (dds::pub::AnyDataWriter &writer, const dds::core::InstanceHandle &handle)=0
<<extension>> (p. 156) Notifies when an instance is replaced in `DataWriter` (p. 908) queue.
- virtual void **on_application_acknowledgment** (dds::pub::AnyDataWriter &writer, const rti::pub::AcknowledgmentInfo &acknowledgment_info)=0
<<extension>> (p. 156) Called when a sample is application-acknowledged.
- virtual void **on_service_request_accepted** (dds::pub::AnyDataWriter &writer, const rti::core::status::ServiceRequestAcceptedStatus &status)=0
<<extension>> (p. 156) Called when a sample that has been received on a the built-in service channel is intended for the `DataWriter` (p. 908) that has installed this listener

8.17.1 Detailed Description

The listener to notify status changes for a `dds::pub::DataWriter` (p. 908) of a generic type.

This class is only intended to act as the base of `PublisherListener` (p. 1732).

See also

`DataWriterListener` (p. 972)

`PublisherListener` (p. 1732)

8.17.2 Member Function Documentation

8.17.2.1 on_offered_deadline_missed()

```
virtual void dds::pub::AnyDataWriterListener::on_offered_deadline_missed (
    dds::pub::AnyDataWriter & writer,
    const ::dds::core::status::OfferedDeadlineMissedStatus & status ) [pure virtual]
```

Handles the **dds::core::status::OfferedDeadlineMissedStatus** (p. 1603) status.

Implemented in **dds::domain::NoOpDomainParticipantListener** (p. 1579), and **dds::pub::NoOpPublisherListener** (p. 1585).

8.17.2.2 on_offered_incompatible_qos()

```
virtual void dds::pub::AnyDataWriterListener::on_offered_incompatible_qos (
    dds::pub::AnyDataWriter & writer,
    const ::dds::core::status::OfferedIncompatibleQosStatus & status ) [pure virtual]
```

Handles the **dds::core::status::OfferedIncompatibleQosStatus** (p. 1604) status.

Implemented in **dds::domain::NoOpDomainParticipantListener** (p. 1579), and **dds::pub::NoOpPublisherListener** (p. 1586).

8.17.2.3 on_liveliness_lost()

```
virtual void dds::pub::AnyDataWriterListener::on_liveliness_lost (
    dds::pub::AnyDataWriter & writer,
    const ::dds::core::status::LivelinessLostStatus & status ) [pure virtual]
```

Handles the **dds::core::status::LivelinessLostStatus** (p. 1398) status.

Implemented in **dds::domain::NoOpDomainParticipantListener** (p. 1579), and **dds::pub::NoOpPublisherListener** (p. 1586).

8.17.2.4 on_publication_matched()

```
virtual void dds::pub::AnyDataWriterListener::on_publication_matched (
    dds::pub::AnyDataWriter & writer,
    const ::dds::core::status::PublicationMatchedStatus & status ) [pure virtual]
```

Handles the **dds::core::status::PublicationMatchedStatus** (p. 1717) status.

Implemented in **dds::domain::NoOpDomainParticipantListener** (p. 1580), and **dds::pub::NoOpPublisherListener** (p. 1586).

8.17.2.5 on_reliable_writer_cache_changed()

```
virtual void dds::pub::AnyDataWriterListener::on_reliable_writer_cache_changed (
    dds::pub::AnyDataWriter & writer,
    const rti::core::status::ReliableWriterCacheChangedStatus & status ) [pure virtual]
```

<<**extension**>> (p. 156) Handles the dds::core::status::ReliableWriterCacheChangedStatus status

Implemented in **dds::domain::NoOpDomainParticipantListener** (p. 1580), and **dds::pub::NoOpPublisherListener** (p. 1586).

8.17.2.6 on_reliable_reader_activity_changed()

```
virtual void dds::pub::AnyDataWriterListener::on_reliable_reader_activity_changed (
    dds::pub::AnyDataWriter & writer,
    const rti::core::status::ReliableReaderActivityChangedStatus & status ) [pure virtual]
```

<<**extension**>> (p. 156) Handles the dds::core::status::ReliableReaderActivityChangedStatus status

Implemented in **dds::domain::NoOpDomainParticipantListener** (p. 1580), and **dds::pub::NoOpPublisherListener** (p. 1587).

8.17.2.7 on_sample_removed()

```
virtual void dds::pub::AnyDataWriterListener::on_sample_removed (
    dds::pub::AnyDataWriter & writer,
    const rti::core::Cookie & cookie ) [pure virtual]
```

<<**extension**>> (p. 156) Notifies when a sample is removed from **DataWriter** (p. 908) queue.

Implemented in **dds::domain::NoOpDomainParticipantListener** (p. 1580), and **dds::pub::NoOpPublisherListener** (p. 1587).

8.17.2.8 on_instance_replaced()

```
virtual void dds::pub::AnyDataWriterListener::on_instance_replaced (
    dds::pub::AnyDataWriter & writer,
    const dds::core::InstanceHandle & handle ) [pure virtual]
```

<<**extension**>> (p. 156) Notifies when an instance is replaced in **DataWriter** (p. 908) queue.

Implemented in **dds::domain::NoOpDomainParticipantListener** (p. 1581), and **dds::pub::NoOpPublisherListener** (p. 1587).

8.17.2.9 on_application_acknowledgment()

```
virtual void dds::pub::AnyDataWriterListener::on_application_acknowledgment (
    dds::pub::AnyDataWriter & writer,
    const rti::pub::AcknowledgmentInfo & acknowledgment_info ) [pure virtual]
```

<<**extension**>> (p. 156) Called when a sample is application-acknowledged.

Implemented in **dds::domain::NoOpDomainParticipantListener** (p. 1581), and **dds::pub::NoOpPublisherListener** (p. 1587).

8.17.2.10 on_service_request_accepted()

```
virtual void dds::pub::AnyDataWriterListener::on_service_request_accepted (
    dds::pub::AnyDataWriter & writer,
    const rti::core::status::ServiceRequestAcceptedStatus & status ) [pure virtual]
```

<<**extension**>> (p. 156) Called when a sample that has been received on a the built-in service channel is intended for the **DataWriter** (p. 908) that has installed this listener

Implemented in **dds::domain::NoOpDomainParticipantListener** (p. 1581), and **dds::pub::NoOpPublisherListener** (p. 1588).

8.18 dds::topic::AnyTopic Class Reference

<<**reference-type**>> (p. 153) This class provides an non-template holder for representing a **Topic** (p.2178) of any type

```
#include "dds/topic/AnyTopic.hpp"
```

Public Member Functions

- `template<typename T >`
AnyTopic (const **dds::topic::Topic**< T > &topic)
*Create an **AnyTopic** (p. 612) that represents a generic, untyped **Topic** (p. 2178).*
- **dds::domain::DomainParticipant** **domain_participant** () const
Gets the DomainParticipant this topic belongs to.
- **dds::core::status::InconsistentTopicStatus** **inconsistent_topic_status** ()
Gets the InconsistentTopicStatus of this topic.
- const **dds::topic::qos::TopicQos** **qos** () const
Get the TopicQos.
- void **qos** (const **dds::topic::qos::TopicQos** &the_qos)
Sets the TopicQos.
- std::string **name** () const
Gets the topic name.
- std::string **type_name** () const
Gets the type name.
- void **close** ()
*Closes the **Topic** (p. 2178).*

*Same as **AnyTopic::get()** (p. 615)*

8.18.1 Detailed Description

<<**reference-type**>> (p. 153) This class provides a non-template holder for representing a **Topic** (p. 2178) of any type

This class is useful for code that uses Topics of different types. It provides access to type-independent **Topic** (p. 2178) functions.

An **AnyTopic** (p. 612) is always created from a typed **Topic** (p. 2178), increasing its reference count. The member function **get()** (p. 615) allows getting the typed **Topic** (p. 2178) back.

8.18.2 Constructor & Destructor Documentation

8.18.2.1 AnyTopic()

```
template<typename T >
dds::topic::AnyTopic::AnyTopic (
    const dds::topic::Topic< T > & topic ) [inline]
```

Create an **AnyTopic** (p. 612) that represents a generic, untyped **Topic** (p. 2178).

Template Parameters

<i>T</i>	The type of the Topic (p. 2178) that this AnyTopic (p. 612) is being created from
----------	---

Parameters

<i>topic</i>	The typed Topic (p. 2178) that this AnyTopic (p. 612) will represent
--------------	--

8.18.3 Member Function Documentation

8.18.3.1 domain_participant()

```
dds::domain::DomainParticipant dds::topic::AnyTopic::domain_participant ( ) const [inline]
```

Gets the DomainParticipant this topic belongs to.

8.18.3.2 inconsistent_topic_status()

```
dds::core::status::InconsistentTopicStatus dds::topic::AnyTopic::inconsistent_topic_status ( )  
[inline]
```

Gets the InconsistentTopicStatus of this topic.

8.18.3.3 qos() [1/2]

```
const dds::topic::qos::TopicQos dds::topic::AnyTopic::qos ( ) const [inline]
```

Get the TopicQos.

8.18.3.4 qos() [2/2]

```
void dds::topic::AnyTopic::qos (  
    const dds::topic::qos::TopicQos & the_qos ) [inline]
```

Sets the TopicQos.

8.18.3.5 name()

```
std::string dds::topic::AnyTopic::name ( ) const [inline]
```

Gets the topic name.

8.18.3.6 type_name()

```
std::string dds::topic::AnyTopic::type_name ( ) const [inline]
```

Gets the type name.

8.18.3.7 close()

```
void dds::topic::AnyTopic::close ( ) [inline]
```

Closes the **Topic** (p.2178).

See also

Topic::close() (p. 1270)

8.18.3.8 get()

```
template<typename T >  
Topic< T > dds::topic::AnyTopic::get ( ) [inline]
```

Gets the typed **Topic** (p.2178) from this **AnyTopic** (p.612).

Template Parameters

<i>T</i>	The type of the Topic (p.2178) to extract
----------	--

Returns

The typed **Topic** (p.2178) that this **AnyTopic** (p.612) represents

Exceptions

<i>dds::core::InvalidDowncastError</i> (p. 1364)	If this AnyTopic (p.612) doesn't represent a Topic <T>.
--	---

Referenced by **get()**.

8.18.4 Friends And Related Function Documentation

8.18.4.1 get()

```
template<typename T >
Topic< T > get (
    const AnyTopic & any_topic ) [related]
```

Same as **AnyTopic::get()** (p. 615)

References **get()**.

8.19 dds::core::xtypes::ArrayType Class Reference

<<**value-type**>> (p. 152) Represents an IDL array type.

```
#include <dds/core/xtypes/CollectionTypes.hpp>
```

Inheritance diagram for dds::core::xtypes::ArrayType:

Public Member Functions

- **ArrayType** (const **dds::core::xtypes::DynamicType** &type, uint32_t the_dimension)
Creates an unidimensional array.
- template<typename IntegerFwdIterator >
ArrayType (const **dds::core::xtypes::DynamicType** &type, IntegerFwdIterator dimensions_begin, IntegerFwdIterator dimensions_end)
Creates a multidimensional array.
- **ArrayType** (const **dds::core::xtypes::DynamicType** &type, std::initializer_list< uint32_t > dimensions)
<<**C++11**>> (p. 155) *Creates a multidimensional array*
- **ArrayType** (**dds::core::xtypes::DynamicType** &&type, uint32_t the_dimension)
<<**C++11**>> (p. 155) *Creates an unidimensional array*
- template<typename IntegerFwdIterator >
ArrayType (**dds::core::xtypes::DynamicType** &&type, IntegerFwdIterator dimensions_begin, IntegerFwdIterator dimensions_end)
<<**C++11**>> (p. 155) *Creates a multidimensional array*
- **ArrayType** (**dds::core::xtypes::DynamicType** &&type, std::initializer_list< uint32_t > dimensions)
<<**C++11**>> (p. 155) *Creates a multidimensional array*
- uint32_t **dimension_count** () const
Returns the number of dimensions.
- uint32_t **dimension** (uint32_t dimension_index) const
Returns the ith dimension.
- uint32_t **total_element_count** () const
Returns the sum of all the dimensions.

Additional Inherited Members

8.19.1 Detailed Description

<< *value-type* >> (p. 152) Represents an IDL array type.

8.19.2 Constructor & Destructor Documentation

8.19.2.1 ArrayType() [1/6]

```
dds::core::xtypes::ArrayType::ArrayType (
    const dds::core::xtypes::DynamicType & type,
    uint32_t the_dimension ) [inline]
```

Creates an unidimensional array.

Parameters

<i>type</i>	The element type
<i>the_dimension</i>	The dimension of this unidimensional array

8.19.2.2 ArrayType() [2/6]

```
template<typename IntegerFwdIterator >
dds::core::xtypes::ArrayType::ArrayType (
    const dds::core::xtypes::DynamicType & type,
    IntegerFwdIterator dimensions_begin,
    IntegerFwdIterator dimensions_end ) [inline]
```

Creates a multidimensional array.

For example, to create the following IDL array:

```
double x[10][20];
```

We can use this code:

```
std::vector<uint32_t> dim(2);
dim[0] = 10;
dim[1] = 20;
ArrayType my_array(primitive_type<double>(), dim.begin(), dim.end());
```

Parameters

<i>type</i>	The element type
<i>dimensions_begin</i>	The beginning of range of dimensions (uint32_t)
<i>dimensions_end</i>	The end of a range of dimensions (uint32_t)

8.19.2.3 ArrayType() [3/6]

```
dds::core::xtypes::ArrayType::ArrayType (
    const dds::core::xtypes::DynamicType & type,
    std::initializer_list< uint32_t > dimensions ) [inline]
```

<<**C++11**>> (p. 155) Creates a multidimensional array

For example, to create the following IDL array:

```
double x[10][20];
```

We can use this code:

```
ArrayType my_array(primitive_type<double>(), {10, 20});
```

Parameters

<i>type</i>	The element type
<i>dimensions</i>	The dimensions of this array

8.19.2.4 ArrayType() [4/6]

```
dds::core::xtypes::ArrayType::ArrayType (
    dds::core::xtypes::DynamicType && type,
    uint32_t the_dimension ) [inline]
```

<<**C++11**>> (p. 155) Creates an unidimensional array

Parameters

<i>type</i>	The element type (to be moved)
<i>the_dimension</i>	The dimension of this unidimensional array

8.19.2.5 ArrayType() [5/6]

```
template<typename IntegerFwdIterator >
dds::core::xtypes::ArrayType::ArrayType (
    dds::core::xtypes::DynamicType && type,
    IntegerFwdIterator dimensions_begin,
    IntegerFwdIterator dimensions_end ) [inline]
```

<<**C++11**>> (p. 155) Creates a multidimensional array

Parameters

<i>type</i>	The element type (to be moved)
<i>dimensions_begin</i>	The beginning of range of dimensions (uint32_t)
<i>dimensions_end</i>	The end of a range of dimensions (uint32_t)

8.19.2.6 ArrayType() [6/6]

```
dds::core::xtypes::ArrayType::ArrayType (
    dds::core::xtypes::DynamicType && type,
    std::initializer_list< uint32_t > dimensions ) [inline]
```

<<**C++11**>> (p. 155) Creates a multidimensional array

Parameters

<i>type</i>	The element type (to be moved)
<i>dimensions</i>	The dimensions of this array

8.19.3 Member Function Documentation**8.19.3.1 dimension_count()**

```
uint32_t dds::core::xtypes::ArrayType::dimension_count ( ) const
```

Returns the number of dimensions.

8.19.3.2 dimension()

```
uint32_t dds::core::xtypes::ArrayType::dimension (
    uint32_t dimension_index ) const
```

Returns the ith dimension.

8.19.3.3 total_element_count()

```
uint32_t dds::core::xtypes::ArrayType::total_element_count ( ) const
```

Returns the sum of all the dimensions.

8.20 rti::core::policy::AsynchronousPublisher Class Reference

<<**extension**>> (p. 156) Configures the mechanism to publish data using a separate thread

```
#include <rti/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **AsynchronousPublisher** ()
Creates the default policy.
- **AsynchronousPublisher & disable_asynchronous_write** (bool the_disable_asynchronous_write)
Disable asynchronous publishing.
- bool **disable_asynchronous_write** () const
Getter (see setter with the same name)
- **AsynchronousPublisher & thread** (const **rti::core::ThreadSettings** &the_thread)
Settings of the publishing thread.
- const **rti::core::ThreadSettings** & **thread** () const
Getter (see setter with the same name)
- **rti::core::ThreadSettings** & **thread** ()
Getter (see setter with the same name)
- **AsynchronousPublisher & disable_asynchronous_batch** (bool the_disable_asynchronous_batch)
Disable asynchronous batch flushing.
- bool **disable_asynchronous_batch** () const
Getter (see setter with the same name)
- **AsynchronousPublisher & asynchronous_batch_thread** (const **rti::core::ThreadSettings** &the_↵ asynchronous_batch_thread)
Settings of the batch flushing thread.
- const **rti::core::ThreadSettings** & **asynchronous_batch_thread** () const
Getter (see setter with the same name)
- **rti::core::ThreadSettings** & **asynchronous_batch_thread** ()
Getter (see setter with the same name)
- **AsynchronousPublisher & disable_topic_query_publication** (bool the_disable_topic_query_publication)
Disable topic query publication.
- bool **disable_topic_query_publication** () const
Getter (see setter with the same name)
- **AsynchronousPublisher & topic_query_publication_thread** (const **rti::core::ThreadSettings** &the_topic↵_query_publication_thread)
Settings of the rti::sub::TopicQuery (p. 2220) publication thread.
- const **rti::core::ThreadSettings** & **topic_query_publication_thread** () const
Getter (see setter with the same name)
- **rti::core::ThreadSettings** & **topic_query_publication_thread** ()
Getter (see setter with the same name)

Static Public Member Functions

- static **AsynchronousPublisher Enabled** (bool enable_async_batch=false)
Returns a policy that enables asynchronous write and optionally asynchronous batch flushing.
- static **AsynchronousPublisher Disabled** ()
Creates a policy that disables asynchronous writing.

8.20.1 Detailed Description

<<**extension**>> (p. 156) Configures the mechanism to publish data using a separate thread

Specifies the asynchronous publishing and asynchronous batch flushing settings of the **dds::pub::Publisher** (p. 1719) instances.

The QoS policy specifies whether asynchronous publishing and asynchronous batch flushing are enabled for the **dds::pub::DataWriter** (p. 908) entities belonging to this **dds::pub::Publisher** (p. 1719). If so, the publisher will spawn up to two threads, one for asynchronous publishing and one for asynchronous batch flushing.

This policy also configures the settings of the **rti::sub::TopicQuery** (p. 2220) publication thread. The publisher will spawn this thread only if one or more DataWriters enable TopicQueries.

See also

rti::core::policy::Batch (p. 665).

rti::core::policy::PublishMode (p. 1739).

Entity:

dds::pub::Publisher (p. 1719)

Properties:

RxO (p. 307) = N/A

Changeable (p. 307) = **NO** (p. 307)

8.20.2 Usage

You can use this QoS policy to reduce the amount of time your application thread spends sending data.

You can also use it, along with `rti::core::policy::PublishMode` (p. 1739) and a `rti::pub::FlowController` (p. 1316), to send large data reliably. "Large" in this context means that the data that cannot be sent as a single packet by a network transport. For example, to send data larger than 63K reliably using UDP/IP, you must configure RTI Connext to fragment the data and send it asynchronously.

The asynchronous *publisher* thread is shared by all `rti::core::policy::PublishModeKind_def::ASYNCHRONOUS` (p. 1745) `dds::pub::DataWriter` (p. 908) instances that belong to this publisher and handles their data transmission chores.

The asynchronous *batch flushing* thread is shared by all `dds::pub::DataWriter` (p. 908) instances with batching enabled that belong to this publisher.

This QoS policy also allows you to adjust the settings of the asynchronous publishing and the asynchronous batch flushing threads. To use different threads for two different `dds::pub::DataWriter` (p. 908) entities, the instances must belong to different `dds::pub::Publisher` (p. 1719) instances.

A `dds::pub::Publisher` (p. 1719) must have asynchronous publishing enabled for its `dds::pub::DataWriter` (p. 908) instances to write asynchronously.

A `dds::pub::Publisher` (p. 1719) must have asynchronous batch flushing enabled in order to flush the batches of its `dds::pub::DataWriter` (p. 908) instances asynchronously. However, no asynchronous batch flushing thread will be started until the first `dds::pub::DataWriter` (p. 908) instance with batching enabled is created from this `dds::pub::Publisher` (p. 1719).

8.20.3 Constructor & Destructor Documentation

8.20.3.1 AsynchronousPublisher()

```
rti::core::policy::AsynchronousPublisher::AsynchronousPublisher ( ) [inline]
```

Creates the default policy.

8.20.4 Member Function Documentation

8.20.4.1 disable_asynchronous_write() [1/2]

```
AsynchronousPublisher & rti::core::policy::AsynchronousPublisher::disable_asynchronous_write (
    bool the_disable_asynchronous_write )
```

Disable asynchronous publishing.

If set to true, any **dds::pub::DataWriter** (p.908) created with **rti::core::policy::PublishModeKind_def::ASYNCHRONOUS** (p. 1745) will fail with **dds::core::InconsistentPolicyError** (p. 1354).

[default] false

Referenced by **rti::core::policy::Event::initial_count()**.

8.20.4.2 disable_asynchronous_write() [2/2]

```
bool rti::core::policy::AsynchronousPublisher::disable_asynchronous_write ( ) const
```

Getter (see setter with the same name)

8.20.4.3 thread() [1/3]

```
AsynchronousPublisher & rti::core::policy::AsynchronousPublisher::thread (
    const rti::core::ThreadSettings & the_thread )
```

Settings of the publishing thread.

There is only one asynchronous publishing thread per **dds::pub::Publisher** (p. 1719).

[default] priority below normal.

The actual value depends on your architecture:

For Windows: -2

For Linux: OS default priority

For a complete list of platform specific values, please refer to [Platform Notes](#).

8.20.4.4 thread() [2/3]

```
const rti::core::ThreadSettings & rti::core::policy::AsynchronousPublisher::thread ( ) const
```

Getter (see setter with the same name)

8.20.4.5 thread() [3/3]

```
rti::core::ThreadSettings & rti::core::policy::AsynchronousPublisher::thread ( )
```

Getter (see setter with the same name)

8.20.4.6 disable_asynchronous_batch() [1/2]

```
AsynchronousPublisher & rti::core::policy::AsynchronousPublisher::disable_asynchronous_batch (
    bool the_disable_asynchronous_batch )
```

Disable asynchronous batch flushing.

If set to true, any **dds::pub::DataWriter** (p. 908) created with batching enabled will fail with **dds::core::InconsistentPolicyError** (p. 1354).

If **rti::core::policy::Batch::max_flush_delay** (p. 669) is different than **dds::core::Duration::infinite()** (p. 1197), **rti::core::policy::AsynchronousPublisher::disable_asynchronous_batch** (p. 624) must be set false.

[default] false

Referenced by **rti::core::policy::Event::initial_count()**.

8.20.4.7 disable_asynchronous_batch() [2/2]

```
bool rti::core::policy::AsynchronousPublisher::disable_asynchronous_batch ( ) const
```

Getter (see setter with the same name)

8.20.4.8 asynchronous_batch_thread() [1/3]

```
AsynchronousPublisher & rti::core::policy::AsynchronousPublisher::asynchronous_batch_thread (
    const rti::core::ThreadSettings & the_asynchronous_batch_thread )
```

Settings of the batch flushing thread.

There is only one asynchronous batch flushing thread per **dds::pub::Publisher** (p. 1719).

[default] priority below normal.

The actual value depends on your architecture:

For Windows: -2

For Linux: OS default priority

For a complete list of platform specific values, please refer to Platform Notes. **[default]** The actual value depends on your architecture:

[default] mask = **rti::core::ThreadSettingsKindMask::ThreadSettingsKindMask()** (p. 2160)

8.20.4.9 asynchronous_batch_thread() [2/3]

```
const rti::core::ThreadSettings & rti::core::policy::AsynchronousPublisher::asynchronous_batch_↔
thread ( ) const
```

Getter (see setter with the same name)

8.20.4.10 asynchronous_batch_thread() [3/3]

```
rti::core::ThreadSettings & rti::core::policy::AsynchronousPublisher::asynchronous_batch_thread (
)
```

Getter (see setter with the same name)

8.20.4.11 disable_topic_query_publication() [1/2]

```
AsynchronousPublisher & rti::core::policy::AsynchronousPublisher::disable_topic_query_publication
(
    bool the_disable_topic_query_publication )
```

Disable topic query publication.

If set to true, any **dds::pub::DataWriter** (p. 908) created with **rti::core::policy::TopicQueryDispatch::enable** (p. 2228) set to true will fail with **dds::core::InconsistentPolicyError** (p. 1354).

[default] false

8.20.4.12 disable_topic_query_publication() [2/2]

```
bool rti::core::policy::AsynchronousPublisher::disable_topic_query_publication ( ) const
```

Getter (see setter with the same name)

8.20.4.13 topic_query_publication_thread() [1/3]

```
AsynchronousPublisher & rti::core::policy::AsynchronousPublisher::topic_query_publication_thread
(
    const rti::core::ThreadSettings & the_topic_query_publication_thread )
```

Settings of the **rti::sub::TopicQuery** (p. 2220) publication thread.

There is only one TopicQuery publication thread per **dds::pub::Publisher** (p. 1719). This thread will exist as long as one or more **dds::pub::DataWriter** (p. 908) enables TopicQueries (via **rti::core::policy::TopicQueryDispatch** (p. 2226)).

[default] priority below normal.

The actual value depends on your architecture:

For Windows: -2

For Linux: OS default priority

For a complete list of platform specific values, please refer to [Platform Notes](#). **[default]** The actual value depends on your architecture:

[default] mask = **rti::core::ThreadSettingsKindMask::ThreadSettingsKindMask()** (p. 2160)

8.20.4.14 topic_query_publication_thread() [2/3]

```
const rti::core::ThreadSettings & rti::core::policy::AsynchronousPublisher::topic_query_publication_↔
_thread ( ) const
```

Getter (see setter with the same name)

8.20.4.15 topic_query_publication_thread() [3/3]

```
rti::core::ThreadSettings & rti::core::policy::AsynchronousPublisher::topic_query_publication_↔
thread ( )
```

Getter (see setter with the same name)

8.20.4.16 Enabled()

```
static AsynchronousPublisher rti::core::policy::AsynchronousPublisher::Enabled (
    bool enable_async_batch = false ) [inline], [static]
```

Returns a policy that enables asynchronous write and optionally asynchronous batch flushing.

It uses the default thread settings.

For example:

```
using namespace rti::core::policy;
publisher_qos < AsynchronousPublisher::Enabled()
```

8.20.4.17 Disabled()

```
static AsynchronousPublisher rti::core::policy::AsynchronousPublisher::Disabled ( ) [inline],
[static]
```

Creates a policy that disables asynchronous writing.

8.21 rti::core::cond::AsyncWaitSet Class Reference

<<*extension*>> (p. 156) Dispatches **dds::core::cond::Condition** (p. 729) objects using separate threads of execution. Unlike a normal **dds::core::cond::WaitSet** (p. 2318), which operates on the current thread, an **AsyncWaitSet** (p. 627) uses a thread pool.

```
#include <rti/core/cond/AsyncWaitSet.hpp>
```

Inheritance diagram for rti::core::cond::AsyncWaitSet:

Public Member Functions

- **AsyncWaitSet** ()
Constructor without arguments that create an `rti::core::cond::AsyncWaitSet` (p. 627) with default property.
- **AsyncWaitSet** (const **AsyncWaitSetProperty** &the_property)
Single-argument constructor that allows creating a `rti::core::cond::AsyncWaitSet` (p. 627) with custom behavior.
- **AsyncWaitSet** (const **AsyncWaitSetProperty** &the_property, **AsyncWaitSetListener** *listener)
Constructor that allows specifying a `rti::core::cond::AsyncWaitSetListener` (p. 643).
- void **start** ()
Initiates the asynchronous wait on this `rti::core::cond::AsyncWaitSet` (p. 627).
- void **start** (**AsyncWaitSetCompletionToken** completion_token)
Initiates the asynchronous wait on this `rti::core::cond::AsyncWaitSet` (p. 627).
- void **stop** ()
Initiates the stop procedure on this `rti::core::cond::AsyncWaitSet` (p. 627) that will stop the asynchronous wait.
- void **stop** (**AsyncWaitSetCompletionToken** completion_token)
Initiates the stop procedure on this `rti::core::cond::AsyncWaitSet` (p. 627) that will stop the asynchronous wait.
- **AsyncWaitSet** & **attach_condition** (**dds::core::cond::Condition** condition)
Attaches the specified `dds::core::cond::Condition` (p. 729) to this `rti::core::cond::AsyncWaitSet` (p. 627).
- **AsyncWaitSet** & **attach_condition** (**dds::core::cond::Condition** condition, **AsyncWaitSetCompletionToken** completion_token)
Attaches the specified `dds::core::cond::Condition` (p. 729) to this `rti::core::cond::AsyncWaitSet` (p. 627).
- **AsyncWaitSet** & **detach_condition** (**dds::core::cond::Condition** condition)
Deaches the specified `dds::core::cond::Condition` (p. 729) from this `rti::core::cond::AsyncWaitSet` (p. 627).
- **AsyncWaitSet** & **detach_condition** (**dds::core::cond::Condition** condition, **AsyncWaitSetCompletionToken** completion_token)
Deaches the specified `dds::core::cond::Condition` (p. 729) from this `rti::core::cond::AsyncWaitSet` (p. 627).
- **AsyncWaitSet** & **operator+=** (**dds::core::cond::Condition** condition)
Attaches the specified `dds::core::cond::Condition` (p. 729) to this `rti::core::cond::AsyncWaitSet` (p. 627).
- **AsyncWaitSet** & **operator-=** (**dds::core::cond::Condition** condition)
Deaches the specified `dds::core::cond::Condition` (p. 729) from this `rti::core::cond::AsyncWaitSet` (p. 627).
- void **unlock_condition** (**dds::core::cond::Condition** condition)
Allows the `dds::core::cond::Condition` (p. 729) under dispatch to be available for concurrent dispatch from another thread from the pool.
- **AsyncWaitSetProperty** property ()
Retrieves the `rti::core::cond::AsyncWaitSetProperty` (p. 644) configuration of the associated `rti::core::cond::AsyncWaitSet` (p. 627).
- ConditionSeq **conditions** () const
Returns the list of attached `dds::core::cond::Condition` (p. 729) (s).
- ConditionSeq & **conditions** (ConditionSeq &attached_conditions) const
Retrieves the list of attached `dds::core::cond::Condition` (p. 729) (s).

8.21.1 Detailed Description

<<**extension**>> (p. 156) Dispatches `dds::core::cond::Condition` (p. 729) objects using separate threads of execution. Unlike a normal `dds::core::cond::WaitSet` (p. 2318), which operates on the current thread, an `AsyncWaitSet` (p. 627) uses a thread pool.

`rti::core::cond::AsyncWaitSet` (p. 627) provides a proactive model to process application events through `dds::core::cond::Condition` (p. 729) objects. `rti::core::cond::AsyncWaitSet` (p. 627) owns a pool of threads to asynchronously wait for the attached `dds::core::cond::Condition` (p. 729) objects to trigger and dispatch them upon wakeup. The asynchronous behavior is the main key different with regards to the `dds::core::cond::WaitSet` (p. 2318).

The class diagram and its collaborators is shown below:

8.21.2 AsyncWaitSet Thread Orchestration

rti::core::cond::AsyncWaitSet (p. 627) internally applies a leader-follower pattern for the orchestration of the thread pool. Once a **rti::core::cond::AsyncWaitSet** (p. 627) starts, it will create the thread pool of M threads from which only one thread will become the `Leader` thread, and remaining threads will become the `Followers`, where:

- The `Leader` thread is the one waiting for the attached **dds::core::cond::Condition** (p. 729) to trigger. Remaining threads in the pool, if any, are either idle awaiting to become the leader or busy while processing active **dds::core::cond::Condition** (p. 729).
- Upon wait wakeup, the `Leader` thread resigns its leader status to become a `Processor` thread and dispatch the next active **dds::core::cond::Condition** (p. 729) through the **dds::core::cond::Condition::dispatch** (p. 730) operation.
- One of the `Follower` threads wakes up and becomes the new leader to resume the wait for **dds::core::cond::Condition** (p. 729).

"Thread orchestration in a **rti::core::cond::AsyncWaitSet**"

This behavior implies the following considerations:

- Only one thread a time can wait for the attached **dds::core::cond::Condition** (p. 729) objects to trigger. From a pool of M threads, only one is the leader, P are processing active **dds::core::cond::Condition** (p. 729), and F are idle followers.
- A thread can dispatch only one active **dds::core::cond::Condition** (p. 729) at a time.
- **rti::core::cond::AsyncWaitSet** (p. 627) efficiently distributes threads to dispatch **dds::core::cond::Condition** (p. 729) objects on demand. This avoids underutilizing a thread if **dds::core::cond::Condition** (p. 729) objects do not trigger or trigger unfrequently.
- At a given time, all the threads in the pool could be in processing state. In this situation, the **rti::core::cond::AsyncWaitSet** (p. 627) is not able to wait for more **dds::core::cond::Condition** (p. 729) objects until one thread becomes the leader.

rti::core::cond::AsyncWaitSet (p. 627) has a built-in dispatcher that guarantees fairness and avoids starvation of **dds::core::cond::Condition** (p. 729) objects. By applying a round-robin distribution policy, each attached and active **dds::core::cond::Condition** (p. 729) is dispatched within a finite period of time, assuming the **functor handler** (p. 1859) always return control after the **dds::core::cond::Condition::dispatch** (p. 730) operation.

8.21.3 AsyncWaitSet Thread Safety

A key aspect of the **rti::core::cond::AsyncWaitSet** (p. 627) is the thread safety. **rti::core::cond::AsyncWaitSet** (p. 627) interface is thread safe, so you can concurrently call any operation on the **rti::core::cond::AsyncWaitSet** (p. 627) object from multiple threads in your application.

Furthermore, **rti::core::cond::AsyncWaitSet** (p. 627) also safely interacts with its own thread pool. Internally, the **rti::core::cond::AsyncWaitSet** (p. 627) applies the asynchronous completion token pattern to perform activities that involve synchronization with the thread pool.

For instance to detach a **dds::core::cond::Condition** (p. 729), the **rti::core::cond::AsyncWaitSet** (p. 627) generates an internal request to its thread pool to process it. As soon as the detachment completes, the thread pool provides the notification through an associated completion token.

Note

The asynchronous completion token behavior only takes place if the `rti::core::cond::AsyncWaitSet` (p. 627) is started. Otherwise the internal request will be directly executed by the calling thread.

For a finer control on this behavior, each `rti::core::cond::AsyncWaitSet` (p. 627) operation where this applies comes in two flavors:

- **Default**: the operation hides all the details of the completion token and returns after the operation completes. Operations of this kind internally use an implicit `rti::core::cond::AsyncWaitSetCompletionToken` (p. 640). The `rti::core::cond::AsyncWaitSet` (p. 627) creates and reuses `rti::core::cond::AsyncWaitSetCompletionToken` (p. 640) objects as needed. This is the recommended flavor unless your application has special resource needs.
- **With completion token**: An overloaded version of the default one that also receives an `rti::core::cond::AsyncWaitSetCompletionToken` (p. 640) object on which you can wait on at any time for the actual operation to complete. This flavor is available to assist applications with resource constraints and that want more control on the interaction with the thread pool of the `rti::core::cond::AsyncWaitSet` (p. 627).

8.21.3.1 Condition Locking

`rti::core::cond::AsyncWaitSet` (p. 627) incorporates a safety mechanism that prevents calling `dds::core::cond::Condition::dispatch` (p. 730) concurrently. `rti::core::cond::AsyncWaitSet` (p. 627) locks the `dds::core::cond::Condition` (p. 729) while a processor thread is dispatching it so no other thread within the pool can dispatch it again.

This mechanism ensures not only unexpected concurrent dispatch of a `dds::core::cond::Condition` (p. 729) but also spurious thread activity. Because it is responsibility of your application to reset the Condition trigger, there is a period of time in which the dispatched condition may remain active, causing the `rti::core::cond::AsyncWaitSet` (p. 627) to enter in a continuous immediate wakeup from the wait. This behavior typically leads to thread hogging and high CPU usage.

Nevertheless, your application may still want to receive concurrent and controlled dispatch notifications. `rti::core::cond::AsyncWaitSet` (p. 627) will still allow you to unlock a `dds::core::cond::Condition` (p. 729) so any other available thread can dispatch the same condition concurrently while preventing the above mentioned problems. You can achieve this by calling `rti::core::cond::AsyncWaitSet::unlock_condition` (p. 639) on the Condition being dispatched within the dispatch callback. Note that the `AsyncWaitSet` (p. 627) locks a Condition each time it dispatches it. Hence you need to unlock the Condition each time you want to enable a concurrent dispatch.

8.21.4 AsyncWaitSet Events and Resources

Besides `dds::core::cond::Condition` (p. 729) processing, you can listen to other kind of internal events related to the `rti::core::cond::AsyncWaitSet` (p. 627) and its thread pool by means of the `rti::core::cond::AsyncWaitSetListener` (p. 643).

`rti::core::cond::AsyncWaitSet` (p. 627) exposes operations to start and stop the asynchronous wait, which involves the creation and deletion of the thread pool respectively.

`rti::core::cond::AsyncWaitSet` (p. 627) relies on thread-specific storage to provide the described functionality. Each application thread that calls an operation on a `rti::core::cond::AsyncWaitSet` (p. 627) will generate resources that will be associated with such thread. You can free these resources upon thread termination by calling `DomainParticipantFactory::unregister_thread`.

MT Safety:

Safe.

8.21.5 Constructor & Destructor Documentation

8.21.5.1 AsyncWaitSet() [1/3]

```
rti::core::cond::AsyncWaitSet::AsyncWaitSet ( ) [inline]
```

Constructor without arguments that create an **rti::core::cond::AsyncWaitSet** (p. 627) with default property.

See also

rti::core::cond::AsyncWaitSetProperty::AsyncWaitSetProperty() (p. 646)

8.21.5.2 AsyncWaitSet() [2/3]

```
rti::core::cond::AsyncWaitSet::AsyncWaitSet (
    const AsyncWaitSetProperty & the_property ) [inline]
```

Single-argument constructor that allows creating a **rti::core::cond::AsyncWaitSet** (p. 627) with custom behavior.

You can provide **rti::core::cond::AsyncWaitSetProperty::AsyncWaitSetProperty()** (p. 646) as `property` to create an **rti::core::cond::AsyncWaitSet** (p. 627) with default behavior.

The **rti::core::cond::AsyncWaitSet** (p. 627) is created with no listener installed.

Parameters

<code><i>the_property</i></code>	<< <i>in</i> >> (p. 157) configuration rti::core::cond::AsyncWaitSetProperty (p. 644)
----------------------------------	--

8.21.5.3 AsyncWaitSet() [3/3]

```
rti::core::cond::AsyncWaitSet::AsyncWaitSet (
    const AsyncWaitSetProperty & the_property,
    AsyncWaitSetListener * listener ) [inline]
```

Constructor that allows specifying a `rti::core::cond::AsyncWaitSetListener` (p. 643).

Creates a new `rti::core::cond::AsyncWaitSet` (p. 627) with the specified property `rti::core::cond::AsyncWaitSetProperty` (p. 644) and `rti::core::cond::AsyncWaitSetListener` (p. 643).

Parameters

<i>the_property</i>	<< <i>in</i> >> (p. 157) configuration <code>rti::core::cond::AsyncWaitSetProperty</code> (p. 644)
<i>listener</i>	<< <i>in</i> >> (p. 157) the <code>rti::core::cond::AsyncWaitSetListener</code> (p. 643). Cannot be NULL.

8.21.6 Member Function Documentation

8.21.6.1 start() [1/2]

```
void rti::core::cond::AsyncWaitSet::start ( ) [inline]
```

Initiates the asynchronous wait on this `rti::core::cond::AsyncWaitSet` (p. 627).

This operation blocks until the start request completes. Upon successful return, it is guaranteed that this `rti::core::cond::AsyncWaitSet` (p. 627) has initiated the asynchronous wait and dispatch.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

See also

`rti::core::cond::AsyncWaitSet::start(AsyncWaitSetCompletionToken)` (p. 632)

`rti::core::cond::AsyncWaitSet::stop` (p. 633)

8.21.6.2 start() [2/2]

```
void rti::core::cond::AsyncWaitSet::start (
    AsyncWaitSetCompletionToken completion_token ) [inline]
```

Initiates the asynchronous wait on this **rti::core::cond::AsyncWaitSet** (p. 627).

If this operation succeeds, a start request has been scheduled and your application can use the provided `completion_token` to wait for this **rti::core::cond::AsyncWaitSet** (p. 627) to process the request. If the **rti::core::cond::AsyncWaitSetCompletionToken::wait** (p. 642) operation returns successfully, it is guaranteed that the thread pool has been created and the leader thread is waiting for the attached **dds::core::cond::Condition** (p. 729) to trigger.

Once this **rti::core::cond::AsyncWaitSet** (p. 627) is started, attached **dds::core::cond::Condition** (p. 729) will be dispatched through the **dds::core::cond::Condition::dispatch** (p. 730) operation when they trigger.

The start procedure causes the **rti::core::cond::AsyncWaitSet** (p. 627) to spawn all the threads within the thread pool, which involves the underlying operating system to allocate the associated thread stack and context for each thread. If a **rti::core::cond::AsyncWaitSetListener** (p. 643) is installed, this **rti::core::cond::AsyncWaitSet** (p. 627) will sequentially invoke the **rti::core::cond::AsyncWaitSetListener::on_thread_spawned** (p. 643) once per spawned thread.

A **rti::core::cond::AsyncWaitSet** (p. 627) can be restarted after a stop. If this **rti::core::cond::AsyncWaitSet** (p. 627) is already started, this operation will return immediately with success, and waiting on the `completion_token` will also return immediately with success.

Parameters

<code>completion_token</code>	<< <i>inout</i> >> (p. 157) a valid rti::core::cond::AsyncWaitSetCompletionToken (p. 640) instance that can be used by your application to wait for the start request to complete. You can provide the special sentinel rti::core::cond::AsyncWaitSetCompletionToken::Ignore() (p. 302).
-------------------------------	--

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

See also

rti::core::cond::AsyncWaitSet::start (p. 632)

rti::core::cond::AsyncWaitSet::start(AsyncWaitSetCompletionToken) (p. 632)

dds::core::cond::WaitSet::wait (p. 2323)

8.21.6.3 stop() [1/2]

```
void rti::core::cond::AsyncWaitSet::stop ( ) [inline]
```

Initiates the stop procedure on this `rti::core::cond::AsyncWaitSet` (p. 627) that will stop the asynchronous wait.

This operation will block until the stop request completes. Upon successful return, it is guaranteed that this `rti::core::cond::AsyncWaitSet` (p. 627) stopped the asynchronous wait and dispatch.

Exceptions

One	of the Standard Exceptions (p. 228)
-----	--

See also

`rti::core::cond::AsyncWaitSet::start(AsyncWaitSetCompletionToken)` (p. 632)

`rti::core::cond::AsyncWaitSet::stop` (p. 633)

8.21.6.4 stop() [2/2]

```
void rti::core::cond::AsyncWaitSet::stop (
    AsyncWaitSetCompletionToken completion_token ) [inline]
```

Initiates the stop procedure on this `rti::core::cond::AsyncWaitSet` (p. 627) that will stop the asynchronous wait.

If this operation succeeds, a stop request has been scheduled and your application can use the provided `completion_token` to wait for this `rti::core::cond::AsyncWaitSet` (p. 627) to process the request. If the `rti::core::cond::AsyncWaitSetCompletionToken::wait` (p. 642) operation returns successfully, it is guaranteed that the thread pool has been deleted and this `rti::core::cond::AsyncWaitSet` (p. 627) no longer process any of the attached `dds::core::cond::Condition` (p. 729) objects.

Once this `rti::core::cond::AsyncWaitSet` (p. 627) is stopped, the `dds::core::cond::Condition::dispatch` (p. 730) will no longer be called on any of the attached `dds::core::cond::Condition` (p. 729), no matter what their trigger value is.

The stop procedure causes the `rti::core::cond::AsyncWaitSet` (p. 627) to delete all the threads within the thread pool, which involves the underlying operating system to release the associated thread stack and context of each thread. If a `rti::core::cond::AsyncWaitSetListener` (p. 643) is installed, this `rti::core::cond::AsyncWaitSet` (p. 627) will sequentially invoke the `rti::core::cond::AsyncWaitSetListener::on_thread_deleted` (p. 644) once per deleted thread.

If this `rti::core::cond::AsyncWaitSet` (p. 627) is already stopped, this operation will return immediately with success, and waiting on the `completion_token` will also return immediately with success.

Parameters

<code>completion_token</code>	<< <i>inout</i> >> (p. 157) a valid <code>rti::core::cond::AsyncWaitSetCompletionToken</code> (p. 640) instance that can be used by your application to wait for the stop request to complete. You can provide the special sentinel <code>rti::core::cond::AsyncWaitSetCompletionToken::Ignore()</code> (p. 302).

8.21.6.5 attach_condition() [1/2]

```
AsyncWaitSet & rti::core::cond::AsyncWaitSet::attach_condition (
    dds::core::cond::Condition condition ) [inline]
```

Attaches the specified **dds::core::cond::Condition** (p. 729) to this **rti::core::cond::AsyncWaitSet** (p. 627).

This operation will block until the attach request completes. Upon successful return, it is guaranteed that the specified **dds::core::cond::Condition** (p. 729) is attached.

Parameters

<i>condition</i>	<< <i>in</i> >> (p. 157) dds::core::cond::Condition (p. 729) to be attached.
------------------	---

Exceptions

One	of the Standard Exceptions (p. 228)
-----	--

See also

rti::core::cond::AsyncWaitSet::attach_condition(dds::core::cond::Condition, AsyncWaitSetCompletionToken) (p. 635)

8.21.6.6 attach_condition() [2/2]

```
AsyncWaitSet & rti::core::cond::AsyncWaitSet::attach_condition (
    dds::core::cond::Condition condition,
    AsyncWaitSetCompletionToken completion_token ) [inline]
```

Attaches the specified **dds::core::cond::Condition** (p. 729) to this **rti::core::cond::AsyncWaitSet** (p. 627).

If this operation succeeds, an attach request has been scheduled and your application can use the output parameter `completion_token` to wait for this `rti::core::cond::AsyncWaitSet` (p. 627) to process the request. `rti::core::cond::AsyncWaitSetCompletionToken::wait` (p. 642) operation returns successfully, it is guaranteed that the `dds::core::cond::Condition` (p. 729) is attached to this `rti::core::cond::AsyncWaitSet` (p. 627).

Once the `dds::core::cond::Condition` (p. 729) is attached, its trigger value may cause the leader thread of the `rti::core::cond::AsyncWaitSet` (p. 627) to wake up call the `dds::core::cond::Condition::dispatch` (p. 730) operation.

`dds::core::cond::Condition` (p. 729) may be attached at any time independently of the state of the `rti::core::cond::AsyncWaitSet` (p. 627).

Parameters

<code>condition</code>	<< <i>in</i> >> (p. 157) <code>dds::core::cond::Condition</code> (p. 729) to be attached.
<code>completion_token</code>	<< <i>inout</i> >> (p. 157) a valid <code>rti::core::cond::AsyncWaitSetCompletionToken</code> (p. 640) instance that can be used by your application to wait for the attach request to complete. You can provide the special sentinel <code>rti::core::cond::AsyncWaitSetCompletionToken::Ignore()</code> (p. 302).

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

See also

`rti::core::cond::AsyncWaitSet::attach_condition` (p. 635)

`rti::core::cond::AsyncWaitSetCompletionToken::wait` (p. 642)

8.21.6.7 detach_condition() [1/2]

```
AsyncWaitSet & rti::core::cond::AsyncWaitSet::detach_condition (
    dds::core::cond::Condition condition ) [inline]
```

Deaches the specified `dds::core::cond::Condition` (p. 729) from this `rti::core::cond::AsyncWaitSet` (p. 627).

This operation blocks until the detach request completes. Upon successful return, it is guaranteed that the specified `dds::core::cond::Condition` (p. 729) is detached.

Parameters

<code>condition</code>	<< <i>in</i> >> (p. 157) <code>dds::core::cond::Condition</code> (p. 729) to be detached.
------------------------	---

Exceptions

One	of the Standard Exceptions (p. 228)
-----	--

See also

rti::core::cond::AsyncWaitSet::detach_condition(dds::core::cond::Condition, AsyncWaitSetCompletionToken) (p. 637)

8.21.6.8 detach_condition() [2/2]

```
AsyncWaitSet & rti::core::cond::AsyncWaitSet::detach_condition (
    dds::core::cond::Condition condition,
    AsyncWaitSetCompletionToken completion_token ) [inline]
```

Detaches the specified **dds::core::cond::Condition** (p. 729) from this **rti::core::cond::AsyncWaitSet** (p. 627).

If this operation succeeds, a detach request has been scheduled and your application can use the provided `completion_token` to wait for this **rti::core::cond::AsyncWaitSet** (p. 627) to process the request. If the **rti::core::cond::AsyncWaitSetCompletionToken::wait** (p. 642) operation returns successfully, it is guaranteed that the **dds::core::cond::Condition** (p. 729) is detached from this **rti::core::cond::AsyncWaitSet** (p. 627).

Once the **dds::core::cond::Condition** (p. 729) is detached, it is guaranteed that the **rti::core::cond::AsyncWaitSet** (p. 627) will no longer process it so it is safe for your application to release any resources associated with the detached **dds::core::cond::Condition** (p. 729).

dds::core::cond::Condition (p. 729) may be detached at any time independently of the state of the **rti::core::cond::AsyncWaitSet** (p. 627).

Parameters

<i>condition</i>	<< <i>in</i> >> (p. 157) dds::core::cond::Condition (p. 729) to be detached.
<i>completion_token</i>	<< <i>inout</i> >> (p. 157) a valid rti::core::cond::AsyncWaitSetCompletionToken (p. 640) instance that can be used by your application to wait for the detach request to complete. You can provide the special sentinel rti::core::cond::AsyncWaitSetCompletionToken::Ignore() (p. 302).

Exceptions

rti::core::cond::AsyncWaitSet::detach_condition(dds::core::cond::Condition, AsyncWaitSetCompletionToken) (p. 637)

8.21.6.11 unlock_condition()

```
void rti::core::cond::AsyncWaitSet::unlock_condition (
    dds::core::cond::Condition condition ) [inline]
```

Allows the **dds::core::cond::Condition** (p. 729) under dispatch to be available for concurrent dispatch from another thread from the pool.

This operation can be called from the dispatch callback of the **dds::core::cond::Condition** (p. 729) this **rti::core::cond::AsyncWaitSet** (p. 627) is dispatching. After successfully calling this operation, if the **dds::core::cond::Condition** (p. 729) becomes active this **rti::core::cond::AsyncWaitSet** (p. 627) is allowed to dispatch it again from any available thread from the pool.

You may call this operation any time you need the same **dds::core::cond::Condition** (p. 729) to be dispatched concurrently.

This operation will fail with **dds::core::PreconditionNotMetError** (p. 1669) if you call it from a different context than the dispatch callback or on a different **dds::core::cond::Condition** (p. 729).

Returns the list of attached **dds::core::cond::Condition** (p. 729) (s).

8.21.6.14 conditions() [2/2]

```
ConditionSeq & rti::core::cond::AsyncWaitSet::conditions (
    ConditionSeq & attached_conditions ) const [inline]
```

Retrieves the list of attached **dds::core::cond::Condition** (p. 729) (s).

Parameters

<i>attached_conditions</i>	<< <i>inout</i> >> (p. 157) a ConditionSeq object where the list of attached conditions will be returned.
----------------------------	---

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

8.22 rti::core::cond::AsyncWaitSetCompletionToken Class Reference

Implementation of the completion token role element of the asynchronous completion token pattern that is part of the **AsyncWaitSet** (p. 627) behavior.

```
#include <AsyncWaitSet.hpp>
```

Inheritance diagram for rti::core::cond::AsyncWaitSetCompletionToken:

Public Member Functions

- **AsyncWaitSetCompletionToken** (**AsyncWaitSet** &aws)
Creates a new rti::core::cond::AsyncWaitSetCompletionToken (p. 640).
- void **wait** (const **dds::core::Duration** &max_wait= **dds::core::Duration::infinite**())
Waits for the request associated to an operation made on the rti::core::cond::AsyncWaitSet (p. 627) to complete.

Static Public Member Functions

- static **AsyncWaitSetCompletionToken ignore** ()
For the operations that allow an rti::core::cond::AsyncWaitSetCompletionToken (p. 640), this sentinel can be provided to indicate an rti::core::cond::AsyncWaitSet (p. 627) to perform the action associating a 'null' completion token.

8.22.1 Detailed Description

Implementation of the completion token role element of the asynchronous completion token pattern that is part of the **AsyncWaitSet** (p. 627) behavior.

A **rti::core::cond::AsyncWaitSetCompletionToken** (p. 640) can be in one of the following states:

- **READY**: The completion token can be used to associate a new request. Calling **rti::core::cond::AsyncWaitSetCompletionToken::wait** (p. 642) on a ready completion token will return immediately with success. A ready completion token can only transition to the queued state.
- **QUEUED**: The completion token has an associated request that is pending processing. Calling **rti::core::cond::AsyncWaitSetCompletionToken::wait** (p. 642) on a queued completion token will block until the request completes or times out. A queued completion token can only transition to the processed state.
- **PROCESSED**: The completion token has an associated request that has been processed but the application did not call **rti::core::cond::AsyncWaitSetCompletionToken::wait** (p. 642) yet. Calling **rti::core::cond::AsyncWaitSetCompletionToken::wait** (p. 642) on a processed completion token will return immediately with the return code result of processing the associated request. A processed completion token can transition to both ready or queued states.

8.22.2 AsyncWaitSetCompletionToken management

The same **rti::core::cond::AsyncWaitSetCompletionToken** (p. 640) instance can be reused multiple times to associate a request and wait for its completion. Reusing is allowed only if the completion token is either in **READY** or **PROCESSED** state. Otherwise the **rti::core::cond::AsyncWaitSet** (p. 627) operation that associates the completion token will fail with **dds::core::PreconditionNotMetError** (p. 1669).

The completion token functionality can be viewed as a **rti::core::cond::AsyncWaitSet** (p. 627) internal detail from which your application should not need to know. In general, it is recommended to use the default flavor of **rti::core::cond::AsyncWaitSet** (p. 627) operations that handle the internals of the completion tokens for you.

Nevertheless, if a completion token represents an expensive resource in your environment, your application may want to have full control of how and when completion tokens are created. It's for these reasons why is exposed as a public collaborator of the **rti::core::cond::AsyncWaitSet** (p. 627).

MT Safety:

Safe.

8.22.3 Constructor & Destructor Documentation

8.22.3.1 AsyncWaitSetCompletionToken()

```
rti::core::cond::AsyncWaitSetCompletionToken::AsyncWaitSetCompletionToken (
    AsyncWaitSet & aws ) [inline]
```

Creates a new **rti::core::cond::AsyncWaitSetCompletionToken** (p. 640).

All the created **rti::core::cond::AsyncWaitSetCompletionToken** (p. 640) must be deleted by calling **rti::core::cond::AsyncWaitSet::delete_completion_token**.

See also

rti::core::cond::AsyncWaitSet::delete_completion_token
rti::core::cond::AsyncWaitSet::delete

8.22.4 Member Function Documentation

8.22.4.1 wait()

```
void rti::core::cond::AsyncWaitSetCompletionToken::wait (
    const dds::core::Duration & max_wait = dds::core::Duration::infinite() ) [inline]
```

Waits for the request associated to an operation made on the **rti::core::cond::AsyncWaitSet** (p. 627) to complete.

This operation will block the calling thread for a maximum amount of time specified by `max_wait` until the **rti::core::cond::AsyncWaitSet** (p. 627) request associated with this completion token completes.

If there is no timeout, upon return it is guaranteed that the request associated with this token completed. This operation may fail due to an error during the wait or while processing the associated request.

If this operation is called from within the context of one the thread that conforms the thread pool of the **rti::core::cond::AsyncWaitSet** (p. 627), it will fail with **dds::core::PreconditionNotMetError** (p. 1669).

If the operation failed with **dds::core::TimeoutError** (p. 2177) your application can wait again on this completion token.

Parameters

<code>max_wait</code>	<< <i>in</i> >> (p. 157) Cannot be NULL. Maximum time to wait for the request associated to this completion token to complete before timeout.
-----------------------	---

Exceptions

One	of the Standard Exceptions (p. 228)
-----	--

8.23 rti::core::cond::AsyncWaitSetListener Class Reference

Listener (p. 1381) for receiving event notifications related to the thread pool of the **AsyncWaitSet** (p. 627).

```
#include <AsyncWaitSetListener.hpp>
```

Inheritance diagram for rti::core::cond::AsyncWaitSetListener:

Public Member Functions

- virtual void **on_thread_spawned** (ThreadId thread_id)=0
*Handles the spawning of each thread conforming the thread pool of the **rti::core::cond::AsyncWaitSet** (p. 627).*
- virtual void **on_thread_deleted** (ThreadId thread_id)=0
*Handles the deletion of each thread conforming the thread pool of the **rti::core::cond::AsyncWaitSet** (p. 627).*
- virtual void **on_wait_timeout** (ThreadId thread_id)=0
*Handles the wait timeout generated by the leader thread of the **rti::core::cond::AsyncWaitSet** (p. 627).*

8.23.1 Detailed Description

Listener (p. 1381) for receiving event notifications related to the thread pool of the **AsyncWaitSet** (p. 627).

8.23.2 Member Function Documentation

8.23.2.1 on_thread_spawned()

```
virtual void rti::core::cond::AsyncWaitSetListener::on_thread_spawned (
    ThreadId thread_id ) [pure virtual]
```

Handles the spawning of each thread conforming the thread pool of the **rti::core::cond::AsyncWaitSet** (p. 627).

Implemented in **rti::core::cond::NoOpAsyncWaitSetListener** (p. 1569).

8.23.2.2 on_thread_deleted()

```
virtual void rti::core::cond::AsyncWaitSetListener::on_thread_deleted (
    ThreadId thread_id ) [pure virtual]
```

Handles the deletion of each thread conforming the thread pool of the **rti::core::cond::AsyncWaitSet** (p. 627).

Implemented in **rti::core::cond::NoOpAsyncWaitSetListener** (p. 1569).

8.23.2.3 on_wait_timeout()

```
virtual void rti::core::cond::AsyncWaitSetListener::on_wait_timeout (
    ThreadId thread_id ) [pure virtual]
```

Handles the wait timeout generated by the leader thread of the **rti::core::cond::AsyncWaitSet** (p. 627).

Implemented in **rti::core::cond::NoOpAsyncWaitSetListener** (p. 1569).

8.24 rti::core::cond::AsyncWaitSetProperty Class Reference

Specifies the **rti::core::cond::AsyncWaitSet** (p. 627) behavior.

```
#include <rti/core/cond/AsyncWaitSet.hpp>
```

Public Member Functions

- **AsyncWaitSetProperty** ()
Creates the default property.
- **AsyncWaitSetProperty** (**rti::core::cond::WaitSetProperty** &the_waitset_property, **dds::core::Duration** &the_wait_timeout, int32_t the_level, const std::string &the_thread_name_prefix, **rti::core::ThreadSettings** &the_thread_settings, int32_t the_thread_pool_size)
Creates an instance with all the specified parameters.
- **rti::core::cond::WaitSetProperty** waitset_property () const
Getter (see setter with the same name)
- **AsyncWaitSetProperty** & **waitset_property** (**rti::core::cond::WaitSetProperty** &the_waitset_property)
*Specifies the behavior of the asynchronous wait behavior, which is equivalent to the wait mechanism of a **dds::core::cond::WaitSet** (p. 2318).*
- **dds::core::Duration** wait_timeout () const
Getter (see setter with the same name)
- **AsyncWaitSetProperty** & **wait_timeout** (**dds::core::Duration** &the_wait_timeout)
Asynchronous wait timeout.
- int32_t **level** () const
Getter (see setter with the same name)
- **AsyncWaitSetProperty** & **level** (int32_t the_level)
*Specifies the level of an **rti::core::cond::AsyncWaitSet** (p. 627).*
- const std::string **thread_name_prefix** () const
Getter (see setter with the same name)
- **AsyncWaitSetProperty** & **thread_name_prefix** (const std::string &thr_thread_name_prefix)
*Prefix used to composed the name of each thread that conforms the thread pool the **rti::core::cond::AsyncWaitSet** (p. 627).*
- **rti::core::ThreadSettings** **thread_settings** () const
Getter (see setter with the same name)
- **AsyncWaitSetProperty** & **thread_settings** (**rti::core::ThreadSettings** &the_thread_settings)
***rti::core::ThreadSettings** (p. 2154) for each thread conforming the thread pool of the **rti::core::cond::AsyncWaitSet** (p. 627).*
- int32_t **thread_pool_size** () const
Getter (see setter with the same name)
- **AsyncWaitSetProperty** & **thread_pool_size** (int32_t the_level)
*Number of threads that conform the thread pool of the **rti::core::cond::AsyncWaitSet** (p. 627).*

8.24.1 Detailed Description

Specifies the **rti::core::cond::AsyncWaitSet** (p. 627) behavior.

This property allows configuring the behavior of the asynchronous wait and the **dds::core::cond::Condition** (p. 729) dispatch, as well as the parameters of the thread pool.

See also

rti::core::cond::WaitSetProperty (p. 2328)

rti::core::ThreadSettings (p. 2154)

8.24.2 Constructor & Destructor Documentation

8.24.2.1 AsyncWaitSetProperty() [1/2]

```
rti::core::cond::AsyncWaitSetProperty::AsyncWaitSetProperty ( ) [inline]
```

Creates the default property.

The default value for each field is documented in its corresponding setter.

8.24.2.2 AsyncWaitSetProperty() [2/2]

```
rti::core::cond::AsyncWaitSetProperty::AsyncWaitSetProperty (
    rti::core::cond::WaitSetProperty & the_waitset_property,
    dds::core::Duration & the_wait_timeout,
    int32_t the_level,
    const std::string & the_thread_name_prefix,
    rti::core::ThreadSettings & the_thread_settings,
    int32_t the_thread_pool_size )
```

Creates an instance with all the specified parameters.

8.24.3 Member Function Documentation

8.24.3.1 waitset_property() [1/2]

```
rti::core::cond::WaitSetProperty rti::core::cond::AsyncWaitSetProperty::waitset_property ( )
const
```

Getter (see setter with the same name)

8.24.3.2 waitset_property() [2/2]

```
AsyncWaitSetProperty & rti::core::cond::AsyncWaitSetProperty::waitset_property (
    rti::core::cond::WaitSetProperty & the_waitset_property )
```

Specifies the behavior of the asynchronous wait behavior, which is equivalent to the wait mechanism of a `dds::core::cond::WaitSet` (p. 2318).

See also

`rti::core::cond::WaitSetProperty` (p. 2328)

8.24.3.3 wait_timeout() [1/2]

```
dds::core::Duration rti::core::cond::AsyncWaitSetProperty::wait_timeout ( ) const
```

Getter (see setter with the same name)

8.24.3.4 wait_timeout() [2/2]

```
AsyncWaitSetProperty & rti::core::cond::AsyncWaitSetProperty::wait_timeout (
    dds::core::Duration & the_wait_timeout )
```

Asynchronous wait timeout.

Specifies the maximum amount of time the leader thread of the **rti::core::cond::AsyncWaitSet** (p. 627) waits for an attached **dds::core::cond::Condition** (p. 729) to trigger before it wakes up.

Duration must be a value greater than zero.

See also

dds::core::cond::WaitSet::wait (p. 2323)

[default] **dds::core::Duration::infinite()** (p. 1197)

8.24.3.5 level() [1/2]

```
int32_t rti::core::cond::AsyncWaitSetProperty::level ( ) const
```

Getter (see setter with the same name)

8.24.3.6 level() [2/2]

```
AsyncWaitSetProperty & rti::core::cond::AsyncWaitSetProperty::level (
    int32_t the_level )
```

Specifies the level of an **rti::core::cond::AsyncWaitSet** (p. 627).

The level prevents an application to deadlock when it uses multiple **rti::core::cond::AsyncWaitSet** (p. 627) instances that call operations on each other from the context of one of their thread pool's thread.

Inside the context of one of these threads, the application can synchronize only with other **rti::core::cond::AsyncWaitSet** (p. 627) of bigger level.

[default] 1

8.24.3.7 thread_name_prefix() [1/2]

```
const std::string rti::core::cond::AsyncWaitSetProperty::thread_name_prefix ( ) const
```

Getter (see setter with the same name)

8.24.3.8 thread_name_prefix() [2/2]

```
AsyncWaitSetProperty & rti::core::cond::AsyncWaitSetProperty::thread_name_prefix (
    const std::string & thr_thread_name_prefix )
```

Prefix used to composed the name of each thread that conforms the thread pool the **rti::core::cond::AsyncWaitSet** (p. 627).

The composed name has the form:

`thread_name_prefix##[index]AWs` where [index] is an integer that identifies the thread relative to the **rti::core::cond::AsyncWaitSet** (p. 627).

If the string is empty, the default prefix will be used.

[default] Empty string (use default prefix)

8.24.3.9 thread_settings() [1/2]

```
rti::core::ThreadSettings rti::core::cond::AsyncWaitSetProperty::thread_settings ( ) const
```

Getter (see setter with the same name)

8.24.3.10 thread_settings() [2/2]

```
AsyncWaitSetProperty & rti::core::cond::AsyncWaitSetProperty::thread_settings (
    rti::core::ThreadSettings & the_thread_settings )
```

rti::core::ThreadSettings (p. 2154) for each thread conforming the thread pool of the **rti::core::cond::AsyncWaitSet** (p. 627).

Each thread within the pool is created with the same settings.

[default] Default thread settings values.

See also

rti::core::ThreadSettings (p. 2154)

8.24.3.11 thread_pool_size() [1/2]

```
int32_t rti::core::cond::AsyncWaitSetProperty::thread_pool_size ( ) const
```

Getter (see setter with the same name)

8.24.3.12 thread_pool_size() [2/2]

```
AsyncWaitSetProperty & rti::core::cond::AsyncWaitSetProperty::thread_pool_size (
    int32_t the_level )
```

Number of threads that conform the thread pool of the **rti::core::cond::AsyncWaitSet** (p. 627).

Size must be equal or greater than one.

[default] 1

8.25 rti::config::activity_context::AttributeKindMask Class Reference

The attributes used in the string representation of the Activity Context can be configured through this mask.

```
#include <ActivityContext.hpp>
```

Inherits `std::bitset< 32 >`.

Public Types

- `typedef std::bitset< 32 > MaskType`
A typedef of `std::bitset<32>` for convenience.

Public Member Functions

- **AttributeKindMask** ()
Not provide any attribute of the resource of the Activity Context.
- **AttributeKindMask** (uint64_t mask)
Construct a **AttributeKindMask** (p. 649) from an integer.
- **AttributeKindMask** (const **MaskType** &mask)
Construct a **AttributeKindMask** (p. 649) from a **MaskType** object.

Static Public Member Functions

- static const **AttributeKindMask** **guid_prefix** ()
Provide the entity GUID prefix to the resource of the Activity Context.
- static const **AttributeKindMask** **topic** ()
Provide the Topic to the resource of the Activity Context. The topic attribute is specified by "Topic".
- static const **AttributeKindMask** **type** ()
Provide the data type to the resource of the Activity Context. The type attribute is specified by "Type".
- static const **AttributeKindMask** **entity_kind** ()
Provide the entity kind to the resource of the Activity Context. The kind attribute is specified by "Entity".
- static const **AttributeKindMask** **domain_id** ()
Provide the domain ID to the resource of the Activity Context. The domain attribute is specified by "Domain".
- static const **AttributeKindMask** **entity_name** ()
Provide the entity name to the resource of the Activity Context. The name attribute is specified by "Name".
- static const **AttributeKindMask** **default_mask** ()
Provide the default attributes of the resource of the Activity Context.
- static const **AttributeKindMask** **none** ()
Not provide any attribute of the resource of the Activity Context.
- static const **AttributeKindMask** **all** ()
Provide all the possibles attributes of the resource of the Activity Context.

8.25.1 Detailed Description

The attributes used in the string representation of the Activity Context can be configured through this mask.

This mask indicates what attributes of the resource are used when RTI Connexxt logs a message or when the Heap Monitoring utility saves statistics for a memory allocation.

8.25.2 Member Typedef Documentation

8.25.2.1 MaskType

```
typedef std::bitset<32> rti::config::activity_context::AttributeKindMask::MaskType
```

A typedef of `std::bitset<32>` for convenience.

8.25.3 Constructor & Destructor Documentation

8.25.3.1 AttributeKindMask() [1/3]

```
rti::config::activity_context::AttributeKindMask::AttributeKindMask ( ) [inline]
```

Not provide any attribute of the resource of the Activity Context.

8.25.3.2 AttributeKindMask() [2/3]

```
rti::config::activity_context::AttributeKindMask::AttributeKindMask (
    uint64_t mask ) [inline], [explicit]
```

Construct a **AttributeKindMask** (p. 649) from an integer.

Parameters

<i>mask</i>	Value whose bits are copied to the bitset positions
-------------	---

8.25.3.3 AttributeKindMask() [3/3]

```
rti::config::activity_context::AttributeKindMask::AttributeKindMask (
    const MaskType & mask ) [inline]
```

Construct a **AttributeKindMask** (p. 649) from a MaskType object.

Parameters

<i>mask</i>	A std::bitset<32> to construct this AttributeKindMask (p. 649) from
-------------	--

8.25.4 Member Function Documentation

8.25.4.1 guid_prefix()

```
static const AttributeKindMask rti::config::activity_context::AttributeKindMask::guid_prefix ( )
[inline], [static]
```

Provide the entity GUID prefix to the resource of the Activity Context.

For example:

- For the following string representation of the context:
[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName,Entity=DW,Topic=test,Type=Foo,Domain=1}|Write]
- The GUID prefix is 0X101A76B,0X79E5D71,0X50EE914. If the bit `ActivityContextAttributeKind::GUID_PREFIX` is not set, the string representation will not show the GUID prefix:
[:0X80000003{Name=testDataWriterName,Entity=DW,Topic=test,Type=Foo,Domain=1}|Write]

8.25.4.2 topic()

```
static const AttributeKindMask rti::config::activity_context::AttributeKindMask::topic ( ) [inline],
[static]
```

Provide the Topic to the resource of the Activity Context. The topic attribute is specified by "Topic".

For example:

- For the following string representation of the context:
[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName,Entity=DW,Topic=test,Type=Foo,Domain=1}|Write]
- The Topic is "test." If the bit `ActivityContextAttributeKind::TOPIC` is not set, the string representation will not show the Topic:
[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName,Entity=DW,Type=Foo,Domain=1}|Write]

8.25.4.3 type()

```
static const AttributeKindMask rti::config::activity_context::AttributeKindMask::type ( ) [inline],
[static]
```

Provide the data type to the resource of the Activity Context. The type attribute is specified by "Type".

For example:

- For the following string representation of the context:
[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName,Entity=DW,Topic=test,Type=Foo,Domain=1}|Write]
- The data type is "Foo." If the bit `ActivityContextAttributeKind::TYPE` is not set, the string representation will not show the data type:
[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName,Entity=DW,Topic=test,Domain=1}|Write]

8.25.4.4 entity_kind()

```
static const AttributeKindMask rti::config::activity_context::AttributeKindMask::entity_kind ( )  
[inline], [static]
```

Provide the entity kind to the resource of the Activity Context. The kind attribute is specified by "Entity".

For example:

- For the following string representation of the context:
`[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName,Entity=DW,Topic=test,Type=Foo,Domain=1}|Write]`
- The entity kind is "Writer." If the bit `ActivityContextAttributeKind::ENTITY_KIND` is not set, the string representation will not show the entity kind:
`[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName,Topic=test,Type=Foo,Domain=1}|Write]`

8.25.4.5 domain_id()

```
static const AttributeKindMask rti::config::activity_context::AttributeKindMask::domain_id ( )  
[inline], [static]
```

Provide the domain ID to the resource of the Activity Context. The domain attribute is specified by "Domain".

For example:

- For the following string representation of the context:
`[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName,Entity=DW,Topic=test,Type=Foo,Domain=1}|Write]`
- The domain ID is "1." If the bit `ActivityContextAttributeKind::DOMAIN_ID` is not set, the string representation will not show the domain ID:
`[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName,Entity=DW,Topic=test,Type=Foo}|Write]`

8.25.4.6 entity_name()

```
static const AttributeKindMask rti::config::activity_context::AttributeKindMask::entity_name ( )  
[inline], [static]
```

Provide the entity name to the resource of the Activity Context. The name attribute is specified by "Name".

For example:

- For the following string representation of the context:
`[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName,Entity=DW,Topic=test,Type=Foo,Domain=1}|Write]`
- The entity name is "testDataWriterName." If the bit `ActivityContextAttributeKind::ENTITY_NAME` is not set, the string representation will not show the entity name:
`[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Entity=DW,Topic=test,Type=Foo,Domain=1}|Write]`

8.25.4.7 default_mask()

```
static const AttributeKindMask rti::config::activity_context::AttributeKindMask::default_mask ( )
[inline], [static]
```

Provide the default attributes of the resource of the Activity Context.

8.25.4.8 none()

```
static const AttributeKindMask rti::config::activity_context::AttributeKindMask::none ( ) [inline],
[static]
```

Not provide any attribute of the resource of the Activity Context.

8.25.4.9 all()

```
static const AttributeKindMask rti::config::activity_context::AttributeKindMask::all ( ) [inline],
[static]
```

Provide all the possibles attributes of the resource of the Activity Context.

8.26 rti::core::policy::Availability Class Reference

<<*extension*>> (p. 156) Configures data availability in the context of Collaborative DataWriters and Required Subscriptions

```
#include <rti/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **Availability** ()
 - Creates the default policy.*
- **Availability** (bool the_enable_required_subscriptions, const **dds::core::Duration** &the_data_waiting_time, const **dds::core::Duration** &the_endpoint_waiting_time, const **rti::core::EndpointGroupSeq** &the_required_endpoint_groups)
 - Creates a policy with all the paramters.*
- **Availability & enable_required_subscriptions** (bool the_enable_required_subscriptions)
 - Enables support for required subscriptions in a **dds::pub::DataWriter** (p. 908).*
- bool **enable_required_subscriptions** () const
 - Getter (see setter with the same name)*
- **Availability & max_data_availability_waiting_time** (const **dds::core::Duration** &the_data_waiting_time)

Defines how much time to wait before delivering a sample to the application without having received some of the previous samples.

- **dds::core::Duration max_data_availability_waiting_time** () const
Getter (see setter with the same name)
- **Availability & max_endpoint_availability_waiting_time** (const **dds::core::Duration** &the_endpoint_↔
waiting_time)
Defines how much time to wait to discover DataWriters providing samples for the same data source (virtual GUID).
- **dds::core::Duration max_endpoint_availability_waiting_time** () const
Getter (see setter with the same name)
- **Availability & required_matched_endpoint_groups** (const **rti::core::EndpointGroupSeq** &the_required_↔
enpoint_groups)
A sequence of endpoint groups.
- **rti::core::EndpointGroupSeq required_matched_endpoint_groups** () const
Getter (see setter with the same name)

8.26.1 Detailed Description

<<**extension**>> (p. 156) Configures data availability in the context of Collaborative DataWriters and Required Subscriptions

Entity:

dds::sub::DataReader (p. 756), **dds::pub::DataWriter** (p. 908)

Properties:

RxO (p. 307) = NO

Changeable (p. 307) = **YES** (p. 307) (only on a **dds::pub::DataWriter** (p. 908) except for the member **rti::core::policy::Availability::enable_required_subscriptions** (p. 657))

8.26.2 Usage

This QoS policy is used in the context of two features:

- Collaborative DataWriters
- Required Subscriptions

Collaborative DataWriters

The Collaborative DataWriters feature allows having multiple DataWriters publishing samples from a common logical data source. The DataReaders will combine the samples coming from the DataWriters in order to reconstruct the correct order at the source.

This QoS policy allows you to configure the ordering and combination process in the DataReader and can be used to support two different use cases:

- **Ordered delivery of samples in high-availability scenarios** One example of this is RTI Persistence **Service** (p. 2057). When a late-joining `DataReader` configured with `dds::core::policy::Durability` (p. 1181) set to `dds::core::policy::DurabilityKind::PERSISTENT` or `dds::core::policy::DurabilityKind::TRANSIENT` joins a DDS domain, it will start receiving historical samples from multiple `DataWriters`. For example, if the original `DataWriter` is still alive, the newly created `DataReader` will receive samples from the original `DataWriter` and one or more RTI Persistence **Service** (p. 2057) `DataWriters` (`PRSTDataWriters`). This policy can be used to configure the sample ordering process on the `DataReader`.
- **Ordered delivery of samples in load-balanced scenarios** Multiple instances of the same application can work together to process and deliver samples. When the samples arrive through different data-paths out of order, the `DataReader` will be able to reconstruct the order at the destination. An example of this is when multiple instances of RTI Persistence **Service** (p. 2057) are used to persist the data. Persisting data to a database on disk can be a bottleneck for throughput. You can improve scalability and performance by dividing the workload across different instances of RTI Persistence **Service** (p. 2057) that use different databases. For example, samples larger than 10 are persisted by Persistence **Service** (p. 2057) 1, samples less than or equal to 10 are persisted by Persistence **Service** (p. 2057) 2.
- **Ordered delivery of samples with Group Ordered Access** This policy can also be used to configure the sample ordering process when the `Subscriber` is configured with `dds::core::policy::Presentation` (p. 1670) `access_scope` set to `dds::core::policy::PresentationAccessScopeKind_def::GROUP` (p. 1677). In this case, the `Subscriber` must deliver in order the samples published by a group of `DataWriters` that belong to the same `Publisher` and have `access_scope` set to `dds::core::policy::PresentationAccessScopeKind_def::GROUP` (p. 1677).

Each sample published in a DDS domain for a given logical data source is uniquely identified by a pair (virtual GUID, virtual sequence number). Samples from the same data source (same virtual GUID) can be published by different `DataWriters`. A `DataReader` will deliver a sample (VGUIDn, VSNm) to the application if one of the following conditions is satisfied:

- (VGUIDn, VSNm-1) has already been delivered to the application.
- All the known `DataWriters` publishing VGUIDn have announced that they do not have (VGUIDn, VSNm-1).
- None of the known `DataWriters` publishing VGUIDn have announced potential availability of (VGUIDn, VSNm-1) and both timeouts in this QoS policy have expired.

A `DataWriter` announces potential availability of samples by using virtual heartbeats (HBs).

When `dds::core::policy::Presentation::access_scope` (p. 1674) is set to `dds::core::policy::PresentationAccessScopeKind_def::TOPIC` (p. 1677) or `dds::core::policy::PresentationAccessScopeKind_def::INSTANCE` (p. 1677), the virtual HB contains information about the samples contained in the `dds::pub::DataWriter` (p. 908) history.

When `dds::core::policy::Presentation::access_scope` (p. 1674) is set to `dds::core::policy::PresentationAccessScopeKind_def::GROUP` (p. 1677), the virtual HB contains information about all `DataWriters` in the `dds::pub::Publisher` (p. 1719).

The frequency at which virtual HBs are sent is controlled by the protocol parameters `rti::core::RtpsReliableWriterProtocol::virtual_heartbeat_period` and `rti::core::RtpsReliableWriterProtocol::samples_per_virtual_heartbeat`.

Required Subscriptions

In the context of Required Subscriptions, this QoS policy can be used to configure a set of Required Subscriptions on a `dds::pub::DataWriter` (p. 908).

Required subscriptions are preconfigured, named subscriptions that may leave and subsequently rejoin the network from time to time, at the same or different physical locations. Any time a required subscription is disconnected, any samples that would have been delivered to it are stored for delivery if and when the subscription rejoins the network.

8.26.3 Consistency

For a DataWriter, the setting of **AVAILABILITY** (p. 308) must be set consistently with that of the **RELIABILITY** (p. 335) and **DURABILITY** (p. 320).

If **rti::core::policy::Availability::enable_required_subscriptions** (p.657) is set to true, **dds::core::policy::Reliability::kind** (p. 1876) must be set to **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 1881), **dds::core::policy::Durability** (p. 1181) must be set to a value different than **dds::core::policy::DurabilityKind::VOLATILE**, and **dds::core::policy::Durability::writer_depth** (p. 1187) must be set to either **rti::core::policy::auto_writer_depth()** (p. 322) or **dds::core::LENGTH_UNLIMITED** (p. 238).

8.26.4 Constructor & Destructor Documentation

8.26.4.1 Availability() [1/2]

```
rti::core::policy::Availability::Availability ( ) [inline]
```

Creates the default policy.

8.26.4.2 Availability() [2/2]

```
rti::core::policy::Availability::Availability (
    bool the_enable_required_subscriptions,
    const dds::core::Duration & the_data_waiting_time,
    const dds::core::Duration & the_endpoint_waiting_time,
    const rti::core::EndpointGroupSeq & the_required_endpoint_groups )
```

Creates a policy with all the parameters.

8.26.5 Member Function Documentation

8.26.5.1 enable_required_subscriptions() [1/2]

```
Availability & rti::core::policy::Availability::enable_required_subscriptions (
    bool the_enable_required_subscriptions )
```

Enables support for required subscriptions in a **dds::pub::DataWriter** (p. 908).

[default] false

8.26.5.2 `enable_required_subscriptions()` [2/2]

```
bool rti::core::policy::Availability::enable_required_subscriptions ( ) const
```

Getter (see setter with the same name)

8.26.5.3 `max_data_availability_waiting_time()` [1/2]

```
Availability & rti::core::policy::Availability::max_data_availability_waiting_time (
    const dds::core::Duration & the_data_waiting_time )
```

Defines how much time to wait before delivering a sample to the application without having received some of the previous samples.

Collaborative DataWriters

A sample identified by (VGUIDn, VSNm) will be delivered to the application if this timeout expires for the sample and the following two conditions are satisfied:

- None of the known DataWriters publishing VGUIDn have announced potential availability of (VGUIDn, VSNm-1).
- The DataWriters for all the endpoint groups specified in **required_matched_endpoint_groups** (p. 659) have been discovered or **max_endpoint_availability_waiting_time** (p. 658) has expired.

Required Subscriptions

This field is not applicable to Required Subscriptions.

[default] `dds::core::Duration::automatic()` (p. 1198) (`dds::core::Duration::infinite()` (p. 1197) for `dds::core::policy::PresentationAccessScopeKind_def::GROUP` (p. 1677). Otherwise, 0 seconds)

[range] [0, `dds::core::Duration::infinite()` (p. 1197)], `dds::core::Duration::automatic()` (p. 1198)

8.26.5.4 `max_data_availability_waiting_time()` [2/2]

```
dds::core::Duration rti::core::policy::Availability::max_data_availability_waiting_time ( ) const
```

Getter (see setter with the same name)

8.26.5.5 max_endpoint_availability_waiting_time() [1/2]

```
Availability & rti::core::policy::Availability::max_endpoint_availability_waiting_time (
    const dds::core::Duration & the_endpoint_waiting_time )
```

Defines how much time to wait to discover DataWriters providing samples for the same data source (virtual GUID).

Collaborative DataWriters

The set of endpoint groups that are required to provide samples for a data source can be configured using **required_↵**
matched_endpoint_groups (p. 659).

A non-consecutive sample identified by (VGUIDn, VSNm) cannot be delivered to the application unless DataWriters for all the endpoint groups in **required_matched_endpoint_groups** (p. 659) are discovered or this timeout expires.

Required Subscriptions

This field is not applicable to Required Subscriptions.

[default] **dds::core::Duration::automatic()** (p. 1198) (**dds::core::Duration::infinite()** (p. 1197) for **dds::core↵**
::policy::PresentationAccessScopeKind_def::GROUP (p. 1677). Otherwise, 0 seconds)

[range] [0, **dds::core::Duration::infinite()** (p. 1197)], **dds::core::Duration::automatic()** (p. 1198)

8.26.5.6 max_endpoint_availability_waiting_time() [2/2]

```
dds::core::Duration rti::core::policy::Availability::max_endpoint_availability_waiting_time ( )
const
```

Getter (see setter with the same name)

8.26.5.7 required_matched_endpoint_groups() [1/2]

```
Availability & rti::core::policy::Availability::required_matched_endpoint_groups (
    const rti::core::EndpointGroupSeq & the_required_endpoint_groups )
```

A sequence of endpoint groups.

Collaborative DataWriters

In the context of Collaborative DataWriters, it specifies the set of endpoint groups that are expected to provide samples for the same data source.

The quorum count in a group represents the number of DataWriters that must be discovered for that group before the DataReader is allowed to provide non consecutive samples to the application.

A DataWriter becomes a member of an endpoint group by configuring the role_name in **rti::core::policy::EntityName** (p. 1275).

Required Subscriptions

In the context of Required Subscriptions, it specifies the set of Required Subscriptions on a **dds::pub::DataWriter** (p. 908).

Each Required Subscription is specified by a name and a quorum count.

The quorum count represents the number of DataReaders that have to acknowledge the sample before it can be considered fully acknowledged for that Required Subscription.

A DataReader is associated with a Required Subscription by configuring the role_name in **rti::core::policy::Entity↵**
Name (p. 1275).

[default] Empty sequence

8.26.5.8 required_matched_endpoint_groups() [2/2]

```
rti::core::EndpointGroupSeq rti::core::policy::Availability::required_matched_endpoint_groups ( )
const
```

Getter (see setter with the same name)

8.27 dds::core::basic_string< CharType, Allocator > Class Template Reference

<<*value-type*>> (p. 152) A string convertible to std::string and with similar functionality

```
#include <dds/core/String.hpp>
```

Public Member Functions

- **basic_string** ()
Creates an empty string.
- **basic_string** (const **basic_string** &other)
Copy constructor.
- **basic_string** (const CharType *other_str)
Constructor from C string.
- **basic_string** (const std::basic_string< CharType > &std_string)
Constructor from std::basic_string.
- **basic_string** (size_t the_size)
Creates a string of a given size, initialized to '\0'.
- **basic_string** (**basic_string** &&other) OMG_NOEXCEPT
<<**C++11**>> (p. 155) *Move constructor*
- const CharType * **c_str** () const
Gets the underlying C string.
- size_type **size** () const
Gets the size.
- **basic_string** & **operator=** (const **basic_string** &other)
Assignment operator.
- **basic_string** & **operator=** (**basic_string** &&other) OMG_NOEXCEPT
<<**C++11**>> (p. 155) *Move-assignment operator*
- bool **operator==** (const **basic_string** &other) const
Returns if two strings are equal.
- bool **operator!=** (const **basic_string** &other) const
Returns if two strings are different.
- std::basic_string< CharType > **to_std_string** () const
Creates a std::basic_string from this dds::core::basic_string (p. 660).
- **operator std::basic_string< CharType >** () const
Creates a std::string from this dds::core::string (p. 235).

Related Functions

(Note that these are not member functions.)

- `template<typename CharType , typename Allocator >`
`std::ostream & operator<< (std::ostream &out, const basic_string< CharType, Allocator > &the_string)`
Prints the string.

8.27.1 Detailed Description

```
template<typename CharType, typename Allocator>
class dds::core::basic_string< CharType, Allocator >
```

<<*value-type*>> (p. 152) A string convertible to `std::string` and with similar functionality

In many cases, for performance reasons and other implementation requirements, the RTI Connex API uses `dds::core::string` (p. 235) instead of `std::string`. The most significant case is the C++ types that `rtiddsgen` generates from `IDL` (p. 395).

A `dds::core::string` (p. 235) provides a subset of the functionality of a `std::string`. It also provides automatic conversion to and from `std::string`.

8.27.2 Constructor & Destructor Documentation

8.27.2.1 basic_string() [1/6]

```
template<typename CharType , typename Allocator >
dds::core::basic_string< CharType, Allocator >::basic_string ( ) [inline]
```

Creates an empty string.

8.27.2.2 basic_string() [2/6]

```
template<typename CharType , typename Allocator >
dds::core::basic_string< CharType, Allocator >::basic_string (
    const basic_string< CharType, Allocator > & other ) [inline]
```

Copy constructor.

References `dds::core::basic_string< CharType, Allocator >::c_str()`, and `dds::core::basic_string< CharType, Allocator >::size()`.

8.27.2.3 basic_string() [3/6]

```
template<typename CharType , typename Allocator >
dds::core::basic_string< CharType, Allocator >::basic_string (
    const CharType * other_str ) [inline]
```

Constructor from C string.

8.27.2.4 basic_string() [4/6]

```
template<typename CharType , typename Allocator >
dds::core::basic_string< CharType, Allocator >::basic_string (
    const std::basic_string< CharType > & std_string ) [inline]
```

Constructor from std::basic_string.

8.27.2.5 basic_string() [5/6]

```
template<typename CharType , typename Allocator >
dds::core::basic_string< CharType, Allocator >::basic_string (
    size_t the_size ) [inline], [explicit]
```

Creates a string of a given size, initialized to '\0'.

8.27.2.6 basic_string() [6/6]

```
template<typename CharType , typename Allocator >
dds::core::basic_string< CharType, Allocator >::basic_string (
    basic_string< CharType, Allocator > && other ) [inline]
```

<<**C++11**>> (p. 155) Move constructor

References `dds::core::Duration::swap()`.

8.27.3 Member Function Documentation

8.27.3.1 c_str()

```
template<typename CharType , typename Allocator >
const CharType * dds::core::basic_string< CharType, Allocator >::c_str ( ) const [inline]
```

Gets the underlying C string.

Referenced by `dds::core::basic_string< CharType, Allocator >::basic_string()`, and `dds::core::basic_string< CharType, Allocator >::operator<<()`.

8.27.3.2 size()

```
template<typename CharType , typename Allocator >
size_type dds::core::basic_string< CharType, Allocator >::size ( ) const [inline]
```

Gets the size.

Referenced by `dds::core::basic_string< CharType, Allocator >::basic_string()`, `dds::core::basic_string< CharType, Allocator >::operator=()`, and `dds::core::basic_string< CharType, Allocator >::operator==(())`.

8.27.3.3 operator=() [1/2]

```
template<typename CharType , typename Allocator >
basic_string & dds::core::basic_string< CharType, Allocator >::operator= (
    const basic_string< CharType, Allocator > & other ) [inline]
```

Assignment operator.

References `dds::core::basic_string< CharType, Allocator >::size()`, and `dds::core::Duration::swap()`.

8.27.3.4 operator=() [2/2]

```
template<typename CharType , typename Allocator >
basic_string & dds::core::basic_string< CharType, Allocator >::operator= (
    basic_string< CharType, Allocator > && other ) [inline]
```

<<**C++11**>> (p. 155) Move-assignment operator

References `dds::core::Duration::swap()`.

8.27.3.5 operator==()

```
template<typename CharType , typename Allocator >
bool dds::core::basic_string< CharType, Allocator >::operator==(
    const basic_string< CharType, Allocator > & other ) const [inline]
```

Returns if two strings are equal.

References `dds::core::basic_string< CharType, Allocator >::size()`.

8.27.3.6 operator!=()

```
template<typename CharType , typename Allocator >
bool dds::core::basic_string< CharType, Allocator >::operator!=(
    const basic_string< CharType, Allocator > & other ) const [inline]
```

Returns if two strings are different.

8.27.3.7 to_std_string()

```
template<typename CharType , typename Allocator >
std::basic_string< CharType > dds::core::basic_string< CharType, Allocator >::to_std_string ( )
const [inline]
```

Creates a `std::basic_string` from this `dds::core::basic_string` (p.660).

8.27.3.8 operator std::basic_string< CharType >()

```
template<typename CharType , typename Allocator >
dds::core::basic_string< CharType, Allocator >::operator std::basic_string< CharType > ( ) const
[inline]
```

Creates a `std::string` from this `dds::core::string` (p.235).

8.27.4 Friends And Related Function Documentation

8.27.4.1 operator<<()

```
template<typename CharType , typename Allocator >
std::ostream & operator<< (
    std::ostream & out,
    const basic_string< CharType, Allocator > & the_string ) [related]
```

Prints the string.

References **dds::core::basic_string< CharType, Allocator >::c_str()**.

8.28 rti::core::policy::Batch Class Reference

<<*extension*>> (p. 156) Allows a **dds::pub::DataWriter** (p. 908) to batch multiple samples into a single network packet to increase throughput.

```
#include <rti/core/policy/CorePolicy.hpp>
```

Public Member Functions

Static Public Member Functions

- static **Batch Enabled** ()
Returns an instance that enables batching with the default **max_samples()** (p. 669) and **max_data_bytes()** (p. 668).
- static **Batch Disabled** ()
Returns an instance that disables batching.
- static **Batch EnabledWithMaxDataBytes** (int32_t the_max_bytes)
Returns an instance that enables batching with **max_data_bytes()** (p. 668)
- static **Batch EnabledWithMaxSamples** (int32_t the_max_samples)
Returns an instance that enables batching with **max_samples()** (p. 669)

8.28.1 Detailed Description

<<**extension**>> (p. 156) Allows a **dds::pub::DataWriter** (p. 908) to batch multiple samples into a single network packet to increase throughput.

This QoS policy configures the ability of the middleware to collect multiple user data samples to be sent in a single network packet, to take advantage of the efficiency of sending larger packets and thus increase effective throughput.

This QoS policy can be used to dramatically increase effective throughput for small data samples. Usually, throughput for small samples (size < 2048 bytes) is limited by CPU capacity and not by network bandwidth. Batching many smaller samples to be sent in a single large packet will increase network utilization, and thus throughput, in terms of samples per second.

Entity:

dds::pub::DataWriter (p. 908)

Properties:

RxO (p. 307) = NO

Changeable (p. 307) = **UNTIL ENABLE** (p. 307)

8.28.2 Constructor & Destructor Documentation

8.28.2.1 Batch()

```
rti::core::policy::Batch::Batch ( ) [inline]
```

Creates the default policy (batching is disabled)

8.28.3 Member Function Documentation

8.28.3.1 Enabled()

```
static Batch rti::core::policy::Batch::Enabled ( ) [inline], [static]
```

Returns an instance that enables batching with the default **max_samples()** (p. 669) and **max_data_bytes()** (p. 668).

8.28.3.2 Disabled()

```
static Batch rti::core::policy::Batch::Disabled ( ) [inline], [static]
```

Returns an instance that disables batching.

8.28.3.3 EnabledWithMaxDataBytes()

```
static Batch rti::core::policy::Batch::EnabledWithMaxDataBytes (
    int32_t the_max_bytes ) [inline], [static]
```

Returns an instance that enables batching with **max_data_bytes()** (p. 668)

For example:

```
using namespace rti::core::policy;
writer_qos << Batch::EnabledWithMaxDataBytes(2048);
```

8.28.3.4 EnabledWithMaxSamples()

```
static Batch rti::core::policy::Batch::EnabledWithMaxSamples (
    int32_t the_max_samples ) [inline], [static]
```

Returns an instance that enables batching with **max_samples()** (p. 669)

8.28.3.5 `enable()` [1/2]

```
Batch & rti::core::policy::Batch::enable (
    bool the_enable )
```

Enables or disables batching.

Referenced by `max_data_bytes()`, and `max_flush_delay()`.

8.28.3.6 `enable()` [2/2]

```
bool rti::core::policy::Batch::enable ( ) const
```

Returns whether batching is enabled or not.

8.28.3.7 `max_data_bytes()` [1/2]

```
Batch & rti::core::policy::Batch::max_data_bytes (
    int32_t the_max_data_bytes )
```

Sets the maximum cumulative length of all serialized samples in a batch.

A batch is flushed automatically when this maximum is reached.

`max_data_bytes` does not include the meta data associated with the batch samples. Each sample has at least 8 bytes of meta data containing information such as the timestamp and sequence number. The meta data can be as large as 52 bytes for keyed topics and 20 bytes for unkeyed topics.

Note: Batches must contain whole samples. If a new batch is started and its initial sample causes the serialized size to exceed `max_data_bytes`, RTI Connext will send the sample in a single batch.

[default] 1024

[range] [1, `dds::core::LENGTH_UNLIMITED` (p. 238)]

8.28.4 Consistency

The setting of `rti::core::policy::Batch::max_data_bytes` (p. 668) must be consistent with `rti::core::policy::Batch::max_samples` (p. 669). For these two values to be consistent, they cannot be both `dds::core::LENGTH_UNLIMITED` (p. 238).

Referenced by `max_flush_delay()`.

8.28.4.1 max_data_bytes() [2/2]

```
int32_t rti::core::policy::Batch::max_data_bytes ( ) const
```

Getter (see setter with the same name)

References [enable\(\)](#).

8.28.4.2 max_samples() [1/2]

```
Batch & rti::core::policy::Batch::max_samples (
    int32_t the_max_samples )
```

Sets the maximum number of samples in a batch.

A batch is flushed automatically when this maximum is reached.

[default] [dds::core::LENGTH_UNLIMITED](#) (p. 238)

[range] [1, [dds::core::LENGTH_UNLIMITED](#) (p. 238)]

8.28.5 Consistency

The setting of [rti::core::policy::Batch::max_samples](#) (p. 669) must be consistent with [rti::core::policy::Batch::max_data_bytes](#) (p. 668). For these two values to be consistent, they cannot be both [dds::core::LENGTH_UNLIMITED](#) (p. 238).

8.28.5.1 max_samples() [2/2]

```
int32_t rti::core::policy::Batch::max_samples ( ) const
```

Getter (see setter with the same name)

8.28.5.2 max_flush_delay() [1/2]

```
Batch & rti::core::policy::Batch::max_flush_delay (
    const dds::core::Duration & the_max_flush_delay )
```

Sets the maximum delay after which a batch is flushed.

A batch is flushed automatically after the delay specified by this parameter.

The delay is measured from the time the first sample in the batch is written by the application.

[default] [dds::core::Duration::infinite\(\)](#) (p. 1197)

[range] [0, [dds::core::Duration::infinite\(\)](#) (p. 1197)]

8.28.6 Consistency

The setting of `rti::core::policy::Batch::max_flush_delay` (p.669) must be consistent with `rti::core::policy::AsynchronousPublisher::disable_asynchronous_batch` (p.624) and `rti::core::policy::Batch::thread_safe_write` (p.671). If the delay is different than `dds::core::Duration::infinite()` (p.1197), `rti::core::policy::AsynchronousPublisher::disable_asynchronous_batch` (p.624) must be set to false and `rti::core::policy::Batch::thread_safe_write` (p.671) must be set to true.

References `enable()`, and `max_data_bytes()`.

8.28.6.1 max_flush_delay() [2/2]

```
dds::core::Duration rti::core::policy::Batch::max_flush_delay ( ) const
```

Getter (see setter with the same name)

8.28.6.2 source_timestamp_resolution() [1/2]

```
Batch & rti::core::policy::Batch::source_timestamp_resolution (
    const dds::core::Duration & the_source_timestamp_resolution )
```

Sets the timestamp resolution of the samples in a batch.

The value of this field determines how the source timestamp is associated with the samples in a batch.

A sample written with timestamp 't' inherits the source timestamp 't2' associated with the previous sample unless ('t' - 't2') > source_timestamp_resolution.

If source_timestamp_resolution is set to `dds::core::Duration::infinite()` (p.1197), every sample in the batch will share the source timestamp associated with the first sample.

If source_timestamp_resolution is set to zero, every sample in the batch will contain its own source timestamp corresponding to the moment when the sample was written.

The performance of the batching process is better when source_timestamp_resolution is set to `dds::core::Duration::infinite()` (p.1197).

[default] `dds::core::Duration::infinite()` (p.1197)

[range] [0, `dds::core::Duration::infinite()` (p.1197)]

8.28.7 Consistency

The setting of `rti::core::policy::Batch::source_timestamp_resolution` (p.670) must be consistent with `rti::core::policy::Batch::thread_safe_write` (p.671). If `rti::core::policy::Batch::thread_safe_write` (p.671) is set to false, `rti::core::policy::Batch::source_timestamp_resolution` (p.670) must be set to `dds::core::Duration::infinite()` (p.1197).

8.28.7.1 source_timestamp_resolution() [2/2]

```
dds::core::Duration rti::core::policy::Batch::source_timestamp_resolution ( ) const
```

Getter (see setter with the same name)

8.28.7.2 thread_safe_write() [1/2]

```
Batch & rti::core::policy::Batch::thread_safe_write (
    bool the_thread_safe_write )
```

Indicates if the write operation needs to be thread-safe.

If this parameter is set to true, multiple threads can call write on the **dds::pub::DataWriter** (p. 908) concurrently.

[default] true

8.28.8 Consistency

The setting of **rti::core::policy::Batch::thread_safe_write** (p. 671) must be consistent with **rti::core::policy::Batch::source_timestamp_resolution** (p. 670). If **rti::core::policy::Batch::thread_safe_write** (p. 671) is set to false, **rti::core::policy::Batch::source_timestamp_resolution** (p. 670) must be set to **dds::core::Duration::infinite()** (p. 1197).

8.28.8.1 thread_safe_write() [2/2]

```
bool rti::core::policy::Batch::thread_safe_write ( ) const
```

Getter (see setter with the same name)

8.29 rti::core::bounded_sequence< T, MaxLength > Class Template Reference

<< **value-type** >> (p. 152) A bounded sequence of elements

```
#include <rti/core/BoundedSequence.hpp>
```

Public Types

- typedef std::vector< T > **vector_type**
The type of the underlying vector.
- typedef vector_type::value_type **value_type**
The type of the elements, T.
- typedef vector_type::allocator_type **allocator_type**
The allocator type of the underlying vector.
- typedef vector_type::size_type **size_type**
The size type.
- typedef vector_type::difference_type **difference_type**
The difference type.
- typedef vector_type::reference **reference**
The reference type.
- typedef vector_type::const_reference **const_reference**
The const reference type.
- typedef vector_type::pointer **pointer**
The pointer type.
- typedef vector_type::const_pointer **const_pointer**
The const pointer type.
- typedef vector_type::iterator **iterator**
The iterator type.
- typedef vector_type::const_iterator **const_iterator**
The const iterator type.
- typedef vector_type::reverse_iterator **reverse_iterator**
The reverse iterator type.
- typedef vector_type::const_reverse_iterator **const_reverse_iterator**
The const reverse iterator type.

Public Member Functions

- **bounded_sequence** ()
*Creates an empty **bounded_sequence** (p. 671).*
- **bounded_sequence** (const **bounded_sequence** &other)
Copy constructor.
- template<size_t M>
bounded_sequence (const **bounded_sequence**< T, M > &other)
Copies a bounded sequence with a different bound M.

- **reference operator[]** (**size_type** pos)
 Index access.
- **const_reference operator[]** (**size_type** pos) const
 Index access.
- **reference at** (**size_type** pos)
 Index access with bounds check.
- **const_reference at** (**size_type** pos) const
 Index access with bounds check.
- **reference front** ()
 Returns a reference to the first element.
- **const_reference front** () const
 Returns a const reference to the first element.
- **reference back** ()
 Returns a reference to the last element.
- **const_reference back** () const
 Returns a const reference to the last element.
- **pointer data** ()
 Returns a pointer to the underlying data buffer.
- **const_pointer data** () const
 Returns a pointer to the underlying data buffer.
- **iterator begin** () OMG_NOEXCEPT
 Returns an iterator to the first element.
- **const_iterator begin** () const OMG_NOEXCEPT
 Returns an const iterator to the first element.
- **const_iterator cbegin** () const OMG_NOEXCEPT
 Returns an const iterator to the first element.
- **iterator end** () OMG_NOEXCEPT
 Returns an iterator to one past the last element.
- **const_iterator end** () const OMG_NOEXCEPT
 Returns an const iterator to one past the last element.

- **const_iterator cend** () const OMG_NOEXCEPT
Returns a const iterator to one past the last element.
- **reverse_iterator rbegin** () OMG_NOEXCEPT
Returns an iterator to the reverse-beginning of the sequence.
- **const_reverse_iterator rbegin** () const OMG_NOEXCEPT
Returns a const iterator to the reverse-beginning of the sequence.
- **const_reverse_iterator crbegin** () const OMG_NOEXCEPT
Returns a const iterator to the reverse-beginning of the sequence.
- **reverse_iterator rend** () OMG_NOEXCEPT
Returns an iterator to the reverse-end of the sequence.
- **const_reverse_iterator crend** () const OMG_NOEXCEPT
Returns a const iterator to the reverse-end of the sequence.
- **bool empty** () const OMG_NOEXCEPT
Returns whether there are no elements.
- **size_type size** () const OMG_NOEXCEPT
Returns the number of elements.
- **size_type max_size** () const OMG_NOEXCEPT
Returns `MaxLength`.
- **void reserve** (**size_type** new_capacity)
Pre-allocates elements up to new_capacity.
- **size_type capacity** () const OMG_NOEXCEPT
Returns the current capacity.
- **void clear** () OMG_NOEXCEPT
Removes the elements.
- **void shrink_to_fit** ()
Destroys any extra elements reserved above the current size.
- **iterator insert** (**iterator** pos, const T &value)
Inserts a new element in a position specified by an iterator.
- **iterator erase** (**iterator** pos)
Erases an element specified by an iterator.
- **void push_back** (const T &value)
Adds a new element at the end.
- **void push_back** (T &&value)
Adds a new element at the end by moving it.
- **void pop_back** ()
Removes the last element.
- **void resize** (**size_type** count)
Resizes the container to contain count elements.
- **void resize** (**size_type** count, const T &value)
Resizes the container to contain count elements.
- **void swap** (**bounded_sequence** &other) OMG_NOEXCEPT
Swap the contents of two sequences.

8.29.1 Detailed Description

```
template<typename T, size_t MaxLength>
class rti::core::bounded_sequence< T, MaxLength >
```

<< **value-type** >> (p. 152) A bounded sequence of elements

Template Parameters

<i>T</i>	The element type
<i>MaxLength</i>	The maximum number of elements

IDL bounded sequences map to this type, as described in [Working with IDL types](#) (p. 395).

This type has a interface similar to `std::vector`, but it differs in two aspects:

- It enforces its bound, `MaxLength`, in its operations. Operations that would make the sequence grow beyond the limit throw `dds::core::PreconditionNotMetError` (p. 1669).
- it implements a different element life-cycle strategy that optimizes the performance of the internal `dds::sub<↳::DataReader` (p. 756) and `dds::pub::DataWriter` (p. 908) serialization operations. Just like a `std::vector`, a `bounded_sequence` (p. 671) has a size and a capacity. But when `capacity > size`, the extra elements are default-constructed, unlike a `std::vector` where the extra elements are uninitialized memory. Functions that reduce the size of the sequence do not destroy the elements that they remove. Only `shrink_to_fit()` (p. 687) does.

See also

[Working with IDL types](#) (p. 395).

Examples

`Foo.hpp`.

8.29.2 Member Typedef Documentation

8.29.2.1 vector_type

```
template<typename T , size_t MaxLength>
typedef std::vector<T> rti::core::bounded_sequence< T, MaxLength >::vector_type
```

The type of the underlying vector.

8.29.2.2 value_type

```
template<typename T , size_t MaxLength>
typedef vector_type::value_type rti::core::bounded_sequence< T, MaxLength >::value_type
```

The type of the elements, T.

8.29.2.3 allocator_type

```
template<typename T , size_t MaxLength>
typedef vector_type::allocator_type  rti::core::bounded_sequence< T, MaxLength >::allocator_type
```

The allocator type of the underlying vector.

8.29.2.4 size_type

```
template<typename T , size_t MaxLength>
typedef vector_type::size_type  rti::core::bounded_sequence< T, MaxLength >::size_type
```

The size type.

8.29.2.5 difference_type

```
template<typename T , size_t MaxLength>
typedef vector_type::difference_type  rti::core::bounded_sequence< T, MaxLength >::difference_↔
type
```

The difference type.

8.29.2.6 reference

```
template<typename T , size_t MaxLength>
typedef vector_type::reference  rti::core::bounded_sequence< T, MaxLength >::reference
```

The reference type.

8.29.2.7 const_reference

```
template<typename T , size_t MaxLength>
typedef vector_type::const_reference  rti::core::bounded_sequence< T, MaxLength >::const_reference
```

The const reference type.

8.29.2.8 pointer

```
template<typename T , size_t MaxLength>
typedef vector_type::pointer rti::core::bounded_sequence< T, MaxLength >::pointer
```

The pointer type.

8.29.2.9 const_pointer

```
template<typename T , size_t MaxLength>
typedef vector_type::const_pointer rti::core::bounded_sequence< T, MaxLength >::const_pointer
```

The const pointer type.

8.29.2.10 iterator

```
template<typename T , size_t MaxLength>
typedef vector_type::iterator rti::core::bounded_sequence< T, MaxLength >::iterator
```

The iterator type.

8.29.2.11 const_iterator

```
template<typename T , size_t MaxLength>
typedef vector_type::const_iterator rti::core::bounded_sequence< T, MaxLength >::const_iterator
```

The const iterator type.

8.29.2.12 reverse_iterator

```
template<typename T , size_t MaxLength>
typedef vector_type::reverse_iterator rti::core::bounded_sequence< T, MaxLength >::reverse_↔
iterator
```

The reverse iterator type.

8.29.2.13 const_reverse_iterator

```
template<typename T , size_t MaxLength>
typedef vector_type::const_reverse_iterator rti::core::bounded_sequence< T, MaxLength >::const↔
_reverse_iterator
```

The const reverse iterator type.

8.29.3 Constructor & Destructor Documentation

8.29.3.1 bounded_sequence() [1/9]

```
template<typename T , size_t MaxLength>
rti::core::bounded_sequence< T, MaxLength >::bounded_sequence ( ) [inline]
```

Creates an empty **bounded_sequence** (p. 671).

8.29.3.2 bounded_sequence() [2/9]

```
template<typename T , size_t MaxLength>
rti::core::bounded_sequence< T, MaxLength >::bounded_sequence (
    const bounded_sequence< T, MaxLength > & other ) [inline]
```

Copy constructor.

8.29.3.3 bounded_sequence() [3/9]

```
template<typename T , size_t MaxLength>
template<size_t M>
rti::core::bounded_sequence< T, MaxLength >::bounded_sequence (
    const bounded_sequence< T, M > & other ) [inline], [explicit]
```

Copies a bounded sequence with a different bound M.

Exceptions

dds::core::PreconditionNotMetError (p. 1669)	if other.size() > MaxLength
---	-----------------------------

8.29.3.4 bounded_sequence() [4/9]

```
template<typename T , size_t MaxLength>
rti::core::bounded_sequence< T, MaxLength >::bounded_sequence (
    size_type count ) [inline]
```

Create a **bounded_sequence** (p. 671) with a number of default-constructed elements.

8.29.3.5 bounded_sequence() [5/9]

```
template<typename T , size_t MaxLength>
rti::core::bounded_sequence< T, MaxLength >::bounded_sequence (
    size_type count,
    const value_type & value ) [inline]
```

Create a **bounded_sequence** (p. 671) with a number of elements.

8.29.3.6 bounded_sequence() [6/9]

```
template<typename T , size_t MaxLength>
template<typename InputIt >
rti::core::bounded_sequence< T, MaxLength >::bounded_sequence (
    InputIt first,
    InputIt last ) [inline]
```

Create a **bounded_sequence** (p. 671) from a range of elements.

8.29.3.7 bounded_sequence() [7/9]

```
template<typename T , size_t MaxLength>
rti::core::bounded_sequence< T, MaxLength >::bounded_sequence (
    const std::vector< T > & v ) [inline]
```

Create a **bounded_sequence** (p. 671) copying the elements of a `std::vector`.

Exceptions

dds::core::PreconditionNotMetError (p. 1669)	if <code>v.size() > MaxLength</code>
---	---

8.29.3.8 bounded_sequence() [8/9]

```
template<typename T , size_t MaxLength>
rti::core::bounded_sequence< T, MaxLength >::bounded_sequence (
    bounded_sequence< T, MaxLength > && other ) [inline]
```

<<**C++11**>> (p. 155) Move constructor

8.29.3.9 bounded_sequence() [9/9]

```
template<typename T , size_t MaxLength>
rti::core::bounded_sequence< T, MaxLength >::bounded_sequence (
    std::vector< T > && v ) [inline]
```

<<**C++11**>> (p. 155) Creates a **bounded_sequence** (p. 671) by moving a `std::vector`

8.29.4 Member Function Documentation

8.29.4.1 operator=() [1/6]

```
template<typename T , size_t MaxLength>
bounded_sequence & rti::core::bounded_sequence< T, MaxLength >::operator= (
    const bounded_sequence< T, MaxLength > & other ) [inline]
```

Assignment operator.

References `rti::core::bounded_sequence< T, MaxLength >::begin()`, `rti::core::bounded_sequence< T, MaxLength >::end()`, and `rti::core::bounded_sequence< T, MaxLength >::size()`.

8.29.4.2 operator=() [2/6]

```
template<typename T , size_t MaxLength>
template<typename U , size_t M>
bounded_sequence & rti::core::bounded_sequence< T, MaxLength >::operator= (
    const bounded_sequence< U, M > & other ) [inline]
```

Copies the elements of a sequence with a different bound.

Exceptions

dds::core::PreconditionNotMetError (p. 1669)	if other.size() > MaxLength
---	-----------------------------

References `rti::core::bounded_sequence< T, MaxLength >::begin()`, `rti::core::bounded_sequence< T, MaxLength >::end()`, and `rti::core::bounded_sequence< T, MaxLength >::size()`.

8.29.4.3 operator=() [3/6]

```
template<typename T , size_t MaxLength>
bounded_sequence & rti::core::bounded_sequence< T, MaxLength >::operator= (
    const std::vector< T > & v ) [inline]
```

Copies the elements of a `std::vector`.

8.29.4.4 operator=() [4/6]

```
template<typename T , size_t MaxLength>
bounded_sequence & rti::core::bounded_sequence< T, MaxLength >::operator= (
    bounded_sequence< T, MaxLength > && other ) [inline]
```

<<**C++11**>> (p. 155) Move-assignment operator

8.29.4.5 operator=() [5/6]

```
template<typename T , size_t MaxLength>
bounded_sequence & rti::core::bounded_sequence< T, MaxLength >::operator= (
    std::vector< T > && v ) [inline]
```

<<**C++11**>> (p. 155) Moves a `std::vector` into this `bounded_sequence` (p. 671)

8.29.4.6 operator=() [6/6]

```
template<typename T , size_t MaxLength>
bounded_sequence & rti::core::bounded_sequence< T, MaxLength >::operator= (
    std::initializer_list< T > l ) [inline]
```

<<**C++11**>> (p. 155) Copies the elements in an `initializer_list`

Parameters

/	The initializer list
---	----------------------

8.29.4.7 operator[]() [1/2]

```
template<typename T , size_t MaxLength>
reference rti::core::bounded_sequence< T, MaxLength >::operator[] (
    size_type pos ) [inline]
```

Index access.

8.29.4.8 operator[]() [2/2]

```
template<typename T , size_t MaxLength>
const_reference rti::core::bounded_sequence< T, MaxLength >::operator[] (
    size_type pos ) const [inline]
```

Index access.

8.29.4.9 at() [1/2]

```
template<typename T , size_t MaxLength>
reference rti::core::bounded_sequence< T, MaxLength >::at (
    size_type pos ) [inline]
```

Index access with bounds check.

Exceptions

<i>std::out_of_range</i>	if pos is \geq size() (p. 686)
--------------------------	---

8.29.4.10 at() [2/2]

```
template<typename T , size_t MaxLength>
const_reference rti::core::bounded_sequence< T, MaxLength >::at (
    size_type pos ) const [inline]
```

Index access with bounds check.

Exceptions

<code>std::out_of_range</code>	if pos is \geq <code>size()</code> (p.686)
--------------------------------	--

8.29.4.11 front() [1/2]

```
template<typename T , size_t MaxLength>  
reference rti::core::bounded_sequence< T, MaxLength >::front ( ) [inline]
```

Returns a reference to the first element.

8.29.4.12 front() [2/2]

```
template<typename T , size_t MaxLength>  
const_reference rti::core::bounded_sequence< T, MaxLength >::front ( ) const [inline]
```

Returns a const reference to the first element.

8.29.4.13 back() [1/2]

```
template<typename T , size_t MaxLength>  
reference rti::core::bounded_sequence< T, MaxLength >::back ( ) [inline]
```

Returns a reference to the last element.

8.29.4.14 back() [2/2]

```
template<typename T , size_t MaxLength>  
const_reference rti::core::bounded_sequence< T, MaxLength >::back ( ) const [inline]
```

Returns a const reference to the last element.

8.29.4.15 data() [1/2]

```
template<typename T , size_t MaxLength>
pointer rti::core::bounded_sequence< T, MaxLength >::data ( ) [inline]
```

Returns a pointer to the underlying data buffer.

8.29.4.16 data() [2/2]

```
template<typename T , size_t MaxLength>
const_pointer rti::core::bounded_sequence< T, MaxLength >::data ( ) const [inline]
```

Returns a pointer to the underlying data buffer.

8.29.4.17 begin() [1/2]

```
template<typename T , size_t MaxLength>
iterator rti::core::bounded_sequence< T, MaxLength >::begin ( ) [inline]
```

Returns an iterator to the first element.

Referenced by `rti::core::bounded_sequence< T, MaxLength >::operator=()`.

8.29.4.18 begin() [2/2]

```
template<typename T , size_t MaxLength>
const_iterator rti::core::bounded_sequence< T, MaxLength >::begin ( ) const [inline]
```

Returns a const iterator to the first element.

8.29.4.19 cbegin()

```
template<typename T , size_t MaxLength>
const_iterator rti::core::bounded_sequence< T, MaxLength >::cbegin ( ) const [inline]
```

Returns a const iterator to the first element.

8.29.4.20 end() [1/2]

```
template<typename T , size_t MaxLength>
iterator rti::core::bounded_sequence< T, MaxLength >::end ( ) [inline]
```

Returns an iterator to one past the last element.

Referenced by `rti::core::bounded_sequence< T, MaxLength >::operator=()`.

8.29.4.21 end() [2/2]

```
template<typename T , size_t MaxLength>
const_iterator rti::core::bounded_sequence< T, MaxLength >::end ( ) const [inline]
```

Returns a const iterator to one past the last element.

8.29.4.22 cend()

```
template<typename T , size_t MaxLength>
const_iterator rti::core::bounded_sequence< T, MaxLength >::cend ( ) const [inline]
```

Returns a const iterator to one past the last element.

8.29.4.23 rbegin() [1/2]

```
template<typename T , size_t MaxLength>
reverse_iterator rti::core::bounded_sequence< T, MaxLength >::rbegin ( ) [inline]
```

Returns an iterator to the reverse-beginning of the sequence.

8.29.4.24 rbegin() [2/2]

```
template<typename T , size_t MaxLength>
const_reverse_iterator rti::core::bounded_sequence< T, MaxLength >::rbegin ( ) const [inline]
```

Returns a const iterator to the reverse-beginning of the sequence.

8.29.4.25 crbegin()

```
template<typename T , size_t MaxLength>
const_reverse_iterator rti::core::bounded_sequence< T, MaxLength >::crbegin ( ) const [inline]
```

Returns a const iterator to the reverse-beginning of the sequence.

8.29.4.26 rend()

```
template<typename T , size_t MaxLength>
reverse_iterator rti::core::bounded_sequence< T, MaxLength >::rend ( ) [inline]
```

Returns an iterator to the reverse-end of the sequence.

8.29.4.27 crend()

```
template<typename T , size_t MaxLength>
const_reverse_iterator rti::core::bounded_sequence< T, MaxLength >::crend ( ) const [inline]
```

Returns a const iterator to the reverse-end of the sequence.

8.29.4.28 empty()

```
template<typename T , size_t MaxLength>
bool rti::core::bounded_sequence< T, MaxLength >::empty ( ) const [inline]
```

Returns whether there are no elements.

8.29.4.29 size()

```
template<typename T , size_t MaxLength>
size_type rti::core::bounded_sequence< T, MaxLength >::size ( ) const [inline]
```

Returns the number of elements.

Referenced by `rti::core::bounded_sequence< T, MaxLength >::operator=()`.

8.29.4.30 max_size()

```
template<typename T , size_t MaxLength>
size_type rti::core::bounded_sequence< T, MaxLength >::max_size ( ) const [inline]
```

Returns MaxLength.

8.29.4.31 reserve()

```
template<typename T , size_t MaxLength>
void rti::core::bounded_sequence< T, MaxLength >::reserve (
    size_type new_capacity ) [inline]
```

Pre-allocates elements up to new_capacity.

This operation reserves space for new_capacity elements and, unlike std::vector, it also default-constructs the extra elements. The **size()** (p. 686) remains the same.

8.29.4.32 capacity()

```
template<typename T , size_t MaxLength>
size_type rti::core::bounded_sequence< T, MaxLength >::capacity ( ) const [inline]
```

Returns the current capacity.

See also

reserve() (p. 687)

8.29.4.33 clear()

```
template<typename T , size_t MaxLength>
void rti::core::bounded_sequence< T, MaxLength >::clear ( ) [inline]
```

Removes the elements.

This operation resizes the sequence to 0, but it doesn't destroy the elements, like std::vector would.

To destroy the elements, follow with a call to shrink_to_fit.

8.29.4.34 `shrink_to_fit()`

```
template<typename T , size_t MaxLength>
void rti::core::bounded_sequence< T, MaxLength >::shrink_to_fit ( ) [inline]
```

Destroys any extra elements reserved above the current size.

Note that `resize()` (p.689) or `clear()` (p.687) alone won't destroy the extra elements when they reduce the size of a sequence.

For example

```
bounded_sequence<Foo, 20> s;
s.resize(10); // 10 elements
s.resize(4); // size is now 4, but the other 6 elements are not destroyed
s.shrink_to_fit(); // size is 4, and the other 6 elements are destroyed
```

8.29.4.35 `insert()`

```
template<typename T , size_t MaxLength>
iterator rti::core::bounded_sequence< T, MaxLength >::insert (
    iterator pos,
    const T & value ) [inline]
```

Inserts a new element in a position specified by an iterator.

Exceptions

<i>dds::core::PreconditionNotMetError</i> (p. 1669)	if <code>size()</code> (p. 686) == <code>MaxLength</code>
--	---

8.29.4.36 `erase()`

```
template<typename T , size_t MaxLength>
iterator rti::core::bounded_sequence< T, MaxLength >::erase (
    iterator pos ) [inline]
```

Erases an element specified by an iterator.

8.29.4.37 `push_back()` [1/2]

```
template<typename T , size_t MaxLength>
void rti::core::bounded_sequence< T, MaxLength >::push_back (
    const T & value ) [inline]
```

Adds a new element at the end.

Exceptions

dds::core::PreconditionNotMetError (p. 1669)	if size() (p. 686) == MaxLength
---	--

8.29.4.38 push_back() [2/2]

```
template<typename T , size_t MaxLength>
void rti::core::bounded_sequence< T, MaxLength >::push_back (
    T && value ) [inline]
```

Adds a new element at the end by moving it.

Exceptions

dds::core::PreconditionNotMetError (p. 1669)	if size() (p. 686) == MaxLength
---	--

8.29.4.39 pop_back()

```
template<typename T , size_t MaxLength>
void rti::core::bounded_sequence< T, MaxLength >::pop_back ( ) [inline]
```

Removes the last element.

The element removed is not destroyed. To destroy it, follow pop_back with a call to shrink_to_fit.

8.29.4.40 resize() [1/2]

```
template<typename T , size_t MaxLength>
void rti::core::bounded_sequence< T, MaxLength >::resize (
    size_type count ) [inline]
```

Resizes the container to contain count elements.

If count < **size()** (p. 686), the sequence is reduced to the first count elements, but elements are not destroyed.

If count > **size()** (p. 686), the sequence is expanded as follows: if **capacity()** (p. 687) >= count, new elements are not constructed, since they already had been. If **capacity()** (p. 687) < count, the extra elements are default-constructed.

Exceptions

dds::core::PreconditionNotMetError (p. 1669)	if count > MaxLength
---	----------------------

8.29.4.41 `resize()` [2/2]

```
template<typename T , size_t MaxLength>
void rti::core::bounded_sequence< T, MaxLength >::resize (
    size_type count,
    const T & value ) [inline]
```

Resizes the container to contain count elements.

This overload specifies the value.

8.29.4.42 `swap()`

```
template<typename T , size_t MaxLength>
void rti::core::bounded_sequence< T, MaxLength >::swap (
    bounded_sequence< T, MaxLength > & other ) [inline]
```

Swap the contents of two sequences.

8.30 `dds::topic::BuiltinTopicKey` Class Reference

The key of the built-in topics.

```
#include <dds/topic/BuiltinTopicKey.hpp>
```

Public Member Functions

- `TBuiltinTopicKey ()`
Creates a key whose value() are all zeros.
- `std::vector< uint32_t > value () const`
Returns a copy of the four integers that represent the key.

8.30.1 Detailed Description

The key of the built-in topics.

Each remote `dds::core::Entity` (p. 1265) to be discovered can be uniquely identified by this key. This is the key of all the built-in topic data types.

#include <rti/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **BuiltinTopicReaderResourceLimits** ()
Creates an instance with the default settings.
- **BuiltinTopicReaderResourceLimits** & **initial_samples** (int32_t the_initial_samples)
Initial number of samples.
- int32_t **initial_samples** () const
Getter (see setter with the same name)
- **BuiltinTopicReaderResourceLimits** & **max_samples** (int32_t the_max_samples)
Maximum number of samples.
- int32_t **max_samples** () const
Getter (see setter with the same name)
- **BuiltinTopicReaderResourceLimits** & **initial_infos** (int32_t the_initial_infos)
Initial number of sample infos.
- int32_t **initial_infos** () const
Getter (see setter with the same name)
- **BuiltinTopicReaderResourceLimits** & **max_infos** (int32_t the_max_infos)
Maximum number of sample infos.
- int32_t **max_infos** () const
Getter (see setter with the same name)

- **BuiltinTopicReaderResourceLimits & initial_outstanding_reads** (int32_t the_initial_outstanding_reads)
The initial number of outstanding reads that have not called finish yet on the same built-in topic `dds::sub::DataReader` (p. 756).
- int32_t **initial_outstanding_reads** () const
Getter (see setter with the same name)
- **BuiltinTopicReaderResourceLimits & max_outstanding_reads** (int32_t the_max_outstanding_reads)
The maximum number of outstanding reads that have not called finish yet on the same built-in topic `dds::sub::DataReader` (p. 756).
- int32_t **max_outstanding_reads** () const
Getter (see setter with the same name)
- **BuiltinTopicReaderResourceLimits & max_samples_per_read** (int32_t the_max_samples_per_read)
Maximum number of samples that can be read/taken on a same built-in topic `dds::sub::DataReader` (p. 756).
- int32_t **max_samples_per_read** () const
Getter (see setter with the same name)
- **BuiltinTopicReaderResourceLimits & disable_fragmentation_support** (bool the_disable_fragmentation_support)
Determines whether the built-in topic `dds::sub::DataReader` (p. 756) can receive fragmented samples.
- bool **disable_fragmentation_support** () const
Getter (see setter with the same name)
- **BuiltinTopicReaderResourceLimits & max_fragmented_samples** (int32_t the_max_fragmented_samples)
The maximum number of samples for which the built-in topic `dds::sub::DataReader` (p. 756) may store fragments at a given point in time.
- int32_t **max_fragmented_samples** () const
Getter (see setter with the same name)
- **BuiltinTopicReaderResourceLimits & initial_fragmented_samples** (int32_t the_initial_fragmented_samples)
The initial number of samples for which a built-in topic `dds::sub::DataReader` (p. 756) may store fragments.
- int32_t **initial_fragmented_samples** () const
Getter (see setter with the same name)
- **BuiltinTopicReaderResourceLimits & max_fragmented_samples_per_remote_writer** (int32_t the_max_fragmented_samples_per_remote_writer)
The maximum number of samples per remote writer for which a built-in topic `dds::sub::DataReader` (p. 756) may store fragments.
- int32_t **max_fragmented_samples_per_remote_writer** () const
Getter (see setter with the same name)
- **BuiltinTopicReaderResourceLimits & max_fragments_per_sample** (int32_t the_max_fragments_per_sample)
Maximum number of fragments for a single sample.
- int32_t **max_fragments_per_sample** () const
Getter (see setter with the same name)
- **BuiltinTopicReaderResourceLimits & dynamically_allocate_fragmented_samples** (bool the_dynamically_allocate_fragmented_samples)
Determines whether the built-in topic `dds::sub::DataReader` (p. 756) pre-allocates storage for storing fragmented samples.
- bool **dynamically_allocate_fragmented_samples** () const
Getter (see setter with the same name)

8.31.1 Detailed Description

<<**extension**>> (p. 156) Configures several resource management aspects of the built-in topic DataReaders

Defines the resources that can be used for a built-in-topic data reader.

A built-in topic data reader subscribes reliably to built-in topics containing declarations of new entities or updates to existing entities in the domain. Keys are used to differentiate among entities of the same type. RTI Connext assigns a unique key to each entity in a domain.

Properties:

RxO (p. 307) = N/A

Changeable (p. 307) = **NO** (p. 307)

QoS:

rti::core::policy::DiscoveryConfig (p. 1035)

8.31.2 Constructor & Destructor Documentation

8.31.2.1 BuiltinTopicReaderResourceLimits()

```
rti::core::policy::BuiltinTopicReaderResourceLimits::BuiltinTopicReaderResourceLimits ( ) [inline]
```

Creates an instance with the default settings.

8.31.3 Member Function Documentation

8.31.3.1 initial_samples() [1/2]

```
BuiltinTopicReaderResourceLimits & rti::core::policy::BuiltinTopicReaderResourceLimits::initial↔  
_samples (   
    int32_t the_initial_samples )
```

Initial number of samples.

This should be a value between 1 and initial number of instance of the built-in-topic reader, depending on how many instances are sending data concurrently.

[default] 64

[range] [1, 1 million], <= max_samples

8.31.3.2 initial_samples() [2/2]

```
int32_t rti::core::policy::BuiltinTopicReaderResourceLimits::initial_samples ( ) const
```

Getter (see setter with the same name)

8.31.3.3 max_samples() [1/2]

```
BuiltinTopicReaderResourceLimits & rti::core::policy::BuiltinTopicReaderResourceLimits::max_↔  
samples (   
    int32_t the_max_samples )
```

Maximum number of samples.

This should be a value between 1 and max number of instance of the built-in-topic reader, depending on how many instances are sending data concurrently. Also, it should not be less than `initial_samples`.

[default] `dds::core::LENGTH_UNLIMITED` (p. 238)

[range] [1, 1 million] or `dds::core::LENGTH_UNLIMITED` (p. 238), \geq `initial_samples`

8.31.3.4 max_samples() [2/2]

```
int32_t rti::core::policy::BuiltinTopicReaderResourceLimits::max_samples ( ) const
```

Getter (see setter with the same name)

8.31.3.5 initial_infos() [1/2]

```
BuiltinTopicReaderResourceLimits & rti::core::policy::BuiltinTopicReaderResourceLimits::initial_↔  
_infos (   
    int32_t the_initial_infos )
```

Initial number of sample infos.

The initial number of info units that a built-in topic `dds::sub::DataReader` (p. 756) can have. Info units are used to store `dds::sub::SampleInfo` (p. 1992).

[default] 64

[range] [1, 1 million] \leq `max_infos`

8.31.3.6 initial_infos() [2/2]

```
int32_t rti::core::policy::BuiltinTopicReaderResourceLimits::initial_infos ( ) const
```

Getter (see setter with the same name)

8.31.3.7 max_infos() [1/2]

```
BuiltinTopicReaderResourceLimits & rti::core::policy::BuiltinTopicReaderResourceLimits::max_infos  
(  
    int32_t the_max_infos )
```

Maximum number of sample infos.

The maximum number of info units that a built-in topic **dds::sub::DataReader** (p. 756) can use to store **dds::sub::↔SampleInfo** (p. 1992).

[default] **dds::core::LENGTH_UNLIMITED** (p. 238)

[range] [1, 1 million] or **dds::core::LENGTH_UNLIMITED** (p. 238), >= initial_infos

8.31.3.8 max_infos() [2/2]

```
int32_t rti::core::policy::BuiltinTopicReaderResourceLimits::max_infos ( ) const
```

Getter (see setter with the same name)

8.31.3.9 initial_outstanding_reads() [1/2]

```
BuiltinTopicReaderResourceLimits & rti::core::policy::BuiltinTopicReaderResourceLimits::initial↔  
_outstanding_reads (  
    int32_t the_initial_outstanding_reads )
```

The initial number of outstanding reads that have not called finish yet on the same built-in topic **dds::sub::DataReader** (p. 756).

Must be less than or equal to max_outstanding_reads.

[default] 2

[range] [1, 1024]

8.31.3.10 initial_outstanding_reads() [2/2]

```
int32_t rti::core::policy::BuiltinTopicReaderResourceLimits::initial_outstanding_reads ( ) const
```

Getter (see setter with the same name)

8.31.3.11 max_outstanding_reads() [1/2]

```
BuiltinTopicReaderResourceLimits & rti::core::policy::BuiltinTopicReaderResourceLimits::max_↔  
outstanding_reads (   
    int32_t the_max_outstanding_reads )
```

The maximum number of outstanding reads that have not called finish yet on the same built-in topic **dds::sub::Data↔Reader** (p. 756).

Must be greater than or equal to initial_outstanding_reads.

[default] **dds::core::LENGTH_UNLIMITED** (p. 238)

[range] [1, 1024] or **dds::core::LENGTH_UNLIMITED** (p. 238)

8.31.3.12 max_outstanding_reads() [2/2]

```
int32_t rti::core::policy::BuiltinTopicReaderResourceLimits::max_outstanding_reads ( ) const
```

Getter (see setter with the same name)

8.31.3.13 max_samples_per_read() [1/2]

```
BuiltinTopicReaderResourceLimits & rti::core::policy::BuiltinTopicReaderResourceLimits::max_↔  
samples_per_read (   
    int32_t the_max_samples_per_read )
```

Maximum number of samples that can be read/taken on a same built-in topic **dds::sub::DataReader** (p. 756).

[default] 1024

[range] [1, 65536]

8.31.3.14 max_samples_per_read() [2/2]

```
int32_t rti::core::policy::BuiltinTopicReaderResourceLimits::max_samples_per_read ( ) const
```

Getter (see setter with the same name)

8.31.3.15 disable_fragmentation_support() [1/2]

```
BuiltinTopicReaderResourceLimits & rti::core::policy::BuiltinTopicReaderResourceLimits::disable_↔
_fragmentation_support (
    bool the_disable_fragmentation_support )
```

Determines whether the built-in topic **dds::sub::DataReader** (p. 756) can receive fragmented samples.

When fragmentation support is not needed, disabling fragmentation support will save some memory resources.

[default] false

8.31.3.16 disable_fragmentation_support() [2/2]

```
bool rti::core::policy::BuiltinTopicReaderResourceLimits::disable_fragmentation_support ( ) const
```

Getter (see setter with the same name)

8.31.3.17 max_fragmented_samples() [1/2]

```
BuiltinTopicReaderResourceLimits & rti::core::policy::BuiltinTopicReaderResourceLimits::max_↔
fragmented_samples (
    int32_t the_max_fragmented_samples )
```

The maximum number of samples for which the built-in topic **dds::sub::DataReader** (p. 756) may store fragments at a given point in time.

At any given time, a built-in topic **dds::sub::DataReader** (p. 756) may store fragments for up to `max_fragmented_↔_samples` samples while waiting for the remaining fragments. These samples need not have consecutive sequence numbers and may have been sent by different built-in topic **dds::pub::DataWriter** (p. 908) instances.

Once all fragments of a sample have been received, the sample is treated as a regular sample and becomes subject to standard QoS settings such as `BuiltinTopicReaderResourceLimits_t::max_samples`.

The middleware will drop fragments if the `max_fragmented_samples` limit has been reached. For best-effort communication, the middleware will accept a fragment for a new sample, but drop the oldest fragmented sample from the same remote writer. For reliable communication, the middleware will drop fragments for any new samples until all fragments for at least one older sample from that writer have been received.

Only applies if `BuiltinTopicReaderResourceLimits_t::disable_fragmentation_support` is false.

[default] 1024

[range] [1, 1 million]

8.31.3.18 max_fragmented_samples() [2/2]

```
int32_t rti::core::policy::BuiltinTopicReaderResourceLimits::max_fragmented_samples ( ) const
```

Getter (see setter with the same name)

8.31.3.19 initial_fragmented_samples() [1/2]

```
BuiltinTopicReaderResourceLimits & rti::core::policy::BuiltinTopicReaderResourceLimits::initial↔  
_fragmented_samples (   
    int32_t the_initial_fragmented_samples )
```

The initial number of samples for which a built-in topic **dds::sub::DataReader** (p. 756) may store fragments.

Only applies if `BuiltinTopicReaderResourceLimits_t::disable_fragmentation_support` is false.

[default] 4

[range] [1,1024], <= max_fragmented_samples

8.31.3.20 initial_fragmented_samples() [2/2]

```
int32_t rti::core::policy::BuiltinTopicReaderResourceLimits::initial_fragmented_samples ( ) const
```

Getter (see setter with the same name)

8.31.3.21 max_fragmented_samples_per_remote_writer() [1/2]

```
BuiltinTopicReaderResourceLimits & rti::core::policy::BuiltinTopicReaderResourceLimits::max_↔  
fragmented_samples_per_remote_writer (   
    int32_t the_max_fragmented_samples_per_remote_writer )
```

The maximum number of samples per remote writer for which a built-in topic **dds::sub::DataReader** (p. 756) may store fragments.

Logical limit so a single remote writer cannot consume all available resources.

Only applies if `BuiltinTopicReaderResourceLimits_t::disable_fragmentation_support` is false.

[default] 256

[range] [1, 1 million], <= max_fragmented_samples

8.31.3.22 max_fragmented_samples_per_remote_writer() [2/2]

```
int32_t rti::core::policy::BuiltinTopicReaderResourceLimits::max_fragmented_samples_per_remote_↔
writer ( ) const
```

Getter (see setter with the same name)

8.31.3.23 max_fragments_per_sample() [1/2]

```
BuiltinTopicReaderResourceLimits & rti::core::policy::BuiltinTopicReaderResourceLimits::max_↔
fragments_per_sample (
    int32_t the_max_fragments_per_sample )
```

Maximum number of fragments for a single sample.

Only applies if `BuiltinTopicReaderResourceLimits_t::disable_fragmentation_support` is false.

[default] `dds::core::LENGTH_UNLIMITED` (p. 238)

[range] [1, 1 million] or `dds::core::LENGTH_UNLIMITED` (p. 238)

8.31.3.24 max_fragments_per_sample() [2/2]

```
int32_t rti::core::policy::BuiltinTopicReaderResourceLimits::max_fragments_per_sample ( ) const
```

Getter (see setter with the same name)

8.31.3.25 dynamically_allocate_fragmented_samples() [1/2]

```
BuiltinTopicReaderResourceLimits & rti::core::policy::BuiltinTopicReaderResourceLimits::dynamically_↔
_allocate_fragmented_samples (
    bool the_dynamically_allocate_fragmented_samples )
```

Determines whether the built-in topic `dds::sub::DataReader` (p. 756) pre-allocates storage for storing fragmented samples.

By default, the middleware does not allocate memory upfront, but instead allocates memory from the heap upon receiving the first fragment of a new sample. The amount of memory allocated equals the amount of memory needed to store all fragments in the sample. Once all fragments of a sample have been received, the sample is deserialized and stored in the regular receive queue. At that time, the dynamically allocated memory is freed again.

This QoS setting is useful for large, but variable-sized data types where upfront memory allocation for multiple samples based on the maximum possible sample size may be expensive. The main disadvantage of not pre-allocating memory is that one can no longer guarantee the middleware will have sufficient resources at runtime.

If `dynamically_allocate_fragmented_samples` is set to false, the middleware will allocate memory upfront for storing fragments for up to `rti::core::policy::DataReaderResourceLimits::initial_fragmented_samples` (p. 866) samples. This memory may grow up to `rti::core::policy::DataReaderResourceLimits::max_fragmented_samples` (p. 866) if needed.

Only applies if `rti::core::policy::DataReaderResourceLimits::disable_fragmentation_support` (p. 865) is false.

[default] true

8.31.3.26 `dynamically_allocate_fragmented_samples()` [2/2]

```
bool rti::core::policy::BuiltinTopicReaderResourceLimits::dynamically_allocate_fragmented_samples
( ) const
```

Getter (see setter with the same name)

8.32 `dds::core::BytesTopicType` Class Reference

Built-in type consisting of a variable-length array of opaque bytes.

```
#include <dds/core/BuiltinTopicTypes.hpp>
```

Public Member Functions

- **BytesTopicType** ()
Creates a sample with an empty array of bytes.
- **BytesTopicType** (const std::vector< uint8_t > &the_data)
Creates a sample with a vector of bytes.
- **operator std::vector< uint8_t > ()** const
Automatic conversion to std::vector.
- std::vector< uint8_t > **data** () const
Gets the bytes in a std::vector.
- void **data** (const std::vector< uint8_t > &value)
Sets the bytes.
- uint8_t & **operator[]** (uint32_t index)
Access the bytes by index.
- uint8_t **operator[]** (uint32_t index) const
Access the bytes by index.
- int32_t **length** () const
Get the number of bytes.

8.32.1 Detailed Description

Built-in type consisting of a variable-length array of opaque bytes.

See also

Built-in Types (p. 49)

8.32.2 Constructor & Destructor Documentation

8.32.2.1 BytesTopicType() [1/2]

```
dds::core::BytesTopicType::BytesTopicType ( ) [inline]
```

Creates a sample with an empty array of bytes.

8.32.2.2 BytesTopicType() [2/2]

```
dds::core::BytesTopicType::BytesTopicType (
    const std::vector< uint8_t > & the_data ) [inline]
```

Creates a sample with a vector of bytes.

Parameters

<i>the_data</i>	The octets
-----------------	------------

Note that this constructor is implicit so you can use a `std::vector<uint8_t>` wherever a **BytesTopicType** (p. 700) instance is expected

8.32.3 Member Function Documentation

8.32.3.1 operator std::vector< uint8_t >()

```
dds::core::BytesTopicType::operator std::vector< uint8_t > ( ) const [inline]
```

Automatic conversion to `std::vector`.

Returns

A copy of the bytes

8.32.3.2 data() [1/2]

```
std::vector< uint8_t > dds::core::BytesTopicType::data ( ) const [inline]
```

Gets the bytes in a `std::vector`.

Returns

A copy of the bytes

8.32.3.3 data() [2/2]

```
void dds::core::BytesTopicType::data (
    const std::vector< uint8_t > & value ) [inline]
```

Sets the bytes.

Parameters

<i>value</i>	The bytes
--------------	-----------

8.32.3.4 operator[]() [1/2]

```
uint8_t & dds::core::BytesTopicType::operator[] (
    uint32_t index ) [inline]
```

Access the bytes by index.

References [dds::core::Value< D >::delegate\(\)](#).

8.32.3.5 operator[]() [2/2]

```
uint8_t dds::core::BytesTopicType::operator[] (
    uint32_t index ) const [inline]
```

Access the bytes by index.

References [dds::core::Value< D >::delegate\(\)](#).

8.32.3.6 length()

```
int32_t dds::core::BytesTopicType::length ( ) const [inline]
```

Get the number of bytes.

References [dds::core::Value< D >::delegate\(\)](#).

8.33 rti::core::policy::CdrPaddingKind_def Struct Reference

<<*extension*>> (p. 156) The definition of the `dds::core::safe_enum` (p. 1972) `CdrPaddingKind`

```
#include <PolicyKind.hpp>
```

Public Types

- enum `type` {
ZERO ,
NOT_SET ,
AUTO }

The underlying enum type.

8.33.1 Detailed Description

<<*extension*>> (p. 156) The definition of the `dds::core::safe_enum` (p. 1972) `CdrPaddingKind`

The CDR padding kind determines whether or not the padding bytes will be set to zero during CDR serialization.

8.33.2 Member Enumeration Documentation

8.33.2.1 type

```
enum rti::core::policy::CdrPaddingKind_def::type
```

The underlying enum type.

Enumerator

ZERO	Set padding bytes to zero during CDR serialization.
NOT_SET	Don't set padding bytes to any value.
AUTO	Set the value automatically, depending on the Entity. When set on a DomainParticipant the default behavior is NOT_SET When set on a DataWriter or DataReader the behavior is to inherit the value from the DomainParticipant.

8.34 rti::core::ChannelSettings Class Reference

<<*extension*>> (p. 156) Configures the properties of a channel in `rti::core::policy::MultiChannel` (p. 1483)

```
#include <rti/core/PolicySettings.hpp>
```

Public Member Functions

- **ChannelSettings** (const **TransportMulticastSettingsSeq** &the_multicast_settings, const std::string &the_filter_expression, int32_t the_priority)

Creates an instance with the specified multicast settings, filter expression and priority.
- **ChannelSettings** & **multicast_settings** (const **TransportMulticastSettingsSeq** &the_multicast_settings)

*A sequence of **rti::core::TransportMulticastSettings** (p. 2252) used to configure the multicast addresses associated with a channel.*
- **TransportMulticastSettingsSeq** **multicast_settings** () const

Getter (see the setter with the same name)
- **ChannelSettings** & **filter_expression** (const std::string &the_filter_expression)

A logical expression used to determine the data that will be published in the channel.
- std::string **filter_expression** () const

Getter (see the setter with the same name)
- **ChannelSettings** & **priority** (int32_t the_priority)

Publication priority.
- int32_t **priority** () const

Getter (see the setter with the same name)

8.34.1 Detailed Description

<<**extension**>> (p. 156) Configures the properties of a channel in **rti::core::policy::MultiChannel** (p. 1483)

QoS:

rti::core::policy::MultiChannel (p. 1483)

8.34.2 Constructor & Destructor Documentation

8.34.2.1 ChannelSettings()

```
rti::core::ChannelSettings::ChannelSettings (
    const TransportMulticastSettingsSeq & the_multicast_settings,
    const std::string & the_filter_expression,
    int32_t the_priority ) [inline]
```

Creates an instance with the specified multicast settings, filter expression and priority.

See individual setters.

8.34.3 Member Function Documentation

8.34.3.1 multicast_settings() [1/2]

```
ChannelSettings & rti::core::ChannelSettings::multicast_settings (
    const TransportMulticastSettingsSeq & the_multicast_settings )
```

A sequence of **rti::core::TransportMulticastSettings** (p. 2252) used to configure the multicast addresses associated with a channel.

The sequence cannot be empty.

The maximum number of multicast locators in a channel is limited to 16 (a locator is defined by a transport alias, a multicast address and a port). Note that this is a hard limit that cannot be increased. However, this limit can be decreased by configuring the 'dds.domain_participant.max_announced_locator_list_size' property in the **rti::core::policy::Property** (p. 1695) associated with the **dds::domain::qos::DomainParticipantQos** (p. 1136).

[default] Empty sequence (invalid value)

8.34.3.2 multicast_settings() [2/2]

```
TransportMulticastSettingsSeq rti::core::ChannelSettings::multicast_settings ( ) const
```

Getter (see the setter with the same name)

8.34.3.3 filter_expression() [1/2]

```
ChannelSettings & rti::core::ChannelSettings::filter_expression (
    const std::string & the_filter_expression ) [inline]
```

A logical expression used to determine the data that will be published in the channel.

If the expression evaluates to TRUE, a sample will be published on the channel.

An empty string always evaluates the expression to TRUE.

The syntax of the expression will depend on the value of **rti::core::policy::MultiChannel::filter_name** (p. 1486)

The filter expression length (including NULL-terminated character) cannot be greater than **rti::core::policy::DomainParticipantResourceLimits::channel_filter_expression_max_length** (p. 1172).

See also

Queries and Filters Syntax (p. 82)

[default] NULL (invalid value)

8.34.3.4 filter_expression() [2/2]

```
std::string rti::core::ChannelSettings::filter_expression ( ) const [inline]
```

Getter (see the setter with the same name)

8.34.3.5 priority() [1/2]

```
ChannelSettings & rti::core::ChannelSettings::priority (
    int32_t the_priority ) [inline]
```

Publication priority.

A positive integer value designating the relative priority of the channel, used to determine the transmission order of pending writes.

Use of publication priorities requires the asynchronous publisher (`rti::core::policy::PublishModeKind_def::ASYNCHRONOUS` (p. 1745)) with `rti::pub::FlowControllerProperty::scheduling_policy` (p. 1323) set to `FlowControllerSchedulingPolicy_def::HIGHEST_PRIORITY_FIRST`.

Larger numbers have higher priority.

If the publication priority of the channel is any value other than `PUBLICATION_PRIORITY_UNDEFINED`, then the channel's priority will take precedence over the data writer's priority.

If the publication priority of the channel is set to `PUBLICATION_PRIORITY_UNDEFINED`, then the channel's priority will be set to the value of the data writer's priority.

If the publication priority of both the data writer and the channel are `PUBLICATION_PRIORITY_UNDEFINED`, the channel will be assigned the lowest priority value.

If the publication priority of the channel is `PUBLICATION_PRIORITY_AUTOMATIC`, then the channel will be assigned the priority of the largest publication priority of all samples in the channel. The publication priority of each sample can be set in the `rti::pub::WriteParams` (p. 2342) of the `dds::pub::DataWriter::write(const T&, rti::pub::WriteParams&)` (p. 949) function.

[default] `PUBLICATION_PRIORITY_UNDEFINED`

8.34.3.6 priority() [2/2]

```
int32_t rti::core::ChannelSettings::priority ( ) const [inline]
```

Getter (see the setter with the same name)

8.35 dds::rpc::ClientEndpoint< Request, Reply > Class Template Reference

<<*reference-type*>> (p. 153) Manages the DDS entities required to make remote function calls.

```
#include <dds/rpc/ClientEndpoint.hpp>
```

Inheritance diagram for dds::rpc::ClientEndpoint< Request, Reply >:

Public Types

- using **RequestType** = Request
The type used to make function calls.
- using **ReplyType** = Reply
The type used to receive the results of function calls.

Public Member Functions

- **ClientEndpoint** (const **ClientParams** ¶ms)
*Creates a new **ClientEndpoint** (p. 707).*
- void **close** ()
Destroys the underlying requester and other resources.
- bool **closed** () const
Whether this instance has been closed already.
- void **wait_for_service** (const **dds::core::Duration** &maxWait)
Waits for one or more services to be discovered.
- void **wait_for_service** ()
Waits for one or more services to be discovered for an unlimited period of time.
- **dds::pub::DataWriter**< **RequestType** > **request_datawriter** () const
*Accesses the underlying **DataWriter** that sends the requests (function calls)*
- **dds::sub::DataReader**< **ReplyType** > **reply_datareader** () const
*Accesses the underlying **DataReader** that receives the replies (return values from the function calls)*

8.35.1 Detailed Description

```
template<typename Request, typename Reply>
class dds::rpc::ClientEndpoint< Request, Reply >
```

<<*reference-type*>> (p. 153) Manages the DDS entities required to make remote function calls.

This class is always the base of a concrete client, such as **rpc_example::RobotControlClient** (p. 1934).

8.35.2 Member Typedef Documentation

8.35.2.1 RequestType

```
template<typename Request , typename Reply >
using dds::rpc::ClientEndpoint< Request, Reply >::RequestType = Request
```

The type used to make function calls.

8.35.2.2 ReplyType

```
template<typename Request , typename Reply >
using dds::rpc::ClientEndpoint< Request, Reply >::ReplyType = Reply
```

The type used to receive the results of function calls.

8.35.3 Constructor & Destructor Documentation

8.35.3.1 ClientEndpoint()

```
template<typename Request , typename Reply >
dds::rpc::ClientEndpoint< Request, Reply >::ClientEndpoint (
    const ClientParams & params ) [inline], [explicit]
```

Creates a new **ClientEndpoint** (p. 707).

8.35.4 Member Function Documentation

8.35.4.1 close()

```
template<typename Request , typename Reply >
void dds::rpc::ClientEndpoint< Request, Reply >::close ( ) [inline]
```

Destroys the underlying requester and other resources.

Any operation after **close()** (p. 708) throws **dds::core::AlreadyClosedError** (p. 594)

8.35.4.2 closed()

```
template<typename Request , typename Reply >
bool dds::rpc::ClientEndpoint< Request, Reply >::closed ( ) const [inline]
```

Whether this instance has been closed already.

8.35.4.3 wait_for_service() [1/2]

```
template<typename Request , typename Reply >
void dds::rpc::ClientEndpoint< Request, Reply >::wait_for_service (
    const dds::core::Duration & maxWait ) [inline]
```

Waits for one or more services to be discovered.

Warning

This method doesn't ensure that the service has discovered this client. It only waits for this client's DataReader and DataWriter to discover the service's DataWriter and DataReader, respectively.

Parameters

<i>maxWait</i>	The maximum time to wait, after which dds::core::TimeoutError (p. 2177) is thrown.
----------------	---

8.35.4.4 wait_for_service() [2/2]

```
template<typename Request , typename Reply >
void dds::rpc::ClientEndpoint< Request, Reply >::wait_for_service ( ) [inline]
```

Waits for one or more services to be discovered for an unlimited period of time.

Warning

This method doesn't ensure that the service has discovered this client. It only waits for this client's DataReader and DataWriter to discover the service's DataWriter and DataReader, respectively.

8.35.4.5 request_datawriter()

```
template<typename Request , typename Reply >
dds::pub::DataWriter< RequestType > dds::rpc::ClientEndpoint< Request, Reply >::request_↔
datawriter ( ) const [inline]
```

Accesses the underlying DataWriter that sends the requests (function calls)

Returns

The DataWriter

8.35.4.6 reply_datareader()

```
template<typename Request , typename Reply >
dds::sub::DataReader< ReplyType > dds::rpc::ClientEndpoint< Request, Reply >::reply_datareader
( ) const [inline]
```

Accesses the underlying DataReader that receives the replies (return values from the function calls)

Returns

The DataReader

8.36 dds::rpc::ClientParams Class Reference

<<*value-type*>> (p. 152) The parameters used to configure a **ClientEndpoint** (p. 707)

```
#include <dds/rpc/ClientEndpoint.hpp>
```

Inherits rti::request::detail::EntityParamsWithSetters< ActualEntity >.

Public Member Functions

- **ClientParams** (dds::domain::DomainParticipant participant)
Construct a new Client Params object.
- **ClientParams & function_call_max_wait** (const dds::core::Duration &max_wait)
Specifies the maximum wait time for all the remote calls.
- **dds::core::Duration function_call_max_wait** () const
Returns the maximum wait time.

8.36.1 Detailed Description

<<*value-type*>> (p. 152) The parameters used to configure a **ClientEndpoint** (p. 707)

Since clients use a **rti::request::Requester** (p. 1907) to communicate with a service, the **ClientParams** (p. 710) type contains the same parameters as an **rti::request::RequesterParams** (p. 1917), plus `function_call_max_wait`.

8.36.2 Constructor & Destructor Documentation

8.36.2.1 ClientParams()

```
dds::rpc::ClientParams::ClientParams (
    dds::domain::DomainParticipant participant ) [inline]
```

Construct a new Client Params object.

Parameters

<i>participant</i>	The DomainParticipant is a required parameter
--------------------	---

8.36.3 Member Function Documentation

8.36.3.1 function_call_max_wait() [1/2]

```
ClientParams & dds::rpc::ClientParams::function_call_max_wait (
    const dds::core::Duration & max_wait ) [inline]
```

Specifies the maximum wait time for all the remote calls.

Parameters

<i>max_wait</i>	The maximum wait time for all remote calls made by a client
-----------------	---

Returns

This object

8.36.3.2 function_call_max_wait() [2/2]

```
dds::core::Duration dds::rpc::ClientParams::function_call_max_wait ( ) const [inline]
```

Returns the maximum wait time.

8.37 dds::sub::CoherentAccess Class Reference

<<**value-type**>> (p. 152) Controls whether RTI Connexx will preserve the groupings of changes made by the publishing application by means of begin_coherent_changes and end_coherent_changes.

```
#include "dds/sub/CoherentAccess.hpp"
```

Public Member Functions

- **CoherentAccess** (const **dds::sub::Subscriber** &sub)

*Creating a **CoherentAccess** (p. 712) object indicates that the application is about to access the data samples in any of the **DataReader** (p. 756) objects attached to the provided **Subscriber** (p. 2116).*

- void **end** ()

*Explicitly indicate that the application has finished accessing the data samples in **DataReader** (p. 756) objects managed by the **Subscriber** (p. 2116).*

- **~CoherentAccess** ()

The destructor implicitly ends coherent access.

8.37.1 Detailed Description

<<**value-type**>> (p. 152) Controls whether RTI Connexx will preserve the groupings of changes made by the publishing application by means of begin_coherent_changes and end_coherent_changes.

8.37.2 Constructor & Destructor Documentation

8.37.2.1 CoherentAccess()

```
dds::sub::CoherentAccess::CoherentAccess (
    const dds::sub::Subscriber & sub ) [inline], [explicit]
```

Creating a **CoherentAccess** (p. 712) object indicates that the application is about to access the data samples in any of the **DataReader** (p. 756) objects attached to the provided **Subscriber** (p. 2116).

If the **dds::core::policy::Presentation::access_scope** (p. 1674) of the **dds::sub::Subscriber** (p. 2116) is **dds::core::policy::PresentationAccessScopeKind_def::GROUP** (p. 1677) or **dds::core::policy::PresentationAccessScopeKind_def::HIGHEST_OFFERED** (p. 1677) and **dds::core::policy::Presentation::ordered_access** (p. 1675) is true, the application is required to use this operation to access the samples in order across DataWriters of the same group (**dds::pub::Publisher** (p. 1719) with **dds::core::policy::Presentation::access_scope** (p. 1674) set to **dds::core::policy::PresentationAccessScopeKind_def::GROUP** (p. 1677)).

In the above case, this operation must be called prior to calling any of the sample-accessing operations, or **dds::sub::find** (p. 460)

Once the application has finished accessing the data samples, it must call **dds::sub::CoherentAccess::end()** (p. 714) or let this object be destroyed.

The application is not required to call **dds::sub::CoherentAccess::CoherentAccess()** (p. 712) / **dds::sub::CoherentAccess::end()** (p. 714) to access the samples in order if the **PRESENTATION** (p. 331) policy in the **dds::pub::Publisher** (p. 1719) has **dds::core::policy::Presentation::access_scope** (p. 1674) set to something other than **dds::core::policy::PresentationAccessScopeKind_def::GROUP** (p. 1677). In this case, calling **dds::sub::CoherentAccess::CoherentAccess()** (p. 712) / **dds::sub::CoherentAccess::end()** (p. 714) is not considered an error and has no effect.

Calls to **dds::sub::CoherentAccess::CoherentAccess()** (p. 712) / **dds::sub::CoherentAccess::end()** (p. 714) may be nested and must be balanced.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228) or dds::core::NotEnabledError (p. 1601).
------------	--

See also

Access to data samples (p. 61)

dds::sub::find (p. 460)

PRESENTATION (p. 331)

8.37.2.2 ~CoherentAccess()

```
dds::sub::CoherentAccess::~~CoherentAccess ( ) [inline]
```

The destructor implicitly ends coherent access.

See also

end() (p. 714)

8.37.3 Member Function Documentation

8.37.3.1 end()

```
void dds::sub::CoherentAccess::end ( ) [inline]
```

Explicitly indicate that the application has finished accessing the data samples in **DataReader** (p. 756) objects managed by the **Subscriber** (p. 2116).

This operation must be used to close a corresponding `begin_access()`.

This call must close a previous call to `dds::sub::CoherentAccess::CoherentAccess()` (p. 712), otherwise the operation will fail with the error `dds::core::PreconditionNotMetError` (p. 1669).

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228) or <code>dds::core::PreconditionNotMetError</code> (p. 1669) or <code>dds::core::NotEnabledError</code> (p. 1601).
------------	---

8.38 dds::pub::CoherentSet Class Reference

<< **value-type** >> (p. 152) A publishing application can request that a set of DDS data-sample changes be propagated in such a way that they are interpreted at the receivers' side as a cohesive set of modifications.

```
#include "dds/pub/CoherentSet.hpp"
```

Public Member Functions

- **CoherentSet** (const `dds::pub::Publisher` &pub)
 - Creating a **CoherentSet** (p. 714) object indicates that the application will begin a coherent set of modifications using `dds::pub::DataWriter` (p. 908) objects attached to the `dds::pub::Publisher` (p. 1719).*
- void **end** ()
 - Explicitly terminate a coherent set initiated by the **CoherentSet** (p. 714) constructor.*
- `~CoherentSet` ()
 - Implicitly terminate a coherent set.*

8.38.1 Detailed Description

<< **value-type** >> (p. 152) A publishing application can request that a set of DDS data-sample changes be propagated in such a way that they are interpreted at the receivers' side as a cohesive set of modifications.

In this case, the receiver will only be able to access the data after all the modifications in the set are available at the subscribing end.

8.38.2 Constructor & Destructor Documentation

8.38.2.1 CoherentSet()

```
dds::pub::CoherentSet::CoherentSet (
    const dds::pub::Publisher & pub ) [inline], [explicit]
```

Creating a **CoherentSet** (p. 714) object indicates that the application will begin a coherent set of modifications using **dds::pub::DataWriter** (p. 908) objects attached to the **dds::pub::Publisher** (p. 1719).

A 'coherent set' is a set of modifications that must be propagated in such a way that they are interpreted at the receiver's side as a consistent set of modifications; that is, the receiver will only be able to access the data after all the modifications in the set are available at the receiver end.

A connectivity change may occur in the middle of a set of coherent changes; for example, the set of partitions used by the **dds::pub::Publisher** (p. 1719) or one of its subscribers (**dds::sub::Subscriber** (p. 2116)) may change, a late-joining **dds::sub::DataReader** (p. 756) may appear on the network, or a communication failure may occur. In the event that such a change prevents an entity from receiving the entire set of coherent changes, that entity must behave as if it had received none of the set.

These calls can be nested. In that case, the coherent set terminates only with the last call to **dds::pub::CoherentSet::end()** (p. 716). **Publisher** (p. 1719)'s samples (samples published by any of the **DataWriters** within the **Publisher** (p. 1719)) that are not published within a `begin_coherent_changes/end_coherent_changes` block will not be provided to the **DataReaders** as a set.

The support for coherent changes enables a publishing application to change the value of several data-instances that could belong to the same or different topics and have those changes be seen *atomically* by the readers. This is useful in cases where the values are inter-related (for example, if there are two data-instances representing the altitude and velocity vector of the same aircraft and both are changed, it may be useful to communicate those values in a way the reader can see both together; otherwise, it may, e.g., erroneously interpret that the aircraft is on a collision course).

Note

Coherent sets don't apply to Topic Queries. If a **rti::sub::TopicQuery** (p. 2220) selects only a subset of samples that was published as a coherent set, the subscribing application will receive them regardless of their membership to the coherent set.

Exceptions

One	of the Standard Exceptions (p. 228) or dds::core::NotEnabledError (p. 1601).
-----	--

See also

dds::core::policy::Presentation (p. 1670)

Parameters

<i>pub</i>	The Publisher (p. 1719)
------------	--------------------------------

8.38.2.2 `~CoherentSet()`

```
dds::pub::CoherentSet::~~CoherentSet ( ) [inline]
```

Implicitly terminate a coherent set.

See also

`end()` (p. 716)

8.38.3 Member Function Documentation**8.38.3.1** `end()`

```
void dds::pub::CoherentSet::end ( ) [inline]
```

Explicitly terminate a coherent set initiated by the **CoherentSet** (p. 714) constructor.

Precondition

If there is no matching call to **dds::pub::CoherentSet::CoherentSet** (p. 715) the operation will fail with **dds::core::PreconditionNotMetError** (p. 1669).

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), dds::core::PreconditionNotMetError (p. 1669) or dds::core::NotEnabledError (p. 1601).
------------	---

8.39 `rti::core::CoherentSetInfo` Class Reference

<<**extension**>> (p. 156) <<**value-type**>> (p. 152) A `CoherentSampleInfo` provides information about the coherent set associated with a sample.

```
#include "rti/core/CoherentSetInfo.hpp"
```

Public Member Functions

- **CoherentSetInfo** ()
Create a default CoherentSampleInfo object.
- **CoherentSetInfo** (const **Guid** &the_group_guid, const **SequenceNumber** &the_coherent_set_sequence_number, const **SequenceNumber** &the_group_coherent_set_sequence_number, bool the_incomplete_coherent_set)
Creates CoherentSampleInfo object with the specified parameters.
- const **Guid** & **group_guid** () const
*Gets the coherent set group **Guid** (p. 1340).*
- **Guid** & **group_guid** ()
*Gets the coherent set group **Guid** (p. 1340).*
- **CoherentSetInfo** & **group_guid** (const **Guid** &value)
*Sets the coherent set group **Guid** (p. 1340).*
- const **SequenceNumber** & **coherent_set_sequence_number** () const
Gets the coherent set sequence number that identifies a sample as part of a DataWriter coherent set.
- **SequenceNumber** & **coherent_set_sequence_number** ()
Gets the coherent set sequence number that identifies a sample as part of a DataWriter coherent set.
- **CoherentSetInfo** & **coherent_set_sequence_number** (const **SequenceNumber** &value)
Sets the coherent set sequence number that identifies a sample as part of a DataWriter coherent set.
- const **SequenceNumber** & **group_coherent_set_sequence_number** () const
Gets the group coherent set sequence number that identifies a sample as part of a group coherent set.
- **SequenceNumber** & **group_coherent_set_sequence_number** ()
Gets the group coherent set sequence number that identifies a sample as part of a group coherent set.
- **CoherentSetInfo** & **group_coherent_set_sequence_number** (const **SequenceNumber** &value)
Gets the group coherent set sequence number that identifies a sample as part of a group coherent set.
- bool **incomplete_coherent_set** () const
Indicates if a sample is part of an incomplete coherent set.
- **CoherentSetInfo** & **incomplete_coherent_set** (bool value)
Sets the incomplete coherent set status.

Static Public Member Functions

- static **CoherentSetInfo** **unknown** ()
An invalid or unknown coherent set info.

Related Functions

(Note that these are not member functions.)

- std::ostream & **operator**<< (std::ostream &out, const **CoherentSetInfo** &csi)
*Prints a **CoherentSetInfo** (p. 716) to an output stream.*

8.39.1 Detailed Description

<<*extension*>> (p. 156) <<*value-type*>> (p. 152) A CoherentSampleInfo provides information about the coherent set associated with a sample.

8.39.2 Constructor & Destructor Documentation

8.39.2.1 CoherentSetInfo() [1/2]

```
rti::core::CoherentSetInfo::CoherentSetInfo ( ) [inline]
```

Create a default CoherentSampleInfo object.

8.39.2.2 CoherentSetInfo() [2/2]

```
rti::core::CoherentSetInfo::CoherentSetInfo (
    const Guid & the_group_guid,
    const SequenceNumber & the_coherent_set_sequence_number,
    const SequenceNumber & the_group_coherent_set_sequence_number,
    bool the_incomplete_coherent_set ) [inline]
```

Creates CoherentSampleInfo object with the specified parameters.

8.39.3 Member Function Documentation

8.39.3.1 group_guid() [1/3]

```
const Guid & rti::core::CoherentSetInfo::group_guid ( ) const [inline]
```

Gets the coherent set group **Guid** (p. 1340).

This GUID identifies the **dds::pub::DataWriter** (p. 908) or the group of DataWriters publishing the coherent set, depending on the value of **dds::core::policy::Presentation::access_scope** (p. 1674) in the **dds::sub::Subscriber** (p. 2116).

8.39.3.2 group_guid() [2/3]

```
Guid & rti::core::CoherentSetInfo::group_guid ( ) [inline]
```

Gets the coherent set group **Guid** (p. 1340).

This GUID identifies the **dds::pub::DataWriter** (p. 908) or the group of DataWriters publishing the coherent set, depending on the value of **dds::core::policy::Presentation::access_scope** (p. 1674) in the **dds::sub::Subscriber** (p. 2116).

8.39.3.3 group_guid() [3/3]

```
CoherentSetInfo & rti::core::CoherentSetInfo::group_guid (
    const Guid & value ) [inline]
```

Sets the coherent set group **Guid** (p. 1340).

This GUID identifies the **dds::pub::DataWriter** (p. 908) or the group of DataWriters publishing the coherent set, depending on the value of **dds::core::policy::Presentation::access_scope** (p. 1674) in the **dds::sub::Subscriber** (p. 2116).

8.39.3.4 coherent_set_sequence_number() [1/3]

```
const SequenceNumber & rti::core::CoherentSetInfo::coherent_set_sequence_number ( ) const [inline]
```

Gets the coherent set sequence number that identifies a sample as part of a DataWriter coherent set.

When **dds::core::policy::Presentation::access_scope** (p.1674) in the **dds::sub::Subscriber** (p.2116) is set to **dds::core::policy::PresentationAccessScopeKind_def::INSTANCE** (p.1677) or **dds::core::policy::PresentationAccessScopeKind_def::TOPIC** (p.1677), the coherent set associated with a sample is identified by the pair (group_guid, coherent_set_sequence_number).

8.39.3.5 coherent_set_sequence_number() [2/3]

```
SequenceNumber & rti::core::CoherentSetInfo::coherent_set_sequence_number ( ) [inline]
```

Gets the coherent set sequence number that identifies a sample as part of a DataWriter coherent set.

When **dds::core::policy::Presentation::access_scope** (p.1674) in the **dds::sub::Subscriber** (p.2116) is set to **dds::core::policy::PresentationAccessScopeKind_def::INSTANCE** (p.1677) or **dds::core::policy::PresentationAccessScopeKind_def::TOPIC** (p.1677), the coherent set associated with a sample is identified by the pair (group_guid, coherent_set_sequence_number).

8.39.3.6 coherent_set_sequence_number() [3/3]

```
CoherentSetInfo & rti::core::CoherentSetInfo::coherent_set_sequence_number (
    const SequenceNumber & value ) [inline]
```

Sets the coherent set sequence number that identifies a sample as part of a DataWriter coherent set.

This GUID identifies the **dds::pub::DataWriter** (p. 908) or the group of DataWriters publishing the coherent set, depending on the value of **dds::core::policy::Presentation::access_scope** (p. 1674) in the **dds::sub::Subscriber** (p. 2116).

8.39.3.7 group_coherent_set_sequence_number() [1/3]

```
const SequenceNumber & rti::core::CoherentSetInfo::group_coherent_set_sequence_number ( ) const
[inline]
```

Gets the group coherent set sequence number that identifies a sample as part of a group coherent set.

When **dds::core::policy::Presentation::access_scope** (p. 1674) in the **dds::sub::Subscriber** (p. 2116) is set to **dds::core::policy::PresentationAccessScopeKind_def::GROUP** (p. 1677), the coherent set associated with a sample is identified by the pair (group_guid, group_coherent_set_sequence_number).

8.39.3.8 group_coherent_set_sequence_number() [2/3]

```
SequenceNumber & rti::core::CoherentSetInfo::group_coherent_set_sequence_number ( ) [inline]
```

Gets the group coherent set sequence number that identifies a sample as part of a group coherent set.

When **dds::core::policy::Presentation::access_scope** (p. 1674) in the **dds::sub::Subscriber** (p. 2116) is set to **dds::core::policy::PresentationAccessScopeKind_def::GROUP** (p. 1677), the coherent set associated with a sample is identified by the pair (group_guid, group_coherent_set_sequence_number).

8.39.3.9 group_coherent_set_sequence_number() [3/3]

```
CoherentSetInfo & rti::core::CoherentSetInfo::group_coherent_set_sequence_number (
    const SequenceNumber & value ) [inline]
```

Gets the group coherent set sequence number that identifies a sample as part of a group coherent set.

This GUID identifies the **dds::pub::DataWriter** (p. 908) or the group of DataWriters publishing the coherent set, depending on the value of **dds::core::policy::Presentation::access_scope** (p. 1674) in the **dds::sub::Subscriber** (p. 2116).

8.39.3.10 incomplete_coherent_set() [1/2]

```
bool rti::core::CoherentSetInfo::incomplete_coherent_set ( ) const [inline]
```

Indicates if a sample is part of an incomplete coherent set.

8.39.3.11 incomplete_coherent_set() [2/2]

```
CoherentSetInfo & rti::core::CoherentSetInfo::incomplete_coherent_set (
    bool value ) [inline]
```

Sets the incomplete coherent set status.

8.39.3.12 unknown()

```
static CoherentSetInfo rti::core::CoherentSetInfo::unknown ( ) [inline], [static]
```

An invalid or unknown coherent set info.

8.39.4 Friends And Related Function Documentation

8.39.4.1 operator<<()

```
std::ostream & operator<< (
    std::ostream & out,
    const CoherentSetInfo & csi ) [related]
```

Prints a **CoherentSetInfo** (p. 716) to an output stream.

8.40 dds::core::xtypes::CollectionType Class Reference

<< *value-type* >> (p. 152) The base class of all collection types

```
#include <dds/core/xtypes/CollectionTypes.hpp>
```

Inheritance diagram for dds::core::xtypes::CollectionType:

Public Member Functions

- `const dds::core::xtypes::DynamicType & content_type () const`
Gets the type of the elements of this collection.

Additional Inherited Members

8.40.1 Detailed Description

<<*value-type*>> (p. 152) The base class of all collection types

8.40.2 Member Function Documentation

8.40.2.1 content_type()

```
const dds::core::xtypes::DynamicType & dds::core::xtypes::CollectionType::content_type ( ) const
```

Gets the type of the elements of this collection.

8.41 rti::core::CompressionIdMask Class Reference

<<*extension*>> (p. 156) Mask that specifies which built-in compression method to used.

```
#include <rti/core/PolicySettings.hpp>
```

Public Types

- `typedef std::bitset< 16 > MaskType`
The base type, std::bitset.

Public Member Functions

- `CompressionIdMask (uint64_t mask)`
Creates a mask from the bits in an integer.
- `CompressionIdMask (const MaskType &mask)`
Creates a mask from a std::bitset.

Static Public Member Functions

- static const **CompressionIdMask** **all** ()
All bits are set.
- static const **CompressionIdMask** **none** ()
No bits are set.
- static const **CompressionIdMask** **default_publication** ()
Default mask value for publication.
- static const **CompressionIdMask** **default_subscription** ()
Default mask value for subscription.
- static const **CompressionIdMask** **zlib** ()
Selects the built-in ZLIB compression algorithm.
- static const **CompressionIdMask** **bzip2** ()
Selects the built-in BZIP2 compression algorithm.
- static const **CompressionIdMask** **lz4** ()
Selects the built-in LZ4 compression algorithm.

8.41.1 Detailed Description

<<*extension*>> (p. 156) Mask that specifies which built-in compression method to used.

8.41.2 Member Typedef Documentation

8.41.2.1 MaskType

```
typedef std::bitset<16> rti::core::CompressionIdMask::MaskType
```

The base type, std::bitset.

8.41.3 Constructor & Destructor Documentation

8.41.3.1 CompressionIdMask() [1/2]

```
rti::core::CompressionIdMask::CompressionIdMask (  
    uint64_t mask ) [inline], [explicit]
```

Creates a mask from the bits in an integer.

8.41.3.2 CompressionIdMask() [2/2]

```
rti::core::CompressionIdMask::CompressionIdMask (  
    const MaskType & mask ) [inline]
```

Creates a mask from a std::bitset.

8.41.4 Member Function Documentation

8.41.4.1 all()

```
static const CompressionIdMask rti::core::CompressionIdMask::all ( ) [inline], [static]
```

All bits are set.

8.41.4.2 none()

```
static const CompressionIdMask rti::core::CompressionIdMask::none ( ) [inline], [static]
```

No bits are set.

8.41.4.3 default_publication()

```
static const CompressionIdMask rti::core::CompressionIdMask::default_publication ( ) [inline],  
[static]
```

Default mask value for publication.

8.41.4.4 default_subscription()

```
static const CompressionIdMask rti::core::CompressionIdMask::default_subscription ( ) [inline],  
[static]
```

Default mask value for subscription.

8.41.4.5 zlib()

```
static const CompressionIdMask rti::core::CompressionIdMask::zlib ( ) [inline], [static]
```

Selects the built-in ZLIB compression algorithm.

8.41.4.6 bzip2()

```
static const CompressionIdMask rti::core::CompressionIdMask::bzip2 ( ) [inline], [static]
```

Selects the built-in BZIP2 compression algorithm.

8.41.4.7 lz4()

```
static const CompressionIdMask rti::core::CompressionIdMask::lz4 ( ) [inline], [static]
```

Selects the built-in LZ4 compression algorithm.

8.42 rti::core::CompressionSettings Class Reference

<<*extension*>> (p. 156) Compression Settings

```
#include <rti/core/PolicySettings.hpp>
```

Public Member Functions

- **CompressionSettings** ()
Creates an instance with default, compression_ids, writer_compression_level and writer_compression_threshold.
- **CompressionSettings** (const **rti::core::CompressionIdMask** compression_ids)
Creates an instance with the given compression_ids.
- **CompressionSettings** (const **rti::core::CompressionIdMask** compression_ids, const uint32_t writer_compression_level, const int32_t writer_compression_threshold)
Creates an instance with the given compression_ids, writer_compression_level and writer_compression_threshold.
- **rti::core::CompressionIdMask** compression_ids () const
Getter for compression_ids.
- **CompressionSettings** compression_ids (**rti::core::CompressionIdMask** compression_ids)
Setter for compression_ids.
- uint32_t **writer_compression_level** () const
Getter for writer_compression_level.
- **CompressionSettings** **writer_compression_level** (uint32_t writer_compression_level)
Setter for writer_compression_level.
- int32_t **writer_compression_threshold** () const
Getter for writer_compression_threshold.
- **CompressionSettings** **writer_compression_threshold** (int32_t writer_compression_threshold)
Setter for writer_compression_threshold.

Static Public Member Functions

- static uint32_t **compression_level_default** ()
Return the default value for the compression level.
- static uint32_t **compression_level_best_compression** ()
Get the compression level that can be used to achieve the best compression ratio.
- static uint32_t **compression_level_best_speed** ()
Get the compression level that can be used to achieve the best compression speed.

8.42.1 Detailed Description

<<*extension*>> (p. 156) Compression Settings

QoS:

dds::core::policy::DataRepresentation (p. 883)

8.42.2 Constructor & Destructor Documentation

8.42.2.1 CompressionSettings() [1/3]

```
rti::core::CompressionSettings::CompressionSettings ( ) [inline]
```

Creates an instance with default, `compression_ids`, `writer_compression_level` and `writer_compression_threshold`.

8.42.2.2 CompressionSettings() [2/3]

```
rti::core::CompressionSettings::CompressionSettings (
    const rti::core::CompressionIdMask compression_ids ) [inline], [explicit]
```

Creates an instance with the given `compression_ids`.

8.42.2.3 CompressionSettings() [3/3]

```
rti::core::CompressionSettings::CompressionSettings (
    const rti::core::CompressionIdMask compression_ids,
    const uint32_t writer_compression_level,
    const int32_t writer_compression_threshold ) [inline]
```

Creates an instance with the given `compression_ids`, `writer_compression_level` and `writer_compression_threshold`.

References `compression_ids()`, `compression_level_default()`, `writer_compression_level()`, and `writer_compression_threshold()`.

8.42.3 Member Function Documentation

8.42.3.1 compression_level_default()

```
static uint32_t rti::core::CompressionSettings::compression_level_default ( ) [inline], [static]
```

Return the default value for the compression level.

Referenced by **CompressionSettings()**.

8.42.3.2 compression_level_best_compression()

```
static uint32_t rti::core::CompressionSettings::compression_level_best_compression ( ) [inline], [static]
```

Get the compression level that can be used to achieve the best compression ratio.

8.42.3.3 compression_level_best_speed()

```
static uint32_t rti::core::CompressionSettings::compression_level_best_speed ( ) [inline], [static]
```

Get the compression level that can be used to achieve the best compression speed.

8.42.3.4 compression_ids() [1/2]

```
rti::core::CompressionIdMask rti::core::CompressionSettings::compression_ids ( ) const [inline]
```

Getter for compression_ids.

Referenced by **CompressionSettings()**.

8.42.3.5 `compression_ids()` [2/2]

```
CompressionSettings rti::core::CompressionSettings::compression_ids (
    rti::core::CompressionIdMask compression_ids ) [inline]
```

Setter for `compression_ids`.

A bitmap that represents the compression algorithm IDs (**rti::core::CompressionIdMask** (p. 722)) that are supported by the endpoint. The **dds::pub::DataWriter** (p. 908) creation will fail if more than one algorithm is provided.

If a **dds::pub::DataWriter** (p. 908) inherits multiple compression IDs from a **dds::topic::Topic** (p. 2178), only the least significant bit enabled will be inherited. This forces the following order of preference: **rti::core::CompressionIdMask::zlib()** (p. 724), **rti::core::CompressionIdMask::bzip2()** (p. 725), **rti::core::CompressionIdMask::lz4()** (p. 725).

Interactions with Security and Batching: Currently, the only algorithm that is supported when compression and batching are enabled on the same **dds::pub::DataWriter** (p. 908) is **rti::core::CompressionIdMask::zlib()** (p. 724).

The combination of compression, batching, and data protection is supported. First, compression is applied to the entire batch. Then, data protection is applied to the compressed batch.

Note: When **rti::core::policy::DataWriterProtocol::serialize_key_with_dispose** (p. 983) is enabled and a dispose message is sent, the serialized key is not compressed.

[default] For **dds::topic::Topic** (p. 2178), **dds::pub::DataWriter** (p. 908) a **rti::core::CompressionIdMask** (p. 722) mask set to **rti::core::CompressionIdMask::none()** (p. 724)

[default] For **dds::sub::DataReader** (p. 756) a **rti::core::CompressionIdMask** (p. 722) mask set to **rti::core::CompressionIdMask::all()** (p. 724).

8.42.3.6 `writer_compression_level()` [1/2]

```
uint32_t rti::core::CompressionSettings::writer_compression_level ( ) const [inline]
```

Getter for `writer_compression_level`.

Referenced by **CompressionSettings()**.

8.42.3.7 `writer_compression_level()` [2/2]

```
CompressionSettings rti::core::CompressionSettings::writer_compression_level (
    uint32_t writer_compression_level ) [inline]
```

Setter for `writer_compression_level`.

Compression algorithms typically allow you to choose a level with which to compress the data. Each level has trade-offs between the resulting compression ratio and the speed of compression.

[range] [0, 10]

The value 1 represents the fastest compression time and the lowest compression ratio. The value 10 represents the slowest compression time but the highest compression ratio.

A value of 0 disables compression.

[default] **rti::core::CompressionSettings::compression_level_best_compression()** (p. 727)

Note

Only available for a **dds::pub::DataWriter** (p. 908) and **dds::topic::Topic** (p. 2178).

8.42.3.8 writer_compression_threshold() [1/2]

```
int32_t rti::core::CompressionSettings::writer_compression_threshold ( ) const [inline]
```

Getter for `writer_compression_threshold`.

Referenced by `CompressionSettings()`.

8.42.3.9 writer_compression_threshold() [2/2]

```
CompressionSettings rti::core::CompressionSettings::writer_compression_threshold (
    int32_t writer_compression_threshold ) [inline]
```

Setter for `writer_compression_threshold`.

Any sample with a serialized size greater than or equal to the threshold will be eligible to be compressed. All samples with an eligible serialized size will be compressed. Only if the compressed size is smaller than the serialized size will the sample be stored and sent compressed on the wire.

For batching we check the maximum serialized size of the batch, calculated as `serialized_sample_max_size * rti::core::policy::Batch::max_samples` (p. 669)

[range] [0, 2147483647] or `dds::core::LENGTH_UNLIMITED` (p. 238)

Setting the threshold to `dds::core::LENGTH_UNLIMITED` (p. 238) disables the compression.

[default] `rti::core::CompressionSettings::compression_threshold_default()` (8192)

Note

Only available for a `dds::pub::DataWriter` (p. 908) and `dds::topic::Topic` (p. 2178).

8.43 dds::core::cond::Condition Class Reference

<<*reference-type*>> (p. 153) Abstract base class of all the conditions

```
#include <dds/core/cond/Condition.hpp>
```

Inheritance diagram for `dds::core::cond::Condition`:

Public Member Functions

- void **dispatch** ()
Dispatches the functors that have been registered with the condition.
- bool **trigger_value** () const
*This operation retrieves the `trigger_value` of the **Condition** (p. 729).*

8.43.1 Detailed Description

<<**reference-type**>> (p. 153) Abstract base class of all the conditions

Note

Condition (p. 729) and its subclasses provide all the functions of a <<**reference-type**>> (p. 153) except **close()** (p. 801) and **retain()**.

This basic class is specialised in three classes:

dds::core::cond::GuardCondition (p. 1338), **dds::core::cond::StatusCondition** (p. 2079), and **dds::sub::cond::ReadCondition** (p. 1858).

A **dds::core::cond::Condition** (p. 729) has a `trigger_value` that can be true or false and is set automatically by RTI Connext.

See also

- dds::core::cond::WaitSet** (p. 2318)
- Waitset Use Cases** (p. 131)

8.43.2 Member Function Documentation

8.43.2.1 dispatch()

```
void dds::core::cond::Condition::dispatch ( ) [inline]
```

Dispatches the functors that have been registered with the condition.

If **trigger_value()** (p. 730) is true, calling **dispatch()** (p. 730) will call the registered functor handlers.

Note: it is more common to use **WaitSet::dispatch()** (p. 2325) rather than this function.

8.43.2.2 trigger_value()

```
bool dds::core::cond::Condition::trigger_value ( ) const [inline]
```

This operation retrieves the `trigger_value` of the **Condition** (p. 729).

8.44 rti::queuing::ConsumerAvailabilityParams Class Reference

Definition of the availability feedback information that can be provided by consumers to Queuing Service.

```
#include <QueueSupport.hpp>
```

Public Attributes

- bool **reception_enabled**

*Flag that provides a way to indicate whether or not the **QueueConsumer** (p. 1787) can receive samples from Queuing Service.*

- int **unacked_threshold**

*Maximum number of samples pending acknowledgement that the **QueueConsumer** (p. 1787) can have to maintain sample reception. Note: This value is only applied when **ConsumerAvailabilityParams::reception_enabled** (p. 731) is true.*

8.44.1 Detailed Description

Definition of the availability feedback information that can be provided by consumers to Queuing Service.

8.44.2 Member Data Documentation

8.44.2.1 reception_enabled

```
bool rti::queuing::ConsumerAvailabilityParams::reception_enabled
```

Flag that provides a way to indicate whether or not the **QueueConsumer** (p. 1787) can receive samples from Queuing Service.

This value acts as a switch that QueueConsumers can use to temporarily enable or disable the reception of samples from Queuing Service.

8.44.2.2 unacked_threshold

```
int rti::queuing::ConsumerAvailabilityParams::unacked_threshold
```

Maximum number of samples pending acknowledgement that the **QueueConsumer** (p. 1787) can have to maintain sample reception. Note: This value is only applied when **ConsumerAvailabilityParams::reception_enabled** (p. 731) is true.

Once this value is reached, the **QueueConsumer** (p. 1787) will not receive more samples until it acknowledged enough samples so that it is one again under the unacked threshold.

This value has precedence over the unacked threshold settings defined in the Queuing Service configuration. This allows you to dynamically change the threshold on a per Consumer basis.

8.45 rti::topic::ContentFilter< T, CompileData > Class Template Reference

<<*extension*>> (p. 156) A class to inherit from when implementing a custom content filter

```
#include <rti/topic/ContentFilter.hpp>
```

Public Member Functions

- virtual CompileData & **compile** (const std::string &expression, const **dds::core::StringSeq** ¶meters, const **dds::core::optional**< **dds::core::xtypes::DynamicType** > &type_code, const std::string &type_class_name, CompileData *old_compile_data)=0
Compile an instance of the content filter according to the filter expression and parameters of the given data type.
- virtual bool **evaluate** (CompileData &compile_data, const T &sample, const **FilterSampleInfo** &meta_data)=0
Evaluate whether the sample is passing the filter or not according to the sample content.
- virtual void **finalize** (CompileData &compile_data)=0
A previously compiled instance of the content filter is no longer in use and resources can now be cleaned up.

Related Functions

(Note that these are not member functions.)

- **no_compile_data_t no_compile_data**
A constant to return if your compile function does not create any compile data

8.45.1 Detailed Description

```
template<typename T, typename CompileData = no_compile_data_t>
class rti::topic::ContentFilter< T, CompileData >
```

<<*extension*>> (p. 156) A class to inherit from when implementing a custom content filter

This interface can be implemented by an application-provided class and then registered with the DomainParticipant such that samples can be filtered for **dds::topic::ContentFilteredTopic** (p. 735) with the filter name that the filter is registered with.

Note: the API for using a custom content filter is subject to change in a future release.

For an example of how to create a custom content filter see **Creating Custom Content Filters** (p. 134)

Template Parameters

<i>T</i>	The type of the samples that this ContentFilter (p. 732) will filter
<i>CompileData</i>	the type of the data that the compile function will return. If your compile function will not return data, you can leave this template parameter to the default no_compile_data_t (p. 1567) type and return <code>rti::topic::no_compile_data</code> in your compile function

See also

rti::topic::CustomFilter (p. 749)

dds::domain::DomainParticipant::register_contentfilter() (p. 1103)

8.45.2 Member Function Documentation

8.45.2.1 compile()

```
template<typename T , typename CompileData = no_compile_data_t>
virtual CompileData & rti::topic::ContentFilter< T, CompileData >::compile (
    const std::string & expression,
    const dds::core::StringSeq & parameters,
    const dds::core::optional< dds::core::xtypes::DynamicType > & type_code,
    const std::string & type_class_name,
    CompileData * old_compile_data ) [pure virtual]
```

Compile an instance of the content filter according to the filter expression and parameters of the given data type.

This method is called when an instance of the locally registered content filter is created or when the expression parameter for the locally registered content filter instance is changed.

An instance of the locally registered content filter is created every time a local **dds::topic::ContentFilteredTopic** (p. 735) with the matching filter name is created, or when a **dds::sub::DataReader** (p. 756) with a matching filter name is discovered.

It is possible for multiple threads to be calling into this function at the same time. However, this function will never be called on a content filter that has been unregistered.

Parameters

<i>expression</i>	An <code>std::string</code> with the filter expression. If you want to manipulate this string, you must first make a copy of it.
<i>parameters</i>	A string sequence with the expression parameters the ContentFilteredTopic was created with. The string sequence is equal (but not identical) to the string sequence passed to dds::topic::ContentFilteredTopic() (p. 735). Note that the sequence passed to the compile function is owned by RTI Connex and must not be referenced outside the compile function.

Parameters

<i>type_code</i>	The DynamicType for the related Topic of the ContentFilteredTopic. A type code is a description of a type in terms of which types it contains (such as long, string, etc.) and the corresponding member field names in the data type structure. The type code can be used to write custom content filters that can be used with any type.
<i>type_class_name</i>	Fully qualified class name of the related Topic.
<i>old_compile_data</i>	The previous CompileData value from a previous call to this instance of a content filter. If the compile function is called more than once for an instance of a ContentFilteredTopic, e.g., if the expression parameters are changed, then the CompileData value returned by the previous invocation is passed in the <i>old_compile_data</i> parameter (which can be NULL). If this is a new instance of the filter, NULL is passed. This parameter is useful for freeing or reusing previously allocated resources.

Returns

User specified compile data for this instance of the content filter. This value is then passed to the evaluate finalize functions for this instance of the content filter. Can be set to `rti::topic::no_compile_data`.

8.45.2.2 evaluate()

```
template<typename T , typename CompileData = no_compile_data_t>
virtual bool rti::topic::ContentFilter< T, CompileData >::evaluate (
    CompileData & compile_data,
    const T & sample,
    const FilterSampleInfo & meta_data ) [pure virtual]
```

Evaluate whether the sample is passing the filter or not according to the sample content.

This method is called when a sample for a locally created **dds::sub::DataReader** (p. 756) associated with the filter is received, or when a sample for a discovered **dds::sub::DataReader** (p. 756) associated with the filter needs to be sent.

It is possible for multiple threads to be calling into this function at the same time. However, this function will never be called on a content filter that has been unregistered.

Parameters

<i>compile_data</i>	The last return value of the compile function for this instance of the content filter.
<i>sample</i>	A deserialized sample to be filtered.
<i>meta_data</i>	Meta data associated with the sample.

Returns

The function must return false if the sample should be filtered out (did not pass the filter), true otherwise

8.45.2.3 `finalize()`

```
template<typename T , typename CompileData = no_compile_data_t>
virtual void rti::topic::ContentFilter< T, CompileData >::finalize (
    CompileData & compile_data ) [pure virtual]
```

A previously compiled instance of the content filter is no longer in use and resources can now be cleaned up.

This method is called when an instance of the locally registered content filter is deleted.

An instance of the locally registered content filter is deleted every time a local `dds::topic::ContentFilteredTopic` (p. 735) with the matching filter name is deleted, or when a `dds::sub::DataReader` (p. 756) with a matching filter name is removed due to discovery.

This method is also called on all instances of the discovered `dds::sub::DataReader` (p. 756) with a matching filter name if the filter is unregistered with `dds::domain::DomainParticipant::unregister_contentfilter(const std::string & filter_name)` (p. 1104).

It is possible for multiple threads to be calling into this function at the same time. However, this function will never be called on a content filter that has been unregistered.

Parameters

<code><i>compile_data</i></code>	The last return value of the compile function for this instance of the content filter.
----------------------------------	--

8.46 `dds::topic::ContentFilteredTopic< T >` Class Template Reference

<<*reference-type*>> (p. 153) Specialization of `TopicDescription` (p. 2207) that allows for content-based subscriptions.

```
#include <dds/topic/ContentFilteredTopic.hpp>
```

Inheritance diagram for `dds::topic::ContentFilteredTopic< T >`:

Public Member Functions

- `ContentFilteredTopic` (const `Topic< T >` &the_topic, RTI_STRING_IN the_name, const `dds::topic::Filter` &filter)

- Creates a **ContentFilteredTopic** (p. 735) to perform content-based subscriptions.*

 - `std::string filter_expression () const`
Gets the filter expression.
 - `const dds::core::StringSeq filter_parameters () const`
Gets the filter expression parameters.
 - `template<typename FwdIterator >`
`void filter_parameters (const FwdIterator &begin, const FwdIterator &end)`
Modifies the filter parameters.
 - `const dds::topic::Topic< T > & topic () const`
Gets the related topic.
 - `void filter (const dds::topic::Filter &the_filter)`
`<<extension>>` (p. 156) *Modifies the filter*
 - `void append_to_expression_parameter (int32_t index, const std::string &val)`
`<<extension>>` (p. 156) *Appends a term to a parameter*
 - `void remove_from_expression_parameter (int32_t index, const std::string &val)`
`<<extension>>` (p. 156) *Removes a term from a parameter*

Related Functions

(Note that these are not member functions.)

- `template<typename BinIterator >`
`uint32_t find_registered_content_filters (const dds::domain::DomainParticipant & participant, BinIterator begin)`
*Lookup the names of all of the custom content filters registered to a **dds::domain::DomainParticipant** (p. 1079).*

8.46.1 Detailed Description

```
template<typename T>
class dds::topic::ContentFilteredTopic< T >
```

`<<reference-type>>` (p. 153) Specialization of **TopicDescription** (p.2207) that allows for content-based subscriptions.

It describes a more sophisticated subscription that indicates a **dds::sub::DataReader** (p. 756) does not want to necessarily see all values of each instance published under the **dds::topic::Topic** (p. 2178). Rather, it wants to see only the values whose contents satisfy certain criteria. This class therefore can be used to request content-based subscriptions.

The selection of the content is done using the `filter_expression` with parameters `expression_↵ parameters`.

- The `filter_expression` attribute is a string that specifies the criteria to select the data samples of interest. It is similar to the WHERE part of an SQL clause.
- The `expression_parameters` attribute is a sequence of strings that give values to the 'parameters' (i.e. "%n" tokens) in the `filter_expression`. The number of supplied parameters must fit with the requested values in the `filter_expression` (i.e. the number of n tokens).

Queries and Filters Syntax (p.82) describes the syntax of `filter_expression` and `expression_↵ parameters`.

Template Parameters

<i>T</i>	The topic-type
----------	----------------

See also

Filtering with ContentFilteredTopic (p. 133)

Creating Custom Content Filters (p. 134)

8.46.2 Constructor & Destructor Documentation

8.46.2.1 ContentFilteredTopic()

```
template<typename T >
dds::topic::ContentFilteredTopic< T >::ContentFilteredTopic (
    const Topic< T > & the_topic,
    RTI_STRING_IN the_name,
    const dds::topic::Filter & filter ) [inline]
```

Creates a **ContentFilteredTopic** (p. 735) to perform content-based subscriptions.

The **ContentFilteredTopic** (p. 735) only relates to samples published under that **Topic** (p. 2178), filtered according to their content. The filtering is done by means of evaluating a logical expression that involves the values of some of the data-fields in the sample. The logical expression derived from the **Filter** (p. 1303) arguments.

Queries and Filters Syntax (p. 82) describes the syntax of *filter_expression* and *expression_parameters*.

Precondition

The application is not allowed to create two **ContentFilteredTopic** (p. 735) objects with the same topic name attached to the same DomainParticipant. If the application attempts this, this function will fail and throw **dds::core::Error** (p. 1284).

By default this function will create a content filter using the built-in SQL filter which implements a superset of the DDS specification. This filter requires that all IDL types have been compiled with DynamicType (also known as TypeCode). If this precondition is not met, this operation return throws **dds::core::Error** (p. 1284). Do not use rtdsgen's `-notypecode` option if you want to use the built-in SQL filter.

To use a different filter, set **Filter::name()** (p. 1307).

Parameters

<i>the_topic</i>	The Topic (p. 2178) to be filtered
<i>the_name</i>	Name for the new content filtered topic, must not exceed 255 characters.
<i>filter</i>	The filter to apply, which includes the filter name (by default SQL), the filter expression and the expression parameters.

8.46.3 Member Function Documentation

8.46.3.1 filter_expression()

```
template<typename T >
std::string dds::topic::ContentFilteredTopic< T >::filter_expression ( ) const [inline]
```

Gets the filter expression.

8.46.3.2 filter_parameters() [1/2]

```
template<typename T >
const dds::core::StringSeq dds::topic::ContentFilteredTopic< T >::filter_parameters ( ) const
[inline]
```

Gets the filter expression parameters.

8.46.3.3 filter_parameters() [2/2]

```
template<typename T >
template<typename FwdIterator >
void dds::topic::ContentFilteredTopic< T >::filter_parameters (
    const FwdIterator & begin,
    const FwdIterator & end ) [inline]
```

Modifies the filter parameters.

Template Parameters

<i>FwdIterator</i>	A forward iterator whose value type is std::string (or convertible to std::string)
--------------------	--

Parameters

<i>begin</i>	The beginning of the range
<i>end</i>	The end of the range (can't contain more than 100 elements)

8.46.3.4 topic()

```
template<typename T >
const dds::topic::Topic< T > & dds::topic::ContentFilteredTopic< T >::topic ( ) const [inline]
```

Gets the related topic.

8.46.3.5 filter()

```
template<typename T >
void filter (
    const dds::topic::Filter & the_filter )
```

<<**extension**>> (p. 156) Modifies the filter

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

Parameters

<i>the_filter</i>	Contains the new filter expression and parameters. The filter name is immutable: if filter-> name() (p. 2208) is different it will be ignored.
-------------------	---

Changes the `filter_expression` and `expression_parameters` associated with the `dds::topic::ContentFilteredTopic` (p. 735).

8.46.3.6 append_to_expression_parameter()

```
template<typename T >
void append_to_expression_parameter (
    int32_t index,
    const std::string & val )
```

<<**extension**>> (p. 156) Appends a term to a parameter

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

Appends the input string to the end of the specified parameter string, separated by a comma. If the original parameter string is enclosed in quotation marks ("), the resultant string will also be enclosed in quotation marks.

This method can be used in expression parameters associated with MATCH operators in order to add a pattern to the match pattern list. For example, if the filter expression parameter value is:

'IBM'

Then `append_to_expression_parameter(0, "MSFT")` would generate the new value:

'IBM,MSFT'

Parameters

<i>index</i>	<< <i>in</i> >> (p. 157) The index of the parameter string to be modified. The first index is index 0. When using the rti::topic::stringmatch_filter_name (p. 48) filter, <i>index</i> <i>must</i> be 0.
<i>val</i>	<< <i>in</i> >> (p. 157) The string term to be appended to the parameter string.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

8.46.3.7 `remove_from_expression_parameter()`

```
template<typename T >
void remove_from_expression_parameter (
    int32_t index,
    const std::string & val )
```

<<**extension**>> (p. 156) Removes a term from a parameter

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

Removes the input string from the specified parameter string. To be found and removed, the input string must exist as a complete term, bounded by comma separators or the strong boundary. If the original parameter string is enclosed in quotation marks ("), the resultant string will also be enclosed in quotation marks. If the removed term was the last entry in the string, the result will be a string of empty quotation marks.

This method can be used in expression parameters associated with MATCH operators in order to remove a pattern from the match pattern list. For example, if the filter expression parameter value is:

'IBM,MSFT'

Then `remove_from_expression_parameter(0, "IBM")` would generate the expression:

'MSFT'

Parameters

<i>index</i>	<< <i>in</i> >> (p. 157) The index of the parameter string to be modified. The first index is index 0. When using the rti::topic::stringmatch_filter_name (p. 48) filter, <i>index</i> <i>must</i> be 0.
<i>val</i>	<< <i>in</i> >> (p. 157) The string term to be removed from the parameter string.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

8.46.4 Friends And Related Function Documentation

8.46.4.1 find_registered_content_filters()

```
template<typename BinIterator >
uint32_t find_registered_content_filters (
    const dds::domain::DomainParticipant & participant,
    BinIterator begin ) [related]
```

Lookup the names of all of the custom content filters registered to a **dds::domain::DomainParticipant** (p. 1079).

```
#include <dds/topic/find.hpp>
```

Note

This is a standalone function in the namespace **rti::topic** (p. 558)

The names of the RTI Connex built-in content filters will not be returned as part of the list.

Template Parameters

<i>BinIterator</i>	A back-inserting iterator whose value type is <code>std::string</code> (or convertible to)
--------------------	--

Parameters

<i>participant</i>	The dds::domain::DomainParticipant (p. 1079) that the content filters are registered with
<i>begin</i>	A back-inserting iterator to the position in the destination container to insert the the names of the found content filters into

Returns

The number of found content filters

References **rti::topic::find_registered_content_filters()**.

8.47 rti::core::ContentFilterProperty Class Reference

<<**extension**>> (p. 156) <<**value-type**>> (p. 152) Provides all the required information to enable content filtering.

```
#include <ContentFilterProperty.hpp>
```

Public Member Functions

- **optional_string content_filter_topic_name** () const
Name of the ContentFilteredTopic associated with the DataReader.
- **dds::core::StringSeq expression_parameters** () const
The ContentFilteredTopic filter parameters.
- **optional_string filter_class_name** () const
Identifies the filter class this filter belongs to.
- **optional_string filter_expression** () const
The filter expression.
- **optional_string related_topic_name** () const
The name of the ContentFilteredTopic's related Topic.

8.47.1 Detailed Description

<<*extension*>> (p. 156) <<*value-type*>> (p. 152) Provides all the required information to enable content filtering.

8.47.2 Member Function Documentation

8.47.2.1 content_filter_topic_name()

```
optional_string rti::core::ContentFilterProperty::content_filter_topic_name ( ) const [inline]
```

Name of the ContentFilteredTopic associated with the DataReader.

8.47.2.2 expression_parameters()

```
dds::core::StringSeq rti::core::ContentFilterProperty::expression_parameters ( ) const [inline]
```

The ContentFilteredTopic filter parameters.

8.47.2.3 filter_class_name()

```
optional_string rti::core::ContentFilterProperty::filter_class_name ( ) const [inline]
```

Identifies the filter class this filter belongs to.

8.47.2.4 filter_expression()

```
optional_string rti::core::ContentFilterProperty::filter_expression ( ) const [inline]
```

The filter expression.

8.47.2.5 related_topic_name()

```
optional_string rti::core::ContentFilterProperty::related_topic_name ( ) const [inline]
```

The name of the ContentFilteredTopic's related Topic.

8.48 rti::util::network_capture::ContentKindMask Class Reference

<<*extension*>> (p. 156) Mask indicating the types of contents to remove from RTPS frames before saving them to the capture file.

```
#include <network_capture.hpp>
```

Inherits std::bitset< 32 >.

Public Types

- typedef std::bitset< 32 > **MaskType**
A typedef of std::bitset<32> for convenience.

Public Member Functions

- **ContentKindMask** ()
Default constructor for **ContentKindMask** (p. 743).
- **ContentKindMask** (uint64_t mask)
Construct a **ContentKindMask** (p. 743) from an integer.
- **ContentKindMask** (const **MaskType** &mask)
Construct a **ContentKindMask** (p. 743) from a **MaskType** object.

Static Public Member Functions

- static const **ContentKindMask** **user** ()
The serialized data coming from a user.
- static const **ContentKindMask** **encrypted** ()
The encrypted user data.
- static const **ContentKindMask** **default_mask** ()
Default mask for `network_capture::ContentKindMask` (p. 743): do not remove any content.
- static const **ContentKindMask** **none** ()
The RTPS frames in the capture file will be saved as they are.
- static const **ContentKindMask** **all** ()
The RTPS frames in the capture file will not include user data (either plain or encrypted).

8.48.1 Detailed Description

<<**extension**>> (p. 156) Mask indicating the types of contents to remove from RTPS frames before saving them to the capture file.

The masks are based on a combination (or only one) of the `network_capture::ContentKindMask` (p. 743) bitmaps.

See also

`network_capture::ContentKindMask` (p. 743)

8.48.2 Member Typedef Documentation

8.48.2.1 MaskType

```
typedef std::bitset<32> rti::util::network_capture::ContentKindMask::MaskType
```

A typedef of `std::bitset<32>` for convenience.

8.48.3 Constructor & Destructor Documentation

8.48.3.1 ContentKindMask() [1/3]

```
rti::util::network_capture::ContentKindMask::ContentKindMask ( ) [inline]
```

Default constructor for `ContentKindMask` (p. 743).

8.48.3.2 ContentKindMask() [2/3]

```
rti::util::network_capture::ContentKindMask::ContentKindMask (
    uint64_t mask ) [inline], [explicit]
```

Construct a `ContentKindMask` (p. 743) from an integer.

Parameters

<i>mask</i>	Value whose bits are copied to the bitset positions
-------------	---

8.48.3.3 ContentKindMask() [3/3]

```
rti::util::network_capture::ContentKindMask::ContentKindMask (  
    const MaskType & mask ) [inline]
```

Construct a **ContentKindMask** (p. 743) from a MaskType object.

Parameters

<i>mask</i>	A std::bitset<32> to construct this NetworkCaptureContentKindMask from.
-------------	---

8.48.4 Member Function Documentation

8.48.4.1 user()

```
static const ContentKindMask rti::util::network_capture::ContentKindMask::user ( ) [inline],  
[static]
```

The serialized data coming from a user.

8.48.4.2 encrypted()

```
static const ContentKindMask rti::util::network_capture::ContentKindMask::encrypted ( ) [inline],  
[static]
```

The encrypted user data.

8.48.4.3 default_mask()

```
static const ContentKindMask rti::util::network_capture::ContentKindMask::default_mask ( ) [inline],
[static]
```

Default mask for `network_capture::ContentKindMask` (p. 743): do not remove any content.

It is equivalent to `network_capture::ContentKindMask::none()` (p. 746).

[default] Do not remove any content.

8.48.4.4 none()

```
static const ContentKindMask rti::util::network_capture::ContentKindMask::none ( ) [inline],
[static]
```

The RTPS frames in the capture file will be saved as they are.

8.48.4.5 all()

```
static const ContentKindMask rti::util::network_capture::ContentKindMask::all ( ) [inline],
[static]
```

The RTPS frames in the capture file will not include user data (either plain or encrypted).

Its value is the result of setting the bits for removing user data and removing encrypted data: (`network_capture::ContentKindMask::user()` (p. 745) | `network_capture::ContentKindMask::encrypted()` (p. 745))

8.49 rti::core::Cookie Class Reference

Unique identifier for a written data sample in the form of a sequence of bytes.

```
#include <rti/core/Cookie.hpp>
```

Public Member Functions

- **Cookie ()**
Creates an empty cookie.
- `template<typename ByteContainer >`
Cookie (const ByteContainer &bytes)
Creates a new cookie with the bytes inside a container.
- **dds::core::vector< uint8_t > & value ()**
Retrieves a reference to the vector of bytes.
- `const dds::core::vector< uint8_t > & value () const`
Retrieves a const reference to the vector of bytes.
- `template<typename T >`
`T * to_pointer () const`
Converts a cookie into a pointer.

Related Functions

(Note that these are not member functions.)

- typedef `dds::core::vector< Cookie > CookieSeq`
A sequence of `Cookie` (p. 746) objects.
- `std::ostream & operator<< (std::ostream &out, const Cookie &cookie)`
Prints a `Cookie` (p. 746) to an output stream.

8.49.1 Detailed Description

Unique identifier for a written data sample in the form of a sequence of bytes.

See also

`dds::pub::DataWriter::write(const T&, rti::pub::WriteParams&)` (p. 949)

8.49.2 Constructor & Destructor Documentation

8.49.2.1 Cookie() [1/2]

```
rti::core::Cookie::Cookie ( ) [inline]
```

Creates an empty cookie.

8.49.2.2 Cookie() [2/2]

```
template<typename ByteContainer >  
rti::core::Cookie::Cookie (   
    const ByteContainer & bytes ) [inline], [explicit]
```

Creates a new cookie with the bytes inside a container.

8.49.3 Member Function Documentation

8.49.3.1 value() [1/2]

```
dds::core::vector< uint8_t > & rti::core::Cookie::value ( )
```

Retrieves a reference to the vector of bytes.

8.49.3.2 value() [2/2]

```
const dds::core::vector< uint8_t > & rti::core::Cookie::value ( ) const
```

Retrieves a const reference to the vector of bytes.

8.49.3.3 to_pointer()

```
template<typename T >
T * rti::core::Cookie::to_pointer ( ) const [inline]
```

Converts a cookie into a pointer.

Utility function that allows retrieving a pointer stored in a cookie.

Precondition

The cookie's value was filled with a pointer, otherwise the value returned may not be a valid memory address.

Template Parameters

<i>T</i>	The pointer type
----------	------------------

Returns

The pointer this cookie represents

8.49.4 Friends And Related Function Documentation**8.49.4.1 CookieSeq**

```
typedef dds::core::vector< Cookie> CookieSeq [related]
```

A sequence of **Cookie** (p. 746) objects.

8.49.4.2 operator<<()

```
std::ostream & operator<< (
    std::ostream & out,
    const Cookie & cookie ) [related]
```

Prints a **Cookie** (p. 746) to an output stream.

8.50 rti::topic::CustomFilter< T > Class Template Reference

<<**extension**>> (p. 156) <<**reference-type**>> (p. 153) A wrapper class for the user-defined implementation of a **ContentFilter** (p. 732).

```
#include <rti/topic/CustomFilter.hpp>
```

Inheritance diagram for rti::topic::CustomFilter< T >:

Public Member Functions

- **CustomFilter** (typename dds::core::smart_ptr_traits< T >::ref_type content_filter_ref)
Create a **CustomFilter** (p. 749) which holds a shared pointer to a user-defined content filter.
- const T * **get** () const
Get a const pointer to the underlying content filter.
- T * **get** ()
Get a pointer to the underlying content filter.

8.50.1 Detailed Description

```
template<typename T>
class rti::topic::CustomFilter< T >
```

<<**extension**>> (p. 156) <<**reference-type**>> (p. 153) A wrapper class for the user-defined implementation of a **ContentFilter** (p. 732).

In order to register a custom content filter a user must:

- Implement the content filter by creating their own class which inherits from one of the abstract classes: **ContentFilter** (p. 732), **WriterContentFilter** (p. 2351), or **WriterContentFilterHelper** (p. 2356)
- Create a **CustomFilter** (p. 749) which holds a shared pointer to the user-defined content filter
- Register the **CustomFilter** (p. 749) with the **dds::domain::DomainParticipant** (p. 1079) using **dds::domain::DomainParticipant::register_contentfilter** (p. 1103)

The **CustomFilter** (p. 749) class prevents your content filter from being deleted while RTI Connext is using your filter by retaining a reference to your filter until it is no longer being used by RTI Connext.

For an example of how to create and register a custom content filter see **Creating Custom Content Filters** (p. 134).

Template Parameters

<i>T</i>	The type of the custom content filter that is being registered. It must be a type which inherits and implements the interface of one of ContentFilter (p. 732), WriterContentFilter (p. 2351), or WriterContentFilterHelper (p. 2356)
----------	--

8.50.2 Constructor & Destructor Documentation

8.50.2.1 CustomFilter()

```
template<typename T >
rti::topic::CustomFilter< T >::CustomFilter (
    typename dds::core::smart_ptr_traits< T >::ref_type content_filter_ref ) [inline]
```

Create a **CustomFilter** (p. 749) which holds a shared pointer to a user-defined content filter.

Parameters

<i>content_filter_ref</i>	A shared pointer to a user-defined content filter object.
---------------------------	---

8.50.3 Member Function Documentation

8.50.3.1 get() [1/2]

```
template<typename T >
const T * rti::topic::CustomFilter< T >::get ( ) const [inline]
```

Get a const pointer to the underlying content filter.

8.50.3.2 get() [2/2]

```
template<typename T >
T * rti::topic::CustomFilter< T >::get ( ) [inline]
```

Get a pointer to the underlying content filter.

8.51 rti::core::policy::Database Class Reference

<<*extension*>> (p. 156) Configures threads and resource limits that RTI Connex uses to control its internal database

```
#include <rti/core/policy/CorePolicy.hpp>
```

Public Member Functions

- int32_t **initial_weak_references** () const
 - Getter (see setter with the same name)*

8.51.1 Detailed Description

<<*extension*>> (p. 156) Configures threads and resource limits that RTI Connex uses to control its internal database

RTI uses an internal in-memory "database" to store information about entities created locally as well as remote entities found during the discovery process. This database uses a background thread to garbage-collect records related to deleted entities. When the **dds::domain::DomainParticipant** (p. 1079) that maintains this database is deleted, it shuts down this thread.

The **Database** (p. 751) QoS policy is used to configure how RTI Connex manages its database, including how often it cleans up, the priority of the database thread, and limits on resources that may be allocated by the database.

You may be interested in modifying the **rti::core::policy::Database::shutdown_timeout** (p. 753) and **rti::core::policy::Database::shutdown_cleanup_period** (p. 753) parameters to decrease the time it takes to delete a **dds::domain::DomainParticipant** (p. 1079) when your application is shutting down.

The **rti::core::policy::DomainParticipantResourceLimits** (p. 1143) controls the memory allocation for elements stored in the database.

This QoS policy is an extension to the DDS standard.

Entity:

dds::domain::DomainParticipant (p. 1079)

Properties:

RxO (p. 307) = N/A

Changeable (p. 307) **NO** (p. 307)

8.51.2 Member Function Documentation

8.51.2.1 thread() [1/3]

```
Database & rti::core::policy::Database::thread (
    const rti::core::ThreadSettings & the_thread )
```

Sets the thread settings.

There is only one database thread: the clean-up thread.

[default] Priority: LOW.

The actual value depends on your architecture:

For Windows: -3

For Linux: OS default priority

For a complete list of platform specific values, please refer to [Platform Notes](#).

[default] Stack Size: The actual value depends on your architecture:

For Windows: OS default stack size

For Linux: OS default stack size

For a complete list of platform specific values, please refer to [Platform Notes](#).

[default] Mask: **rti::core::ThreadSettingsKindMask::stdio()** (p. 2161)

8.51.2.2 thread() [2/3]

```
const rti::core::ThreadSettings & rti::core::policy::Database::thread ( ) const
```

Gets the thread settings (by const reference)

8.51.2.3 thread() [3/3]

```
rti::core::ThreadSettings & rti::core::policy::Database::thread ( )
```

Gets the thread settings by reference.

See also

thread(const rti::core::ThreadSettings&) (p. 752)

8.51.2.4 shutdown_timeout() [1/2]

```
Database & rti::core::policy::Database::shutdown_timeout (
    const dds::core::Duration & the_shutdown_timeout )
```

The domain participant will exit after the timeout, even if the database has not been fully cleaned up.

[default] 15 seconds

[range] [0,dds::core::Duration::infinite() (p. 1197)]

8.51.2.5 shutdown_timeout() [2/2]

```
dds::core::Duration rti::core::policy::Database::shutdown_timeout ( ) const
```

Getter (see setter with the same name)

8.51.2.6 cleanup_period() [1/2]

```
Database & rti::core::policy::Database::cleanup_period (
    const dds::core::Duration & the_cleanup_period )
```

[default] 61 seconds

[range] [0,1 year]

8.51.2.7 cleanup_period() [2/2]

```
dds::core::Duration rti::core::policy::Database::cleanup_period ( ) const
```

Getter (see setter with the same name)

8.51.2.8 shutdown_cleanup_period() [1/2]

```
Database & rti::core::policy::Database::shutdown_cleanup_period (
    const dds::core::Duration & period )
```

If you would like to shorten the time taken for a DomainParticipant to shutdown, you can decrease this value.

It is recommended to set this value to something other than 0 if running in an RTOS environment, to avoid CPU starvation.

[default] 10 milliseconds

[range] [0,1 year]

8.51.2.9 shutdown_cleanup_period() [2/2]

```
dds::core::Duration rti::core::policy::Database::shutdown_cleanup_period ( ) const
```

Getter (see setter with the same name)

8.51.2.10 initial_records() [1/2]

```
Database & rti::core::policy::Database::initial_records (
    int32_t the_initial_records )
```

[default] 1024

[range] [1,10 million]

8.51.2.11 initial_records() [2/2]

```
int32_t rti::core::policy::Database::initial_records ( ) const
```

Getter (see setter with the same name)

8.51.2.12 max_skiplist_level()

```
Database & rti::core::policy::Database::max_skiplist_level (
    int32_t the_max_skiplist_level )
```

The skiplist is used to keep records in the database. Usually, the search time is $\log_2(N)$, where N is the total number of records in one skiplist. However, once N exceeds 2^n , where n is the maximum skiplist level, the search time will become more and more linear. Therefore, the maximum level should be set such that 2^n is larger than the maximum N among all skiplists). Usually, the maximum N is the maximum number of remote and local writers or readers.

[default] 7

[range] [1,31]

8.51.2.13 max_weak_references() [1/2]

```
Database & rti::core::policy::Database::max_weak_references (
    int32_t the_max_weak_references )
```

A weak reference is an internal data structure that refers to a record within RTI ConnexT' internal database. This field configures the maximum number of such references that RTI ConnexT may create.

The actual number of weak references is permitted to grow from an initial value (indicated by **rti::core::policy::Database::initial_weak_references** (p. 755)) to this maximum. To prevent RTI ConnexT from allocating any weak references after the system has reached a steady state, set the initial and maximum values equal to one another. To indicate that the number of weak references should continue to grow as needed indefinitely, set this field to **dds::core::LENGTH_UNLIMITED** (p. 238). Be aware that although a single weak reference occupies very little memory, allocating a very large number of them can have a significant impact on your overall memory usage.

Tuning this value precisely is difficult without intimate knowledge of the structure of RTI ConnexT' database; doing so is an advanced feature not required by most applications. The default value has been chosen to be sufficient for reasonably large systems. If you believe you may need to modify this value, please consult with RTI support personnel for assistance.

[default] **dds::core::LENGTH_UNLIMITED** (p. 238)

[range] [1, 100 million] or **dds::core::LENGTH_UNLIMITED** (p. 238), >= initial_weak_references

See also

rti::core::policy::Database::initial_weak_references (p. 755)

8.51.2.14 max_weak_references() [2/2]

```
int32_t rti::core::policy::Database::max_weak_references ( ) const
```

Getter (see setter with the same name)

8.51.2.15 initial_weak_references() [1/2]

```
Database & rti::core::policy::Database::initial_weak_references (
    int32_t the_initial_weak_references )
```

See **rti::core::policy::Database::max_weak_references** (p. 754) for more information about what a weak reference is.

If the QoS set contains an initial_weak_references value that is too small to ever grow to **rti::core::policy::Database::max_weak_references** (p. 754) using RTI ConnexT' internal algorithm, this value will be adjusted upwards as necessary. Subsequent accesses of this value will reveal the actual initial value used.

Changing the value of this field is an advanced feature; it is recommended that you consult with RTI support personnel before doing so.

[default] 2049, which is the minimum initial value imposed by REDA when the maximum is unlimited. If a lower value is specified, it will simply be increased to 2049 automatically.

[range] [1, 100 million], <= max_weak_references

```

Getter (see setter with the same name)

8.52 dds::sub::DataReader< T > Class Template Reference

<<*reference-type*>> (p. 153) Allows the application to: (1) declare the data it wishes to receive (i.e. make a subscription) and (2) access the data received by the attached **dds::sub::Subscriber** (p. 2116).

```
#include "dds/sub/DataReader.hpp"
```

Inheritance diagram for dds::sub::DataReader< T >:

Classes

- class **ManipulatorSelector**
A *Selector* (p. 2027) class enabling the streaming API.
- class **Selector**
The *Selector* (p. 2027) class is used by the *DataReader* (p. 756) to compose read and take operations.

Public Member Functions

- **DataReader** (const **dds::sub::Subscriber** &sub, const **dds::topic::Topic**< T > &topic)
Create a *DataReader* (p. 756).
- **DataReader** (const **dds::sub::Subscriber** &sub, const **dds::topic::Topic**< T > &topic, const **dds::sub::qos::DataReaderQos** &the_qos, **dds::sub::DataReaderListener**< T > *the_listener=NULL, const **dds::core::status::StatusMask** &mask= **dds::core::status::StatusMask::all**())
Create a *DataReader* (p. 756).
- **DataReader** (const **dds::sub::Subscriber** &sub, const **dds::topic::Topic**< T > &topic, const **dds::sub::qos::DataReaderQos** &the_qos, std::shared_ptr< **Listener** > the_listener, const **dds::core::status::StatusMask** &mask= **dds::core::status::StatusMask::all**())
Create a *DataReader* (p. 756).
- **DataReader** (const **dds::sub::Subscriber** &sub, const **dds::topic::ContentFilteredTopic**< T > &topic)
Create a *DataReader* (p. 756) for a *dds::topic::ContentFilteredTopic* (p. 735).
- **DataReader** (const **dds::sub::Subscriber** &sub, const **dds::topic::ContentFilteredTopic**< T > &topic, const **dds::sub::qos::DataReaderQos** &the_qos, **dds::sub::DataReaderListener**< T > *the_listener=NULL, const **dds::core::status::StatusMask** &mask= **dds::core::status::StatusMask::all**())
Create a *DataReader* (p. 756) for a *dds::topic::ContentFilteredTopic* (p. 735).

- **DataReader** (const **dds::sub::Subscriber** &sub, const **dds::topic::ContentFilteredTopic**< T > &topic, const **dds::sub::qos::DataReaderQos** &the_qos, std::shared_ptr< **Listener** > the_listener, const **dds::core::status::StatusMask** &mask= **dds::core::status::StatusMask::all()**)
*Create a **DataReader** (p. 756) for a **dds::topic::ContentFilteredTopic** (p. 735) with a listener.*
- **DataReader** (const **dds::topic::Topic**< T > &topic)
*Create a **DataReader** (p. 756).*
- **DataReader** (const **dds::topic::Topic**< T > &topic, const **dds::sub::qos::DataReaderQos** &the_qos)
*Create a **DataReader** (p. 756) with QoS.*
- **DataReader** (const **dds::topic::ContentFilteredTopic**< T > &topic, const **dds::sub::qos::DataReaderQos** &the_qos)
*Create a **DataReader** (p. 756) for a **dds::topic::ContentFilteredTopic** (p. 735).*
- **DataReader** (const **dds::topic::Topic**< T > &topic, const **dds::sub::qos::DataReaderQos** &the_qos, std::shared_ptr< **Listener** > the_listener, const **dds::core::status::StatusMask** &mask= **dds::core::status::StatusMask::all()**)
*Create a **DataReader** (p. 756).*
- **DataReader** (const **dds::topic::ContentFilteredTopic**< T > &topic)
*Create a **DataReader** (p. 756) for a **dds::topic::ContentFilteredTopic** (p. 735).*
- **DataReader** (const **dds::topic::ContentFilteredTopic**< T > &topic, const **dds::sub::qos::DataReaderQos** &the_qos, std::shared_ptr< **Listener** > the_listener, const **dds::core::status::StatusMask** &mask= **dds::core::status::StatusMask::all()**)
*Create a **DataReader** (p. 756) for a **dds::topic::ContentFilteredTopic** (p. 735) with a listener.*
- const **dds::sub::status::DataState** & **default_filter_state** ()
Returns the default state for read/take operations.
- **DataReader** & **default_filter_state** (const **dds::sub::status::DataState** & state)
Set the default state filter for read/take operations.
- **DataReader** & **operator**>> (**dds::sub::LoanedSamples**< T > &ls)
*Use the stream operator to take samples, placing them into a **LoanedSamples** (p. 1406) container.*
- **ManipulatorSelector** **operator**>> (bool(*manipulator)(**ReadModeDummyType**))
Use the stream operator to read or take samples.
- template<typename Functor >
ManipulatorSelector **operator**>> (Functor f)
Use the stream operator to dictate the behavior of the read or take operation.
- **LoanedSamples**< T > **read** ()
Read all samples using the default filter state.
- **LoanedSamples**< T > **take** ()
Take all samples using the default filter state.
- template<typename SamplesFWIterator >
 uint32_t **read** (SamplesFWIterator sfit, int32_t **max_samples**)
Read up to max_samples samples using the default filter state.
- template<typename SamplesFWIterator >
 uint32_t **take** (SamplesFWIterator sfit, int32_t **max_samples**)
Take up to max_samples samples using the default filter state.
- template<typename SamplesBIIterator >
 uint32_t **read** (SamplesBIIterator sbit)
Read all samples available in the reader cache using the default filter state.
- template<typename SamplesBIIterator >
 uint32_t **take** (SamplesBIIterator sbit)
Take all samples available in the reader cache samples using the default filter state.
- **Selector** **select** ()

- Get a **Selector** (p. 2027) to perform complex data selections, such as per-instance selection, content and status filtering.
- **T & key_value** (T &key_holder, const **dds::core::InstanceHandle** &handle)

Retrieve the instance key that corresponds to an instance handle.
 - **dds::topic::TopicInstance**< T > & **key_value** (**dds::topic::TopicInstance**< T > &key_holder, const **dds::core::InstanceHandle** &handle)

Retrieve the instance key that corresponds to an instance handle.
 - **dds::core::InstanceHandle** **lookup_instance** (const T &key_holder) const

Retrieve the InstanceHandle that corresponds to an instance key holder.
 - **dds::topic::TopicDescription**< DataType > **topic_description** () const

Returns the **dds::topic::TopicDescription** (p. 2207) associated with the **DataReader** (p. 756).
 - const **dds::sub::Subscriber** & **subscriber** () const

Returns the **Subscriber** (p. 2116) to which the **DataReader** (p. 756) belongs.
 - void **listener** (**Listener** *the_listener, const **dds::core::status::StatusMask** &event_mask)

Sets the listener associated with this reader.
 - **Listener** * **listener** () const

Returns the listener currently associated with this **DataReader** (p. 756).
 - void **set_listener** (std::shared_ptr< **Listener** > the_listener, const **dds::core::status::StatusMask** &event_mask)

Sets the listener associated with this reader.
 - void **set_listener** (std::shared_ptr< **Listener** > the_listener)

Sets the listener associated with this reader.
 - std::shared_ptr< **Listener** > **get_listener** () const

Returns the listener currently associated with this **DataReader** (p. 756).
 - const **dds::sub::qos::DataReaderQos** **qos** () const

Get the QoS associated with this reader.
 - void **qos** (const **dds::sub::qos::DataReaderQos** &the_qos)

Set the QoS associated with this reader.
 - **DataReader** & **operator**<< (const **dds::sub::qos::DataReaderQos** &the_qos)

Set the QoS associated with this reader.
 - **DataReader** & **operator**>> (**dds::sub::qos::DataReaderQos** &the_qos)

Get the QoS associated with this reader.
 - void **wait_for_historical_data** (const **dds::core::Duration** &max_wait)

Waits until all "historical" data is received for DataReaders that have a non-VOLATILE Durability QoS kind.
 - **dds::core::status::LivelinessChangedStatus** **liveliness_changed_status** () const

Get the LivelinessChangedStatus for this **DataReader** (p. 756).
 - **dds::core::status::SampleRejectedStatus** **sample_rejected_status** () const

Get the SampleRejectedStatus for this **DataReader** (p. 756).
 - **dds::core::status::SampleLostStatus** **sample_lost_status** () const

Get the SampleLostStatus for this **DataReader** (p. 756).
 - **dds::core::status::RequestedDeadlineMissedStatus** **requested_deadline_missed_status** ()

Get the RequestedDeadlineMissedStatus for this **DataReader** (p. 756).
 - **dds::core::status::RequestedIncompatibleQoSStatus** **requested_incompatible_qos_status** () const

Get the RequestedIncompatibleQoSStatus for this **DataReader** (p. 756).
 - **dds::core::status::SubscriptionMatchedException** **subscription_matched_status** () const

Get the SubscriptionMatchedException for this **DataReader** (p. 756).
 - **rti::core::status::DataReaderCacheStatus** **datreader_cache_status** () const

<<extension>> (p. 156) Get the DataReaderCacheStatus for this **DataReader** (p. 756)

- **rti::core::status::DataReaderProtocolStatus datareader_protocol_status ()** const
 <<extension>> (p. 156) Get the *DataReaderProtocolStatus* for this **DataReader** (p. 756)
- **rti::core::status::DataReaderProtocolStatus matched_publication_datareader_protocol_status** (const **dds::core::InstanceHandle** &publication_handle)
 <<extension>> (p. 156) Get the *DataReaderProtocolStatus* for this **DataReader** (p. 756)
- void **acknowledge_all ()**
 <<extension>> (p. 156) Acknowledge all previously accessed samples
- void **acknowledge_all** (const AckResponseData &response_data)
 <<extension>> (p. 156) Acknowledge all previously accessed samples
- void **acknowledge_sample** (const **dds::sub::SampleInfo** &sample_info)
 <<extension>> (p. 156) Acknowledge a single sample explicitly
- void **acknowledge_sample** (const **dds::sub::SampleInfo** &sample_info, const AckResponseData &response_data)
 <<extension>> (p. 156) Acknowledge a single sample explicitly
- void **close_contained_entities ()**
 <<extension>> (p. 156) Closes all the entities created from this **DataReader** (p. 756)
- **rti::core::Result< dds::sub::LoanedSamples< T > > read_noexcept ()** noexcept
 <<extension>> (p. 156) Alternative to *read()* (p. 773) that doesn't throw exceptions.
- **rti::core::Result< dds::sub::LoanedSamples< T > > take_noexcept ()** noexcept
 <<extension>> (p. 156) Alternative to *take()* (p. 774) that doesn't throw exceptions.
- bool **read** (T &sample)
 <<extension>> (p. 156) Copies the next not-previously-accessed valid data value from the **DataReader** (p. 756) via a read operation.
- bool **read** (T &sample, **dds::sub::SampleInfo** &sample_info)
 <<extension>> (p. 156) Copies the next not-previously-accessed data value from the **DataReader** (p. 756) via a read operation.
- bool **take** (T &sample)
 <<extension>> (p. 156) Copies the next not-previously-accessed valid data value from the **DataReader** (p. 756) via a take operation.
- bool **take** (T &sample, **dds::sub::SampleInfo** &sample_info)
 <<extension>> (p. 156) Copies the next not-previously-accessed data value from the **DataReader** (p. 756) via a take operation.
- bool **is_data_consistent** (const T &sample, const **dds::sub::SampleInfo** &sample_info)
 <<extension>> (p. 156) Checks if the sample has been overwritten by the *DataWriter*
- bool **is_data_consistent** (const **rti::sub::LoanedSample< T >** &sample)
 <<extension>> (p. 156) Checks if the sample has been overwritten by the *DataWriter*
- const std::string & **topic_name ()** const
 <<extension>> (p. 156) Get the topic name associated with this **DataReader** (p. 756)
- const std::string & **type_name ()** const
 <<extension>> (p. 156) Get the type name associated with this **DataReader** (p. 756)
- void **close ()**
 Close this **DataReader** (p. 756).

Related Functions

(Note that these are not member functions.)

- **bool read (dds::sub::ReadModeDummyType)**
The stream manipulator to indicate that the reader should read samples as opposed to taking the samples.
- **bool take (dds::sub::ReadModeDummyType)**
The stream manipulator to indicate that the reader should take samples as opposed to reading the samples.
- **dds::sub::functors::MaxSamplesManipulatorFunctor max_samples (uint32_t n)**
Stream manipulator to set the maximum number of samples to read or take.
- **dds::sub::functors::ContentFilterManipulatorFunctor content (const dds::sub::Query &query)**
*Stream manipulator to set a **Query** (p. 1778) to use during the subsequent read/take operation.*

`::topic::TopicDescription< T > & topic_description)`
<<extension>> (p. 156) Retrieves a dds::sub::DataReader (p. 756) with the given TopicDescription within the dds←
::sub::Subscriber (p. 2116)
- `template<typename Reader >`
`Reader find_datareader_by_name (dds::domain::DomainParticipant participant, const std::string`
`&datareader_name)`
<<extension>> (p. 156) Retrieves a dds::sub::DataReader (p. 756) within the dds::domain::DomainParticipant (p. 1079) with the given name

8.52.1 Detailed Description

```
template<typename T>
class dds::sub::DataReader< T >
```

<<*reference-type*>> (p. 153) Allows the application to: (1) declare the data it wishes to receive (i.e. make a subscription) and (2) access the data received by the attached **dds::sub::Subscriber** (p. 2116).

Template Parameters

<i>T</i>	The topic-type that the DataReader (p. 756) subscribes to
----------	--

QoS:

dds::sub::qos::DataReaderQos (p. 848)

Status:

dds::core::status::StatusMask::data_available() (p. 2090);
dds::core::status::StatusMask::liveliness_changed() (p. 2090), **dds::core::status::LivelinessChanged**↔
Status (p. 1395);
dds::core::status::StatusMask::requested_deadline_missed() (p. 2087), **dds::core::status::Requested**↔
DeadlineMissedStatus (p. 1904);
dds::core::status::StatusMask::requested_incompatible_qos() (p. 2088), **dds::core::status::Requested**↔
IncompatibleQosStatus (p. 1905);
dds::core::status::StatusMask::sample_lost() (p. 2088), **dds::core::status::SampleLostStatus** (p. 2010);
dds::core::status::StatusMask::sample_rejected() (p. 2089), **dds::core::status::SampleRejectedStatus**
(p. 2022);
dds::core::status::StatusMask::subscription_matched() (p. 2091), **dds::core::status::Subscription**↔
MatchedStatus (p. 2144);

Listener:

dds::sub::DataReaderListener (p. 832)

A **dds::sub::DataReader** (p. 756) refers to exactly one TopicDescription (either a **dds::topic::Topic** (p. 2178), a **dds**↔
::topic::ContentFilteredTopic (p. 735) or a MultiTopic) that identifies the data to be read.

The subscription has a unique resulting type. The data-reader may give access to several instances of the resulting type, which can be distinguished from each other by their `key`.

The following operations may be called even if the **dds::sub::DataReader** (p. 756) is not enabled. Other operations will fail with the value **dds::core::NotEnabledError** (p. 1601) if called on a disabled **dds::sub::DataReader** (p. 756):

- **dds::sub::DataReader::qos(const dds::sub::qos::DataReaderQos&)** (p. 785), **dds::sub::DataReader::qos()**
const (p. 784), **dds::sub::DataReader::set_listener** (p. 783), **dds::sub::DataReader::get_listener** (p. 784),
dds::core::Entity::enable (p. 1269), **dds::core::cond::StatusCondition::StatusCondition(const dds::core**↔
::Entity&) (p. 2080), **dds::core::Entity::status_changes()** (p. 1270), **dds::sub::DataReader::liveliness**↔
changed_status (p. 788), **dds::sub::DataReader::requested_deadline_missed_status** (p. 788), **dds::sub**↔
::DataReader::requested_incompatible_qos_status (p. 789), **dds::sub::DataReader::sample_lost_status**
(p. 788), **dds::sub::DataReader::sample_rejected_status** (p. 788), **dds::sub::DataReader::subscription**↔
matched_status (p. 789)

All sample-accessing operations may fail with the exception `dds::core::PreconditionNotMetError` (p. 1669) as described in `dds::sub::CoherentAccess::CoherentAccess()` (p. 712).

DataReader Use Cases (p. 118)

Entity Use Cases (p. 126)

Examples

`Foo_subscriber.cxx`.

8.52.2 Constructor & Destructor Documentation

8.52.2.1 DataReader() [1/12]

```
template<typename T >
dds::sub::DataReader< T >::DataReader (
    const dds::sub::Subscriber & sub,
    const dds::topic::Topic< T > & topic ) [inline]
```

Create a **DataReader** (p. 756).

It uses the default `DataReaderQos`, and no listener.

Parameters

<i>sub</i>	the Subscriber (p. 2116) owning this DataReader (p. 756).
<i>topic</i>	the Topic associated with this DataReader (p. 756).

8.52.2.2 DataReader() [2/12]

```
template<typename T >
dds::sub::DataReader< T >::DataReader (
    const dds::sub::Subscriber & sub,
    const dds::topic::Topic< T > & topic,
    const dds::sub::qos::DataReaderQos & the_qos,
    dds::sub::DataReaderListener< T > * the_listener = NULL,
```

```

const dds::core::status::StatusMask & mask = dds::core::status::StatusMask::all() )
[inline]

```

Create a **DataReader** (p. 756).

[DEPRECATED] When using a listener, prefer the constructor that receives a `shared_ptr<Listener` (p. 1381)> instead of a regular `Listener*` pointer.

When a **DataReader** (p. 756) is created, only those transports already registered are available to the **DataReader** (p. 756). See **Built-in Transport Plugins** (p. 81) for details on when a builtin transport is registered.

MT Safety:

UNSAFE. If the `qos` parameter is omitted it is not safe to create the datareader while another thread may be simultaneously calling `dds::sub::Subscriber::default_datareader_qos(dds::sub::qos::DataReaderQos)`.

Precondition

If `sub` is enabled, the topic must be enabled. If it is not, this operation will fail and no **DataReader** (p. 756) will be created.

The given `dds::topic::Topic` (p. 2178) must have been created from the same participant as this subscriber. If it was created from a different participant no **DataReader** (p. 756) will be created.

Parameters

<i>sub</i>	the Subscriber (p. 2116) owning this DataReader (p. 756).
<i>topic</i>	the Topic associated with this DataReader (p. 756).
<i>the_qos</i>	the QoS settings for this DataReader (p. 756).
<i>the_listener</i>	the listener.
<i>mask</i>	the event mask associated to the DataReader (p. 756) listener.

listener() (p. 783)

8.52.2.3 DataReader() [3/12]

```

template<typename T >
dds::sub::DataReader< T >::DataReader (

```

```

const dds::sub::Subscriber & sub,
const dds::topic::Topic< T > & topic,
const dds::sub::qos::DataReaderQos & the_qos,
std::shared_ptr< Listener > the_listener,
const dds::core::status::StatusMask & mask = dds::core::status::StatusMask::all() )
[inline]

```

Create a **DataReader** (p. 756).

When a **DataReader** (p. 756) is created, only those transports already registered are available to the **DataReader** (p. 756). See **Built-in Transport Plugins** (p. 81) for details on when a builtin transport is registered.

MT Safety:

UNSAFE. If the qos parameter is omitted it is not safe to create the datareader while another thread may be simultaneously calling `dds::sub::Subscriber::default_datareader_qos(dds::sub::qos::DataReaderQos)`.

Precondition

If sub is enabled, the topic must be enabled. If it is not, this operation will fail and no **DataReader** (p. 756) will be created.

The given `dds::topic::Topic` (p. 2178) must have been created from the same participant as this subscriber. If it was created from a different participant no **DataReader** (p. 756) will be created.

Parameters

<i>sub</i>	the Subscriber (p. 2116) owning this DataReader (p. 756).
<i>topic</i>	the Topic associated with this DataReader (p. 756).
<i>the_qos</i>	the QoS settings for this DataReader (p. 756).
<i>the_listener</i>	A <code>shared_ptr</code> to the listener. See <code>set_listener()</code> (p. 783) for more information.
<i>mask</i>	Indicates which status updates the listener will receive

`dds::sub::qos::DataReaderQos::operator=(const dds::topic::qos::TopicQos&)` (p. 852) which allows assigning the contents of a TopicQos into a DataReaderQos

8.52.2.4 DataReader() [4/12]

```

template<typename T >
dds::sub::DataReader< T >::DataReader (

```

```

const dds::sub::Subscriber & sub,
const dds::topic::ContentFilteredTopic< T > & topic ) [inline]

```

Create a **DataReader** (p. 756) for a **dds::topic::ContentFilteredTopic** (p. 735).

This **DataReader** (p. 756) will only receive that data that matches the Filter associated with the ContentFilteredTopic. The QoS will be set to sub.default_datareader_qos().

Parameters

<i>sub</i>	the Subscriber (p. 2116) owning this DataReader (p. 756).
<i>topic</i>	the content filtered topic

8.52.2.5 DataReader() [5/12]

```

template<typename T >
dds::sub::DataReader< T >::DataReader (
    const dds::sub::Subscriber & sub,
    const dds::topic::ContentFilteredTopic< T > & topic,
    const dds::sub::qos::DataReaderQos & the_qos,
    dds::sub::DataReaderListener< T > * the_listener = NULL,
    const dds::core::status::StatusMask & mask = dds::core::status::StatusMask::all() )
[inline]

```

Create a **DataReader** (p. 756) for a **dds::topic::ContentFilteredTopic** (p. 735).

[DEPRECATED] When using a listener, prefer the constructor that receives a shared_ptr<**Listener** (p. 1381)> instead of a regular Listener* pointer.

This **DataReader** (p. 756) will only receive that data that mathes the Filter associated with the ContentFilteredTopic.

Parameters

<i>sub</i>	the subscriber owning this DataReader (p. 756).
<i>topic</i>	the content filtered topic.
<i>the_qos</i>	the QoS settings for this DataReader (p. 756).
<i>the_listener</i>	the listener.
<i>mask</i>	the event mask associated to the DataReader (p. 756) listener.

8.52.2.6 DataReader() [6/12]

```

template<typename T >
dds::sub::DataReader< T >::DataReader (

```

```

const dds::sub::Subscriber & sub,
const dds::topic::ContentFilteredTopic< T > & topic,
const dds::sub::qos::DataReaderQos & the_qos,
std::shared_ptr< Listener > the_listener,
const dds::core::status::StatusMask & mask = dds::core::status::StatusMask::all() )
[inline]

```

Create a **DataReader** (p. 756) for a **dds::topic::ContentFilteredTopic** (p. 735) with a listener.

This **DataReader** (p. 756) will only receive that data that matches the Filter associated with the ContentFilteredTopic.

Parameters

<i>sub</i>	the subscriber owning this DataReader (p. 756).
<i>topic</i>	the content filtered topic.
<i>the_qos</i>	the QoS settings for this DataReader (p. 756).
<i>the_listener</i>	the listener.
<i>mask</i>	the event mask associated to the DataReader (p. 756) listener.

8.52.2.7 DataReader() [7/12]

```

template<typename T >
dds::sub::DataReader< T >::DataReader (
    const dds::topic::Topic< T > & topic ) [inline], [explicit]

```

Create a **DataReader** (p. 756).

It uses default DataReaderQos, and no listener. The reader is created in the implicit subscriber (**rti::sub**↔
::implicit_subscriber (p. 541) (`topic.participant()`))

Parameters

<i>topic</i>	the Topic associated with this DataReader (p. 756).
--------------	--

8.52.2.8 DataReader() [8/12]

```

template<typename T >
dds::sub::DataReader< T >::DataReader (
    const dds::topic::Topic< T > & topic,
    const dds::sub::qos::DataReaderQos & the_qos ) [inline]

```

Create a **DataReader** (p. 756) with QoS.

The reader is created in the implicit subscriber.

Parameters

<i>topic</i>	the Topic associated with this DataReader (p. 756).
<i>the_qos</i>	the QoS settings for this DataReader (p. 756).

8.52.2.9 DataReader() [9/12]

```
template<typename T >
dds::sub::DataReader< T >::DataReader (
    const dds::topic::ContentFilteredTopic< T > & topic,
    const dds::sub::qos::DataReaderQos & the_qos ) [inline]
```

Create a **DataReader** (p. 756) for a **dds::topic::ContentFilteredTopic** (p. 735).

This **DataReader** (p. 756) will only receive that data that matches the Filter associated with the ContentFilteredTopic.

The reader is created in the implicit subscriber.

Parameters

<i>topic</i>	the content filtered topic.
<i>the_qos</i>	the QoS settings for this DataReader (p. 756).

8.52.2.10 DataReader() [10/12]

```
template<typename T >
dds::sub::DataReader< T >::DataReader (
    const dds::topic::Topic< T > & topic,
    const dds::sub::qos::DataReaderQos & the_qos,
    std::shared_ptr< Listener > the_listener,
    const dds::core::status::StatusMask & mask = dds::core::status::StatusMask::all() )
[inline]
```

Create a **DataReader** (p. 756).

When a **DataReader** (p. 756) is created, only those transports already registered are available to the **DataReader** (p. 756). See **Built-in Transport Plugins** (p. 81) for details on when a builtin transport is registered.

MT Safety:

UNSAFE. If the qos parameter is omitted it is not safe to create the datareader while another thread may be simultaneously calling `dds::sub::Subscriber::default_datareader_qos(dds::sub::qos::DataReaderQos)`.

The reader is created in the implicit subscriber (`rti::sub::implicit_subscriber` (p. 541) (`topic.↔ participant()`))

Parameters

<i>topic</i>	the Topic associated with this DataReader (p. 756).
<i>the_qos</i>	the QoS settings for this DataReader (p. 756).
<i>the_listener</i>	A shared_ptr to the listener. See set_listener() (p. 783) for more information.
<i>mask</i>	Indicates which status updates the listener will receive

8.52.2.11 DataReader() [11/12]

```
template<typename T >
dds::sub::DataReader< T >::DataReader (
    const dds::topic::ContentFilteredTopic< T > & topic ) [inline], [explicit]
```

Create a **DataReader** (p. 756) for a **dds::topic::ContentFilteredTopic** (p. 735).

This **DataReader** (p. 756) will only receive that data that matches the Filter associated with the ContentFilteredTopic. The QoS will be set to sub.default_datareader_qos().

The reader is created in the implicit subscriber.

Parameters

<i>topic</i>	the content filtered topic
--------------	----------------------------

8.52.2.12 DataReader() [12/12]

```
template<typename T >
dds::sub::DataReader< T >::DataReader (
    const dds::topic::ContentFilteredTopic< T > & topic,
    const dds::sub::qos::DataReaderQos & the_qos,
    std::shared_ptr< Listener > the_listener,
    const dds::core::status::StatusMask & mask = dds::core::status::StatusMask::all() )
[inline]
```

Create a **DataReader** (p. 756) for a **dds::topic::ContentFilteredTopic** (p. 735) with a listener.

This **DataReader** (p. 756) will only receive that data that matches the Filter associated with the ContentFilteredTopic.

The reader is created in the implicit subscriber.

Parameters

<i>topic</i>	the content filtered topic.
<i>the_qos</i>	the QoS settings for this DataReader (p. 756).
<i>the_listener</i>	the listener.
<i>mask</i>	the event mask associated to the DataReader (p. 756) listener.

8.52.3 Member Function Documentation

8.52.3.1 default_filter_state() [1/2]

```
template<typename T >
const dds::sub::status::DataState & dds::sub::DataReader< T >::default_filter_state ( ) [inline]
```

Returns the default state for read/take operations.

If left as default, it is set to **dds::sub::status::DataState::any()** (p. 894).

8.52.3.2 default_filter_state() [2/2]

```
template<typename T >
DataReader & dds::sub::DataReader< T >::default_filter_state (
    const dds::sub::status::DataState & state ) [inline]
```

Set the default state filter for read/take operations.

Parameters

<i>state</i>	the state mask that will be used to read/take samples.
--------------	--

8.52.3.3 operator>>() [1/4]

```
template<typename T >
DataReader & dds::sub::DataReader< T >::operator>> (
    dds::sub::LoanedSamples< T > & ls ) [inline]
```

Use the stream operator to take samples, placing them into a **LoanedSamples** (p. 1406) container.

For example:

```
reader » loaned_samples;
```

If you want to read samples, instead of take, you must use the stream manipulator **read(dds::sub::ReadModeDummyType)** (p. 801) and **operator>>(bool(*manipulator)(ReadModeDummyType))** (p. 1868))

For example:

```
reader » read » loaned_samples;
```

Parameters

<i>/s</i>	The LoanedSamples (p. 1406) container to put the taken samples into
-----------	--

See also

operator>>(bool(*manipulator)(ReadModeDummyType)) (p. 1868))

operator>>(Functor f) (p. 772)

Accessing Received Data (p. 119)

8.52.3.4 operator>>() [2/4]

```
template<typename T >
ManipulatorSelector dds::sub::DataReader< T >::operator>> (
    bool(*) ( ReadModeDummyType) manipulator ) [inline]
```

Use the stream operator to read or take samples.

The read and take manipulators are defined externally to make it possible to control whether the stream operators reads or takes.

This stream operator can be chained together with **operator>>(Functor f)** (p. 772) to set other various properties of the read/take operation.

It is used as follows:

```
dr » read » loanedSamples;
dr » take » loanedSamples;
```

If either the read or take manipulator is not passed into the stream, the default behavior is to take.

Parameters

<i>manipulator</i>	Either read or take
--------------------	---------------------

See also

- operator>>(Functor f)** (p. 772)
- operator>>(dds::sub::LoanedSamples<T>& ls)** (p. 770)
- ReadModeDummyType** (p. 1868)
- Accessing Received Data** (p. 119)

8.52.3.5 operator>>() [3/4]

```
template<typename T >
template<typename Functor >
ManipulatorSelector dds::sub::DataReader< T >::operator>> (
    Functor f ) [inline]
```

Use the stream operator to dictate the behavior of the read or take operation.

There are a number of pre-defined stream manipulators (functions which return a functor that will be used by the stream operator). They dictate how the samples will be read or taken:

- `max_samples`: Read/Take up to a maximum number of samples
- `content`: Read/Take using a **Query** (p. 1778)
- `condition`: Read/Take using a **dds::sub::cond::ReadCondition** (p. 1858)
- `state`: Read/Take only samples with a specific `DataState`
- `instance`: Read/Take a specific instance
- `next_instance`: Read/Take the next instance after a specified instance

For example, to read up to 10 samples that have not been read before:

```
dr >> read
  >> max_samples(10)
  >> state(DataState::new_data())
  >> loanedSamples;
```

Parameters

<i>f</i>	Each of the stream manipulators listed above return a Functor that will be passed to the stream operator. These Functors do not need to be accessed by the user directly. They should instead be passed indirectly via the return value of one of the provided stream manipulators.

8.52.3.6 read() [1/5]

```
template<typename T >
LoanedSamples< T > dds::sub::DataReader< T >::read ( ) [inline]
```

Read all samples using the default filter state.

This operation offers the same functionality and API as **dds::sub::DataReader::take** (p. 774) except that the samples returned remain in the **dds::sub::DataReader** (p. 756) such that they can be retrieved again by means of a read or take operation.

Please refer to the documentation of **dds::sub::DataReader::take** (p. 774) for details on the number of samples returned as well as the order in which the samples appear in these sequences.

The act of reading a sample changes its `sample_state` to **dds::sub::status::SampleState::read()** (p. 2025). If the sample belongs to the most recent generation of the instance, it will also set the `view_state` of the instance to be **dds::sub::status::ViewState::not_new_view()** (p. 2317). It will not affect the `instance_state` of the instance.

Once the application completes its use of the samples, it must 'return the loan' to the **dds::sub::DataReader** (p. 756). This can be done explicitly by calling the **dds::sub::LoanedSamples::return_loan()** (p. 1410) operation or implicitly by the **dds::sub::LoanedSamples** (p. 1406) destructor.

Important: When you loan data from the middleware, you *must not* keep any pointers to any part of the data samples or the **dds::sub::SampleInfo** (p. 1992) objects after the call to **dds::sub::LoanedSamples::return_loan()** (p. 1410). Returning the loan places the objects back into a pool, allowing the middleware to overwrite them with new data.

Note: While the loan must be returned at some point, you do *not* have to do so before the next **dds::sub::DataReader::take** (p. 774) call. However, failure to return the loan will eventually deplete the **dds::sub::DataReader** (p. 756) of the buffers it needs to receive new samples and eventually samples will start to be lost. The total number of buffers available to the **dds::sub::DataReader** (p. 756) is specified by the **dds::core::policy::ResourceLimits** (p. 1921) and the **rti::core::policy::DataReaderResourceLimits** (p. 856).

Important: If the samples "returned" by this method are loaned from RTI Connex (see **dds::sub::DataReader::take** (p. 774) for more information on memory loaning), it is important that their contents not be changed. Because the memory in which the data is stored belongs to the middleware, any modifications made to the data will be seen the next time the same samples are read or taken; the samples will no longer reflect the state that was received from the network.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), dds::core::PreconditionNotMetError (p. 1669), dds::core::NotEnabledError (p. 1601).
------------	---

See also

dds::sub::DataReader::take (p. 774)

Accessing Received Data (p. 119)

select() (p. 780)

8.52.3.7 take() [1/5]

```
template<typename T >
LoanedSamples< T > dds::sub::DataReader< T >::take ( ) [inline]
```

Take all samples using the default filter state.

The operation will return the list of samples received by the **dds::sub::DataReader** (p. 756) since the last **dds::sub::DataReader::take** (p. 774) operation that matches the specified `SampleStateMask`, `ViewStateMask` and `InstanceStateMask`.

This operation may fail with **dds::core::Error** (p. 1284) if the **rti::core::policy::DataReaderResourceLimits::max_outstanding_reads** (p. 864) limit has been exceeded.

The actual number of samples returned depends on the information that has been received by the middleware as well as the **dds::core::policy::History** (p. 1346), **dds::core::policy::ResourceLimits** (p. 1921), **rti::core::policy::DataReaderResourceLimits** (p. 856) and the characteristics of the data-type that is associated with the **dds::sub::DataReader** (p. 756):

- In the case where the **dds::core::policy::History::kind** (p. 1348) is `dds::core::policy::HistoryKind::KEEP_LAST`, the call will return at most **dds::core::policy::History::depth** (p. 1349) samples for each `ALIVE` instance and **(dds::core::policy::History::depth + 1)** samples for each `NOT_ALIVE` instance. The extra sample is an invalid sample (**dds::sub::SampleInfo::valid** (p. 1996) is `FALSE`) that is used to indicate the instance state transition from `ALIVE` to `NOT_ALIVE`.
- The maximum number of samples returned is limited by **dds::core::policy::ResourceLimits::max_samples** (p. 1924), and by **rti::core::policy::DataReaderResourceLimits::max_samples_per_read** (p. 865).
- For multiple instances, the number of samples returned is additionally limited by the product (**dds::core::policy::ResourceLimits::max_samples_per_instance** (p. 1925)
 - **dds::core::policy::ResourceLimits::max_instances** (p. 1924))
- If **rti::core::policy::DataReaderResourceLimits::max_infos** (p. 862) is limited, the number of samples returned may also be limited if insufficient **dds::sub::SampleInfo** (p. 1992) resources are available.

If the `read` or `take` succeeds and the number of samples returned has been limited (by means of a maximum limit, as listed above, or insufficient `dds::sub::SampleInfo` (p. 1992) resources), the call will complete successfully and provide those samples the reader is able to return. The user may need to make additional calls, or return outstanding loaned buffers in the case of insufficient resources, in order to access remaining samples.

Note that in the case where the `dds::topic::Topic` (p. 2178) associated with the `dds::sub::DataReader` (p. 756) is bound to a data-type that has no key definition, then there will be at most one instance in the `dds::sub::DataReader` (p. 756). So the per-sample limits will apply.

The act of *taking* a sample removes it from RTI Connex so it cannot be read or taken again. If the sample belongs to the most recent generation of the instance, it will also set the `view_state` of the sample's instance to `dds::sub::status::ViewState::not_new_view()` (p. 2317). It will not affect the `instance_state` of the sample's instance.

Once the application completes its use of the samples it must 'return the loan' to the `dds::sub::DataReader` (p. 756) by calling the `dds::sub::LoanedSamples::return_loan()` (p. 1410) operation. The `dds::sub::LoanedSamples` (p. 1406) destructor also takes care of returning the loan for you, so calling `dds::sub::LoanedSamples::return_loan()` (p. 1410) explicitly is not required.

Important: When you loan data from the middleware, you *must not* keep any pointers to any part of the data samples or the `dds::sub::SampleInfo` (p. 1992) objects after the call to `dds::sub::LoanedSamples::return_loan()` (p. 1410). Returning the loan places the objects back into a pool, allowing the middleware to overwrite them with new data.

Note: While you must call `dds::sub::LoanedSamples::return_loan()` (p. 1410) at some point, you do *not* have to do so before the next `dds::sub::DataReader::take` (p. 774) call. However, failure to return the loan will eventually deplete the `dds::sub::DataReader` (p. 756) of the buffers it needs to receive new samples and eventually samples will start to be lost. The total number of buffers available to the `dds::sub::DataReader` (p. 756) is specified by the `dds::core::policy::ResourceLimits` (p. 1921) and the `rti::core::policy::DataReaderResourceLimits` (p. 856).

To copy samples from the reader instead of taking a loan, you can use any of the `read` or `take` operations that receive an iterator to a container in which to copy the samples:

- `read(SamplesFWIterator sfit, int32_t max_samples)` (p. 777)
- `take(SamplesFWIterator sfit, int32_t max_samples)` (p. 778)
- `read(SamplesBIIterator sbit)` (p. 778)
- `take(SamplesBIIterator sbit)` (p. 779)

The order of the samples returned to the caller depends on the `dds::core::policy::Presentation` (p. 1670).

- If `dds::core::policy::Presentation::access_scope` (p. 1674) is `dds::core::policy::PresentationAccessScopeKind_def::INSTANCE` (p. 1677), the returned collection is a list where samples belonging to the same data instance are consecutive.
- If `dds::core::policy::Presentation::access_scope` (p. 1674) is `dds::core::policy::PresentationAccessScopeKind_def::TOPIC` (p. 1677) and `dds::core::policy::Presentation::ordered_access` (p. 1675) is set to false, then the returned collection is a list where samples belonging to the same data instance are consecutive.

- If `dds::core::policy::Presentation::access_scope` (p.1674) is `dds::core::policy::PresentationAccessScopeKind_def::TOPIC` (p.1677) and `dds::core::policy::Presentation::ordered_access` (p.1675) is set to true, then the returned collection is a list where the relative order of samples as they were written by a `DataWriter` is preserved also across different instances. In other words, changes made by a single `DataWriter` are made available to subscribers in the same order in which they occur. Samples belonging to the same instance may or may not be consecutive. This is because, to preserve order within a single `DataWriter`, it may be necessary to mix samples from different instances.
- If `dds::core::policy::Presentation::access_scope` (p.1674) is `dds::core::policy::PresentationAccessScopeKind_def::GROUP` (p.1677) and `dds::core::policy::Presentation::ordered_access` (p.1675) is set to false, then the returned collection is a list where samples belonging to the same data instance are consecutive.
- If `dds::core::policy::Presentation::access_scope` (p.1674) is `dds::core::policy::PresentationAccessScopeKind_def::GROUP` (p.1677) and `dds::core::policy::Presentation::ordered_access` (p.1675) is set to true, then changes made to instances by a set of `DataWriters` attached to a common `Publisher` are made available in the order in which they were written. For this to happen, the application must take the samples using the `Subscriber` (p.2116)'s `dds::sub::CoherentAccess::CoherentAccess()` (p.712) and `dds::sub::CoherentAccess::end()` (p.714) operations (see the "Ordered Access" section in the "PRESENTATION QosPolicy" section of the `Core Libraries User's Manual`).

In all of the above cases, the relative order between the samples of one instance is consistent with the `DESTINATION_ORDER` (p.316) policy:

- If `dds::core::policy::DestinationOrder::kind` (p.1025) is `dds::core::policy::DestinationOrderKind::BY_RECEPTION_TIMESTAMP`, samples belonging to the same instances will appear in the relative order in which there were received (FIFO, earlier samples ahead of the later samples).
- If `dds::core::policy::DestinationOrder::kind` (p.1025) is `dds::core::policy::DestinationOrderKind::BY_SOURCE_TIMESTAMP`, samples belonging to the same instances will appear in the relative order implied by the `source_timestamp` (FIFO, smaller values of `source_timestamp` ahead of the larger values).

In addition to the collection of samples, the read and take operations also use a collection of `dds::sub::SampleInfo` (p.1992) structures.

Some elements in the returned collection may not have valid data. If the `instance_state` in the `dds::sub::SampleInfo` (p.1992) is `dds::sub::status::InstanceState::not_alive_disposed()` (p.1361) or `dds::sub::status::InstanceState::not_alive_no_writers()` (p.1361), then the last sample for that instance in the collection (that is, the one whose `dds::sub::SampleInfo` (p.1992) has `sample_rank==0`) does not contain valid data.

Samples that contain no data do not count towards the limits imposed by the `dds::core::policy::ResourceLimits` (p.1921). The act of reading/taking a sample sets its `sample_state` to `dds::sub::status::SampleState::read()` (p.2025).

If the sample belongs to the most recent generation of the instance, it will also set the `view_state` of the instance to `dds::sub::status::ViewState::not_new_view()` (p.2317). It will not affect the `instance_state` of the instance.

For an example on how `take` can be used, please refer to the **Accessing Received Data** (p.119) "receive example".

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), dds::core::PreconditionNotMetError (p. 1669), dds::core::NotEnabledError (p. 1601).
------------	---

See also

dds::sub::DataReader::read (p. 773)

Accessing Received Data (p. 119)

select() (p. 780)

Examples

Foo_subscriber.cxx.

8.52.3.8 read() [2/5]

```
template<typename T >
template<typename SamplesFWIterator >
uint32_t dds::sub::DataReader< T >::read (
    SamplesFWIterator sfit,
    int32_t max_samples ) [inline]
```

Read up to *max_samples* samples using the default filter state.

The samples are copied into the application provided container using the forward iterator parameter.

Template Parameters

<i>SamplesFWIterator</i>	A forward iterator whose value type is dds::sub::Sample<T>
--------------------------	--

Parameters

<i>sfit</i>	samples forward iterator
<i>max_samples</i>	the maximum number of samples to read

Returns

uint32_t the number of read samples.

See also

read() (p. 773)

Accessing Received Data (p. 119)

8.52.3.9 take() [2/5]

```
template<typename T >
template<typename SamplesFWIterator >
uint32_t dds::sub::DataReader< T >::take (
    SamplesFWIterator sfit,
    int32_t max_samples ) [inline]
```

Take up to `max_samples` samples using the default filter state.

The samples are copied into the application provided container using the forward iterator parameter.

Template Parameters

<i>SamplesFWIterator</i>	A forward iterator whose value type is <code>dds::sub::Sample<T></code>
--------------------------	---

Parameters

<i>sfit</i>	samples forward iterator.
<i>max_samples</i>	the maximum number of samples to take.

Returns

`uint32_t` The number of taken samples.

See also

take() (p. 774)

Accessing Received Data (p. 119)

8.52.3.10 read() [3/5]

```
template<typename T >
template<typename SamplesBIIterator >
uint32_t dds::sub::DataReader< T >::read (
    SamplesBIIterator sbit ) [inline]
```

Read all samples available in the reader cache using the default filter state.

The samples are copied into the application provided container using a back-inserting iterator. Notice that as a consequence of using a back-inserting iterator, this operation may allocate memory to resize the underlying container.

Template Parameters

<i>SamplesBIIterator</i>	A back-inserting iterator whose value type is dds::sub::Sample<T>.
--------------------------	--

Parameters

<i>sbit</i>	samples back-inserting iterator.
-------------	----------------------------------

Returns

uint32_t the number of read samples.

For example:

```
std::vector<Foo> samples;
// inserts copies of all available samples at the end of 'samples'
uint32_t count = reader.read(std::back_inserter(samples));
assert(count == samples.size());
```

Note

This function should not be confused with **read(T& sample)** (p. 795), an extension function that reads a single sample and assigns it to the argument.

See also

read() (p. 773)

Accessing Received Data (p. 119)

8.52.3.11 take() [3/5]

```
template<typename T >
template<typename SamplesBIIterator >
uint32_t dds::sub::DataReader< T >::take (
    SamplesBIIterator sbit ) [inline]
```

Take all samples available in the reader cache samples using the default filter state.

The samples are copied into the application provided container using a back-inserting iterator. Notice that as a consequence of using a back-inserting iterator, this operation may allocate memory to resize the underlying container.

Template Parameters

<i>SamplesBIIterator</i>	A back-inserting iterator whose value type is dds::sub::Sample<T>
--------------------------	---

Parameters

<i>sbit</i>	samples back-inserting iterator.
-------------	----------------------------------

Returns

the number of taken samples.

Note

This function should not be confused with **take(T& sample)** (p. 797), an extension function that takes a single sample and assigns it to the argument.

See also

take() (p. 774)

Accessing Received Data (p. 119)

8.52.3.12 select()

```
template<typename T >
Selector dds::sub::DataReader< T >::select ( ) [inline]
```

Get a **Selector** (p. 2027) to perform complex data selections, such as per-instance selection, content and status filtering.

The selector can be used as follows:

```
LoanedSamples<Foo> samples = reader.select()
    .instance(handle)
    .content(query)
    .state(state)
    .take();
```

This shows how samples can be taken by selecting a specific instance, then filtering by state and content.

Note that when the application wants to access all available samples it can simply call **DataReader::read()** (p. 773) or **DataReader::take()** (p. 774).

Returns

A **Selector** (p. 2027), typically used in-line to configure it and finally call **Selector::read()** (p. 2032) or **Selector::take()** (p. 2033).

See also

Selector (p. 2027), for the different **parameters** (p. 1787) that can be set to configure what samples to **read** (p. 773) or **take** (p. 774).

Selecting what samples to read (p. 120)

8.52.3.13 key_value() [1/2]

```
template<typename T >
T & dds::sub::DataReader< T >::key_value (
    T & key_holder,
    const dds::core::InstanceHandle & handle ) [inline]
```

Retrieve the instance key that corresponds to an instance handle.

Useful for keyed data types.

The operation will only fill the fields that form the key inside the `key_holder` instance.

For keyed data types, this operation may fail with **dds::core::InvalidArgumentError** (p. 1363) if the `handle` does not correspond to an existing data-object known to the **DataReader** (p. 756).

Parameters

<i>key_holder</i>	A user data type specific key holder of type T whose key fields are filled by this operation. If T has no key, this operation has no effect.
<i>handle</i>	The instance whose key is to be retrieved. If T has a key, <code>handle</code> must represent an existing instance of type T known to the DataReader (p. 756). Otherwise, this method will fail with dds::core::InvalidArgumentError (p. 1363). If T has a key and <code>handle</code> is dds::core::InstanceHandle::nil() (p. 1358), this method will fail with dds::core::InvalidArgumentError (p. 1363). If T has a key and <code>handle</code> represents an instance of another type or an instance of type T that has been unregistered, this method will fail with dds::core::InvalidArgumentError (p. 1363). If T has no key, this method has no effect.

8.52.3.14 key_value() [2/2]

```
template<typename T >
dds::topic::TopicInstance< T > & dds::sub::DataReader< T >::key_value (
    dds::topic::TopicInstance< T > & key_holder,
    const dds::core::InstanceHandle & handle ) [inline]
```

Retrieve the instance key that corresponds to an instance handle.

Useful for keyed data types.

The operation will only fill the fields that form the key inside the `key_holder` instance.

For keyed data types, this operation may fail with **dds::core::InvalidArgumentError** (p. 1363) if the `handle` does not correspond to an existing data-object known to the **DataReader** (p. 756).

Parameters

<i>key_holder</i>	A TopicInstance whose sample's key fields are filled by this operation. If T does not have a key, this method has no effect.
-------------------	--

Parameters

<i>handle</i>	The instance whose key is to be retrieved. If T has a key, <i>handle</i> must represent an existing instance of type T known to the DataReader (p. 756). Otherwise, this method will fail with dds::core::InvalidArgumentError (p. 1363). If T has a key and <i>handle</i> is dds::core::InstanceHandle::nil() (p. 1358), this method will fail with dds::core::InvalidArgumentError (p. 1363). If T has a key and <i>handle</i> represents an instance of another type or an instance of type T that has been unregistered, this method will fail with dds::core::InvalidArgumentError (p. 1363). If T has no key, this method has no effect.
---------------	---

8.52.3.15 lookup_instance()

```
template<typename T >
dds::core::InstanceHandle dds::sub::DataReader< T >::lookup_instance (
    const T & key_holder ) const [inline]
```

Retrieve the InstanceHandle that corresponds to an instance key holder.

Useful for keyed data types.

This operation takes as a parameter an instance and returns a handle that can be used in subsequent operations that accept an instance handle as an argument. The instance parameter is only used for the purpose of examining the fields that define the key. If the instance is unknown to the **DataReader** (p. 756), or if for any other reason the Service is unable to provide an instance handle, the Service will return the special value **dds::core::InstanceHandle::nil()** (p. 1358).

Parameters

<i>key_holder</i>	<< <i>in</i> >> (p. 157) a user data type specific key holder.
-------------------	--

Returns

the instance handle associated with this instance. If T has no key, this method has no effect and returns **dds::core::InstanceHandle::nil()** (p. 1358)

8.52.3.16 topic_description()

```
template<typename T >
dds::topic::TopicDescription< DataType > dds::sub::DataReader< T >::topic_description ( ) const
[inline]
```

Returns the **dds::topic::TopicDescription** (p. 2207) associated with the **DataReader** (p. 756).

Returns that same TopicDescription that was used to create the **dds::sub::DataReader** (p. 756).

Returns

TopicDescription associated with the **dds::sub::DataReader** (p. 756).

8.52.3.17 subscriber()

```
template<typename T >
const dds::sub::Subscriber & dds::sub::DataReader< T >::subscriber ( ) const [inline]
```

Returns the **Subscriber** (p. 2116) to which the **DataReader** (p. 756) belongs.

8.52.3.18 listener() [1/2]

```
template<typename T >
void dds::sub::DataReader< T >::listener (
    Listener * the_listener,
    const dds::core::status::StatusMask & event_mask ) [inline]
```

Sets the listener associated with this reader.

[DEPRECATED] The use of **set_listener()** (p. 783) is recommended. Unlike this function, **set_listener** receives a **shared_ptr** which simplifies the management of listener's lifecycle.

Parameters

<i>the_listener</i>	The DataReaderListener (p. 832) to set
<i>event_mask</i>	The dds::core::status::StatusMask (p. 2082) associated with the listener

8.52.3.19 listener() [2/2]

```
template<typename T >
Listener * dds::sub::DataReader< T >::listener ( ) const [inline]
```

Returns the listener currently associated with this **DataReader** (p. 756).

[DEPRECATED] Prefer **get_listener()** (p. 784) instead of this function.

If there's no listener it returns NULL.

8.52.3.20 set_listener() [1/2]

```
template<typename T >
void dds::sub::DataReader< T >::set_listener (
    std::shared_ptr< Listener > the_listener,
    const dds::core::status::StatusMask & event_mask ) [inline]
```

Sets the listener associated with this reader.

The **DataReader** (p. 756) will hold a **shared_ptr** to the listener argument, ensuring that it is not deleted at least until this **DataReader** (p. 756) is deleted or the listener is reset with **set_listener(nullptr)**.

Warning

It's recommended that the listener implementation doesn't hold a permanent reference to the reader. If it does, the application needs to manually reset the listener or manually close this **DataReader** (p. 756) to ensure that there is no cycle that prevents the destruction of these two objects.

Parameters

<i>the_listener</i>	A shared pointer to the listener to receive status updates or <code>nullptr</code> to reset the current listener and stop receiving status updates.
<i>event_mask</i>	A mask that indicates which status updates will be notified to the listener

8.52.3.21 set_listener() [2/2]

```
template<typename T >
void dds::sub::DataReader< T >::set_listener (
    std::shared_ptr< Listener > the_listener ) [inline]
```

Sets the listener associated with this reader.

If *the_listener* is not `nullptr`, this overload is equivalent to:

```
reader.set_listener(the_listener, dds::core::status::StatusMask::all());
```

If *the_listener* is `nullptr`, it is equivalent to:

```
reader.set_listener(nullptr, dds::core::status::StatusMask::none());
```

Parameters

<i>the_listener</i>	A shared pointer to the listener to receive status updates or <code>nullptr</code> to reset the current listener and stop receiving status updates.
---------------------	---

8.52.3.22 get_listener()

```
template<typename T >
std::shared_ptr< Listener > dds::sub::DataReader< T >::get_listener ( ) const [inline]
```

Returns the listener currently associated with this **DataReader** (p. 756).

Returns

The shared pointer to the current listener or `nullptr` if there is currently no listener associated to this entity.

8.52.3.23 qos() [1/2]

```
template<typename T >
const dds::sub::qos::DataReaderQos dds::sub::DataReader< T >::qos ( ) const [inline]
```

Get the QoS associated with this reader.

8.52.3.24 qos() [2/2]

```
template<typename T >
void dds::sub::DataReader< T >::qos (
    const dds::sub::qos::DataReaderQos & the_qos ) [inline]
```

Set the QoS associated with this reader.

This operation modifies the QoS of the **DataReader** (p. 756).

The **dds::core::policy::UserData** (p. 2292), **dds::core::policy::Deadline** (p. 1020), **dds::core::policy::Latency↔Budget** (p. 1375), **dds::core::policy::TimeBasedFilter** (p. 2174), **dds::core::policy::ReaderDataLifecycle** (p. 1862) can be changed. The other policies are immutable.

Parameters

<i>the_qos</i>	The DataReaderQos to be set to. Policies must be consistent. Immutable policies cannot be changed after the DataReader (p. 756) is enabled. dds::sub::Subscriber::default_datareader_qos() (p. 2123) can be used to set the QoS of the DataReader (p. 756) to match the current default DataReaderQos set in the Subscriber (p. 2116).
----------------	--

Exceptions

dds::core::ImmutablePolicyError (p. 1353), or	dds::core::InconsistentPolicyError (p. 1354),.
--	---

See also

- dds::sub::qos::DataReaderQos** (p. 848) for rules on consistency among QoS
- set_qos (abstract)** (p. 1267)
- Operations Allowed in Listener Callbacks** (p. 1383)

8.52.3.25 operator<<()

```
template<typename T >
DataReader & dds::sub::DataReader< T >::operator<< (
    const dds::sub::qos::DataReaderQos & the_qos ) [inline]
```

Set the QoS associated with this reader.

Parameters

<i>the_qos</i>	the new qos for this DataReader (p. 756).
----------------	--

See also

qos(const dds::sub::qos::DataReaderQos& qos) (p. 785)

8.52.3.26 operator>>() [4/4]

```
template<typename T >
DataReader & dds::sub::DataReader< T >::operator>> (
    dds::sub::qos::DataReaderQos & the_qos ) [inline]
```

Get the QoS associated with this reader.

Parameters

<i>the_qos</i>	the object to populate with the qos for this DataWriter.
----------------	--

See also

qos() (p. 784)

8.52.3.27 wait_for_historical_data()

```
template<typename T >
void dds::sub::DataReader< T >::wait_for_historical_data (
    const dds::core::Duration & max_wait ) [inline]
```

Waits until all "historical" data is received for DataReaders that have a non-VOLATILE Durability Qos kind.

This operation is intended only for **dds::sub::DataReader** (p. 756) entities that have a non-VOLATILE Durability QoS kind.

As soon as an application enables a non-VOLATILE **dds::sub::DataReader** (p. 756), it will start receiving both "historical" data (i.e., the data that was written prior to the time the **dds::sub::DataReader** (p. 756) joined the domain) as well as any new data written by the **dds::pub::DataWriter** (p. 908) entities. There are situations where the application logic may require the application to wait until all "historical" data is received. This is the purpose of the **dds::sub::Data↔Reader::wait_for_historical_data** (p. 786) operations.

dds::sub::DataReader::wait_for_historical_data() (p. 786) blocks the calling thread until either all "historical" data is received, or until the duration specified by the *max_wait* parameter elapses, whichever happens first. It will return

immediately if no DataWriters have been discovered at the time the operation is called; therefore it is advisable to make sure at least one `dds::pub::DataWriter` (p. 908) has been discovered before calling this operation. (One way to do this is by using `dds::sub::DataReader::subscription_matched_status` (p. 789).)

A successful completion indicates that all the "historical" data was "received"; timing out indicates that `max_wait` elapsed before all the data was received.

Parameters

<code>max_wait</code>	<< <i>in</i> >> (p. 157) Timeout value.
-----------------------	---

Exceptions

<i>One</i>	of the Standard Exceptions (p.228), dds::core::TimeoutError (p. 2177) or dds::core::NotEnabledError (p. 1601).
------------	---

8.52.3.28 liveliness_changed_status()

```
template<typename T >
dds::core::status::LivelinessChangedStatus dds::sub::DataReader< T >::liveliness_changed_status
( ) const [inline]
```

Get the LivelinessChangedStatus for this **DataReader** (p. 756).

See also

dds::core::status::LivelinessChangedStatus (p. 1395)

8.52.3.29 sample_rejected_status()

```
template<typename T >
dds::core::status::SampleRejectedStatus dds::sub::DataReader< T >::sample_rejected_status ( )
const [inline]
```

Get the SampleRejectedStatus for this **DataReader** (p. 756).

See also

dds::core::status::SampleRejectedStatus (p. 2022)

8.52.3.30 sample_lost_status()

```
template<typename T >
dds::core::status::SampleLostStatus dds::sub::DataReader< T >::sample_lost_status ( ) const
[inline]
```

Get the SampleLostStatus for this **DataReader** (p. 756).

See also

dds::core::status::SampleLostStatus (p. 2010)

8.52.3.31 requested_deadline_missed_status()

```
template<typename T >
dds::core::status::RequestedDeadlineMissedStatus dds::sub::DataReader< T >::requested_deadline↔
_missed_status ( ) [inline]
```

Get the RequestedDeadlineMissedStatus for this **DataReader** (p. 756).

See also

dds::core::status::RequestedDeadlineMissedStatus (p. 1904)

8.52.3.32 requested_incompatible_qos_status()

```
template<typename T >
dds::core::status::RequestedIncompatibleQosStatus dds::sub::DataReader< T >::requested_incompatible↔
_qos_status ( ) const [inline]
```

Get the RequestedIncompatibleQosStatus for this **DataReader** (p. 756).

See also

dds::core::status::RequestedIncompatibleQosStatus (p. 1905)

8.52.3.33 subscription_matched_status()

```
template<typename T >
dds::core::status::SubscriptionMatchedStatus dds::sub::DataReader< T >::subscription_matched↔
status ( ) const [inline]
```

Get the SubscriptionMatchedStatus for this **DataReader** (p. 756).

See also

dds::core::status::SubscriptionMatchedStatus (p. 2144)

8.52.3.34 `datareader_cache_status()`

```
template<typename T >  
rti::core::status::DataReaderCacheStatus datareader_cache_status ( ) const
```

<<*extension*>> (p. 156) Get the `DataReaderCacheStatus` for this **DataReader** (p. 756)

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

See also

rti::core::status::DataReaderCacheStatus (p. 823)

8.52.3.35 `datareader_protocol_status()`

```
template<typename T >  
rti::core::status::DataReaderProtocolStatus datareader_protocol_status ( ) const
```

<<*extension*>> (p. 156) Get the `DataReaderProtocolStatus` for this **DataReader** (p. 756)

This function is an extension, it must be called via the **extensions() member function** (p. 156)

See also

rti::core::status::DataReaderProtocolStatus (p. 841)

8.52.3.37 acknowledge_all() [1/2]

```
template<typename T >
void acknowledge_all ( )
```

<<**extension**>> (p. 156) Acknowledge all previously accessed samples

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

Applicable only when **dds::core::policy::Reliability::acknowledgment_kind** (p. 1878) = **rti::core::policy::← AcknowledgmentKind_def::APPLICATION_EXPLICIT** (p. 586)

A call to this method does not necessarily trigger the sending of an AppAck RTPS message from the **Data← Reader** (p. 756) to the DataWriter. How and when AppAck messages are sent can be configured using the QoS values **rti::core::RtpsReliableReaderProtocol::samples_per_app_ack** (p. 1940) and **rti::core::RtpsReliableReader← Protocol::app_ack_period** (p. 1939).

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

8.52.3.38 acknowledge_all() [2/2]

```
template<typename T >
void acknowledge_all (
    const AckResponseData & response_data )
```

<<**extension**>> (p. 156) Acknowledge all previously accessed samples

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

Applicable only when **dds::core::policy::Reliability::acknowledgment_kind** (p. 1878) = **rti::core::policy::← AcknowledgmentKind_def::APPLICATION_EXPLICIT** (p. 586)

A call to this method does not necessarily trigger the sending of an AppAck RTPS message from the **Data← Reader** (p. 756) to the DataWriter. How and when AppAck messages are sent can be configured using the QoS values **rti::core::RtpsReliableReaderProtocol::samples_per_app_ack** (p. 1940) and **rti::core::RtpsReliableReader← Protocol::app_ack_period** (p. 1939).

The maximum length of the response is configured using **rti::core::policy::DataReaderResourceLimits::max_app← _ack_response_length** (p. 873).

Parameters

<i>response_data</i>	<< <i>in</i> >> (p. 157) Response data sent to dds::pub::DataWriter (p. 908) upon acknowledgment
----------------------	---

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

8.52.3.39 acknowledge_sample() [1/2]

```
template<typename T >
void acknowledge_sample (
    const dds::sub::SampleInfo & sample_info )
```

<<**extension**>> (p. 156) Acknowledge a single sample explicitly

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

Applicable only when **dds::core::policy::Reliability::acknowledgment_kind** (p. 1878) = **rti::core::policy::↔AcknowledgmentKind_def::APPLICATION_EXPLICIT** (p. 586)

A call to this method does not necessarily trigger the sending of an AppAck RTPS message from the **Data↔Reader** (p. 756) to the DataWriter. How and when AppAck messages are sent can be configured using the QoS values **rti::core::RtpsReliableReaderProtocol::samples_per_app_ack** (p. 1940) and **rti::core::RtpsReliableReader↔Protocol::app_ack_period** (p. 1939).

Parameters

<i>sample_info</i>	<< <i>in</i> >> (p. 157) dds::sub::SampleInfo (p. 1992) identifying the sample being acknowledged.
--------------------	---

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

8.52.3.40 acknowledge_sample() [2/2]

```
template<typename T >
void acknowledge_sample (
```

```
const dds::sub::SampleInfo & sample_info,
const AckResponseData & response_data )
```

<<*extension*>> (p. 156) Acknowledge a single sample explicitly

Note

This function is an extension, it must be called via the **extensions()** member function (p. 156)

Applicable only when **dds::core::policy::Reliability::acknowledgment_kind** (p. 1878) = **rti::core::policy::AcknowledgeKind_def::APPLICATION_EXPLICIT** (p. 586)

A call to this method does not necessarily trigger the sending of an AppAck RTPS message from the **DataReader** (p. 756) to the DataWriter. How and when AppAck messages are sent can be configured using the QoS values **rti::core::RtpsReliableReaderProtocol::samples_per_app_ack** (p. 1940) and **rti::core::RtpsReliableReaderProtocol::app_ack_period** (p. 1939).

The maximum length of the response is configured using **rti::core::policy::DataReaderResourceLimits::max_app_ack_response_length** (p. 873)

Parameters

<i>sample_info</i>	<< <i>in</i> >> (p. 157) dds::sub::SampleInfo (p. 1992) identifying the sample being acknowledged.
<i>response_data</i>	<< <i>in</i> >> (p. 157) Response data sent to dds::pub::DataWriter (p. 908) upon acknowledgment (via dds::pub::DataWriterListener::on_application_acknowledgment (p. 977))

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

8.52.3.41 close_contained_entities()

```
template<typename T >
void close_contained_entities ( )
```

<<*extension*>> (p. 156) Closes all the entities created from this **DataReader** (p. 756)

Note

Calling this function explicitly is not necessary to close a **DataReader** (p. 756).

Deletes all contained **dds::sub::cond::ReadCondition** (p. 1858), **dds::sub::cond::QueryCondition** (p. 1784), and **rti::sub::TopicQuery** (p. 2220) objects.

The operation will fail with **dds::core::PreconditionNotMetError** (p. 1669) if the any of the contained entities is in a state where it cannot be deleted.

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Exceptions

One	of the Standard Exceptions (p. 228), or dds::core::PreconditionNotMetError (p. 1669)
-----	--

8.52.3.42 read_noexcept()

```
template<typename T >
rti::core::Result< dds::sub::LoanedSamples< T > > read_noexcept ( ) [noexcept]
```

<<**extension**>> (p. 156) Alternative to **read()** (p. 773) that doesn't throw exceptions.

This operation behaves exactly like **read()** (p. 773) but is guaranteed to not throw exceptions.

As an extension function, it must be accessed with the `extensions()` method or with the `->` operator. Since `extensions()` can throw if the object is not a valid reference, the `->` operator is recommended.

Example:

```
// Call the extension function
auto result = reader->read_noexcept();
if (result.is_ok()) {
    for (const auto& sample : result.get()) {
        // ...
    }
}
```

Returns

A **Result** that contains the **LoanedSamples** (p. 1406) if the operation was successful. When an error occurs, the **Result** contains the return code.

8.52.3.43 take_noexcept()

```
template<typename T >
rti::core::Result< dds::sub::LoanedSamples< T > > take_noexcept ( ) [noexcept]
```

<<**extension**>> (p. 156) Alternative to **take()** (p. 774) that doesn't throw exceptions.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

This operation behaves exactly like **take()** (p. 774) but is guaranteed to not throw exceptions.

As an extension function, it must be accessed with the `extensions()` method or with the `->` operator. Since `extensions()` can throw if the object is not a valid reference, the `->` operator is recommended.

Example:

```
// Call the extension function
auto result = reader->take_noexcept();
if (result.is_ok()) {
    for (const auto& sample : result.get()) {
        // ...
    }
}
```

Returns

A **Result** that contains the **LoanedSamples** (p. 1406) if the operation was successful. When an error occurs, the **Result** contains the return code.

8.52.3.44 read() [4/5]

```
template<typename T >
bool read (
    T & sample )
```

<<**extension**>> (p. 156) Copies the next not-previously-accessed valid data value from the **DataReader** (p. 756) via a read operation.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

This function ignores **SampleInfo** (p. 1992) and therefore also skips samples with invalid data.

Parameters

<i>sample</i>	The sample where to copy the values of the next unread sample if the function returned true, or undefined values otherwise.
---------------	---

Returns

True if there was an unread sample

See also

read(T& sample, dds::sub::SampleInfo& sample_info) (p. 796)

8.52.3.45 read() [5/5]

```
template<typename T >
bool read (
    T & sample,
    dds::sub::SampleInfo & sample_info )
```

<<**extension**>> (p. 156) Copies the next not-previously-accessed data value from the **DataReader** (p. 756) via a read operation.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

Returns

True if there was an unread sample

This operation copies the next not-previously-accessed data value from the `dds::sub::DataReader` (p. 756). This operation also copies the corresponding `dds::sub::SampleInfo` (p. 1992). The implied order among the samples stored in the `dds::sub::DataReader` (p. 756) is the same as for the `dds::sub::DataReader::read` (p. 773) operation.

The `dds::sub::DataReader::read(T& sample, dds::sub::SampleInfo& sample_info)` (p. 796) operation is semantically equivalent to the `dds::sub::DataReader::read` (p. 773) operation, where the `sample_states=NOT_READ`, the `view_states=ANY_VIEW_STATE`, and the `instance_states=ANY_INSTANCE_STATE`.

Note

Calling `dds::sub::DataReader::read(T& sample, dds::sub::SampleInfo& sample_info)` (p. 796) from the `dds::sub::DataReaderListener::on_data_available()` (p. 835) callback reads only one sample of potentially many samples in the reader queue, because `dds::sub::DataReaderListener::on_data_available()` (p. 835) is triggered only once when new samples arrive in the queue. Therefore, it is recommended that you call `dds::sub::DataReader::read(T& sample, dds::sub::SampleInfo& sample_info)` (p. 796) in a loop within the `on_data_available` callback until `dds::sub::DataReader::read(T& sample, dds::sub::SampleInfo& sample_info)` (p. 796) returns false. This ensures that all samples in the reader queue are serviced by application logic. (You may also choose to use `dds::sub::DataReader::read` (p. 773) rather than `dds::sub::DataReader::read(T& sample, dds::sub::SampleInfo& sample_info)` (p. 796) in order to read more than one sample at a time.)

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), <code>dds::core::NotEnabledError</code> (p. 1601).
------------	--

See also

`dds::sub::DataReader::read` (p. 773)

8.52.3.46 take() [4/5]

```
template<typename T >
bool take (
    T & sample )
```

<<**extension**>> (p. 156) Copies the next not-previously-accessed valid data value from the `DataReader` (p. 756) via a take operation.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

This function ignores `SampleInfo` (p. 1992) and therefore also skips samples with invalid data.

Parameters

<i>sample</i>	The sample where to copy the values of the next unread sample if the function returned true, or undefined values otherwise.
---------------	---

Returns

True if there was an unread sample to take. When this returns false, the argument is not modified.

Example:

```
Foo sample;
bool read_new_sample = reader.extensions().take(sample);
```

See also

take(T& sample, dds::sub::SampleInfo& sample_info) (p. 798)

8.52.3.47 take() [5/5]

```
template<typename T >
bool take (
    T & sample,
    dds::sub::SampleInfo & sample_info )
```

<<**extension**>> (p. 156) Copies the next not-previously-accessed data value from the **DataReader** (p. 756) via a take operation.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

This operation copies the next not-previously-accessed data value from the **dds::sub::DataReader** (p. 756) and 'removes' it from the **dds::sub::DataReader** (p. 756) so that it is no longer accessible. This operation also copies the corresponding **dds::sub::SampleInfo** (p. 1992). This operation is analogous to the **dds::sub::DataReader::read(T& sample, dds::sub::SampleInfo& sample_info)** (p. 796) except for the fact that the sample is removed from the **dds::sub::DataReader** (p. 756).

The **dds::sub::DataReader::take(T& sample, dds::sub::SampleInfo& sample_info)** (p. 798) operation is semantically equivalent to the **dds::sub::DataReader::take** (p. 774) operation, where the `sample_states=NOT_READ`, the `view_states=ANY_VIEW_STATE`, and the `instance_states=ANY_INSTANCE_STATE`.

Note

Calling **dds::sub::DataReader::take(T& sample, dds::sub::SampleInfo& sample_info)** (p. 798) from the **dds::sub::DataReaderListener::on_data_available()** (p. 835) callback retrieves only one sample of potentially many samples in the reader queue, because **dds::sub::DataReaderListener::on_data_available()** (p. 835) is triggered only once when new samples arrive in the queue. Therefore, it is recommended that you call **dds::sub::DataReader::take(T& sample, dds::sub::SampleInfo& sample_info)** (p. 798) in a loop within the `on_data_available` callback until **dds::sub::DataReader::take(T& sample, dds::sub::SampleInfo& sample_info)** (p. 798) returns false. This ensures that all samples in the reader queue are serviced by application logic. (You may also choose to use the **dds::sub::DataReader::take** (p. 774) rather than **dds::sub::DataReader::take(T& sample, dds::sub::SampleInfo& sample_info)** (p. 798) in order to take more than one sample at a time.)

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228),
------------	---

dds::core::NotEnabledError (p. 1601).

See also

dds::sub::DataReader::take (p. 774)

8.52.3.48 is_data_consistent() [1/2]

```
template<typename T >
bool is_data_consistent (
    const T & sample,
    const dds::sub::SampleInfo & sample_info )
```

<<**extension**>> (p. 156) Checks if the sample has been overwritten by the DataWriter

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

Parameters

<i>sample</i>	Sample (p. 1977) to be validated
<i>sample_info</i>	dds::sub::SampleInfo (p. 1992) object received with the sample

See also

dds::sub::DataReader::is_data_consistent (p. 799)

8.52.3.49 is_data_consistent() [2/2]

```
template<typename T >
bool is_data_consistent (
    const rti::sub::LoanedSample< T > & sample )
```

<<**extension**>> (p. 156) Checks if the sample has been overwritten by the DataWriter

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

When a sample is received via **Zero Copy transfer over shared memory** (p. 49), the sample can be reused by the DataWriter once it is removed from the DataWriter's send queue. Since there is no synchronization between the **DataReader** (p. 756) and the DataWriter, the sample could be overwritten by the DataWriter before it is processed by the **DataReader** (p. 756). The **dds::sub::DataReader::is_data_consistent** (p. 799) operation can be used after processing the sample to check if it was overwritten by the DataWriter.

A precondition for using this operation is to set **rti::core::DataWriterShmemRefTransferModeSettings::enable_data_consistency_check** (p. 1017) to true.

Warning

This operation cannot be used when the data type is annotated with `@language_binding(FLAT_DATA)`. Reading a FlatData sample delivered with Zero Copy transfer over shared memory while the DataWriter is overwriting it is undefined behavior. An application-level synchronization mechanism is required in this case.

Parameters

<i>sample</i>	<< <i>in</i> >> (p. 157) Sample (p. 1977) to be validated
---------------	--

Returns

true if the sample is consistent (i.e., the sample has not been overwritten by the DataWriter)

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228) or dds::core::PreconditionNotMetError (p. 1669).
------------	--

8.52.3.50 topic_name()

```
template<typename T >
const std::string & topic_name ( ) const
```

<<**extension**>> (p. 156) Get the topic name associated with this **DataReader** (p. 756)

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

8.52.3.51 type_name()

```
template<typename T >
const std::string & type_name ( ) const
```

<<**extension**>> (p. 156) Get the type name associated with this **DataReader** (p. 756)

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

Examples

Foo.hpp.

8.52.3.52 close()

```
template<typename T >
void close ( )
```

Close this **DataReader** (p. 756).

8.52.4 Friends And Related Function Documentation

8.52.4.1 read()

```
template<typename T >
bool read (
    dds::sub::ReadModeDummyType ) [related]
```

The stream manipulator to indicate that the reader should read samples as opposed to taking the samples.

Usage:

```
reader » read » loaned_samples;
```

See also

dds::sub::DataReader::operator >>(bool(*manipulator)(**ReadModeDummyType** (p. 1868)))

8.52.4.2 take()

```
template<typename T >
bool take (
    dds::sub::ReadModeDummyType ) [related]
```

The stream manipulator to indicate that the reader should take samples as opposed to reading the samples.

Usage:

```
reader » take » loaned_samples;
```

The default mode to access samples is to take, so the above is equivalent to:

```
reader » loaned_samples;
```

See also

`dds::sub::DataReader::operator >>(bool(*manipulator)(ReadModeDummyType (p. 1868)))`

8.52.4.3 max_samples()

```
template<typename T >
dds::sub::functors::MaxSamplesManipulatorFunctor max_samples (
    uint32_t n ) [related]
```

Stream manipulator to set the maximum number of samples to read or take.

Use this function to set the maximum number of samples to read/take by passing it to the **DataReader::operator >>(Functor f)** (p. 772) operator.

Parameters

<i>n</i>	The maximum number of samples to take
----------	---------------------------------------

See also

`dds::sub::DataReader::operator >>(Functor f)` (p. 772)

8.52.4.4 content()

```
template<typename T >
dds::sub::functors::ContentFilterManipulatorFunctor content (
    const dds::sub::Query & query ) [related]
```

Stream manipulator to set a **Query** (p. 1778) to use during the subsequent read/take operation.

The effect of using this manipulator is that the subsequent read/take will filter the samples based on the **Query** (p. 1778)'s expression. If the **DataReader** (p. 756) has no samples that meet the constraints, the read/take will not return any data.

If this stream manipulator comes before a call to the `condition(const dds::sub::cond::QueryCondition& query_condition)` manipulator then it will be overridden and will not have any effect on the read or take operation. Similarly, if this operation follows a call to `condition()` (p. 803), then the previously set `QueryCondition` will be cleared.

Parameters

<i>query</i>	The Query (p. 1778) to use during the read/take
--------------	--

See also

`dds::sub::DataReader::operator >>(Functor f)` (p. 772)

`dds::sub::condition(const dds::sub::cond::QueryCondition& query_condition)`

8.52.4.5 condition()

```
template<typename T >
dds::sub::functors::ConditionManipulatorFunctor condition (
    const dds::sub::cond::ReadCondition & condition ) [related]
```

Stream manipulator to set a `QueryCondition` to use during the subsequent read/take operation.

The effect of using this manipulator is that the subsequent read/take will filter the samples based on the `QueryCondition`'s expression and state. If the **DataReader** (p. 756) has no samples that meet the constraints, the read/take will not return any data.

If this stream manipulator comes before a call to the `content(const dds::sub::Query& query)` (p. 802) manipulator then it will be overridden and will not have any effect on the read or take operation. Similarly, if this operation follows a call to `content()` (p. 802) and/or `state(const dds::sub::status::DataState& s)` (p. 804), then the previously set **Query** (p. 1778) and `DataState` will be cleared.

This manipulator is effectively a combination of the content and state manipulators.

For example:

```
reader > read
  > content(dds::sub::Query(system.reader, "foo = 7"))
  > state(dds::sub::status::DataState::new_data())
  > samples;
```

is equivalent to:

```
reader > read
  > condition(Query(system.reader, "foo = 7"), DataState()::new_data())
  > samples;
```

Parameters

<i>condition</i>	The QueryCondition to use during the read/take
------------------	--

See also

dds::sub::DataReader::operator >>(Functor f) (p. 772)

content(const dds::sub::Query& query) (p. 802)

References **dds::sub::condition()**.

8.52.4.6 state()

```
template<typename T >
dds::sub::functors::StateFilterManipulatorFunctor state (
    const dds::sub::status::DataState & s ) [related]
```

Stream manipulator to specify the DataState of the samples that should be read/taken.

By setting the **dds::sub::status::DataState** (p. 888) you can specify the state of the samples that should be read or taken. The DataState of a sample encapsulates the **dds::sub::status::SampleState** (p. 2023), **dds::sub::status::ViewState** (p. 2315), and **dds::sub::status::InstanceState** (p. 1359) of a sample.

If this stream manipulator comes before a call to the `condition(const dds::sub::cond::QueryCondition& query_condition)` manipulator then it will be overridden and will not have any effect on the read or take operation.

Parameters

<i>s</i>	The DataState of the samples to be read or taken
----------	--

See also

dds::sub::DataReader::operator >>(Functor f) (p. 772)

8.52.4.7 instance()

```
template<typename T >
dds::sub::functors::InstanceManipulatorFunctor instance (
    const dds::core::InstanceHandle & h ) [related]
```

Stream manipulator to specify the instance whose samples should be read or taken.

This operation causes the subsequent read or take operation to access only samples belonging the single specified instance whose handle is *h*.

Upon successful completion, the data collection will contain samples all belonging to the same instance. The corresponding **SampleInfo** (p. 1992) verifies **SampleInfo.instance_handle()** (p. 1997) == *h*.

The subsequent read/take operation will be semantically equivalent to a read or take without specifying the instance, except in building the collection, the **DataReader** (p. 756) will check that the sample belongs to the specified instance and otherwise it will not place the sample in the returned collection.

The subsequent read/take may operation may fail with **dds::core::InvalidArgumentError** (p. 1363) if the InstanceHandle does not correspond to an existing data-object known to the **DataReader** (p. 756).

Parameters

<i>h</i>	The handle of the instance to access
----------	--------------------------------------

See also

dds::sub::DataReader::operator >>(Functor f) (p. 772)

8.52.4.8 next_instance()

```
template<typename T >
dds::sub::functors::NextInstanceManipulatorFunctor next_instance (
    const dds::core::InstanceHandle & h ) [related]
```

Stream manipulator to specify the samples belonging to the 'next' instance after the provided instance handle should be accessed.

This operation causes the subsequent read or take operation to access only samples belonging a single instance whose handle is considered 'next' after the provided InstanceHandle `h`.

The accessed samples will all belong to the 'next' instance with InstanceHandle 'greater' than the specified previous handle that has available samples.

This operation implies the existence of a total order 'greater-than' relationship between the instance handles. The specifics of this relationship are not all important and are implementation specific. The important thing is that, according to the middleware, all instances are ordered relative to each other. This ordering is between the instance handles; It should not depend on the state of the instance (e.g. whether it has data or not) and must be defined even for instance handles that do not correspond to instances currently managed by the `dds::sub::DataReader` (p. 756). For the purposes of the ordering, it should be 'as if' each instance handle was represented as unique integer.

The behavior of `dds::sub::DataReader::Selector::next_instance` (p. 2029) is 'as if' the `dds::sub::DataReader` (p. 756) invoked `dds::sub::instance(const dds::core::InstanceHandle& h)` (p. 453), passing the smallest `instance_↵_handle` among all the ones that: (a) are greater than `previous_handle`, and (b) have available samples (i.e. samples that meet the constraints imposed by the specified states).

The special value `dds::core::InstanceHandle::nil()` (p. 1358) is guaranteed to be 'less than' any valid `instance_↵_handle`. So the use of the parameter value `previous_handle == dds::core::InstanceHandle::nil()` (p. 1358) will return the samples for the instance which has the smallest `instance_handle` among all the instances that contain available samples.

Note

The operation `dds::sub::DataReader::Selector::next_instance` (p. 2029) is intended to be used in an application-driven iteration, where the application starts by passing `previous_handle == dds::core::↵InstanceHandle::nil()` (p. 1358), examines the samples returned, and then uses the `instance_handle` returned in the `dds::sub::SampleInfo` (p. 1992) as the value of the `previous_handle` argument to the next call to `dds::sub::DataReader::Selector::next_instance` (p. 2029). The iteration continues until the read/take operation doesn't return any more samples. This application-driven iteration is required to ensure that all samples on the reader queue are read.

Note that it is possible to call the `dds::sub::DataReader::Selector::next_instance` (p. 2029) operation with a `previous_handle` that does not correspond to an instance currently managed by the `dds::sub::DataReader` (p. 756). This is because as stated earlier the 'greater-than' relationship is defined even for handles not managed by the `dds::sub::DataReader` (p. 756). One practical situation where this may occur is when an application is iterating though all the instances, takes all the samples of a `dds::sub::status::InstanceState::not_alive_no_writers()` (p. 1361) instance, returns the loan (at which point the instance information may be removed, and thus the handle becomes invalid), and tries to read the next instance.

Parameters

<code>h</code>	The reference instance. The instance after this one will be selected
----------------	--

`dds::sub::DataReader::operator >>(Functor f)` (p. 772)

8.52.4.9 `ignore()` [1/2]

```
template<typename T >
void ignore (
    dds::domain::DomainParticipant & participant,
    const dds::core::InstanceHandle & handle ) [related]
```

Instructs RTI Connex to locally ignore a subscription.

A subscription is defined by the association of a topic name, user data, and partition set on the `dds::sub::Subscriber` (p. 2116) (see `dds::topic::SubscriptionBuiltinTopicData` (p. 2133)). After this call, any data received related to that subscription's `dds::sub::DataReader` (p. 756) will be ignored.

This operation can be used to ignore local *and* remote DataReaders.

The subscription to ignore is identified by the `handle` argument.

- To ignore a *remote* **DataReader** (p. 756), the `handle` can be obtained from the `dds::sub::SampleInfo` (p. 1992) retrieved when reading data samples from the built-in `dds::sub::DataReader` (p. 756) for the subscription topic.
- To ignore a *local* **DataReader** (p. 756), the `handle` can be obtained by calling `dds::core::Entity::instance_↔handle()` (p. 1270) for the local **DataReader** (p. 756).

There is no way to reverse this operation.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), <code>dds::core::OutOfResourcesError</code> (p. 1629) or <code>dds::core::NotEnabledError</code> (p. 1601)
------------	--

See also

`dds::topic::SubscriptionBuiltinTopicData` (p. 2133)

`dds::topic::subscription_topic_name()` (p. 243)

`dds::sub::builtin_subscriber` (p. 459)

Parameters

<i>participant</i>	The DomainParticipant for which the remote entity will be ignored
<i>handle</i>	The InstanceHandle of the remote entity that has to be ignored

8.52.4.10 ignore() [2/2]

```
template<typename FwdIterator >
void ignore (
    dds::domain::DomainParticipant & participant,
    FwdIterator begin,
    FwdIterator end ) [related]
```

Instructs RTI Connex to locally ignore subscriptions.

Parameters

<i>participant</i>	The DomainParticipant for which the remote entity will be ignored
<i>begin</i>	A forward iterator to the initial position in a dds::core::InstanceHandleSeq (p. 407) holding the handles to the remote DataReaders to be ignored.
<i>end</i>	A forward iterator to the final position in a dds::core::InstanceHandleSeq (p. 407) holding the handles to the remote DataReaders to be ignored.

See also

ignore(dds::domain::DomainParticipant&, const dds::core::InstanceHandle&) (p. 807);

References **dds::sub::begin()**, **dds::sub::end()**, and **dds::sub::ignore()**.

8.52.4.11 matched_publications() [1/2]

```
template<typename T >
const dds::core::InstanceHandleSeq matched_publications (
    const dds::sub::DataReader< T > & reader ) [related]
```

Retrieve the list of publications currently "associated" with a **DataReader** (p. 756).

A publication is considered to be matching if all of the following criteria are true:

- The publication is within the same domain as this subscription.
- The publication has a matching **dds::topic::Topic** (p. 2178).
- The publication has compatible QoS.
- If the applications are using partitions, the publication shares a common partition with this subscription.
- The **dds::domain::DomainParticipant** (p. 1079) has not indicated that the publication's **dds::domain::↔ DomainParticipant** (p. 1079) should be "ignored" by means of the **dds::pub::ignore** (p. 435) API.

- If the subscription is using a `dds::topic::ContentFilteredTopic` (p. 735) and the publication is using the `rti::core::policy::MultiChannel` (p. 1483), there is an intersection between at least one of the associated filters.
- If the endpoints need to exchange key material to communicate (i.e., they are securing their communications), the reader has completed the key exchange with the writer.

The handles returned in the `publication_handles` list are the ones that are used by the RTI Connext implementation to locally identify the corresponding matched `dds::pub::DataWriter` (p. 908) entities. These handles match the ones that appear in the `instance_handle` field of the `dds::sub::SampleInfo` (p. 1992) when reading the `dds::topic::publication_topic_name()` (p. 243) builtin topic.

This API may return the publication handles of publications that are not alive. `dds::sub::DataReader::is_matched_publication_alive` (p. 812) can be used to check the liveliness of the remote publication.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), or <code>dds::core::OutOfResourcesError</code> (p. 1629) if the sequence is too small and the system cannot resize it, or <code>dds::core::NotEnabledError</code> (p. 1601)
------------	---

Template Parameters

<i>T</i>	The topic-type that the DataReader (p. 756) subscribes to
----------	--

Parameters

<i>reader</i>	The reader whose publications are being retrieved
---------------	---

Returns

An `InstanceHandleSeq` containing the `InstanceHandles` of the matched publications for the provided **DataReader** (p. 756)

8.52.4.12 `matched_publications()` [2/2]

```
template<typename T , typename FwdIterator >
FwdIterator matched_publications (
    const dds::sub::DataReader< T > & reader,
    FwdIterator begin,
    FwdIterator end ) [related]
```

Retrieve the list of publications currently "associated" with a **DataReader** (p. 756).

A publication is considered to be matching if all of the following criteria are true:

- The publication is within the same domain as this subscription.
- The publication has a matching **dds::topic::Topic** (p. 2178).
- The publication has compatible QoS.
- If the applications are using partitions, the publication shares a common partition with this subscription.
- The **dds::domain::DomainParticipant** (p. 1079) has not indicated that the publication's **dds::domain::DomainParticipant** (p. 1079) should be "ignored" by means of the **dds::pub::ignore** (p. 435) API.
- If the subscription is using a **dds::topic::ContentFilteredTopic** (p. 735) and the publication is using the **rti::core::policy::MultiChannel** (p. 1483), there is an intersection between at least one of the associated filters.
- If the endpoints need to exchange key material to communicate (i.e., they are securing their communications), the reader has completed the key exchange with the writer.

The handles returned in the `publication_handles` list are the ones that are used by the RTI Connext implementation to locally identify the corresponding matched **dds::pub::DataWriter** (p. 908) entities. These handles match the ones that appear in the `instance_handle` field of the **dds::sub::SampleInfo** (p. 1992) when reading the **dds::topic::publication_topic_name()** (p. 243) builtin topic.

This API may return the publication handles of publications that are not alive. **dds::sub::DataReader::is_matched_publication_alive** (p. 812) can be used to check the liveness of the remote publication.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), or dds::core::OutOfResourcesError (p. 1629) if the sequence is too small and the system cannot resize it, or dds::core::NotEnabledError (p. 1601)
------------	---

Template Parameters

<i>T</i>	The topic-type that the DataReader (p. 756) subscribes to
<i>FwdIterator</i>	A forward iterator whose value type is dds::core::InstanceHandle (p. 1356)

Parameters

<i>reader</i>	The reader whose publications are being retrieved
<i>begin</i>	A forward iterator to the beginning position in the destination container of matching InstanceHandles
<i>end</i>	A forward iterator to the ending position in the destination container of matching InstanceHandles

Returns

An iterator placed at the last position in the container where a InstanceHandle was inserted

References **dds::sub::begin()**, **dds::sub::end()**, and **dds::sub::matched_publications()**.

8.52.4.13 matched_publication_data() [1/2]

```
template<typename T >
const dds::topic::PublicationBuiltinTopicData matched_publication_data (
    const dds::sub::DataReader< T > & reader,
    const dds::core::InstanceHandle & handle ) [related]
```

This operation retrieves the information on a publication that is currently "associated" with the **DataReader** (p. 756).

The `publication_handle` must correspond to a publication currently associated with the **dds::sub::DataReader** (p. 756). Otherwise, the operation will fail with **dds::core::InvalidArgumentError** (p. 1363). Use the operation **dds::sub::matched_publications** (p. 456) to find the publications that are currently matched with the **dds::sub::DataReader** (p. 756).

Note: This operation does not retrieve the **dds::topic::PublicationBuiltinTopicData::type** (p. 1712). This information is available through **dds::sub::DataReaderListener::on_data_available()** (p. 835) (if a reader listener is installed on the **dds::sub::DataReader<dds::topic::PublicationBuiltinTopicData>**).

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228) or dds::core::NotEnabledError (p. 1601)
------------	---

Template Parameters

<i>T</i>	The topic-type that the DataReader (p. 756) subscribes to
----------	--

Parameters

<i>reader</i>	The reader associated with the publication whose data is being retrieved
<i>handle</i>	The InstanceHandle Handle to a specific publication associated with the DataWriter. Must correspond to a publication currently associated with the DataReader (p. 756).

Returns

The **dds::topic::PublicationBuiltinTopicData** (p. 1703) of the publication that is associated with the provided handle

8.52.4.14 matched_publication_participant_data()

```
template<typename T >
dds::topic::ParticipantBuiltinTopicData matched_publication_participant_data (
    const dds::sub::DataReader< T > & reader,
    const dds::core::InstanceHandle & handle ) [related]
```

<<**extension**>> (p. 156) This operation retrieves the information on the discovered **dds::domain::DomainParticipant** (p. 1079) associated with the publication that is currently matching with the **dds::sub::DataReader** (p. 756).

Note

This is a standalone function in the namespace `rti::sub` (p. 538)

The `publication_handle` must correspond to a publication currently associated with the `dds::sub::DataReader` (p. 756). Otherwise, the operation will fail with `dds::core::InvalidArgumentError` (p. 1363). The operation may also fail with `dds::core::PreconditionNotMetError` (p. 1669) if the publication corresponds to the same `dds::domain::DomainParticipant` (p. 1079) that the `DataReader` (p. 756) belongs to. Use the operation `dds::sub::matched_publications` (p. 456) to find the publications that are currently matched with the `dds::sub::DataReader` (p. 756).

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228) or <code>dds::core::NotEnabledError</code> (p. 1601)
------------	---

Template Parameters

<i>T</i>	The topic-type that the DataReader (p. 756) subscribes to
----------	--

Parameters

<i>reader</i>	The reader to lookup the matched participant data of
<i>handle</i>	The InstanceHandle to a specific publication. Must correspond to a publication currently associated with the DataReader (p. 756). This handle is available in the <code>dds::sub::SampleInfo::publication_handle()</code> (p. 1997)

Returns

The `dds::topic::ParticipantBuiltinTopicData` (p. 1639) of the DomainParticipant of a matched publication of a `dds::sub::DataReader` (p. 756)

8.52.4.15 `is_matched_publication_alive()`

```
template<typename T >
bool is_matched_publication_alive (
    const dds::sub::DataReader< T > & reader,
    const dds::core::InstanceHandle & handle ) [related]
```

<<**extension**>> (p. 156) Check if a matched publication is alive.

Note

This is a standalone function in the namespace `rti::sub` (p. 538)

Template Parameters

<i>T</i>	The topic-type that the DataReader (p. 756) subscribes to.
----------	---

Parameters

<i>reader</i>	The DataReader (p. 756).
<i>handle</i>	The dds::core::InstanceHandle (p. 1356) of the matched publication.

This API is used for querying the endpoint liveliness of a matched publication. A matched publication will be marked as not alive if the liveliness that it committed to through its **LIVELINESS** (p. 326) QoS policy was not respected. Note that if the participant associated with the matched publication loses liveliness, the **dds::core::InstanceHandle** (p. 1356) will become invalid and this function will fail with **dds::core::InvalidArgumentError** (p. 1363).

of the matched publication. See **dds::sub::matched_publications** (p. 456) for a description of what is considered a matched publication.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

Returns

A boolean indicating whether or not the matched publication is alive.

8.52.4.16 matched_publication_data() [2/2]

```
template<typename T >
std::vector< dds::topic::PublicationBuiltinTopicData > matched_publication_data (
    const dds::sub::DataReader< T > & reader ) [related]
```

<< **extension** >> (p. 156) Obtain the **PublicationBuiltinTopicData** for all of the publications matched with a **DataReader** (p. 756).

Note

This is a standalone function in the namespace **rti::sub** (p. 538)

This API retrieves the matched subscription data from all of the publications currently matched a **DataReader** (p. 756).

Template Parameters

<i>T</i>	The topic-type that the DataReader (p. 756) subscribes to.
----------	---

Parameters

<i>reader</i>	The DataReader (p. 756).
---------------	---------------------------------

Returns

A `std::vector` containing all of the matched publication data.

8.52.4.17 find() [1/4]

```
template<typename Reader , typename FwdIterator >
uint32_t find (
    const dds::sub::Subscriber & subscriber,
    RTI_STRING_IN topic_name,
    FwdIterator begin,
    uint32_t max_size ) [related]
```

This function retrieves a previously-created **DataReader** (p. 756) belonging to the **Subscriber** (p. 2116) that is attached to a Topic with a matching topic name.

Use this operation on the built-in **dds::sub::Subscriber** (p. 2116) (**Built-in Topics** (p. 44)) to access the built-in **dds::sub::DataReader** (p. 756) entities for the built-in topics.

The built-in **dds::sub::DataReader** (p. 756) is created when this operation is called on a built-in topic for the first time. The built-in **dds::sub::DataReader** (p. 756) is deleted automatically when the **dds::domain::DomainParticipant** (p. 1079) is deleted.

To ensure that builtin **dds::sub::DataReader** (p. 756) entities receive all the discovery traffic, it is suggested that you lookup the builtin **dds::sub::DataReader** (p. 756) before the **dds::domain::DomainParticipant** (p. 1079) is enabled. Looking up builtin **dds::sub::DataReader** (p. 756) may implicitly register builtin transports due to creation of **dds::sub::DataReader** (p. 756) (see **Built-in Transport Plugins** (p. 81) for details on when a builtin transport is registered). Therefore, if you are want to modify builtin transport properties, do so *before* using this operation.

Therefore the suggested sequence when looking up builtin DataReaders is:

- Create a disabled **dds::domain::DomainParticipant** (p. 1079).
- (optional) Modify builtin transport properties
- Call **dds::sub::builtin_subscriber()** (p. 459).
- Call **dds::sub::find()** (p. 460).
- Call **enable()** (p. 1269) on the DomainParticipant.

The returned **dds::sub::DataReader** (p. 756) may be enabled or disabled.

If more than one **dds::sub::DataReader** (p. 756) is attached to the **dds::sub::Subscriber** (p. 2116), this operation may return any one of them.

MT Safety:

UNSAFE. It is not safe to lookup a **dds::sub::DataReader** (p. 756) in one thread while another thread is simultaneously creating or destroying that **dds::sub::DataReader** (p. 756).

Template Parameters

<i>Reader</i>	The type of the reader. It can be dds::sub::AnyDataReader (p. 595), or an instantiation of dds::sub::DataReader<T> (if T is not the correct type, this function throws dds::core::InvalidDowncastError (p. 1364))
<i>FwdIterator</i>	The type of forward iterator passed to this function

Parameters

<i>subscriber</i>	The dds::sub::Subscriber (p. 2116) the DataReader (p. 756) belongs to
<i>topic_name</i>	Name of the dds::topic::Topic (p. 2178) associated with the DataReader (p. 756) that is to be looked up.
<i>begin</i>	A forward iterator to the position in the destination container where the DataReaders will be copied into
<i>max_size</i>	Only 1 DataReader (p. 756) will be returned from this function

Returns

The number of DataReaders that were found (either 0 or 1)

References **dds::sub::begin()**.

8.52.4.18 find() [2/4]

```
template<typename Reader , typename BinIterator >
uint32_t find (
    const dds::sub::Subscriber & subscriber,
    RTI_STRING_IN topic_name,
    BinIterator begin ) [related]
```

This function retrieves a previously-created **DataReader** (p. 756) belonging to the **Subscriber** (p. 2116) that is attached to a Topic with a matching topic name.

Use this operation on the built-in **dds::sub::Subscriber** (p. 2116) (**Built-in Topics** (p. 44)) to access the built-in **dds::sub::DataReader** (p. 756) entities for the built-in topics.

The built-in **dds::sub::DataReader** (p. 756) is created when this operation is called on a built-in topic for the first time. The built-in **dds::sub::DataReader** (p. 756) is deleted automatically when the **dds::domain::DomainParticipant** (p. 1079) is deleted.

To ensure that builtin **dds::sub::DataReader** (p. 756) entities receive all the discovery traffic, it is suggested that you lookup the builtin **dds::sub::DataReader** (p. 756) before the **dds::domain::DomainParticipant** (p. 1079) is enabled. Looking up builtin **dds::sub::DataReader** (p. 756) may implicitly register builtin transports due to creation of **dds::sub::DataReader** (p. 756) (see **Built-in Transport Plugins** (p. 81) for details on when a builtin transport is registered). Therefore, if you are want to modify builtin transport properties, do so *before* using this operation.

Therefore the suggested sequence when looking up builtin DataReaders is:

- Create a disabled **dds::domain::DomainParticipant** (p. 1079).
- (optional) Modify builtin transport properties
- Call **dds::sub::builtin_subscriber()** (p. 459).
- Call **dds::sub::find()** (p. 460).
- Call **enable()** (p. 1269) on the DomainParticipant.

The returned **dds::sub::DataReader** (p. 756) may be enabled or disabled.

If more than one **dds::sub::DataReader** (p. 756) is attached to the **dds::sub::Subscriber** (p. 2116), this operation may return any one of them.

MT Safety:

UNSAFE. It is not safe to lookup a **dds::sub::DataReader** (p. 756) in one thread while another thread is simultaneously creating or destroying that **dds::sub::DataReader** (p. 756).

Template Parameters

<i>Reader</i>	The type of the reader. It can be dds::sub::AnyDataReader (p. 595), or an instantiation of dds::sub::DataReader<T> (if T is not the correct type, this function throws dds::core::InvalidDowncastError (p. 1364))
<i>BinIterator</i>	The type of back-inserting iterator passed to this function

Parameters

<i>subscriber</i>	The dds::sub::Subscriber (p. 2116) the DataReader (p. 756) belongs to
<i>topic_name</i>	Name of the dds::topic::Topic (p. 2178) associated with the DataReader (p. 756) that is to be looked up.
<i>begin</i>	A back-inserting iterator to the position in the destination container to insert the found DataReader (p. 756) into

Returns

The number of DataReaders that were found (either 0 or 1)

References **dds::sub::begin()**.

8.52.4.19 find() [3/4]

```
template<typename READER , typename T , typename FwdIterator >
uint32_t find (
    const dds::sub::Subscriber & subscriber,
```

```
const dds::topic::TopicDescription< T > & topic_description,
FwdIterator begin,
uint32_t max_size ) [related]
```

This function retrieves a previously-created **DataReader** (p. 756) belonging to the **Subscriber** (p. 2116) that is attached to a Topic with a matching TopicDescription.

See also

find(const dds::sub::Subscriber& subscriber, RTI_STRING_IN topic_name, FwdIterator begin, uint32_t max_size) (p. 814)

References **dds::sub::begin()**, and **dds::sub::find()**.

8.52.4.20 find() [4/4]

```
template<typename READER , typename T , typename BinIterator >
uint32_t find (
    const dds::sub::Subscriber & subscriber,
    const dds::topic::TopicDescription< T > & topic_description,
    BinIterator begin ) [related]
```

This function retrieves a previously-created **DataReader** (p. 756) belonging to the **Subscriber** (p. 2116) that is attached to a Topic with a matching TopicDescription.

See also

uint32_t find(const dds::sub::Subscriber& subscriber, RTI_STRING_IN topic_name, BinIterator begin) (p. 815)

References **dds::sub::begin()**, and **dds::sub::find()**.

8.52.4.21 find_datareaders() [1/2]

```
template<typename AnyDataReaderBackInsertIterator >
uint32_t find_datareaders (
    dds::sub::Subscriber subscriber,
    AnyDataReaderBackInsertIterator begin ) [related]
```

<<**extension**>> (p. 156) Retrieve all the **dds::sub::DataReader** (p. 756) created from this **dds::sub::Subscriber** (p. 2116)

Note

This is a standalone function in the namespace **rti::sub** (p. 538)

Template Parameters

<i>AnyDataReaderBackInsertIterator</i>	Type of the back-inserting iterator passed into this function, whose <code>value_type</code> must be dds::sub::AnyDataReader (p. 595).
--	---

Parameters

<i>subscriber</i>	The dds::sub::Subscriber (p. 2116) the DataReaders belong to
<i>begin</i>	A back-inserting iterator to the position in the destination container to insert the found DataReaders into

Returns

The number of found DataReaders

See also

Looking up DataReaders (p. 123)

References **rti::sub::begin()**.

8.52.4.22 find_datareaders() [2/2]

```
template<typename AnyDataReaderForwardIterator >
uint32_t find_datareaders (
    dds::sub::Subscriber subscriber,
    AnyDataReaderForwardIterator begin,
    uint32_t max_size ) [related]
```

<<**extension**>> (p. 156) Retrieve all the readers created from a subscriber.

Note

This is a standalone function in the namespace **rti::sub** (p. 538)

Template Parameters

<i>AnyDataReaderForwardIterator</i>	A forward iterator whose <code>value_type</code> is dds::sub::AnyDataReader (p. 595)
-------------------------------------	---

Parameters

<i>subscriber</i>	The dds::sub::Subscriber (p. 2116) the readers belong to
<i>begin</i>	A forward iterator to the position in the destination container where to begin copying the found readers into.

Parameters

<code>max_size</code>	The maximum number of readers to return
-----------------------	---

Returns

The number of found readers

See also

Looking up DataReaders (p. 123)

References `rti::sub::begin()`.

8.52.4.23 `find_datareader_by_topic_name()`

```
template<typename Reader >
Reader find_datareader_by_topic_name (
    dds::sub::Subscriber subscriber,
    const std::string & topic_name ) [related]
```

<<**extension**>> (p. 156) Retrieves a `dds::sub::DataReader` (p. 756) with the given topic name within the `dds::sub::Subscriber` (p. 2116)

Note

This is a standalone function in the namespace `rti::sub` (p. 538)

Use this operation on the built-in `dds::sub::Subscriber` (p. 2116) (**Built-in Topics** (p. 44)) to access the built-in `dds::sub::DataReader` (p. 756) entities for the built-in topics.

The built-in `dds::sub::DataReader` (p. 756) is created when this operation is called on a built-in topic for the first time. The built-in `dds::sub::DataReader` (p. 756) is deleted automatically when the `dds::domain::DomainParticipant` (p. 1079) is deleted.

To ensure that builtin `dds::sub::DataReader` (p. 756) entities receive all the discovery traffic, it is suggested that you lookup the builtin `dds::sub::DataReader` (p. 756) before the `dds::domain::DomainParticipant` (p. 1079) is enabled. Looking up builtin `dds::sub::DataReader` (p. 756) may implicitly register builtin transports due to creation of `dds::sub::DataReader` (p. 756) (see **Built-in Transport Plugins** (p. 81) for details on when a builtin transport is registered). Therefore, if you are want to modify builtin transport properties, do so *before* using this operation.

Therefore the suggested sequence when looking up builtin DataReaders is:

- Create a disabled `dds::domain::DomainParticipant` (p. 1079).
- (optional) Modify builtin transport properties
- Call `dds::sub::builtin_subscriber()` (p. 459).
- Call `dds::sub::find()` (p. 460).
- Call `enable()` (p. 1269) on the DomainParticipant.

The returned `dds::sub::DataReader` (p. 756) may be enabled or disabled.

If more than one `dds::sub::DataReader` (p. 756) is attached to the `dds::sub::Subscriber` (p. 2116), this operation may return any one of them.

MT Safety:

UNSAFE. It is not safe to lookup a **dds::sub::DataReader** (p. 756) in one thread while another thread is simultaneously creating or destroying that **dds::sub::DataReader** (p. 756).

Template Parameters

<i>Reader</i>	The type of the reader. It can be dds::sub::AnyDataReader (p. 595), or an instantiation of dds::sub::DataReader<T> (if T is not the correct type, this function throws dds::core::InvalidDowncastError (p. 1364))
---------------	--

Parameters

<i>subscriber</i>	The dds::sub::Subscriber (p. 2116) that created the DataReader (p. 756) to find
<i>topic_name</i>	Topic name of the DataReader (p. 756) to find

Returns

The **DataReader** (p. 756) with the given topic name, or **dds::core::null** (p. 238) if it doesn't exist

See also

Looking up DataReaders (p. 123)

References **dds::core::null**.

8.52.4.24 find_datareader_by_name() [1/2]

```
template<typename Reader >
Reader find_datareader_by_name (
    dds::sub::Subscriber subscriber,
    const std::string & datareader_name ) [related]
```

<<**extension**>> (p. 156) Retrieves a **dds::sub::DataReader** (p. 756) with the given name within the **dds::sub::Subscriber** (p. 2116)

Note

This is a standalone function in the namespace **rti::sub** (p. 538)

Template Parameters

<i>Reader</i>	The type of the reader. It can be dds::sub::AnyDataReader (p. 595), or an instantiation of dds::sub::DataReader<T> (if T is not the correct type, this function throws dds::core::InvalidDowncastError (p. 1364))
---------------	--

Every `dds::sub::DataReader` (p. 756) in the system has an entity name which is configured and stored in the `<<extension>>` (p. 156) `EntityName` policy, `ENTITY_NAME` (p. 323).

This operation retrieves the `dds::sub::DataReader` (p. 756) within the `dds::sub::Subscriber` (p. 2116) whose name matches the one specified. If there are several `dds::sub::DataReader` (p. 756) with the same name within the `dds::sub::Subscriber` (p. 2116), the operation returns the first matching occurrence.

Parameters

<code>subscriber</code>	The <code>dds::sub::Subscriber</code> (p. 2116) that created the <code>DataReader</code> (p. 756) to find
<code>datareader_name</code>	Entity name of the <code>DataReader</code> (p. 756) to find

Returns

The `DataReader` (p. 756) with the given name, or `dds::core::null` (p. 238) if it doesn't exist

See also

[Looking up DataReaders](#) (p. 123)

References `dds::core::null`.

8.52.4.25 `find_datareader_by_topic_description()`

```
template<typename Reader , typename T >
Reader find_datareader_by_topic_description (
    const dds::sub::Subscriber & subscriber,
    const dds::topic::TopicDescription< T > & topic_description ) [related]
```

`<<extension>>` (p. 156) Retrieves a `dds::sub::DataReader` (p. 756) with the given `TopicDescription` within the `dds::sub::Subscriber` (p. 2116)

Note

This is a standalone function in the namespace `rti::sub` (p. 538)

Template Parameters

<code>Reader</code>	The type of the reader returned, for example, <code>dds::sub::DataReader<Foo></code> , or <code>dds::sub::AnyDataReader</code> (p. 595)
<code>T</code>	The topic-type

Parameters

Parameters

<i>subscriber</i>	The Subscriber (p. 2116) to which the DataReader (p. 756) belongs
<i>topic_description</i>	The TopicDescription identifying the DataReader (p. 756) to find

Returns

The found **DataReader** (p. 756), or **dds::core::null** (p. 238) if it doesn't exist

References **dds::core::null**.

8.52.4.26 find_datareader_by_name() [2/2]

```
template<typename Reader >
Reader find_datareader_by_name (
    dds::domain::DomainParticipant participant,
    const std::string & datareader_name ) [related]
```

<<**extension**>> (p. 156) Retrieves a **dds::sub::DataReader** (p. 756) within the **dds::domain::DomainParticipant** (p. 1079) with the given name

Note

This is a standalone function in the namespace **rti::sub** (p. 538)

Template Parameters

<i>Reader</i>	The type of the reader. It can be dds::sub::AnyDataReader (p. 595), or an instantiation of dds::sub::DataReader<T> (if T is not the correct type, this function throws dds::core::InvalidDowncastError (p. 1364))
---------------	--

Every **dds::sub::DataReader** (p. 756) in the system has an entity name which is configured and stored in the Entity↔Name policy, **ENTITY_NAME** (p. 323).

Every **dds::sub::Subscriber** (p. 2116) in the system has an entity name which is also configured and stored in the EntityName policy, **ENTITY_NAME** (p. 323).

This operation retrieves a **dds::sub::DataReader** (p. 756) within a **dds::sub::Subscriber** (p. 2116) given the specified name which encodes both to the **dds::sub::DataReader** (p. 756) and the **dds::sub::Subscriber** (p. 2116) name.

If there are several **dds::sub::DataReader** (p. 756) with the same name within the corresponding **dds::sub::Subscriber** (p. 2116) this function returns the first matching occurrence.

The specified name might be given as a fully-qualified entity name or as a plain name.

The fully qualified entity name is a concatenation of the **dds::sub::Subscriber** (p. 2116) to which the **dds::sub::DataReader** (p. 756) belongs and the entity name of of the **dds::sub::DataReader** (p. 756) itself, separated by a double colon "::". For example: MySubscriberName::MyDataReaderName

The plain name contains the **dds::sub::DataReader** (p. 756) name only. In this situation it is implied that the **dds::sub::DataReader** (p. 756) belongs to the implicit **dds::sub::Subscriber** (p. 2116) so the use of a plain name is equivalent to specifying a fully qualified name with the **dds::sub::Subscriber** (p. 2116) name part being "implicit". For example: the plain name "MyDataReaderName" is equivalent to specifying the fully qualified name "implicit::MyDataReaderName"

The **dds::sub::DataReader** (p. 756) is only looked up within the **dds::sub::Subscriber** (p. 2116) specified in the fully qualified name, or within the implicit **dds::sub::Subscriber** (p. 2116) if the name was not fully qualified.

Parameters

<i>participant</i>	The dds::domain::DomainParticipant (p. 1079) within which the dds::sub::DataReader (p. 756) exists
<i>datareader_name</i>	EntityName of the DataReader (p. 756) to find

Returns

The first reader with the given name or **dds::core::null** (p. 238) if it is not found.

8.53 rti::core::status::DataReaderCacheStatus Class Reference

<<*extension*>> (p. 156) Information about the status **dds::core::status::StatusMask::datareader_cache()** (p. 2093)

```
#include <Status.hpp>
```

Inherits rti::core::NativeValueType< T, NATIVE_T, ADAPTER >.

Public Member Functions

- int64_t **sample_count** () const
The number of samples in the reader's queue.
- int64_t **sample_count_peak** () const
The highest number of samples in the reader's queue over the lifetime of the reader.
- int64_t **old_source_timestamp_dropped_sample_count** () const

The number of samples dropped as a result of receiving a sample older than the last one, using `dds::core::policy::DestinationOrderKind::BY_SOURCE_TIMESTAMP`.

- `int64_t tolerance_source_timestamp_dropped_sample_count () const`
 The number of samples dropped as a result of receiving a sample in the future, using `dds::core::policy::DestinationOrderKind::BY_SOURCE_TIMESTAMP`.
- `int64_t ownership_dropped_sample_count () const`
 The number of samples dropped as a result of receiving a sample from a `DataWriter` with a lower strength, using `Exclusive Ownership`.
- `int64_t content_filter_dropped_sample_count () const`
 The number of user samples filtered by the `DataReader` due to `Content-Filtered Topics`.
- `int64_t time_based_filter_dropped_sample_count () const`
 The number of user samples filtered by the `DataReader` due to `dds::core::policy::TimeBasedFilter` (p. 2174).
- `int64_t expired_dropped_sample_count () const`
 The number of samples expired by the `DataReader` due to `dds::core::policy::Lifespan` (p. 1379) or the autopurge sample delays.
- `int64_t virtual_duplicate_dropped_sample_count () const`
 The number of virtual duplicate samples dropped by the `DataReader`. A sample is a virtual duplicate if it has the same identity (`Virtual Writer GUID` and `Virtual Sequence Number`) as a previously received sample.
- `int64_t replaced_dropped_sample_count () const`
 The number of samples replaced by the `DataReader` due to `dds::core::policy::HistoryKind::KEEP_LAST` replacement.
- `int64_t writer_removed_batch_sample_dropped_sample_count () const`
 The number of batch samples received by the `DataReader` that were marked as removed by the `DataWriter`.
- `int64_t total_samples_dropped_by_instance_replacement () const`
 The number of samples with sample state `dds::sub::status::SampleState::not_read()` (p. 2025) that were dropped when removing an instance due to instance replacement. See `rti::core::policy::DataReaderResourceLimits::instance_replacement` (p. 877) for more details about when instances are replaced.
- `int64_t alive_instance_count () const`
 The number of instances in the `DataReader`'s queue with an instance state equal to `dds::sub::status::InstanceState::alive()` (p. 1361).
- `int64_t alive_instance_count_peak () const`
 The highest value of `rti::core::status::DataReaderCacheStatus::alive_instance_count` (p. 828) over the lifetime of the `DataReader`.
- `int64_t no_writers_instance_count () const`
 The number of instances in the `DataReader`'s queue with an instance state equal to `dds::sub::status::InstanceState::not_alive_no_writers()` (p. 1361).
- `int64_t no_writers_instance_count_peak () const`
 The highest value of `rti::core::status::DataReaderCacheStatus::no_writers_instance_count` (p. 828) over the lifetime of the `DataReader`.
- `int64_t disposed_instance_count () const`
 The number of instances in the `DataReader`'s queue with an instance state equal to `dds::sub::status::InstanceState::not_alive_disposed()` (p. 1361).
- `int64_t disposed_instance_count_peak () const`
 The highest value of `rti::core::status::DataReaderCacheStatus::disposed_instance_count` (p. 829) over the lifetime of the `DataReader`.
- `int64_t detached_instance_count () const`
 The number of minimal instance states currently being maintained in the `DataReader`'s queue.
- `int64_t detached_instance_count_peak () const`
 The highest value of `rti::core::status::DataReaderCacheStatus::detached_instance_count` (p. 829) over the lifetime of the `DataReader`.
- `int64_t compressed_sample_count () const`
 The number of received samples compressed by a `DataWriter`.

8.53.1 Detailed Description

<<*extension*>> (p. 156) Information about the status `dds::core::status::StatusMask::datareader_cache()` (p. 2093)

Entity:

`dds::sub::DataReader` (p. 756)

8.53.2 Member Function Documentation

8.53.2.1 `sample_count()`

```
int64_t rti::core::status::DataReaderCacheStatus::sample_count ( ) const [inline]
```

The number of samples in the reader's queue.

includes samples that may not yet be available to be read or taken by the user, due to samples being received out of order or **PRESENTATION** (p. 331)

8.53.2.2 `sample_count_peak()`

```
int64_t rti::core::status::DataReaderCacheStatus::sample_count_peak ( ) const [inline]
```

The highest number of samples in the reader's queue over the lifetime of the reader.

8.53.2.3 `old_source_timestamp_dropped_sample_count()`

```
int64_t rti::core::status::DataReaderCacheStatus::old_source_timestamp_dropped_sample_count ( )  
const [inline]
```

The number of samples dropped as a result of receiving a sample older than the last one, using `dds::core::policy::↔ DestinationOrderKind::BY_SOURCE_TIMESTAMP`.

When the `DataReader` is using `dds::core::policy::DestinationOrderKind::BY_SOURCE_TIMESTAMP`:

- If the `DataReader` receives a sample for an instance with a source timestamp that is older than the last source timestamp received for the instance, the sample is dropped.
- If the `DataReader` receives a sample for an instance with a source timestamp that is equal to the last source timestamp received for the instance and the writer has a higher virtual GUID, the sample is dropped.

8.53.2.4 tolerance_source_timestamp_dropped_sample_count()

```
int64_t rti::core::status::DataReaderCacheStatus::tolerance_source_timestamp_dropped_sample_count
( ) const [inline]
```

The number of samples dropped as a result of receiving a sample in the future, using `dds::core::policy::DestinationOrderKind::BY_SOURCE_TIMESTAMP`.

When the DataReader is using `dds::core::policy::DestinationOrderKind::BY_SOURCE_TIMESTAMP`: the DataReader will accept a sample only if the source timestamp is no farther in the future from the reception timestamp than the `source_timestamp_tolerance`. Otherwise, the sample is dropped.

8.53.2.5 ownership_dropped_sample_count()

```
int64_t rti::core::status::DataReaderCacheStatus::ownership_dropped_sample_count ( ) const [inline]
```

The number of samples dropped as a result of receiving a sample from a DataWriter with a lower strength, using Exclusive Ownership.

When using Exclusive Ownership, the DataReader receives data from multiple DataWriters. Each instance can only be owned by one DataWriter.

If other DataWriters write samples on this instance, the samples will be dropped.

8.53.2.6 content_filter_dropped_sample_count()

```
int64_t rti::core::status::DataReaderCacheStatus::content_filter_dropped_sample_count ( ) const
[inline]
```

The number of user samples filtered by the DataReader due to Content-Filtered Topics.

When using a content filter on the DataReader side, if the sample received by the DataReader does not pass the filter, it will be dropped.

8.53.2.7 time_based_filter_dropped_sample_count()

```
int64_t rti::core::status::DataReaderCacheStatus::time_based_filter_dropped_sample_count ( ) const
[inline]
```

The number of user samples filtered by the DataReader due to `dds::core::policy::TimeBasedFilter` (p. 2174).

When using **TIME_BASED_FILTER** (p. 338) on the DataReader side, if the sample received by the DataReader does not pass the `minimum_separation` filter, it will be dropped.

8.53.2.8 expired_dropped_sample_count()

```
int64_t rti::core::status::DataReaderCacheStatus::expired_dropped_sample_count ( ) const [inline]
```

The number of samples expired by the DataReader due to **dds::core::policy::Lifespan** (p. 1379) or the autopurge sample delays.

- **dds::core::policy::Lifespan** (p. 1379)
When a sample expires due to **dds::core::policy::Lifespan** (p. 1379), the data is removed from the DataReader caches. This sample will be considered dropped if its **dds::sub::status::SampleState** (p. 2023) was **dds::sub::status::SampleState::not_read()** (p. 2025).
- **dds::core::policy::ReaderDataLifecycle::autopurge_nowriter_samples_delay** (p. 1865)
When a sample expires due to **dds::core::policy::ReaderDataLifecycle::autopurge_nowriter_samples_delay** (p. 1865), this sample will be considered dropped if its **dds::sub::status::SampleState** (p. 2023) was **dds::sub::status::SampleState::not_read()** (p. 2025).
- **dds::core::policy::ReaderDataLifecycle::autopurge_disposed_samples_delay** (p. 1865)
When a sample expires due to **dds::core::policy::ReaderDataLifecycle::autopurge_disposed_samples_delay** (p. 1865), this sample will be considered dropped if its **dds::sub::status::SampleState** (p. 2023) was **dds::sub::status::SampleState::not_read()** (p. 2025).

8.53.2.9 virtual_duplicate_dropped_sample_count()

```
int64_t rti::core::status::DataReaderCacheStatus::virtual_duplicate_dropped_sample_count ( ) const [inline]
```

The number of virtual duplicate samples dropped by the DataReader. A sample is a virtual duplicate if it has the same identity (Virtual Writer GUID and Virtual Sequence Number) as a previously received sample.

When two DataWriters with the same logical data source publish a sample with the same sequence_number, one sample will be dropped and the other will be received by the DataReader.

This can happen when multiple writers are writing on behalf of the same original DataWriter: for example, in systems with redundant Routing Services or when a DataReader is receiving samples both directly from the original DataWriter and from an instance of Persistence Service.

8.53.2.10 replaced_dropped_sample_count()

```
int64_t rti::core::status::DataReaderCacheStatus::replaced_dropped_sample_count ( ) const [inline]
```

The number of samples replaced by the DataReader due to **dds::core::policy::HistoryKind::KEEP_LAST** replacement.

When the number of samples for an instance in the queue reaches the **dds::core::policy::History::depth** (p. 1349) value, a new sample for the instance will replace the oldest sample for the instance in the queue.

The new sample will be accepted and the old sample will be dropped.

This counter will only be updated if the replaced sample's **dds::sub::status::SampleState** (p. 2023) was **dds::sub::status::SampleState::not_read()** (p. 2025).

8.53.2.11 `writer_removed_batch_sample_dropped_sample_count()`

```
int64_t rti::core::status::DataReaderCacheStatus::writer_removed_batch_sample_dropped_sample_count
( ) const [inline]
```

The number of batch samples received by the `DataReader` that were marked as removed by the `DataWriter`.

When the `DataReader` receives a batch, the batch can contain samples marked as removed by the `DataWriter`. Examples of removed samples in a batch could be because of sample replacement due to `dds::core::policy::HistoryKind::KEEP_LAST` `dds::core::policy::History` (p. 1346) QoS on the `DataWriter` or because the duration in `dds::core::policy::Lifespan` (p. 1379) was reached. By default, any sample marked as removed from a batch is dropped (unless you set the `dds.data_reader.accept_writer_removed_batch_samples` property in the `rti::core::policy::Property` (p. 1695) to true). Note: Historical data with removed batch samples written before the `DataReader` joined the DDS domain will also be included in the count.

8.53.2.12 `total_samples_dropped_by_instance_replacement()`

```
int64_t rti::core::status::DataReaderCacheStatus::total_samples_dropped_by_instance_replacement (
) const [inline]
```

The number of samples with sample state `dds::sub::status::SampleState::not_read()` (p. 2025) that were dropped when removing an instance due to instance replacement. See `rti::core::policy::DataReaderResourceLimits::instance_replacement` (p. 877) for more details about when instances are replaced.

8.53.2.13 `alive_instance_count()`

```
int64_t rti::core::status::DataReaderCacheStatus::alive_instance_count ( ) const [inline]
```

The number of instances in the `DataReader`'s queue with an instance state equal to `dds::sub::status::InstanceState::alive()` (p. 1361).

8.53.2.14 `alive_instance_count_peak()`

```
int64_t rti::core::status::DataReaderCacheStatus::alive_instance_count_peak ( ) const [inline]
```

The highest value of `rti::core::status::DataReaderCacheStatus::alive_instance_count` (p. 828) over the lifetime of the `DataReader`.

See also

`rti::core::status::DataReaderCacheStatus::alive_instance_count` (p. 828)

8.53.2.15 no_writers_instance_count()

```
int64_t rti::core::status::DataReaderCacheStatus::no_writers_instance_count ( ) const [inline]
```

The number of instances in the DataReader's queue with an instance state equal to **dds::sub::status::InstanceState::not_alive_no_writers()** (p. 1361).

8.53.2.16 no_writers_instance_count_peak()

```
int64_t rti::core::status::DataReaderCacheStatus::no_writers_instance_count_peak ( ) const [inline]
```

The highest value of **rti::core::status::DataReaderCacheStatus::no_writers_instance_count** (p. 828) over the lifetime of the DataReader.

See also

rti::core::status::DataReaderCacheStatus::no_writers_instance_count (p. 828)

8.53.2.17 disposed_instance_count()

```
int64_t rti::core::status::DataReaderCacheStatus::disposed_instance_count ( ) const [inline]
```

The number of instances in the DataReader's queue with an instance state equal to **dds::sub::status::InstanceState::not_alive_disposed()** (p. 1361).

8.53.2.18 disposed_instance_count_peak()

```
int64_t rti::core::status::DataReaderCacheStatus::disposed_instance_count_peak ( ) const [inline]
```

The highest value of **rti::core::status::DataReaderCacheStatus::disposed_instance_count** (p. 829) over the lifetime of the DataReader.

See also

rti::core::status::DataReaderCacheStatus::disposed_instance_count (p. 829)

8.53.2.19 detached_instance_count()

```
int64_t rti::core::status::DataReaderCacheStatus::detached_instance_count ( ) const [inline]
```

The number of minimal instance states currently being maintained in the DataReader's queue.

If `rti::core::policy::DataReaderResourceLimits::keep_minimum_state_for_instances` (p. 873) is true, the DataReader will keep up to a maximum of `rti::core::policy::DataReaderResourceLimits::max_total_instances` (p. 868) detached instances in its queue. For a more in-depth description of detached instances, refer to `rti::core::policy::DataReaderResourceLimits::max_total_instances` (p. 868).

8.53.2.20 detached_instance_count_peak()

```
int64_t rti::core::status::DataReaderCacheStatus::detached_instance_count_peak ( ) const [inline]
```

The highest value of `rti::core::status::DataReaderCacheStatus::detached_instance_count` (p. 829) over the lifetime of the DataReader.

See also

`rti::core::status::DataReaderCacheStatus::detached_instance_count` (p. 829)

8.53.2.21 compressed_sample_count()

```
int64_t rti::core::status::DataReaderCacheStatus::compressed_sample_count ( ) const [inline]
```

The number of received samples compressed by a DataWriter.

These include data, dispose, and unregister samples sent by a DataWriter.

8.54 rti::core::policy::DataReaderInstanceRemovalKind_def Struct Reference

Sets the kinds of instances that can be replaced when instance resource limits (`dds::core::policy::ResourceLimits::max_instances` (p. 1924)) are reached.

```
#include <PolicyKind.hpp>
```

Public Types

- enum `type` {
NO_INSTANCE ,
EMPTY_INSTANCES ,
FULLY_PROCESSED_INSTANCES ,
ANY_INSTANCE }

The underlying enum type.

8.54.1 Detailed Description

Sets the kinds of instances that can be replaced when instance resource limits (**dds::core::policy::ResourceLimits::max_instances** (p. 1924)) are reached.

See also

rti::core::policy::DataReaderResourceLimits::instance_replacement (p. 877)

8.54.2 Member Enumeration Documentation

8.54.2.1 type

```
enum rti::core::policy::DataReaderInstanceRemovalKind_def::type
```

The underlying `enum` type.

Enumerator

NO_INSTANCE	No instance can be removed. If an instance resource is required because dds::core::policy::ResourceLimits::max_instances (p. 1924) is reached, this setting will disallow instances from being replaced. Samples for new instances will be dropped and reported as lost with reason rti::core::status::SampleLostState::lost_by_instances_limit() (p. 2006).
EMPTY_INSTANCES	Only empty instances can be removed. Instances can be replaced only if they are empty. An instance is considered empty when all samples have been taken or removed from the DataReader queue due to the dds::core::policy::Lifespan (p. 1379) or sample purging due to the dds::core::policy::ReaderDataLifecycle (p. 1862), and there are no outstanding loans on any of the instance's samples.

Enumerator

FULLY_PROCESSED_INSTANCES	<p>Only fully-processed instances can be removed. An instance is considered fully processed if every sample for the instance has been processed by the application. A sample is considered processed by the application depending on the <code>dds::core::policy::Reliability::kind</code> (p. 1876):</p> <ul style="list-style-type: none"> • <code>dds::core::policy::ReliabilityKind_def::RELIABLE</code> (p. 1881) (depends on the <code>rti::core::policy::AcknowledgmentKind_def</code> (p. 585)): <ul style="list-style-type: none"> – <code>rti::core::policy::AcknowledgmentKind_def::PROTOCOL</code> (p. 585) or <code>rti::core::policy::AcknowledgmentKind_def::↔ APPLICATION_AUTO</code> (p. 586): The sample is considered processed when it has been read or taken by the application and <code>return_loan</code> has been called. – <code>rti::core::policy::AcknowledgmentKind_def::↔ APPLICATION_EXPLICIT</code> (p. 586): The sample is considered processed when the subscribing application has explicitly acknowledged the DDS sample, the <code>AppAckConf</code> has been received, and the application has called <code>return_loan</code>. • <code>dds::core::policy::ReliabilityKind_def::BEST Effort</code> (p. 1881): All samples are considered processed when they have been read or taken by the application and <code>return_loan</code> has been called.
ANY_INSTANCE	<p>Any instance can be removed. Instances can be replaced regardless of whether the subscribing application has processed all of the samples. Samples that have not been processed will be removed.</p>

8.55 `dds::sub::DataReaderListener< T >` Class Template Reference

The `Listener` (p. 1381) to notify status changes for a `dds::sub::DataReader` (p. 756).

```
#include <dds/sub/DataReaderListener.hpp>
```

Inheritance diagram for `dds::sub::DataReaderListener< T >`:

Public Member Functions

- virtual void `on_requested_deadline_missed` (`DataReader< T >` &reader, const `dds::core::status::↔ RequestedDeadlineMissedStatus` &status)=0

Handles the `dds::core::status::RequestedDeadlineMissedStatus` (p. 1904) status.

- virtual void `on_requested_incompatible_qos` (`DataReader< T > &reader`, const `dds::core::status::RequestedIncompatibleQosStatus &status`)=0

Handles the `dds::core::status::RequestedIncompatibleQosStatus` (p. 1905) status.

- virtual void `on_sample_rejected` (`DataReader< T > &reader`, const `dds::core::status::SampleRejectedStatus &status`)=0

Handles the `dds::core::status::SampleRejectedStatus` (p. 2022) status.

- virtual void `on_liveliness_changed` (`DataReader< T > &reader`, const `dds::core::status::LivelinessChangedStatus &status`)=0

Handles the `dds::core::status::LivelinessChangedStatus` (p. 1395) status.

- virtual void `on_data_available` (`DataReader< T > &reader`)=0

Called when one or more new data samples have been received.

- virtual void `on_subscription_matched` (`DataReader< T > &reader`, const `dds::core::status::SubscriptionMatchStatus &status`)=0

Handles the `dds::core::status::SubscriptionMatchStatus` (p. 2144) status.

- virtual void `on_sample_lost` (`DataReader< T > &reader`, const `dds::core::status::SampleLostStatus &status`)=0

Handles the `dds::core::status::SampleLostStatus` (p. 2010) status.

8.55.1 Detailed Description

```
template<typename T>
```

```
class dds::sub::DataReaderListener< T >
```

The **Listener** (p. 1381) to notify status changes for a `dds::sub::DataReader` (p. 756).

Entity:

`dds::sub::DataReader` (p. 756)

Status:

```
dds::core::status::StatusMask::data_available() (p. 2090);
dds::core::status::StatusMask::liveliness_changed() (p. 2090), dds::core::status::LivelinessChangedStatus (p. 1395);
dds::core::status::StatusMask::requested_deadline_missed() (p. 2087), dds::core::status::RequestedDeadlineMissedStatus (p. 1904);
dds::core::status::StatusMask::requested_incompatible_qos() (p. 2088), dds::core::status::RequestedIncompatibleQosStatus (p. 1905);
dds::core::status::StatusMask::sample_lost() (p. 2088), dds::core::status::SampleLostStatus (p. 2010);
dds::core::status::StatusMask::sample_rejected() (p. 2089), dds::core::status::SampleRejectedStatus (p. 2022);
dds::core::status::StatusMask::subscription_matched() (p. 2091), dds::core::status::SubscriptionMatchStatus (p. 2144);
```

See also

Status Kinds (p. 229)

Operations Allowed in Listener Callbacks (p. 1383)

See also

NoOpDataReaderListener (p. 1570)

8.55.2 Member Function Documentation

8.55.2.1 on_requested_deadline_missed()

```
template<typename T >
virtual void dds::sub::DataReaderListener< T >::on_requested_deadline_missed (
    DataReader< T > & reader,
    const dds::core::status::RequestedDeadlineMissedStatus & status ) [pure virtual]
```

Handles the `dds::core::status::RequestedDeadlineMissedStatus` (p. 1904) status.

Implemented in `dds::sub::NoOpDataReaderListener< RequestType >` (p. 1571), and `dds::sub::NoOpDataReaderListener< T >` (p. 1571).

8.55.2.2 on_requested_incompatible_qos()

```
template<typename T >
virtual void dds::sub::DataReaderListener< T >::on_requested_incompatible_qos (
    DataReader< T > & reader,
    const dds::core::status::RequestedIncompatibleQosStatus & status ) [pure virtual]
```

Handles the `dds::core::status::RequestedIncompatibleQosStatus` (p. 1905) status.

Implemented in `dds::sub::NoOpDataReaderListener< RequestType >` (p. 1571), and `dds::sub::NoOpDataReaderListener< T >` (p. 1571).

8.55.2.3 on_sample_rejected()

```
template<typename T >
virtual void dds::sub::DataReaderListener< T >::on_sample_rejected (
    DataReader< T > & reader,
    const dds::core::status::SampleRejectedStatus & status ) [pure virtual]
```

Handles the `dds::core::status::SampleRejectedStatus` (p. 2022) status.

Implemented in `dds::sub::NoOpDataReaderListener< RequestType >` (p. 1571), and `dds::sub::NoOpDataReaderListener< T >` (p. 1571).

8.55.2.4 on_liveliness_changed()

```
template<typename T >
virtual void dds::sub::DataReaderListener< T >::on_liveliness_changed (
    DataReader< T > & reader,
    const dds::core::status::LivelinessChangedStatus & status ) [pure virtual]
```

Handles the `dds::core::status::LivelinessChangedStatus` (p. 1395) status.

Implemented in `dds::sub::NoOpDataReaderListener< RequestType >` (p. 1571), and `dds::sub::NoOpDataReaderListener< T >` (p. 1571).

8.55.2.5 on_data_available()

```
template<typename T >
virtual void dds::sub::DataReaderListener< T >::on_data_available (
    DataReader< T > & reader ) [pure virtual]
```

Called when one or more new data samples have been received.

Implemented in `dds::sub::NoOpDataReaderListener< RequestType >` (p. 1572), and `dds::sub::NoOpDataReaderListener< T >` (p. 1572).

8.55.2.6 on_subscription_matched()

```
template<typename T >
virtual void dds::sub::DataReaderListener< T >::on_subscription_matched (
    DataReader< T > & reader,
    const dds::core::status::SubscriptionMatchedException & status ) [pure virtual]
```

Handles the `dds::core::status::SubscriptionMatchedException` (p. 2144) status.

Implemented in `dds::sub::NoOpDataReaderListener< RequestType >` (p. 1572), and `dds::sub::NoOpDataReaderListener< T >` (p. 1572).

8.55.2.7 on_sample_lost()

```
template<typename T >
virtual void dds::sub::DataReaderListener< T >::on_sample_lost (
    DataReader< T > & reader,
    const dds::core::status::SampleLostStatus & status ) [pure virtual]
```

Handles the `dds::core::status::SampleLostStatus` (p. 2010) status.

Implemented in `dds::sub::NoOpDataReaderListener< RequestType >` (p. 1572), and `dds::sub::NoOpDataReaderListener< T >` (p. 1572).

8.56 rti::core::policy::DataReaderProtocol Class Reference

8.56.1 Detailed Description

<<**extension**>> (p. 156) Configures DataReader-specific aspects of the RTPS protocol

DDS has a standard protocol for packet (user and meta data) exchange between applications using DDS for communications. This QoS policy and **rti::core::policy::DataReaderProtocol** (p. 836) give you control over configurable portions of the protocol, including the configuration of the reliable data delivery mechanism of the protocol on a per DataWriter or DataReader basis.

These configuration parameters control timing, timeouts, and give you the ability to tradeoff between speed of data loss detection and repair versus network and CPU bandwidth used to maintain reliability.

It is important to tune the reliability protocol (on a per **dds::pub::DataWriter** (p. 908) and **dds::sub::DataReader** (p. 756) basis) to meet the requirements of the end-user application so that data can be sent between DataWriters and DataReaders in an efficient and optimal manner in the presence of data loss.

You can also use this QoS policy to control how RTI Connnext responds to "slow" reliable DataReaders or ones that disconnect or are otherwise lost. See **dds::core::policy::Reliability** (p. 1873) for more information on the per-DataReader/DataWriter reliability configuration. **dds::core::policy::History** (p. 1346) and **dds::core::policy::ResourceLimits** (p. 1921) also play an important role in the DDS reliable protocol.

This QoS policy is an extension to the DDS standard.

Entity:

dds::sub::DataReader (p. 756)

Properties:

RxO (p. 307) = N/A

Changeable (p. 307) = **NO** (p. 307)

8.56.2 Constructor & Destructor Documentation

8.56.2.1 DataReaderProtocol()

```
rti::core::policy::DataReaderProtocol::DataReaderProtocol ( ) [inline]
```

Creates the default policy.

8.56.3 Member Function Documentation

8.56.3.1 virtual_guid() [1/2]

```
DataReaderProtocol & rti::core::policy::DataReaderProtocol::virtual_guid (
    const rti::core::Guid & the_virtual_guid )
```

The virtual GUID (Global Unique Identifier).

The virtual GUID is used to uniquely identify different incarnations of the same **dds::sub::DataReader** (p. 756).

The association between a **dds::sub::DataReader** (p. 756) and its persisted state is done using the virtual GUID.

[default] **rti::core::Guid::automatic()** (p. 1341)

8.56.3.2 virtual_guid() [2/2]

```
rti::core::Guid rti::core::policy::DataReaderProtocol::virtual_guid ( ) const
```

Getter (see setter with the same name)

8.56.3.3 rtps_object_id() [1/2]

```
DataReaderProtocol & rti::core::policy::DataReaderProtocol::rtps_object_id (
    uint32_t the_rtps_object_id )
```

The RTPS Object ID.

This value is used to determine the RTPS object ID of a data reader according to the DDS-RTPS Interoperability Wire Protocol.

Only the last 3 bytes are used; the most significant byte is ignored.

If the default value is specified, RTI Connexx will automatically assign the object ID based on a counter value (per participant) starting at 0x00800000. That value is incremented for each new data reader.

A `rtps_object_id` value in the interval [0x00800000,0x00ffffff] may collide with the automatic values assigned by RTI Connexx. In those cases, the recommendation is not to use automatic object ID assignment.

[default] **rti::core::policy::WireProtocol::RTPS_AUTO_ID** (p. 2341)

[range] [0,0x00ffffff]

8.56.3.4 rtps_object_id() [2/2]

```
uint32_t rti::core::policy::DataReaderProtocol::rtps_object_id ( ) const
```

Getter (see setter with the same name)

8.56.3.5 expects_inline_qos() [1/2]

```
DataReaderProtocol & rti::core::policy::DataReaderProtocol::expects_inline_qos (
    bool the_expects_inline_qos )
```

Specifies whether this DataReader expects inline QoS with every sample.

RTI Connex DataWriters do not match with DataReaders that set this field to true (because RTI Connex DataWriters do not support sending inline QoS), but here is how the field is meant to be used:

In RTI Connex, a **dds::sub::DataReader** (p. 756) nominally relies on **Discovery** (p. 1029) to propagate QoS on a matched **dds::pub::DataWriter** (p. 908).

Alternatively, a **dds::sub::DataReader** (p. 756) may get information on a matched **dds::pub::DataWriter** (p. 908) through QoS sent inline with a sample.

Asserting **rti::core::policy::DataReaderProtocol::expects_inline_qos** (p. 838) indicates to a matching **dds::pub::DataWriter** (p. 908) that this **dds::sub::DataReader** (p. 756) expects to receive inline QoS with every sample. The complete set of inline QoS that a **dds::pub::DataWriter** (p. 908) may send inline is specified by the Real-Time Publish-Subscribe (RTPS) Wire Interoperability Protocol.

Because RTI Connex **dds::pub::DataWriter** (p. 908) and **dds::sub::DataReader** (p. 756) cache **Discovery** (p. 1029) information, inline QoS are largely redundant and thus unnecessary. Only for other stateless implementations whose **dds::sub::DataReader** (p. 756) does not cache **Discovery** (p. 1029) information is inline QoS necessary.

Also note that inline QoS are additional wire-payload that consume additional bandwidth and serialization and deserialization time.

[default] false

8.56.3.6 expects_inline_qos() [2/2]

```
bool rti::core::policy::DataReaderProtocol::expects_inline_qos ( ) const
```

Getter (see setter with the same name)

8.56.3.7 disable_positive_acks() [1/2]

```
DataReaderProtocol & rti::core::policy::DataReaderProtocol::disable_positive_acks (
    bool the_disable_positive_acks )
```

Whether the reader sends positive acknowledgements to writers.

If set to true, the reader does not send positive acknowledgments (ACKs) in response to Heartbeat messages. The reader will send negative acknowledgments (NACKs) when a Heartbeat advertises samples that it has not received.

Otherwise, if set to false (the default), the reader will send ACKs to writers that expect ACKs (**rti::core::policy::DataWriterProtocol::disable_positive_acks** (p. 982) = false) and it will not send ACKs to writers that disable ACKs (**rti::core::policy::DataWriterProtocol::disable_positive_acks** (p. 982) = true)

[default] false

8.56.3.8 disable_positive_acks() [2/2]

```
bool rti::core::policy::DataReaderProtocol::disable_positive_acks ( ) const
```

Getter (see setter with the same name)

8.56.3.9 propagate_dispose_of_unregistered_instances() [1/2]

```
DataReaderProtocol & rti::core::policy::DataReaderProtocol::propagate_dispose_of_unregistered_↔
instances (
    bool the_propagate_dispose_of_unregistered_instances )
```

Indicates whether or not an instance can move to the **dds::sub::status::InstanceState::not_alive_disposed()** (p. 1361) state without being in the **dds::sub::status::InstanceState::alive()** (p. 1361) state.

This field only applies to keyed readers.

When the field is set to true, the DataReader will receive dispose notifications even if the instance is not alive.

To guarantee the key availability through the usage of the API **dds::sub::DataReader::key_value** (p. 780), this option should be used in combination with setting **rti::core::policy::DataWriterProtocol::serialize_key_with_dispose** (p. 983) on the DataWriter to true.

[default] false

8.56.3.10 propagate_dispose_of_unregistered_instances() [2/2]

```
bool rti::core::policy::DataReaderProtocol::propagate_dispose_of_unregistered_instances ( ) const
```

Getter (see setter with the same name)

8.56.3.11 propagate_unregister_of_disposed_instances() [1/2]

```
DataReaderProtocol & rti::core::policy::DataReaderProtocol::propagate_unregister_of_disposed_↔
instances (
    bool the_propagate_unregister_of_disposed_instances )
```

Indicates whether or not an instance can move to the **dds::sub::status::InstanceState::not_alive_no_writers()** (p. 1361) state directly from the **dds::sub::status::InstanceState::not_alive_disposed()** (p. 1361).

This field only applies to keyed readers.

When the field is set to true, the DataReader will receive unregister notifications even if the instance is not alive.

[default] false

8.56.3.12 propagate_unregister_of_disposed_instances() [2/2]

```
bool rti::core::policy::DataReaderProtocol::propagate_unregister_of_disposed_instances ( ) const
```

Getter (see setter with the same name)

8.56.3.13 rtps_reliable_reader() [1/3]

```
DataReaderProtocol & rti::core::policy::DataReaderProtocol::rtps_reliable_reader (
    const rti::core::RtpsReliableReaderProtocol & the_rtps_reliable_reader )
```

RTPS protocol-related configuration settings for the RTPS reliable reader associated with a **dds::sub::DataReader** (p. 756). This parameter only has effect if the reader is configured with **dds::core::policy::ReliabilityKind_def::↔ RELIABLE** (p. 1881) **dds::core::policy::ReliabilityKind_def** (p. 1879).

For details, refer to the **rti::core::RtpsReliableReaderProtocol** (p. 1934)

[default] See **rti::core::RtpsReliableReaderProtocol** (p. 1934)

8.56.3.14 rtps_reliable_reader() [2/3]

```
const rti::core::RtpsReliableReaderProtocol & rti::core::policy::DataReaderProtocol::rtps_↔
reliable_reader ( ) const
```

Gets the reliable protocol settings by const reference (see setter)

8.56.3.15 rtps_reliable_reader() [3/3]

```
rti::core::RtpsReliableReaderProtocol & rti::core::policy::DataReaderProtocol::rtps_reliable_↔
reader ( )
```

Gets the reliable protocol setting by reference (see setter)

8.57 rti::core::status::DataReaderProtocolStatus Class Reference

<<**extension**>> (p. 156) Information about the status **dds::core::status::StatusMask::datareader_protocol()** (p. 2094)

```
#include <Status.hpp>
```

Inherits **rti::core::NativeValueType**< T, NATIVE_T, ADAPTER >.

The number of samples dropped by the DataReader due to received window is full and the sample is out-of-order.

8.57.1 Detailed Description

<<*extension*>> (p. 156) Information about the status `dds::core::status::StatusMask::datareader_protocol()` (p. 2094)

Entity:

`dds::sub::DataReader` (p. 756)

8.57.2 Member Function Documentation

8.57.2.1 `received_sample_count()`

```
EventCount64 rti::core::status::DataReaderProtocolStatus::received_sample_count ( ) const [inline]
```

The number of samples received by a DataReader.

Depending on how the `rti::core::status::DataReaderProtocol` was obtained this may count samples coming from a specific DataWriter or from all the DataWriters that are matched with the DataReader.

If the `rti::core::status::DataReaderProtocol` is obtained using the `dds::sub::DataReader::datareader_protocol_status` (p. 790) operation then it will count samples from any DataWriter. If the `DataReaderProtocolStatus` (p. 841) is obtained using the `dds::sub::DataReader::matched_publication_datareader_protocol_status` (p. 790) then it will count the samples for the DataWriter specified as a parameter to the function.

Duplicate samples arriving from the DataWriter(s) (e.g. via multiple network paths) are detected prior to increasing this counter. The duplicate samples are counted by `rti::core::status::DataReaderProtocol::duplicate_sample_count`.

If the DataReader has specified a ContentFilter the received samples that do not pass the filter are part of this counter. The filtered samples are counted by `rti::core::status::DataReaderProtocol::filtered_sample_count`.

Samples rejected because they do not fit on the DataReader Queue are also part of this counter.

Note the `received_sample_count` counts samples received from all DataWriters and it does not necessarily match the number of samples accepted into the DataReader Queue. This is because:

- Samples can also be inserted into the DataReader Queue by lifecycle events that are locally detected like an instance becoming not alive as a result of DataWriters leaving the network.
- Samples can be filtered out due to ContentFilter or TimeFilter
- Samples can be rejected because there is no space in DataReader Queue

Note that when data is fragmented, this statistic is updated when all of the fragments required to reassemble a sample are received, not when individual fragments are received.

8.57.2.2 received_sample_bytes()

```
EventCount64 rti::core::status::DataReaderProtocolStatus::received_sample_bytes ( ) const [inline]
```

The number of bytes received by a DataReader.

See also

```
rti::core::status::DataReaderProtocol::received_sample_count
```

Note that when data is fragmented, this statistic is updated upon the receipt of each fragment, not when a sample is reassembled.

8.57.2.3 duplicate_sample_count()

```
EventCount64 rti::core::status::DataReaderProtocolStatus::duplicate_sample_count ( ) const [inline]
```

The number of samples from a remote DataWriter received, not for the first time, by a local DataReader.

Such samples can be redundant, out-of-order, etc. and are not stored in the reader's queue.

8.57.2.4 duplicate_sample_bytes()

```
EventCount64 rti::core::status::DataReaderProtocolStatus::duplicate_sample_bytes ( ) const [inline]
```

The number of samples from a remote DataWriter received, not for the first time, by a local DataReader.

Such samples can be redundant, out-of-order, etc. and are not stored in the reader's queue.

8.57.2.5 filtered_sample_count()

```
EventCount64 rti::core::status::DataReaderProtocolStatus::filtered_sample_count ( ) const [inline]
```

[DEPRECATED]. See: [rti::core::status::DataReaderCacheStatus::time_based_filter_dropped_sample_count](#) (p. 826) [rti::core::status::DataReaderCacheStatus::content_filter_dropped_sample_count](#) (p. 826)

8.57.2.6 filtered_sample_bytes()

```
EventCount64 rti::core::status::DataReaderProtocolStatus::filtered_sample_bytes ( ) const [inline]
```

[DEPRECATED]. See: [rti::core::status::DataReaderCacheStatus::time_based_filter_dropped_sample_count](#) (p. 826) [rti::core::status::DataReaderCacheStatus::content_filter_dropped_sample_count](#) (p. 826)

8.57.2.7 received_heartbeat_count()

```
EventCount64 rti::core::status::DataReaderProtocolStatus::received_heartbeat_count ( ) const  
[inline]
```

The number of Heartbeats from a remote DataWriter received by a local DataReader.

8.57.2.8 received_heartbeat_bytes()

```
EventCount64 rti::core::status::DataReaderProtocolStatus::received_heartbeat_bytes ( ) const  
[inline]
```

The number of bytes of Heartbeats from a remote DataWriter received by a local DataReader.

8.57.2.9 sent_ack_count()

```
EventCount64 rti::core::status::DataReaderProtocolStatus::sent_ack_count ( ) const [inline]
```

The number of ACKs sent from a local DataReader to a matching remote DataWriter.

8.57.2.10 sent_ack_bytes()

```
EventCount64 rti::core::status::DataReaderProtocolStatus::sent_ack_bytes ( ) const [inline]
```

The number of bytes of ACKs sent from a local DataReader to a matching remote DataWriter.

8.57.2.11 sent_nack_count()

```
EventCount64 rti::core::status::DataReaderProtocolStatus::sent_nack_count ( ) const [inline]
```

The number of NACKs sent from a local DataReader to a matching remote DataWriter.

8.57.2.12 sent_nack_bytes()

```
EventCount64 rti::core::status::DataReaderProtocolStatus::sent_nack_bytes ( ) const [inline]
```

The number of bytes of NACKs sent from a local DataReader to a matching remote DataWriter.

8.57.2.13 received_gap_count()

```
EventCount64 rti::core::status::DataReaderProtocolStatus::received_gap_count ( ) const [inline]
```

The number of GAPS received from remote DataWriter to this DataReader.

8.57.2.14 received_gap_bytes()

```
EventCount64 rti::core::status::DataReaderProtocolStatus::received_gap_bytes ( ) const [inline]
```

The number of bytes of GAPS received from remote DataWriter to this DataReader.

8.57.2.15 rejected_sample_count()

```
EventCount64 rti::core::status::DataReaderProtocolStatus::rejected_sample_count ( ) const [inline]
```

The number of times a sample is rejected because it cannot be accepted by a reliable DataReader.

Samples rejected by a reliable DataReader will be NACKed, and they will have to be resent by the DataWriter if they are still available in the DataWriter queue.

This counter will always be 0 when using **dds::core::policy::ReliabilityKind_def::BEST Effort** (p. 1881).

8.57.2.16 first_available_sample_sequence_number()

```
rti::core::SequenceNumber rti::core::status::DataReaderProtocolStatus::first_available_sample_↔  
sequence_number ( ) const [inline]
```

Sequence number of the first available sample in a matched DataWriters reliability queue.

Applicable only for reliable DataReaders, and when retrieving matched DataWriter statuses.

Updated upon receiving Heartbeat submessages from a matched reliable DataWriter.

8.57.2.17 last_available_sample_sequence_number()

```
rti::core::SequenceNumber rti::core::status::DataReaderProtocolStatus::last_available_sample_↔  
sequence_number ( ) const [inline]
```

Sequence number of the last available sample in a matched Datawriter's reliability queue.

Applicable only for reliable DataReaders, and when retrieving matched DataWriter statuses.

Updated upon receiving Heartbeat submessages from a matched reliable DataWriter.

8.57.2.18 last_committed_sample_sequence_number()

```
rti::core::SequenceNumber rti::core::status::DataReaderProtocolStatus::last_committed_sample_↔  
sequence_number ( ) const [inline]
```

Sequence number of the newest sample received from the matched DataWriter committed to the DataReader's queue.

Applicable only when retrieving matched DataWriter statuses.

For best-effort DataReaders, this is the sequence number of the latest sample received.

For reliable DataReaders, this is the sequence number of the latest sample that is available to be read or taken from the DataReader's queue.

8.57.2.19 uncommitted_sample_count()

```
int32_t rti::core::status::DataReaderProtocolStatus::uncommitted_sample_count ( ) const [inline]
```

Number of received samples that are not yet available to be read or taken, due to being received out of order.

Applicable only when retrieving matched DataWriter statuses.

8.57.2.20 received_fragment_count()

```
int64_t rti::core::status::DataReaderProtocolStatus::received_fragment_count ( ) const [inline]
```

The number of DATA_FRAG messages that have been received by this DataReader.

This statistic is incremented upon the receipt of each DATA_FRAG message. Fragments from duplicate samples do not count towards this statistic. Applicable only when data is fragmented.

8.57.2.21 dropped_fragment_count()

```
int64_t rti::core::status::DataReaderProtocolStatus::dropped_fragment_count ( ) const [inline]
```

The number of DATA_FRAG messages that have been dropped by a DataReader.

This statistic does not include malformed fragments. Applicable only when data is fragmented.

8.57.2.22 reassembled_sample_count()

```
int64_t rti::core::status::DataReaderProtocolStatus::reassembled_sample_count ( ) const [inline]
```

The number of fragmented samples that have been reassembled by a DataReader.

This statistic is incremented when all of the fragments which are required to reassemble an entire sample have been received. Applicable only when data is fragmented.

8.57.2.23 sent_nack_fragment_count()

```
int64_t rti::core::status::DataReaderProtocolStatus::sent_nack_fragment_count ( ) const [inline]
```

The number of NACK fragments that have been sent from a DataReader to a DataWriter.

NACK FRAG RTPS messages are sent when large data is used in conjunction with reliable communication. They have the same properties as NACK messages, but instead of applying to samples, they apply to fragments. Applicable only when data is fragmented.

8.57.2.24 sent_nack_fragment_bytes()

```
int64_t rti::core::status::DataReaderProtocolStatus::sent_nack_fragment_bytes ( ) const [inline]
```

The number of NACK fragment bytes that have been sent from a DataReader to a DataWriter.

NACK FRAG RTPS messages are sent when large data is used in conjunction with reliable communication. They have the same properties as NACK messages, but instead of applying to samples, they apply to fragments. Applicable only when data is fragmented.

8.57.2.25 out_of_range_rejected_sample_count()

```
int64_t rti::core::status::DataReaderProtocolStatus::out_of_range_rejected_sample_count ( ) const [inline]
```

The number of samples dropped by the DataReader due to received window is full and the sample is out-of-order.

When using `dds::core::policy::ReliabilityKind_def::RELIABLE` (p. 1881); if the DataReader received samples out-of-order, they are stored internally until the missing samples are received. The number of out-of-order samples that the DataReader can keep is set by `rti::core::RtpsReliableReaderProtocol::receive_window_size` (p. 1938). When the received window is full any out-of-order sample received will be dropped.

8.58.1 Detailed Description

<<value-type>> (p. 152) Container of the QoS policies that a **dds::sub::DataReader** (p. 756) supports

8.58.2 DataReaderQos policies

A `DataReaderQos` (p. 848) contains the following policies:

- `dds::core::policy::Durability` (p. 1181),
- `dds::core::policy::Deadline` (p. 1020),
- `dds::core::policy::LatencyBudget` (p. 1375),
- `dds::core::policy::Liveliness` (p. 1389),
- `dds::core::policy::Reliability` (p. 1873),
- `dds::core::policy::DestinationOrder` (p. 1022),
- `dds::core::policy::History` (p. 1346),
- `dds::core::policy::ResourceLimits` (p. 1921),
- `dds::core::policy::UserData` (p. 2292),
- `dds::core::policy::Ownership` (p. 1630),
- `dds::core::policy::TimeBasedFilter` (p. 2174),
- `dds::core::policy::ReaderDataLifecycle` (p. 1862),
- `dds::core::policy::DataRepresentation` (p. 883),
- `dds::core::policy::TransportPriority` (p. 2255),
- `dds::core::policy::TypeConsistencyEnforcement` (p. 2265),
- `dds::core::policy::DataTag` (p. 902),
- `rti::core::policy::DataReaderResourceLimits` (p. 856),
- `rti::core::policy::DataReaderProtocol` (p. 836),
- `rti::core::policy::TransportSelection` (p. 2257),
- `rti::core::policy::TransportUnicast` (p. 2259),
- `rti::core::policy::TransportMulticast` (p. 2247),
- `rti::core::policy::Property` (p. 1695),
- `rti::core::policy::Service` (p. 2057),
- `rti::core::policy::Availability` (p. 654),
- `rti::core::policy::EntityName` (p. 1275),
- `rti::core::policy::TypeSupport` (p. 2275)

To get or set policies use the **policy()** (p. 853) getters and setters or operator << (see **examples** (p. 392)).

You must set certain members in a consistent manner:

dds::core::policy::Deadline (p. 1020) .period >= **dds::core::policy::TimeBasedFilter** (p. 2174) .minimum_↔ separation

dds::core::policy::History (p. 1346) .depth <= **dds::core::policy::ResourceLimits** (p. 1921) .max_samples_per_↔ instance

dds::core::policy::ResourceLimits (p. 1921) .max_samples_per_instance <= **dds::core::policy::ResourceLimits** (p. 1921) .max_samples **dds::core::policy::ResourceLimits** (p. 1921) .initial_samples <= **dds::core::policy::↔ ResourceLimits** (p. 1921) .max_samples

dds::core::policy::ResourceLimits (p. 1921) .initial_instances <= **dds::core::policy::ResourceLimits** (p. 1921) .max_instances

rti::core::policy::DataReaderResourceLimits (p. 856) .initial_remote_writers_per_instance <= **rti::core::policy::↔ DataReaderResourceLimits** (p. 856) .max_remote_writers_per_instance

rti::core::policy::DataReaderResourceLimits (p. 856) .initial_infos <= **rti::core::policy::DataReaderResource↔ Limits** (p. 856) .max_infos

rti::core::policy::DataReaderResourceLimits (p. 856) .max_remote_writers_per_instance <= **rti::core::policy::↔ DataReaderResourceLimits** (p. 856) .max_remote_writers

rti::core::policy::DataReaderResourceLimits (p. 856) .max_samples_per_remote_writer <= **dds::core::policy::↔ ResourceLimits** (p. 1921) .max_samples

length of **dds::core::policy::UserData** (p. 2292) .value <= **dds::domain::qos::DomainParticipantQos::resource_limits** .reader_user_data_max_length

If any of the above are not true, **dds::sub::DataReader::qos(const dds::sub::qos::DataReaderQos&)** (p. 785) will fail with **dds::core::InconsistentPolicyError** (p. 1354) and the **dds::sub::DataReader** (p. 756) constructors will fail with **dds::core::Error** (p. 1284)

Qos Use Cases (p. 391)

8.58.3 Constructor & Destructor Documentation

8.58.3.1 DataReaderQos() [1/2]

```
dds::sub::qos::DataReaderQos::DataReaderQos ( )
```

Creates a **DataReaderQos** (p. 848) with the default value for each policy.

Note

If you configure Qos in XML, obtain the default value from the default QosProvider, since it can be overridden by configuration:

```
DataReaderQos reader_qos = dds::core::QosProvider::Default().datareader_qos();
```

8.58.3.2 DataReaderQos() [2/2]

```
dds::sub::qos::DataReaderQos::DataReaderQos (
    const dds::topic::qos::TopicQos & topic_qos )
```

Creates a **DataReaderQos** (p. 848) with the given TopicQos.

A **dds::topic::qos::TopicQos** (p. 2213) contains a subset of the policies of a **DataReaderQos** (p. 848). This constructor copies those common policies into this instance while initializing the policies that are only defined in **DataReaderQos** (p. 848) to their default values.

Parameters

<i>topic_qos</i>	The TopicQos bring copied.
------------------	----------------------------

Example:

```
DataReaderQos reader_qos(topic_qos());
```

8.58.4 Member Function Documentation

8.58.4.1 operator=()

```
DataReaderQos & dds::sub::qos::DataReaderQos::operator= (
    const dds::topic::qos::TopicQos & topic_qos ) [inline]
```

Copies into this **DataReaderQos** (p. 848) those policies that are also in TopicQos.

A **dds::topic::qos::TopicQos** (p. 2213) contains a subset of the policies of a **DataReaderQos** (p. 848). This assignment operator copies those common policies into this instance while leaving the policies that are only defined in **DataReaderQos** (p. 848) unaltered.

Parameters

<i>topic_qos</i>	The TopicQos to copy the common policies from.
------------------	--

For example:

```
// Load a TopicQos from a Qos profile
TopicQos topic_qos = dds::core::QosProvider::Default().topic_qos("MyLibrary::MyProfile");
// Create a DataReaderQos with the default policies
DataReaderQos reader_qos = dds::core::QosProvider::Default().datareader_qos();
// Overwrite the policies that are also defined in topic_qos
reader_qos = topic_qos;
```

8.58.4.2 policy() [1/3]

```
template<typename POLICY >
const POLICY & dds::sub::qos::DataReaderQos::policy ( ) const
```

Gets a QoS policy by const reference.

Template Parameters

<i>Policy</i>	One of the DataReaderQos policies (p. 850)
---------------	---

See also

Setting Qos Values (p. 392)

8.58.4.3 policy() [2/3]

```
template<typename POLICY >
POLICY & dds::sub::qos::DataReaderQos::policy ( )
```

Gets a QoS policy by reference.

Template Parameters

<i>Policy</i>	One of the DataReaderQos policies (p. 850)
---------------	---

See also

Setting Qos Values (p. 392)

8.58.4.4 policy() [3/3]

```
template<typename Policy >
DataReaderQos & dds::sub::qos::DataReaderQos::policy (
    const Policy & p ) [inline]
```

Sets a policy.

See also

policy() (p. 853)

Setting Qos Values (p. 392)

8.58.4.5 operator<<()

```
template<typename Policy >
DataReaderQos & dds::sub::qos::DataReaderQos::operator<< (
    const Policy & p ) [inline]
```

Sets a policy.

[policy\(\)](#) (p. 853)

[Setting Qos Values](#) (p. 392)

8.58.4.6 operator>>()

```
template<typename Policy >
const DataReaderQos & dds::sub::qos::DataReaderQos::operator>> (
    Policy & p ) const [inline]
```

Copies the values of a policy.

Parameters

<i>p</i>	The destination where to copy the current value of the Policy
----------	---

See also

[policy\(\)](#) (p. 853)

[Setting Qos Values](#) (p. 392)

8.58.5 Friends And Related Function Documentation

8.58.5.1 to_string() [1/3]

```
std::string to_string (
    const DataReaderQos & qos,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() ) [related]
```

<<**extension**>> (p. 156) Obtains a string representation of the **dds::sub::qos::DataReaderQos** (p. 848)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>format</i>	The optional print format used to format the output string.

The several `to_string` overloads allow formatting the output and printing only the differences with respect to another Qos object.

```
DataReaderQos qos;
// When no QosPrintFormat is supplied, the default is used. Similarly, since
// no base profile has been specified we will only print the differences
// with respect to the documented default for DataReaderQos
std::string str = to_string(qos);
// In this overload we are specifying the print format used to format the output
// string.
QosPrintFormat format; // ...;
str = to_string(qos, format);
// Here, the differences between qos and base will be included in the output
// string. If the two qos objects are the same, the resulting string will
// be empty.
DataReaderQos base; // ...;
str = to_string(qos, base);
// We could also specify the format at this point
str = to_string(qos, base, format);
// Instead of supplying a base profile, the sentinel value qos_print_all can
// be supplied. This will result in the entire Qos object being printed (as
// opposed to only the differences with respect to a base qos).
str = to_string(qos, qos_print_all);
```

This overload uses the default print format and only prints the differences between qos and the documented default.

Returns

The string representation of the qos

8.58.5.2 to_string() [2/3]

```
std::string to_string (
    const DataReaderQos & qos,
    const DataReaderQos & base,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() ) [related]
```

<<**extension**>> (p. 156) Obtains a string representation of the `dds::sub::qos::DataReaderQos` (p. 848)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>base</i>	The base qos. Only the differences between base and qos are included in the output string. If you want to print everything within the QoS, use the overload that accepts a <code>rti::core::qos_print_all_t</code> (p. 1746).
<i>format</i>	The optional print format used to format the output string.

This overload prints the differences between qos and base. If no print format is specified, the default will be used.

Returns

The string representation of the qos

8.58.5.3 to_string() [3/3]

```
std::string to_string (
    const DataReaderQos & qos,
    const rti::core::qos_print_all_t & qos_print_all,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() ) [related]
```

<<**extension**>> (p. 156) Obtains a string representation of the **dds::sub::qos::DataReaderQos** (p. 848)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>qos_print_all</i>	The sentinel value indicating that the entire QoS should be converted to a string. The other overloads of this API only print the differences with respect to a base profile, or to the documented default.
<i>format</i>	The optional print format used to format the output string.

This overload prints all of the policies within qos. If no print format is specified, the default will be used.

The only valid value for the qos_print_all argument is **rti::core::qos_print_all** (p. 238)

For example:

```
to_string(qos, rti::core::qos_print_all);
```

Returns

The string representation of the qos

8.58.5.4 operator<<()

```
std::ostream & operator<< (
    std::ostream & out,
    const rti::sub::qos::DataReaderQos & qos ) [related]
```

<<**extension**>> (p. 156) Prints a **dds::sub::qos::DataReaderQos** (p. 848) to an output stream.

8.59 rti::core::policy::DataReaderResourceLimits Class Reference

<<**extension**>> (p. 156) Configures the memory usage of a **dds::pub::DataReader**

```
#include <rti/core/policy/CorePolicy.hpp>
```

Getter (see setter with the same name)
- **DataReaderResourceLimits & max_samples_per_read** (int32_t the_max_samples_per_read)
*The maximum number of data samples that the application can receive from the middleware in a single call to **dds::sub::DataReader::read** (p. 773) or **dds::sub::DataReader::take** (p. 774). If more data exists in the middleware, the application will need to issue multiple read/take calls.*

- `int32_t max_samples_per_read () const`
Getter (see setter with the same name)
- `DataReaderResourceLimits & disable_fragmentation_support (bool the_disable_fragmentation_support)`
Determines whether the `dds::sub::DataReader` (p. 756) can receive fragmented samples.
- `bool disable_fragmentation_support () const`
Getter (see setter with the same name)
- `DataReaderResourceLimits & max_fragmented_samples (int32_t the_max_fragmented_samples)`
The maximum number of samples for which the `dds::sub::DataReader` (p. 756) may store fragments at a given point in time.
- `int32_t max_fragmented_samples () const`
Getter (see setter with the same name)
- `DataReaderResourceLimits & initial_fragmented_samples (int32_t the_initial_fragmented_samples)`
The initial number of samples for which a `dds::sub::DataReader` (p. 756) may store fragments.
- `int32_t initial_fragmented_samples () const`
Getter (see setter with the same name)
- `DataReaderResourceLimits & max_fragmented_samples_per_remote_writer (int32_t the_max_↔ fragmented_samples_per_remote_writer)`
The maximum number of samples per remote writer for which a `dds::sub::DataReader` (p. 756) may store fragments.
- `int32_t max_fragmented_samples_per_remote_writer () const`
Getter (see setter with the same name)
- `DataReaderResourceLimits & max_fragments_per_sample (int32_t the_max_fragments_per_sample)`
Maximum number of fragments for a single sample.
- `int32_t max_fragments_per_sample () const`
Getter (see setter with the same name)
- `DataReaderResourceLimits & dynamically_allocate_fragmented_samples (bool the_dynamically_↔ allocate_fragmented_samples)`
Determines whether the `dds::sub::DataReader` (p. 756) pre-allocates storage for storing fragmented samples.
- `bool dynamically_allocate_fragmented_samples () const`
Getter (see setter with the same name)
- `DataReaderResourceLimits & max_total_instances (int32_t the_max_total_instances)`
Maximum number of instances for which a `DataReader` will keep state.
- `int32_t max_total_instances () const`
Getter (see setter with the same name)
- `DataReaderResourceLimits & max_remote_virtual_writers (int32_t the_max_remote_virtual_writers)`
The maximum number of remote virtual writers from which a `dds::sub::DataReader` (p. 756) may read, including all instances.
- `int32_t max_remote_virtual_writers () const`
Getter (see setter with the same name)
- `DataReaderResourceLimits & initial_remote_virtual_writers (int32_t the_initial_remote_virtual_writers)`
The initial number of remote virtual writers from which a `dds::sub::DataReader` (p. 756) may read, including all instances.
- `int32_t initial_remote_virtual_writers () const`
Getter (see setter with the same name)
- `DataReaderResourceLimits & max_remote_virtual_writers_per_instance (int32_t the_max_remote_↔ virtual_writers_per_instance)`
The maximum number of virtual remote writers that can be associated with an instance.
- `int32_t max_remote_virtual_writers_per_instance () const`
Getter (see setter with the same name)

- **DataReaderResourceLimits** & **initial_remote_virtual_writers_per_instance** (int32_t the_initial_remote_virtual_writers_per_instance)

The initial number of virtual remote writers per instance.
- int32_t **initial_remote_virtual_writers_per_instance** () const

Getter (see setter with the same name)
- **DataReaderResourceLimits** & **max_remote_writers_per_sample** (int32_t the_max_remote_writers_per_sample)

The maximum number of remote writers allowed to write the same sample.
- int32_t **max_remote_writers_per_sample** () const

Getter (see setter with the same name)
- **DataReaderResourceLimits** & **max_query_condition_filters** (int32_t the_max_query_condition_filters)

The maximum number of query condition filters a reader is allowed.
- int32_t **max_query_condition_filters** () const

Getter (see setter with the same name)
- **DataReaderResourceLimits** & **max_app_ack_response_length** (int32_t the_max_app_ack_response_length)

Maximum length of application-level acknowledgment response data.
- int32_t **max_app_ack_response_length** () const

Getter (see setter with the same name)
- **DataReaderResourceLimits** & **keep_minimum_state_for_instances** (bool the_keep_minimum_state_for_instances)

*Whether or not keep a minimum instance state for up to **rti::core::policy::DataReaderResourceLimits::max_total_instances** (p. 868).*
- bool **keep_minimum_state_for_instances** () const

Getter (see setter with the same name)
- **DataReaderResourceLimits** & **initial_topic_queries** (int32_t the_initial_topic_queries)

*The initial number of TopicQueries allocated by a **dds::sub::DataReader** (p. 756).*
- int32_t **initial_topic_queries** () const

Getter (see setter with the same name)
- **DataReaderResourceLimits** & **max_topic_queries** (int32_t the_max_topic_queries)

*The maximum number of active TopicQueries that a **dds::sub::DataReader** (p. 756) can create.*
- int32_t **max_topic_queries** () const

Getter (see setter with the same name)
- **DataReaderResourceLimits** & **autopurge_remote_not_alive_writer_delay** (const **dds::core::Duration** &d)

*Maximum duration for which the **dds::sub::DataReader** (p. 756) will maintain information regarding a **dds::pub::DataWriter** (p. 908) once the **dds::pub::DataWriter** (p. 908) has become not alive.*
- **dds::core::Duration** **autopurge_remote_not_alive_writer_delay** () const

Getter (see setter with the same name)
- **DataReaderResourceLimits** & **autopurge_remote_virtual_writer_delay** (const **dds::core::Duration** &d)

*Maximum duration for which the **dds::sub::DataReader** (p. 756) will maintain information regarding a virtual **dds::pub::DataWriter** (p. 908) once the **dds::pub::DataWriter** (p. 908) has become detached.*
- **dds::core::Duration** **autopurge_remote_virtual_writer_delay** () const

Getter (see setter with the same name)
- const **AllocationSettings** & **shmem_ref_transfer_mode_attached_segment_allocation** () const

*Allocation resource for the shared memory segments attached by the **dds::sub::DataReader** (p. 756).*
- **AllocationSettings** & **shmem_ref_transfer_mode_attached_segment_allocation** ()

Getter by non-const reference (see getter by const reference with the same name)
- const **DataReaderResourceLimitsInstanceReplacementSettings** & **instance_replacement** () const

Sets the kind of instances allowed to be replaced for each instance state (`dds::sub::status::InstanceState` (p. 1359)) when a `DataReader` reaches `dds::core::policy::ResourceLimits::max_instances` (p. 1924).

- `DataReaderResourceLimitsInstanceReplacementSettings & instance_replacement` ()

Getter by non-const reference (see getter by const reference with the same name)

Static Public Member Functions

- static `DDS_Long auto_max_total_instances` ()

<<*extension*>> (p. 156) This value is used to make `rti::core::policy::DataReaderResourceLimits::max_total_instances` (p. 868) equal to `dds::core::policy::ResourceLimits::max_instances` (p. 1924).

8.59.1 Detailed Description

<<*extension*>> (p. 156) Configures the memory usage of a `dds::pub::DataReader`

`DataReaders` must allocate internal structures to handle the maximum number of `DataWriters` that may connect to it, whether or not a `dds::sub::DataReader` (p. 756) handles data fragmentation and how many data fragments that it may handle (for data samples larger than the MTU of the underlying network transport), how many simultaneous outstanding loans of internal memory holding data samples can be provided to user code, as well as others.

Most of these internal structures start at an initial size and, by default, will grow as needed by dynamically allocating additional memory. You may set fixed, maximum sizes for these internal structures if you want to bound the amount of memory that can be used by a `dds::sub::DataReader` (p. 756). By setting the initial size to the maximum size, you will prevent RTI Connex from dynamically allocating any memory after the creation of the `dds::sub::DataReader` (p. 756).

This QoS policy is an extension to the DDS standard.

Entity:

`dds::sub::DataReader` (p. 756)

Properties:

`RxO` (p. 307) = N/A

`Changeable` (p. 307) = `NO` (p. 307)

8.59.2 Constructor & Destructor Documentation

8.59.2.1 `DataReaderResourceLimits()`

```
rti::core::policy::DataReaderResourceLimits::DataReaderResourceLimits ( ) [inline]
```

Creates a `DataReaderResourceLimits` (p. 856) qos policy with default values.

8.59.3 Member Function Documentation

8.59.3.1 max_remote_writers() [1/2]

```
DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::max_remote_writers (
    int32_t the_max_remote_writers )
```

The maximum number of remote writers from which a **dds::sub::DataReader** (p. 756) may read, including all instances.

[default] **dds::core::LENGTH_UNLIMITED** (p. 238)

[range] [1, 1 million] or **dds::core::LENGTH_UNLIMITED** (p. 238), \geq initial_remote_writers, \geq max_remote_writers_per_instance

For unkeyed types, this value has to be equal to max_remote_writers_per_instance if max_remote_writers_per_instance is not equal to **dds::core::LENGTH_UNLIMITED** (p. 238).

Note: For efficiency, set max_remote_writers \geq **rti::core::policy::DataReaderResourceLimits::max_remote_writers_per_instance** (p. 861).

8.59.3.2 max_remote_writers() [2/2]

```
int32_t rti::core::policy::DataReaderResourceLimits::max_remote_writers ( ) const
```

Getter (see setter with the same name)

8.59.3.3 max_remote_writers_per_instance() [1/2]

```
DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::max_remote_writers_per_instance (
    int32_t the_max_remote_writers_per_instance )
```

The maximum number of remote writers from which a **dds::sub::DataReader** (p. 756) may read a single instance.

[default] **dds::core::LENGTH_UNLIMITED** (p. 238)

[range] [1, 1024] or **dds::core::LENGTH_UNLIMITED** (p. 238), \leq max_remote_writers or **dds::core::LENGTH_UNLIMITED** (p. 238), \geq initial_remote_writers_per_instance

For unkeyed types, this value has to be equal to max_remote_writers if it is not **dds::core::LENGTH_UNLIMITED** (p. 238).

Note: For efficiency, set max_remote_writers_per_instance \leq **rti::core::policy::DataReaderResourceLimits::max_remote_writers** (p. 861)

8.59.3.4 max_remote_writers_per_instance() [2/2]

```
int32_t rti::core::policy::DataReaderResourceLimits::max_remote_writers_per_instance ( ) const
```

Getter (see setter with the same name)

8.59.3.5 max_samples_per_remote_writer() [1/2]

```
DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::max_samples_per_remote_↔  
writer (   
    int32_t the_max_samples_per_remote_writer )
```

The maximum number of out-of-order samples from a given remote **dds::pub::DataWriter** (p. 908) that a **dds::sub::↔DataReader** (p. 756) may store when maintaining a reliable connection to the **dds::pub::DataWriter** (p. 908).

[default] **dds::core::LENGTH_UNLIMITED** (p. 238)

[range] [1, 100 million] or **dds::core::LENGTH_UNLIMITED** (p. 238), \leq **dds::core::policy::ResourceLimits::max_↔_samples** (p. 1924)

8.59.3.6 max_samples_per_remote_writer() [2/2]

```
int32_t rti::core::policy::DataReaderResourceLimits::max_samples_per_remote_writer ( ) const
```

Getter (see setter with the same name)

References **rti::core::policy::DataWriterTransferMode::shmem_ref_settings()**.

8.59.3.7 max_infos() [1/2]

```
DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::max_infos (   
    int32_t the_max_infos )
```

The maximum number of info units that a **dds::sub::DataReader** (p. 756) can use to store **dds::sub::SampleInfo** (p. 1992).

When read/take is called on a DataReader, the DataReader passes a sequence of data samples and an associated sample info sequence. The sample info sequence contains additional information for each data sample.

max_infos determines the resources allocated for storing sample info. This memory is loaned to the application when passing a sample info sequence.

Note that sample info is a snapshot, generated when read/take is called.

max_infos should not be less than **max_samples**.

[default] **dds::core::LENGTH_UNLIMITED** (p. 238)

[range] [1, 1 million] or **dds::core::LENGTH_UNLIMITED** (p. 238), \geq **initial_infos**

8.59.3.8 max_infos() [2/2]

```
int32_t rti::core::policy::DataReaderResourceLimits::max_infos ( ) const
```

Getter (see setter with the same name)

8.59.3.9 initial_remote_writers() [1/2]

```
DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::initial_remote_writers (
    int32_t the_initial_remote_writers )
```

The initial number of remote writers from which a **dds::sub::DataReader** (p. 756) may read, including all instances.

[default] 2

[range] [1, 1 million], <= max_remote_writers

For unkeyed types this value has to be equal to initial_remote_writers_per_instance.

Note: For efficiency, set initial_remote_writers >= **rti::core::policy::DataReaderResourceLimits::initial_remote_writers_per_instance** (p. 863).

8.59.3.10 initial_remote_writers() [2/2]

```
int32_t rti::core::policy::DataReaderResourceLimits::initial_remote_writers ( ) const
```

Getter (see setter with the same name)

8.59.3.11 initial_remote_writers_per_instance() [1/2]

```
DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::initial_remote_writers_per_instance (
    int32_t the_initial_remote_writers_per_instance )
```

The initial number of remote writers from which a **dds::sub::DataReader** (p. 756) may read a single instance.

[default] 2

[range] [1,1024], <= max_remote_writers_per_instance

For unkeyed types this value has to be equal to initial_remote_writers.

Note: For efficiency, set initial_remote_writers_per_instance <= **rti::core::policy::DataReaderResourceLimits::initial_remote_writers** (p. 863).

8.59.3.12 initial_remote_writers_per_instance() [2/2]

```
int32_t rti::core::policy::DataReaderResourceLimits::initial_remote_writers_per_instance ( ) const
```

Getter (see setter with the same name)

8.59.3.13 initial_infos()

```
int32_t rti::core::policy::DataReaderResourceLimits::initial_infos ( ) const
```

Getter (see setter with the same name)

8.59.3.14 initial_outstanding_reads() [1/2]

```
DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::initial_outstanding_reads (
    int32_t the_initial_outstanding_reads )
```

The initial number of outstanding calls to read/take (or one of their variants) on the same **dds::sub::DataReader** (p. 756) for which memory has not been returned by calling **dds::sub::LoanedSamples::return_loan()** (p. 1410).

[default] 2

[range] [1, 65536], <= max_outstanding_reads

8.59.3.15 initial_outstanding_reads() [2/2]

```
int32_t rti::core::policy::DataReaderResourceLimits::initial_outstanding_reads ( ) const
```

Getter (see setter with the same name)

8.59.3.16 max_outstanding_reads() [1/2]

```
DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::max_outstanding_reads (
    int32_t the_max_outstanding_reads )
```

The maximum number of outstanding read/take calls (or one of their variants) on the same **dds::sub::DataReader** (p. 756) for which memory has not been returned by calling **dds::sub::LoanedSamples::return_loan()** (p. 1410).

[default] **dds::core::LENGTH_UNLIMITED** (p. 238)

[range] [1, 65536] or **dds::core::LENGTH_UNLIMITED** (p. 238), >= initial_outstanding_reads

8.59.3.17 max_outstanding_reads() [2/2]

```
int32_t rti::core::policy::DataReaderResourceLimits::max_outstanding_reads ( ) const
```

Getter (see setter with the same name)

8.59.3.18 max_samples_per_read() [1/2]

```
DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::max_samples_per_read (
    int32_t the_max_samples_per_read )
```

The maximum number of data samples that the application can receive from the middleware in a single call to **dds::sub::DataReader::read** (p. 773) or **dds::sub::DataReader::take** (p. 774). If more data exists in the middleware, the application will need to issue multiple read/take calls.

When reading data using listeners, the expected number of samples available for delivery in a single `take` call is typically small: usually just one, in the case of unbatched data, or the number of samples in a single batch, in the case of batched data. (See **rti::core::policy::Batch** (p. 665) for more information about this feature.) When polling for data or using a **dds::core::cond::WaitSet** (p. 2318), however, multiple samples (or batches) could be retrieved at once, depending on the data rate.

A larger value for this parameter makes the API simpler to use at the expense of some additional memory consumption.

[default] 1024

[range] [1,65536]

8.59.3.19 max_samples_per_read() [2/2]

```
int32_t rti::core::policy::DataReaderResourceLimits::max_samples_per_read ( ) const
```

Getter (see setter with the same name)

8.59.3.20 disable_fragmentation_support() [1/2]

```
DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::disable_fragmentation_
support (
    bool the_disable_fragmentation_support )
```

Determines whether the **dds::sub::DataReader** (p. 756) can receive fragmented samples.

When fragmentation support is not needed, disabling fragmentation support will save some memory resources.

[default] false

8.59.3.21 `disable_fragmentation_support()` [2/2]

```
bool rti::core::policy::DataReaderResourceLimits::disable_fragmentation_support ( ) const
```

Getter (see setter with the same name)

8.59.3.22 `max_fragmented_samples()` [1/2]

```
DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::max_fragmented_samples (
    int32_t the_max_fragmented_samples )
```

The maximum number of samples for which the **dds::sub::DataReader** (p. 756) may store fragments at a given point in time.

At any given time, a **dds::sub::DataReader** (p. 756) may store fragments for up to `max_fragmented_samples` samples while waiting for the remaining fragments. These samples need not have consecutive sequence numbers and may have been sent by different **dds::pub::DataWriter** (p. 908) instances.

Once all fragments of a sample have been received, the sample is treated as a regular sample and becomes subject to standard QoS settings such as **dds::core::policy::ResourceLimits::max_samples** (p. 1924).

The middleware will drop fragments if the `max_fragmented_samples` limit has been reached. For best-effort communication, the middleware will accept a fragment for a new sample, but drop the oldest fragmented sample from the same remote writer. For reliable communication, the middleware will drop fragments for any new samples until all fragments for at least one older sample from that writer have been received.

Only applies if **rti::core::policy::DataReaderResourceLimits::disable_fragmentation_support** (p. 865) is false.

[default] 1024

[range] [1, 1 million]

8.59.3.23 `max_fragmented_samples()` [2/2]

```
int32_t rti::core::policy::DataReaderResourceLimits::max_fragmented_samples ( ) const
```

Getter (see setter with the same name)

8.59.3.24 `initial_fragmented_samples()` [1/2]

```
DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::initial_fragmented_↔
samples (
    int32_t the_initial_fragmented_samples )
```

The initial number of samples for which a **dds::sub::DataReader** (p. 756) may store fragments.

Only applies if **rti::core::policy::DataReaderResourceLimits::disable_fragmentation_support** (p. 865) is false.

[default] 4

[range] [1,1024], <= `max_fragmented_samples`

8.59.3.25 initial_fragmented_samples() [2/2]

```
int32_t rti::core::policy::DataReaderResourceLimits::initial_fragmented_samples ( ) const
```

Getter (see setter with the same name)

8.59.3.26 max_fragmented_samples_per_remote_writer() [1/2]

```
DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::max_fragmented_samples_↔  
per_remote_writer (   
    int32_t the_max_fragmented_samples_per_remote_writer )
```

The maximum number of samples per remote writer for which a **dds::sub::DataReader** (p. 756) may store fragments.

Logical limit so a single remote writer cannot consume all available resources.

Only applies if **rti::core::policy::DataReaderResourceLimits::disable_fragmentation_support** (p. 865) is false.

[default] 256

[range] [1, 1 million], <= max_fragmented_samples

8.59.3.27 max_fragmented_samples_per_remote_writer() [2/2]

```
int32_t rti::core::policy::DataReaderResourceLimits::max_fragmented_samples_per_remote_writer ( )  
const
```

Getter (see setter with the same name)

8.59.3.28 max_fragments_per_sample() [1/2]

```
DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::max_fragments_per_sample  
(   
    int32_t the_max_fragments_per_sample )
```

Maximum number of fragments for a single sample.

Only applies if **rti::core::policy::DataReaderResourceLimits::disable_fragmentation_support** (p. 865) is false.

[default] **dds::core::LENGTH_UNLIMITED** (p. 238)

[range] [1, 1 million] or **dds::core::LENGTH_UNLIMITED** (p. 238)

8.59.3.29 max_fragments_per_sample() [2/2]

```
int32_t rti::core::policy::DataReaderResourceLimits::max_fragments_per_sample ( ) const
```

Getter (see setter with the same name)

8.59.3.30 dynamically_allocate_fragmented_samples() [1/2]

```
DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::dynamically_allocate_↔
fragmented_samples (
    bool the_dynamically_allocate_fragmented_samples )
```

Determines whether the **dds::sub::DataReader** (p. 756) pre-allocates storage for storing fragmented samples.

By default, the middleware does not allocate memory upfront, but instead allocates memory from the heap upon receiving the first fragment of a new sample. The amount of memory allocated equals the amount of memory needed to store all fragments in the sample. Once all fragments of a sample have been received, the sample is deserialized and stored in the regular receive queue. At that time, the dynamically allocated memory is freed again.

This QoS setting is useful for large, but variable-sized data types where upfront memory allocation for multiple samples based on the maximum possible sample size may be expensive. The main disadvantage of not pre-allocating memory is that one can no longer guarantee the middleware will have sufficient resources at runtime.

If `dynamically_allocate_fragmented_samples` is set to false, the middleware will allocate memory upfront for storing fragments for up to **rti::core::policy::DataReaderResourceLimits::initial_fragmented_samples** (p. 866) samples. This memory may grow up to **rti::core::policy::DataReaderResourceLimits::max_fragmented_samples** (p. 866) if needed.

Only applies if **rti::core::policy::DataReaderResourceLimits::disable_fragmentation_support** (p. 865) is false.

[default] true

8.59.3.31 dynamically_allocate_fragmented_samples() [2/2]

```
bool rti::core::policy::DataReaderResourceLimits::dynamically_allocate_fragmented_samples ( )
const
```

Getter (see setter with the same name)

8.59.3.32 max_total_instances() [1/2]

```
DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::max_total_instances (
    int32_t the_max_total_instances )
```

Maximum number of instances for which a DataReader will keep state.

The maximum number of instances actively managed by a DataReader is determined by `dds::core::policy::ResourceLimits::max_instances` (p. 1924).

These instances have associated DataWriters or samples in the DataReader's queue and are visible to the user through operations such as `dds::sub::DataReader::take` (p. 774), `dds::sub::DataReader::read` (p. 773), and `dds::sub::DataReader::key_value` (p. 780).

The features Durable Reader State, **MultiChannel** (p. 1483) DataWriters and RTI Persistence **Service** (p. 2057) require RTI Connex to keep some internal state even for instances without DataWriters or samples in the DataReader's queue. The additional state is used to filter duplicate samples that could be coming from different DataWriter channels or from multiple executions of RTI Persistence **Service** (p. 2057).

The total maximum number of instances that will be managed by the middleware, including instances without associated DataWriters or samples, is determined by `max_total_instances`.

When a new instance is received, RTI Connex will check the resource limit `dds::core::policy::ResourceLimits::max_instances` (p. 1924). If the limit is exceeded, RTI Connex will drop the sample with the reason `LOST_BY_INSTANCES_LIMIT`. If the limit is not exceeded, RTI Connex will check `max_total_instances`. If `max_total_instances` is exceeded, RTI Connex will replace an existing instance without DataWriters and samples with the new one. The application could receive duplicate samples for the replaced instance if it becomes alive again.

The `max_total_instances` limit is not used if `rti::core::policy::DataReaderResourceLimits::keep_minimum_state_for_instances` (p. 873) is false, and in that case should be left at the default value.

[default] `rti::core::policy::DataReaderResourceLimits::auto_max_total_instances` (p. 312)

[range] [1, 1 million] or `dds::core::LENGTH_UNLIMITED` (p. 238) or `rti::core::policy::DataReaderResourceLimits::auto_max_total_instances` (p. 312), `>= dds::core::policy::ResourceLimits::max_instances` (p. 1924)

8.59.3.33 max_total_instances() [2/2]

```
int32_t rti::core::policy::DataReaderResourceLimits::max_total_instances ( ) const
```

Getter (see setter with the same name)

8.59.3.34 max_remote_virtual_writers() [1/2]

```

DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::max_remote_virtual_↔
writers (
    int32_t the_max_remote_virtual_writers )

```

The maximum number of remote virtual writers from which a **dds::sub::DataReader** (p. 756) may read, including all instances.

When **dds::core::policy::Presentation::access_scope** (p. 1674) is set to **dds::core::policy::PresentationAccess↔ScopeKind_def::GROUP** (p. 1677), this value determines the maximum number of DataWriter groups that can be managed by the **dds::sub::Subscriber** (p. 2116) containing this **dds::sub::DataReader** (p. 756).

Since the **dds::sub::Subscriber** (p. 2116) may contain more than one **dds::sub::DataReader** (p. 756), only the setting of the first applies.

[default] **dds::core::LENGTH_UNLIMITED** (p. 238)

[range] [1, 1 million] or **dds::core::LENGTH_UNLIMITED** (p. 238), \geq initial_remote_virtual_writers, \geq max_↔remote_virtual_writers_per_instance

8.59.3.35 max_remote_virtual_writers() [2/2]

```

int32_t rti::core::policy::DataReaderResourceLimits::max_remote_virtual_writers ( ) const

```

Getter (see setter with the same name)

8.59.3.36 initial_remote_virtual_writers() [1/2]

```

DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::initial_remote_virtual_↔
writers (
    int32_t the_initial_remote_virtual_writers )

```

The initial number of remote virtual writers from which a **dds::sub::DataReader** (p. 756) may read, including all instances.

[default] 2

[range] [1, 1 million] or **dds::core::LENGTH_UNLIMITED** (p. 238), \leq max_remote_virtual_writers

8.59.3.37 initial_remote_virtual_writers() [2/2]

```

int32_t rti::core::policy::DataReaderResourceLimits::initial_remote_virtual_writers ( ) const

```

Getter (see setter with the same name)

8.59.3.38 max_remote_virtual_writers_per_instance() [1/2]

```

DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::max_remote_virtual_↔
writers_per_instance (
    int32_t the_max_remote_virtual_writers_per_instance )

```

The maximum number of virtual remote writers that can be associated with an instance.

[default] `dds::core::LENGTH_UNLIMITED` (p. 238)

[range] [1, 1024] or `dds::core::LENGTH_UNLIMITED` (p. 238), \geq `initial_remote_virtual_writers_per_instance`

For unkeyed types, this value is ignored.

The features of Durable Reader State and **MultiChannel** (p. 1483) DataWriters, and RTI Persistence **Service** (p. 2057) require RTI Connex to keep some internal state per virtual writer and instance that is used to filter duplicate samples. These duplicate samples could be coming from different DataWriter channels or from multiple executions of RTI Persistence **Service** (p. 2057).

Once an association between a remote virtual writer and an instance is established, it is permanent – it will not disappear even if the physical writer incarnating the virtual writer is destroyed.

If `max_remote_virtual_writers_per_instance` is exceeded for an instance, RTI Connex will not associate this instance with new virtual writers. Duplicates samples from these virtual writers will not be filtered on the reader.

If you are not using Durable Reader State, **MultiChannel** (p. 1483) DataWriters or RTI Persistence **Service** (p. 2057) in your system, you can set this property to 1 to optimize resources.

8.59.3.39 max_remote_virtual_writers_per_instance() [2/2]

```

int32_t rti::core::policy::DataReaderResourceLimits::max_remote_virtual_writers_per_instance ( )
const

```

Getter (see setter with the same name)

8.59.3.40 initial_remote_virtual_writers_per_instance() [1/2]

```

DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::initial_remote_virtual_↔
writers_per_instance (
    int32_t the_initial_remote_virtual_writers_per_instance )

```

The initial number of virtual remote writers per instance.

[default] 2

[range] [1, 1024], \leq `max_remote_virtual_writers_per_instance`

For unkeyed types, this value is ignored.

8.59.3.41 initial_remote_virtual_writers_per_instance() [2/2]

```
int32_t rti::core::policy::DataReaderResourceLimits::initial_remote_virtual_writers_per_instance (
) const
```

Getter (see setter with the same name)

8.59.3.42 max_remote_writers_per_sample() [1/2]

```
DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::max_remote_writers_per_↔
sample (
    int32_t the_max_remote_writers_per_sample )
```

The maximum number of remote writers allowed to write the same sample.

One scenario in which two DataWriters may write the same sample is Persistence **Service** (p.2057). The DataReader may receive the same sample coming from the original DataWriter and from a Persistence **Service** (p.2057) DataWriter. **[default] 3**

[range] [1, 1024]

8.59.3.43 max_remote_writers_per_sample() [2/2]

```
int32_t rti::core::policy::DataReaderResourceLimits::max_remote_writers_per_sample ( ) const
```

Getter (see setter with the same name)

8.59.3.44 max_query_condition_filters() [1/2]

```
DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::max_query_condition_↔
filters (
    int32_t the_max_query_condition_filters )
```

The maximum number of query condition filters a reader is allowed.

[default] 4

[range] [0, 32]

This value determines the maximum number of unique query condition content filters that a reader may create.

Each query condition content filter is comprised of both its `query_expression` and `query_parameters`. Two query conditions that have the same `query_expression` will require unique query condition filters if their `query_↔_parameters` differ. Query conditions that differ only in their state masks will share the same query condition filter.

8.59.3.45 max_query_condition_filters() [2/2]

```
int32_t rti::core::policy::DataReaderResourceLimits::max_query_condition_filters ( ) const
```

Getter (see setter with the same name)

8.59.3.46 max_app_ack_response_length() [1/2]

```
DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::max_app_ack_response_↔  
length (   
    int32_t the_max_app_ack_response_length )
```

Maximum length of application-level acknowledgment response data.

The maximum length of response data in an application-level acknowledgment.

When set to zero, no response data is sent with application-level acknowledgments.

[default] 1

[range] [0, 32768]

8.59.3.47 max_app_ack_response_length() [2/2]

```
int32_t rti::core::policy::DataReaderResourceLimits::max_app_ack_response_length ( ) const
```

Getter (see setter with the same name)

8.59.3.48 keep_minimum_state_for_instances() [1/2]

```
DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::keep_minimum_state_for_↔  
instances (   
    bool the_keep_minimum_state_for_instances )
```

Whether or not keep a minimum instance state for up to **rti::core::policy::DataReaderResourceLimits::max_total_↔_instances** (p. 868).

The features Durable Reader State, multi-channel DataWriters, and Persistence **Service** (p. 2057) require RTI Connext to keep some minimal internal state even for instances without DataWriters or DDS samples in the DataReader's queue, or that have been purged due to a dispose. The additional state is used to filter duplicate DDS samples that could be coming from different DataWriter channels or from multiple executions of Persistence **Service** (p. 2057). The total maximum number of instances that will be managed by the middleware, including instances without associated Data↔Writers or DDS samples or that have been purged due to a dispose, is determined by **rti::core::policy::DataReader↔ResourceLimits::max_total_instances** (p. 868).

This additional state will only be kept for up to **max_total_instances** if this field is set to true, otherwise the additional state will not be kept for any instances.

The minimum state includes information such as the source timestamp of the last sample received by the instance and the last sequence number received from a virtual GUID.

[default] true

8.59.3.49 keep_minimum_state_for_instances() [2/2]

```
bool rti::core::policy::DataReaderResourceLimits::keep_minimum_state_for_instances ( ) const
```

Getter (see setter with the same name)

8.59.3.50 initial_topic_queries() [1/2]

```
DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::initial_topic_queries (
    int32_t the_initial_topic_queries )
```

The initial number of TopicQueries allocated by a **dds::sub::DataReader** (p. 756).

[default] 1

See also

rti::sub::TopicQuery (p. 2220)

8.59.3.51 initial_topic_queries() [2/2]

```
int32_t rti::core::policy::DataReaderResourceLimits::initial_topic_queries ( ) const
```

Getter (see setter with the same name)

8.59.3.52 max_topic_queries() [1/2]

```
DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::max_topic_queries (
    int32_t the_max_topic_queries )
```

The maximum number of active TopicQueries that a **dds::sub::DataReader** (p. 756) can create.

Once this limit is reached, a **dds::sub::DataReader** (p. 756) can create more TopicQueries only if it deletes some of the previously created ones.

[default] **dds::core::LENGTH_UNLIMITED** (p. 238)

See also

rti::sub::TopicQuery (p. 2220)

8.59.3.53 max_topic_queries() [2/2]

```
int32_t rti::core::policy::DataReaderResourceLimits::max_topic_queries ( ) const
```

Getter (see setter with the same name)

8.59.3.54 autopurge_remote_not_alive_writer_delay() [1/2]

```
DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::autopurge_remote_not_↔  
alive_writer_delay (   
    const dds::core::Duration & d )
```

Maximum duration for which the **dds::sub::DataReader** (p. 756) will maintain information regarding a **dds::pub::Data↔
Writer** (p. 908) once the **dds::pub::DataWriter** (p. 908) has become not alive.

After this time elapses, the **dds::sub::DataReader** (p. 756) will purge all internal information regarding the not alive **dds::pub::DataWriter** (p. 908).

See also

dds::core::policy::Liveliness (p. 1389) for more information on when a **dds::pub::DataWriter** (p. 908) is considered not alive.

When set to **dds::core::Duration::automatic()** (p. 1198), this parameter is set to 10 times the value of **rti::core↔
::policy::DiscoveryConfig::participant_liveliness_lease_duration** (p. 1041).

This QoS only applies when the **dds::sub::DataReader** (p. 756) is using **rti::core::policy::InstanceState↔
ConsistencyKind::recover_state** (p. 336) for the **dds::core::policy::Reliability::instance_state_consistency_kind** (p. 1878) QoS. When using **rti::core::policy::InstanceStateConsistencyKind::recover_state** (p. 336), a **dds::sub↔
::DataReader** (p. 756) keeps state about all **dds::pub::DataWriter** (p. 908) entities and the instances they were writing in order to be able to transition those instances back to their correct state if liveliness with the **dds::pub::DataWriter** (p. 908) is recovered. This can cause unbounded memory growth if that state is never purged and **dds::pub::Data↔
Writer** (p. 908) entities continuously come and go in a system. This QoS avoids that unbounded memory growth by setting a time at which that state will be purged.

This QoS should be set such that it is longer than the longest period of time for which a **dds::pub::DataWriter** (p. 908) and **dds::sub::DataReader** (p. 756) are expected to be disconnected and then reconnected in your system.

An alternative to using this QoS to purge the state is to set the **rti::core::policy::DataReaderResourceLimits::max↔
_remote_writers** (p. 861) QoS to a finite value. If that QoS is set to a finite value and the number of alive + not alive **dds::pub::DataWriter** (p. 908) entities reaches the limit when a new **dds::pub::DataWriter** (p. 908) is discovered, the oldest not alive **dds::pub::DataWriter** (p. 908) will be replaced.

[default] **dds::core::Duration::automatic()** (p. 1198)

[range] > 0 or **dds::core::Duration::automatic()** (p. 1198)

8.59.3.55 autopurge_remote_not_alive_writer_delay() [2/2]

```
dds::core::Duration rti::core::policy::DataReaderResourceLimits::autopurge_remote_not_alive_↔
writer_delay ( ) const
```

Getter (see setter with the same name)

8.59.3.56 autopurge_remote_virtual_writer_delay() [1/2]

```
DataReaderResourceLimits & rti::core::policy::DataReaderResourceLimits::autopurge_remote_virtual_↔
_writer_delay (
    const dds::core::Duration & d )
```

Maximum duration for which the **dds::sub::DataReader** (p. 756) will maintain information regarding a virtual **dds::pub::DataWriter** (p. 908) once the **dds::pub::DataWriter** (p. 908) has become detached.

Determines how long the **dds::sub::DataReader** (p. 756) will maintain information regarding a virtual **dds::pub::DataWriter** (p. 908) that has become detached.

After this time elapses, the **dds::sub::DataReader** (p. 756) will purge all internal information regarding the **dds::pub::DataWriter** (p. 908).

[default] **dds::core::Duration::infinite()** (p. 1197)

[range] ≥ 0 or **dds::core::Duration::infinite()** (p. 1197)

8.59.3.57 autopurge_remote_virtual_writer_delay() [2/2]

```
dds::core::Duration rti::core::policy::DataReaderResourceLimits::autopurge_remote_virtual_↔
writer_delay ( ) const
```

Getter (see setter with the same name)

8.59.3.58 shm_ref_transfer_mode_attached_segment_allocation() [1/2]

```
const AllocationSettings & rti::core::policy::DataReaderResourceLimits::shm_ref_transfer_mode_↔
_attached_segment_allocation ( ) const
```

Allocation resource for the shared memory segments attached by the **dds::sub::DataReader** (p. 756).

The `max_count` does not limit the total number of shared memory segments used by the **dds::sub::DataReader** (p. 756). When this limit is hit, the **dds::sub::DataReader** (p. 756) will try to detach from a segment that doesn't contain any loaned samples and attach to a new segment. If samples are loaned from all attached segments, then the **dds::sub::DataReader** (p. 756) will fail to attach to the new segment. This scenario will result in a sample loss.

[default] `initial_count = rti::core::AllocationSettings::AUTO_COUNT` (p. 593) (**rti::core::policy::DataReaderResourceLimits::initial_remote_writers** (p. 863)); `max_count = rti::core::AllocationSettings::AUTO_COUNT` (p. 593) (**rti::core::policy::DataReaderResourceLimits::max_remote_writers** (p. 861)); `incremental_count = rti::core::AllocationSettings::AUTO_COUNT` (p. 593) (0 if `initial_count = max_count`; -1 otherwise);

[range] See allowed ranges in struct **rti::core::AllocationSettings** (p. 591)

8.59.3.59 shmem_ref_transfer_mode_attached_segment_allocation() [2/2]

```
AllocationSettings & rti::core::policy::DataReaderResourceLimits::shmem_ref_transfer_mode_↔
attached_segment_allocation ( )
```

Getter by non-const reference (see getter by const reference with the same name)

8.59.3.60 instance_replacement() [1/2]

```
const DataReaderResourceLimitsInstanceReplacementSettings & rti::core::policy::DataReaderResource↔
Limits::instance_replacement ( ) const
```

Sets the kind of instances allowed to be replaced for each instance state (**dds::sub::status::InstanceState** (p. 1359)) when a DataReader reaches **dds::core::policy::ResourceLimits::max_instances** (p. 1924).

When **dds::core::policy::ResourceLimits::max_instances** (p. 1924) is reached, a **dds::sub::DataReader** (p. 756) will try to make room for a new instance by attempting to reclaim an existing instance based on the instance replacement kinds specified by this field.

A DataReader can choose what kinds of instances can be replaced for each **dds::sub::status::InstanceState** (p. 1359) separately. This means, for example, that a DataReader can choose to not allow replacing alive (**dds::sub::status::InstanceState::alive()** (p. 1361)) instances but allow replacement of empty disposed (**dds::sub::status::InstanceState::not_alive_disposed()** (p. 1361)) instances.

Only instances whose states match the specified kinds are eligible to be replaced. In addition, there must be no outstanding loans on any of the samples belonging to the instance for it to be considered for replacement.

For all kinds, a **dds::sub::DataReader** (p. 756) will replace the least-recently-updated instance satisfying that kind. An instance is considered 'updated' when a valid sample or dispose sample is received and accepted for that instance. When using **dds::core::policy::OwnershipKind_def::EXCLUSIVE** (p. 1637), only samples that are received from the owner of the instance will cause the instance to be considered updated. An instance is not considered updated when an unregister sample is received because the unregister message simply indicates that there is one less writer that has updates for the instance, not that the instance itself was updated.

If no replaceable instance exists, the sample for the new instance will be considered lost with lost reason **rti::core::status::SampleLostState::lost_by_instances_limit()** (p. 2006) and the instance will not be asserted into the DataReader queue.

[default]

- **rti::core::DataReaderResourceLimitsInstanceReplacementSettings::alive_instance_removal** (p. 880) = **rti::core::policy::DataReaderInstanceRemovalKind_def::NO_INSTANCE** (p. 831)
- **rti::core::DataReaderResourceLimitsInstanceReplacementSettings::disposed_instance_removal** (p. 880) = **rti::core::policy::DataReaderInstanceRemovalKind_def::EMPTY_INSTANCES** (p. 831)
- **rti::core::DataReaderResourceLimitsInstanceReplacementSettings::no_writers_instance_removal** (p. 880) = **rti::core::policy::DataReaderInstanceRemovalKind_def::EMPTY_INSTANCES** (p. 831)

```

Sets the instance replacement policy for instances in the `dds::sub::status::InstanceState::not_alive_no_writers()` (p. 1361) state.

[default] `rti::core::policy::DataReaderInstanceRemovalKind_def::EMPTY_INSTANCES` (p. 831)

8.61 rti::sub::cond::DataReaderStatusConditionHandler< T > Class Template Reference

Realization of a **functor handler** (p. 1859) that handles the status of a `dds::sub::DataReader` (p. 756).

```
#include <DataReaderStatusConditionHandler.hpp>
```

Public Member Functions

- **DataReaderStatusConditionHandler** (`dds::sub::DataReader< T > &reader`, `dds::sub::DataReader← Listener< T > *listener`, `const dds::core::status::StatusMask &listener_mask`)
Creates a new `rti::core::sub::DataReaderStatusConditionHandler` instance.

8.61.1 Detailed Description

```
template<typename T>
class rti::sub::cond::DataReaderStatusConditionHandler< T >
```

Realization of a **functor handler** (p. 1859) that handles the status of a `dds::sub::DataReader` (p. 756).

A `rti::core::sub::DataReaderStatusConditionHandler` demultiplexes a `dds::sub::DataReader` (p. 756) status change into the corresponding callback of a provided `dds::sub::DataReaderListener` (p. 832) implementation.

Note that the `dds::sub::DataReaderListener` (p. 832) notifications have different considerations than if the were made by the `dds::sub::DataReader` (p. 756) directly:

- Context: The `dds::sub::DataReaderListener` (p. 832) callback context is the one of the thread that dispatches the `dds::core::cond::Condition` (p. 729) where this handler is set. For instance, if you attach the condition to a `rti::core::cond::AsyncWaitSet` (p. 627), the context will be one of the threads within the pool.
- Status clearing: All the `dds::sub::DataReader` (p. 756)'s enabled statuses are cleared upon condition dispatch except the `dds::core::status::StatusMask::data_available()` (p. 2090), which will not be cleared until your application reads the data.
- Exclusive Area: Restrictions depend on the context of the dispatching thread. For instance, if the `rti::core::cond::AsyncWaitSet` (p. 627) dispatches the condition, the listener notifications are free of any exclusive area restrictions.

The `rti::core::sub::DataReaderStatusConditionHandler` is a convenience to handle the status changes of a `dds::sub::DataReader` (p. 756). You can install a `rti::core::sub::DataReaderStatusConditionHandler` as the handler of a reader's `dds::core::cond::StatusCondition` (p. 2079). You can then attach it to a `dds::core::cond::WaitSet` (p. 2318) or `rti::core::cond::AsyncWaitSet` (p. 627) and receive status changes notifications through a specific `dds::sub::DataReaderListener` (p. 832) implementation instance.

8.61.2 Constructor & Destructor Documentation

8.61.2.1 DataReaderStatusConditionHandler()

```
template<typename T >
rti::sub::cond::DataReaderStatusConditionHandler< T >::DataReaderStatusConditionHandler (
    dds::sub::DataReader< T > & reader,
    dds::sub::DataReaderListener< T > * listener,
    const dds::core::status::StatusMask & listener_mask ) [inline]
```

Creates a new `rti::core::sub::DataReaderStatusConditionHandler` instance.

The created `DataReaderStatusConditionHandler` (p. 881) can set as `functor handler` (p. 1859) in any `dds::core::cond::Condition` (p. 729) and will demultiplex the specified status changes from the specified `dds::sub::DataReader` (p. 756)

Parameters

<i>reader</i>	<< <i>in</i> >> (p. 157) The <code>dds::sub::DataReader</code> (p. 756) for which the status changes are demultiplexed to the specified <code>listener</code>
<i>listener</i>	<< <i>in</i> >> (p. 157) that receives the status changes notifications from the specified <code>reader</code> .
<i>listener_mask</i>	<< <i>in</i> >> (p. 157) Specifies which status changes from the reader to demultiplex to the <code>listener</code> .

8.62.1 Detailed Description

Contains the data representations supported by entities.

Entity:

dds::topic::Topic (p. 2178), **dds::sub::DataReader** (p. 756), **dds::pub::DataWriter** (p. 908)

Status:

dds::core::status::StatusMask::offered_incompatible_qos() (p. 2087), **dds::core::status::StatusMask**↔
::requested_incompatible_qos() (p. 2088)

Properties:

RxO (p. 307) = YES
Changeable (p. 307) = **UNTIL ENABLE** (p. 307)

See also

DATA_REPRESENTATION (p. 312)

This policy has request-offer semantics for both representation and compression. For representation, a **dds::pub::DataWriter** (p. 908) may only offer a single representation. Attempting to put multiple representations in a **dds::pub::DataWriter** (p. 908) will result in **dds::core::InconsistentPolicyError** (p. 1354). A **dds::pub::DataWriter** (p. 908) will use its offered policy to communicate with its matched **dds::sub::DataReader** (p. 756) entities. A **dds::sub::DataReader** (p. 756) requests one or more representations. If a **dds::pub::DataWriter** (p. 908) offers a representation that is contained within the sequence of the **dds::sub::DataReader** (p. 756), the offer satisfies the request and the policies are compatible. Otherwise, they are incompatible.

When representations are specified in the **dds::topic::qos::TopicQos** (p. 2213), **dds::pub::qos::DataWriterQos**↔
::operator=(const dds::topic::qos::TopicQos&) (p. 998) copies the first element of the sequence, and **dds::sub**↔
::qos::DataReaderQos::operator=(const dds::topic::qos::TopicQos&) (p. 852) copies the whole sequence.

For Compression, only the **rti::core::CompressionSettings::compression_ids** (p. 727) is propagated and a **dds**↔
::pub::DataWriter (p. 908) may only offer a single compression id. Attempting to put multiple **compression_ids** in a **dds::pub::DataWriter** (p. 908) will result in **dds::core::InconsistentPolicyError** (p. 1354).

A **dds::pub::DataWriter** (p. 908) will use its offered compression algorithm to compress data that it sends to its matched **dds::sub::DataReader** (p. 756) entities. A **dds::sub::DataReader** (p. 756) requests zero or more compression algorithms. If a **dds::pub::DataWriter** (p. 908) offers a representation that is contained within the algorithms requested by the **dds::sub::DataReader** (p. 756), the offer satisfies the request and the policies are compatible. Otherwise, they are incompatible.

When compression IDs are specified in the **dds::topic::qos::TopicQos** (p. 2213), **dds::pub::qos::DataWriter**↔
Qos::operator=(const dds::topic::qos::TopicQos&) (p. 998) copies a single compression ID (see **rti::core**↔
::CompressionSettings::compression_ids (p. 727)), and **dds::sub::qos::DataReaderQos::operator=(const dds**↔
::topic::qos::TopicQos&) (p. 852) copies all of the **compression_ids**.

8.62.2 Constructor & Destructor Documentation

8.62.2.1 DataRepresentation() [1/3]

```
dds::core::policy::DataRepresentation::DataRepresentation ( ) [inline]
```

Creates an instance with one element, **auto_id()** (p. 314).

8.62.2.2 DataRepresentation() [2/3]

```
dds::core::policy::DataRepresentation::DataRepresentation (
    const DataRepresentationIdSeq & seq ) [inline], [explicit]
```

Creates an instance with a sequence of DataRepresentationId.

Parameters

<i>seq</i>	A vector containing the DataRepresentationIds to create this DataRepresentation (p. 883)
------------	---

8.62.2.3 DataRepresentation() [3/3]

```
dds::core::policy::DataRepresentation::DataRepresentation (
    const DataRepresentationId * value_begin,
    const DataRepresentationId * value_end ) [inline]
```

Creates an instance with a sequence of DataRepresentationId.

Parameters

<i>value_begin</i>	Beginning of a range of DataRepresentationId
<i>value_end</i>	End of the range

8.62.3 Member Function Documentation

8.62.3.1 create_empty()

```
static DataRepresentation dds::core::policy::DataRepresentation::create_empty ( ) [inline],
[static], [noexcept]
```

Unlike the default constructor, which returns a **DataRepresentation** (p. 883) instance with one element, `auto_id`, this static methods returns an empty **DataRepresentation** (p. 883) instance.

8.62.3.2 value() [1/3]

```
template<typename ShortIter >
DataRepresentation & dds::core::policy::DataRepresentation::value (
    ShortIter the_begin,
    ShortIter the_end ) [inline]
```

Sets the `DataRepresentationId` sequence.

Template Parameters

<i>ShortIter</i>	An input iterator of <code>DataRepresentationId</code> .
------------------	--

Parameters

<i>the_begin</i>	Beginning of the range
<i>the_end</i>	End of the range

8.62.3.3 value() [2/3]

```
DataRepresentationIdSeq dds::core::policy::DataRepresentation::value ( ) const [inline]
```

Gets the **DataRepresentation** (p. 883).

Returns

the sequence of `DataRepresentationId` representing the data representations

8.62.3.4 value() [3/3]

```
DataRepresentation & dds::core::policy::DataRepresentation::value (
    const DataRepresentationIdSeq & source ) [inline]
```

Sets the data representation.

Parameters

<i>source</i>	The vector where the DataRepresentationId will be copied from
---------------	---

8.62.3.5 compression_settings() [1/3]

```
const rti::core::CompressionSettings & compression_settings ( ) const
```

<<**extension**>> (p. 156) Gets the compression settings by const reference (see setter).

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

8.62.3.6 compression_settings() [2/3]

```
rti::core::CompressionSettings & compression_settings ( )
```

<<**extension**>> (p. 156) Gets the compression settings by non-const reference (see setter)

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

8.62.3.7 compression_settings() [3/3]

```
dds::core::policy::DataRepresentation & compression_settings (
    const rti::core::CompressionSettings & compression_settings )
```

<<**extension**>> (p. 156) Sets the compression settings.

Note

This function is an extension, it must be called via the **extensions()** member function (p. 156)

compression_ids:

[default] The value depends on the entity

dds::pub::DataWriter (p. 908) and **dds::topic::Topic** (p. 2178) are set to **rti::core::CompressionIdMask::none()** (p. 724)

dds::sub::DataReader (p. 756) **rti::core::CompressionIdMask::all()** (p. 724)

writer_compression_level:

[default] The value depends on the entity

dds::pub::DataWriter (p. 908) and **dds::topic::Topic** (p. 2178) are set to **rti::core::CompressionSettings::compression_level_default()** (p. 727)

dds::sub::DataReader (p. 756) NOT SUPPORTED

writer_compression_threshold:

[default] The value depends on the entity

dds::pub::DataWriter (p. 908) and **dds::topic::Topic** (p. 2178) are set to **rti::core::CompressionSettings::compression_threshold_default()**

dds::sub::DataReader (p. 756) NOT SUPPORTED

rti::core::CompressionSettings (p. 725)

8.63 dds::sub::status::DataState Class Reference

The **DataState** (p. 888) class describes the state of a sample and includes the information about the sample's **InstanceState** (p. 1359), **ViewState** (p. 2315), and **SampleState** (p. 2023).

```
#include <dds/sub/status/DataState.hpp>
```

Inheritance diagram for dds::sub::status::DataState:

Public Member Functions

- **DataState** ()
Create a **DataState** (p. 888) with **InstanceState::any()** (p. 1362), **ViewState::any()** (p. 2317), and **SampleState::any()** (p. 2025)
- **DataState** (const **SampleState** &the_sample_state)

Create a **DataState** (p. 888) with **InstanceState::any()** (p. 1362), **ViewState::any()** (p. 2317), and the provided **SampleState** (p. 2023).

- **DataState** (const **ViewState** &the_view_state)

Create a **DataState** (p. 888) with **InstanceState::any()** (p. 1362), **SampleState::any()** (p. 2025), and the provided **ViewState** (p. 2315).
- **DataState** (const **InstanceState** &the_instance_state)

Create a **DataState** (p. 888) with **SampleState::any()** (p. 2025), **ViewState::any()** (p. 2317), and the provided **InstanceState** (p. 1359).
- **DataState** (const **SampleState** &the_sample_state, const **ViewState** &the_view_state, const **InstanceState** &the_instance_state)

Create a **DataState** (p. 888) with the provided **SampleState** (p. 2023), **ViewState** (p. 2315), and **InstanceState** (p. 1359).
- bool **operator==** (const **DataState** &other) const

Compare two **DataState** (p. 888) objects for equality.
- bool **operator!=** (const **DataState** &other) const

Compare two **DataState** (p. 888) objects for inequality.
- **DataState** & **operator<<** (const **SampleState** &the_sample_state)

Set the provided **SampleState** (p. 2023) in a **DataState** (p. 888) object.
- **DataState** & **operator<<** (const **InstanceState** &the_instance_state)

Set the provided **InstanceState** (p. 1359) in a **DataState** (p. 888) object.
- **DataState** & **operator<<** (const **ViewState** &the_view_state)

Set the provided **ViewState** (p. 2315) in a **DataState** (p. 888) object.
- const **DataState** & **operator>>** (**SampleState** &the_sample_state) const

Get the **SampleState** (p. 2023) from a **DataState** (p. 888) object.
- const **DataState** & **operator>>** (**InstanceState** &the_instance_state) const

Get the **InstanceState** (p. 1359) from a **DataState** (p. 888) object.
- const **DataState** & **operator>>** (**ViewState** &the_view_state) const

Get the **ViewState** (p. 2315) from a **DataState** (p. 888) object.
- const **SampleState** & **sample_state** () const

Get the **SampleState** (p. 2023) from a **DataState** (p. 888) object.
- void **sample_state** (const **SampleState** &the_sample_state)

Set the provided **SampleState** (p. 2023) in a **DataState** (p. 888) object.
- const **InstanceState** & **instance_state** () const

Get the **InstanceState** (p. 1359) from a **DataState** (p. 888) object.
- void **instance_state** (const **InstanceState** &the_instance_state)

Set the provided **InstanceState** (p. 1359) in a **DataState** (p. 888) object.
- const **ViewState** & **view_state** () const

Get the **ViewState** (p. 2315) from a **DataState** (p. 888) object.
- void **view_state** (const **ViewState** &the_view_state)

Set the provided **ViewState** (p. 2315) in a **DataState** (p. 888) object.

Static Public Member Functions

- static **DataState** **any** ()

Create a **DataState** (p. 888) with **InstanceState::any()** (p. 1362), **ViewState::any()** (p. 2317), and **SampleState::any()** (p. 2025)
- static **DataState** **new_data** ()

Create a **DataState** (p. 888) with **InstanceState::alive()** (p. 1361), **ViewState::any()** (p. 2317), and **SampleState::not_read()** (p. 2025)

- static **DataState any_data ()**

Create a **DataState** (p. 888) with **InstanceState::alive()** (p. 1361), **ViewState::any()** (p. 2317), and **SampleState::any()** (p. 2025)

- static **DataState new_instance ()**

Create a **DataState** (p. 888) with **InstanceState::alive()** (p. 1361), **ViewState::new_view()** (p. 2317), and **SampleState::any()** (p. 2025)

Friends

- void **swap (DataState &left, DataState &right) OMG_NOEXCEPT**

Swap the contents of two **DataState** (p. 888) objects.

Related Functions

(Note that these are not member functions.)

- **std::ostream & operator<< (std::ostream &os, const DataState &s)**

Prints a data state as a readable string.

8.63.1 Detailed Description

The **DataState** (p. 888) class describes the state of a sample and includes the information about the sample's **InstanceState** (p. 1359), **ViewState** (p. 2315), and **SampleState** (p. 2023).

8.63.2 Constructor & Destructor Documentation

8.63.2.1 DataState() [1/5]

```
dds::sub::status::DataState::DataState ( ) [inline]
```

Create a **DataState** (p. 888) with **InstanceState::any()** (p. 1362), **ViewState::any()** (p. 2317), and **SampleState::any()** (p. 2025)

Referenced by **any()**, **any_data()**, **new_data()**, and **new_instance()**.

8.63.2.2 DataState() [2/5]

```
dds::sub::status::DataState::DataState (
    const SampleState & the_sample_state ) [inline]
```

Create a **DataState** (p.888) with **InstanceState::any()** (p.1362), **ViewState::any()** (p.2317), and the provided **SampleState** (p.2023).

Note that the constructor is implicit, so you can use a **SampleState** (p.2023) wherever a **DataState** (p.888) is expected.

8.63.2.3 DataState() [3/5]

```
dds::sub::status::DataState::DataState (
    const ViewState & the_view_state ) [inline]
```

Create a **DataState** (p.888) with **InstanceState::any()** (p.1362), **SampleState::any()** (p.2025), and the provided **ViewState** (p.2315).

Note that the constructor is implicit, so you can use a **ViewState** (p.2315) wherever a **DataState** (p.888) is expected.

8.63.2.4 DataState() [4/5]

```
dds::sub::status::DataState::DataState (
    const InstanceState & the_instance_state ) [inline]
```

Create a **DataState** (p.888) with **SampleState::any()** (p.2025), **ViewState::any()** (p.2317), and the provided **InstanceState** (p.1359).

Note that the constructor is implicit, so you can use a **InstanceState** (p.1359) wherever a **DataState** (p.888) is expected.

8.63.2.5 DataState() [5/5]

```
dds::sub::status::DataState::DataState (
    const SampleState & the_sample_state,
    const ViewState & the_view_state,
    const InstanceState & the_instance_state ) [inline]
```

Create a **DataState** (p.888) with the provided **SampleState** (p.2023), **ViewState** (p.2315), and **InstanceState** (p.1359).

8.63.3 Member Function Documentation

8.63.3.1 operator==()

```
bool dds::sub::status::DataState::operator==(
    const DataState & other ) const [inline]
```

Compare two **DataState** (p. 888) objects for equality.

References **instance_state()**, **sample_state()**, and **view_state()**.

Referenced by **operator!=()**.

8.63.3.2 operator!=()

```
bool dds::sub::status::DataState::operator!=(
    const DataState & other ) const [inline]
```

Compare two **DataState** (p. 888) objects for inequality.

References **operator==()**.

8.63.3.3 operator<<() [1/3]

```
DataState & dds::sub::status::DataState::operator<< (
    const SampleState & the_sample_state ) [inline]
```

Set the provided **SampleState** (p. 2023) in a **DataState** (p. 888) object.

8.63.3.4 operator<<() [2/3]

```
DataState & dds::sub::status::DataState::operator<< (
    const InstanceState & the_instance_state ) [inline]
```

Set the provided **InstanceState** (p. 1359) in a **DataState** (p. 888) object.

8.63.3.5 operator<<() [3/3]

```
DataState & dds::sub::status::DataState::operator<< (
    const ViewState & the_view_state ) [inline]
```

Set the provided **ViewState** (p. 2315) in a **DataState** (p. 888) object.

8.63.3.6 operator>>() [1/3]

```
const DataState & dds::sub::status::DataState::operator>> (
    SampleState & the_sample_state ) const [inline]
```

Get the **SampleState** (p. 2023) from a **DataState** (p. 888) object.

8.63.3.7 operator>>() [2/3]

```
const DataState & dds::sub::status::DataState::operator>> (
    InstanceState & the_instance_state ) const [inline]
```

Get the **InstanceState** (p. 1359) from a **DataState** (p. 888) object.

8.63.3.8 operator>>() [3/3]

```
const DataState & dds::sub::status::DataState::operator>> (
    ViewState & the_view_state ) const [inline]
```

Get the **ViewState** (p. 2315) from a **DataState** (p. 888) object.

8.63.3.9 sample_state() [1/2]

```
const SampleState & dds::sub::status::DataState::sample_state ( ) const [inline]
```

Get the **SampleState** (p. 2023) from a **DataState** (p. 888) object.

Referenced by **dds::sub::find()**, and **operator==(())**.

8.63.3.10 sample_state() [2/2]

```
void dds::sub::status::DataState::sample_state (
    const SampleState & the_sample_state ) [inline]
```

Set the provided **SampleState** (p. 2023) in a **DataState** (p. 888) object.

8.63.3.11 instance_state() [1/2]

```
const InstanceState & dds::sub::status::DataState::instance_state ( ) const [inline]
```

Get the **InstanceState** (p. 1359) from a **DataState** (p. 888) object.

Referenced by **dds::sub::find()**, and **operator==(())**.

8.63.3.12 instance_state() [2/2]

```
void dds::sub::status::DataState::instance_state (
    const InstanceState & the_instance_state ) [inline]
```

Set the provided **InstanceState** (p. 1359) in a **DataState** (p. 888) object.

8.63.3.13 view_state() [1/2]

```
const ViewState & dds::sub::status::DataState::view_state ( ) const [inline]
```

Get the **ViewState** (p. 2315) from a **DataState** (p. 888) object.

Referenced by **dds::sub::find()**, and **operator==(())**.

8.63.3.14 view_state() [2/2]

```
void dds::sub::status::DataState::view_state (
    const ViewState & the_view_state ) [inline]
```

Set the provided **ViewState** (p. 2315) in a **DataState** (p. 888) object.

8.63.3.15 any()

```
static DataState dds::sub::status::DataState::any ( ) [inline], [static]
```

Create a **DataState** (p. 888) with **InstanceState::any()** (p. 1362), **ViewState::any()** (p. 2317), and **SampleState::any()** (p. 2025)

Examples

Foo_subscriber.cxx.

References **dds::sub::status::SampleState::any()**, **dds::sub::status::ViewState::any()**, **dds::sub::status::← InstanceState::any()**, and **DataState()**.

8.63.3.16 new_data()

```
static DataState dds::sub::status::DataState::new_data ( ) [inline], [static]
```

Create a **DataState** (p. 888) with **InstanceState::alive()** (p. 1361), **ViewState::any()** (p. 2317), and **SampleState::not_read()** (p. 2025)

References **dds::sub::status::InstanceState::alive()**, **dds::sub::status::ViewState::any()**, **DataState()**, and **dds::sub::status::SampleState::not_read()**.

8.63.3.17 any_data()

```
static DataState dds::sub::status::DataState::any_data ( ) [inline], [static]
```

Create a **DataState** (p. 888) with **InstanceState::alive()** (p. 1361), **ViewState::any()** (p. 2317), and **SampleState::any()** (p. 2025)

References **dds::sub::status::InstanceState::alive()**, **dds::sub::status::SampleState::any()**, **dds::sub::status::ViewState::any()**, and **DataState()**.

8.63.3.18 new_instance()

```
static DataState dds::sub::status::DataState::new_instance ( ) [inline], [static]
```

Create a **DataState** (p. 888) with **InstanceState::alive()** (p. 1361), **ViewState::new_view()** (p. 2317), and **SampleState::any()** (p. 2025)

References **dds::sub::status::InstanceState::alive()**, **dds::sub::status::SampleState::any()**, **DataState()**, and **dds::sub::status::ViewState::new_view()**.

8.63.4 Friends And Related Function Documentation

8.63.4.1 swap

```
void swap (
    DataState & left,
    DataState & right ) [friend]
```

Swap the contents of two **DataState** (p. 888) objects.

8.63.4.2 operator<<()

```
std::ostream & operator<< (
    std::ostream & os,
    const DataState & s ) [related]
```

Prints a data state as a readable string.

8.64 rti::sub::status::DataStateEx Class Reference

<<*extension*>> (p. 156) <<*value-type*>> (p. 152) An extended version of **dds::sub::status::DataState** (p. 888) that also contains **StreamKind** (p. 2097)

```
#include <DataStateEx.hpp>
```

Inheritance diagram for rti::sub::status::DataStateEx:

Public Member Functions

Create a DataState with InstanceState::alive(), ViewState::new_view(), and SampleState::any()

Friends

- void **swap** (**DataStateEx** &left, **DataStateEx** &right) **OMG_NOEXCEPT**
Swap the contents of two DataState objects.

Additional Inherited Members

8.64.1 Detailed Description

<<**extension**>> (p. 156) <<**value-type**>> (p. 152) An extended version of **dds::sub::status::DataState** (p. 888) that also contains **StreamKind** (p. 2097)

DataStateEx (p. 896) is an extension of **DataState** that allows setting an additional state mask: the **StreamKind** (p. 2097). It is used by **rti::sub::cond::create_read_condition_ex** and **rti::sub::cond::create_query_condition_ex** to create conditions that can filter based on the **StreamKind** (p. 2097).

A **DataStateEx** (p. 896) contains the state masks **InstanceState**, **ViewState** and **SampleState** (with the same getters and setters: **instance_state()** (p. 901), **view_state()** (p. 900) and **sample_state()** (p. 900)).

In addition it contains the mask **StreamKind** (p. 2097) with its getter and setter: **stream_kind()** (p. 899).

8.64.2 Constructor & Destructor Documentation

8.64.2.1 DataStateEx() [1/4]

```
rti::sub::status::DataStateEx::DataStateEx ( ) [inline]
```

Create a **DataStateEx** (p. 896) with InstanceState::any(), ViewState::any(), SampleState::any(), and **StreamKind::any()** (p. 2099).

8.64.2.2 DataStateEx() [2/4]

```
rti::sub::status::DataStateEx::DataStateEx (
    const StreamKind & the_stream_kind ) [inline]
```

Create a **DataStateEx** (p. 896) with InstanceState::any(), ViewState::any(), SampleState::any() and the provided **StreamKind** (p. 2097).

Note that the constructor is implicit, so you can use a **StreamKind** (p. 2097) wherever a **DataStateEx** (p. 896) is expected.

8.64.2.3 DataStateEx() [3/4]

```
rti::sub::status::DataStateEx::DataStateEx (
    const dds::sub::status::DataState & the_data_state ) [inline]
```

Create a **DataStateEx** (p. 896) with the provided SampleState, ViewState, InstanceState, and **StreamKind::any()** (p. 2099)

The constructor is implicit, so DataState can automatically be converted to a **DataStateEx** (p. 896) with **StreamKind**↔**::any()** (p. 2099).

Parameters

<i>the_data_state</i>	Contains the SampleState, ViewState and InstanceState
-----------------------	---

8.64.2.4 DataStateEx() [4/4]

```
rti::sub::status::DataStateEx::DataStateEx (
    const dds::sub::status::DataState & the_data_state,
    const StreamKind & the_stream_kind ) [inline]
```

Create a **DataStateEx** (p. 896) with the provided **SampleState**, **ViewState**, **InstanceState**, and **StreamKind** (p. 2097).

Parameters

<i>the_data_state</i>	Contains the SampleState , ViewState and InstanceState
<i>the_stream_kind</i>	Contains the StreamKind (p. 2097)

8.64.3 Member Function Documentation

8.64.3.1 operator<<()

```
DataStateEx & rti::sub::status::DataStateEx::operator<< (
    const StreamKind & the_stream_kind ) [inline]
```

Set the **StreamKind** (p. 2097).

8.64.3.2 operator>>()

```
const DataStateEx & rti::sub::status::DataStateEx::operator>> (
    StreamKind & the_stream_kind ) const [inline]
```

Get the **StreamKind** (p. 2097).

8.64.3.3 stream_kind() [1/2]

```
const StreamKind & rti::sub::status::DataStateEx::stream_kind ( ) const [inline]
```

Get the **StreamKind** (p. 2097).

Referenced by **operator==()**.

8.64.3.4 stream_kind() [2/2]

```
void rti::sub::status::DataStateEx::stream_kind (
    const StreamKind & the_stream_kind ) [inline]
```

Set the **StreamKind** (p. 2097).

8.64.3.5 data_state()

```
const DataState & rti::sub::status::DataStateEx::data_state ( ) const [inline]
```

Access the view, sample and instance states.

Referenced by **operator==()**.

8.64.3.6 operator==()

```
bool rti::sub::status::DataStateEx::operator==( (
    const DataStateEx & other ) const [inline]
```

Compare two **DataStateEx** (p. 896) objects for equality.

References **data_state()**, and **stream_kind()**.

8.64.3.7 operator!=()

```
bool rti::sub::status::DataStateEx::operator!=( (
    const DataStateEx & other ) const [inline]
```

Compare two **DataStateEx** (p. 896) objects for inequality.

8.64.3.8 sample_state() [1/2]

```
const SampleState & dds::sub::status::DataState::sample_state ( ) const [inline]
```

Access the SampleState.

8.64.3.9 sample_state() [2/2]

```
void dds::sub::status::DataState::sample_state (
    const SampleState & the_sample_state ) [inline]
```

Access the SampleState.

8.64.3.10 view_state() [1/2]

```
const ViewState & dds::sub::status::DataState::view_state ( ) const [inline]
```

Access the ViewState.

8.64.3.11 view_state() [2/2]

```
void dds::sub::status::DataState::view_state (
    const ViewState & the_view_state ) [inline]
```

Access the ViewState.

8.64.3.12 instance_state() [1/2]

```
const InstanceState & dds::sub::status::DataState::instance_state ( ) const [inline]
```

Access the InstanceState.

8.64.3.13 instance_state() [2/2]

```
void dds::sub::status::DataState::instance_state (
    const InstanceState & the_instance_state ) [inline]
```

Access the InstanceState.

8.64.3.14 any()

```
static DataState dds::sub::status::DataState::any ( ) [inline], [static]
```

Create a DataState with InstanceState::any(), ViewState::any(), and SampleState::any()

8.64.3.15 new_data()

```
static DataState dds::sub::status::DataState::new_data ( ) [inline], [static]
```

Create a DataState with InstanceState::alive(), ViewState::any(), and SampleState::not_read()

8.64.3.16 any_data()

```
static DataState dds::sub::status::DataState::any_data ( ) [inline], [static]
```

Create a DataState with InstanceState::alive(), ViewState::any(), and SampleState::any()

8.64.3.17 new_instance()

```
static DataState dds::sub::status::DataState::new_instance ( ) [inline], [static]
```

Create a DataState with InstanceState::alive(), ViewState::new_view(), and SampleState::any()

8.64.4 Friends And Related Function Documentation

8.64.4.1 swap

```
void swap (
    DataStateEx & left,
    DataStateEx & right ) [friend]
```

Swap the contents of two DataState objects.

8.65 dds::core::policy::DataTag Class Reference

Stores name-value (string) pairs that can be used to determine access permissions.

```
#include <dds/core/policy/CorePolicy.hpp>
```

Public Types

- typedef std::pair< std::string, std::string > **Entry**

*The type of the elements that **DataTag** (p. 902) contains.*

Public Member Functions

- **DataTag** ()
Creates a policy with an empty sequence of tags.
- template<typename EntryIter >
DataTag (EntryIter begin, EntryIter end)
*Creates a **DataTag** (p. 902) container with the entries specified by an iterator range.*
- **DataTag** (std::initializer_list< **Entry** > entries)
*<<C++11>> (p. 155) Creates a **DataTag** (p. 902) container with entries from an initializer_list*
- void **set** (std::initializer_list< **Entry** > entries)
<<C++11>> (p. 155) Adds tags from an initializer_list
- bool **exists** (const std::string &key) const
Returns true if a tag exists.
- std::string **get** (const std::string &key) const
Returns the value of a tag identified by a key if it exists.
- **rti::core::optional_value**< std::string > **try_get** (const std::string &key) const
Returns the value of a tag identified by a key or an empty optional_value if it doesn't exist.
- **DataTag** & **set** (const **Entry** &tag)
Adds or assigns a tag from a pair of strings.
- template<typename EntryIter >
DataTag & **set** (EntryIter begin, EntryIter end)
Adds a range of tags.
- bool **remove** (const std::string &key)
Removes the tag identified by a key.
- size_t **size** () const
Returns the number of tags.
- std::map< std::string, std::string > **get_all** () const
Retrieves a copy of all the entries in a std::map.

8.65.1 Detailed Description

Stores name-value (string) pairs that can be used to determine access permissions.

Entity:

dds::sub::DataReader (p. 756) **dds::pub::DataWriter** (p. 908)

Properties:

RxO (p. 307) = N/A;

Changeable (p. 307) = **NO** (p. 307)

8.65.2 Usage

The DATA_TAG QoS policy can be used to associate a set of tags in the form of (name, value) pairs with a `dds::sub::DataReader` (p. 756) or `dds::pub::DataWriter` (p. 908). This is similar to the `rti::core::policy::Property` (p. 1695), except for the following differences:

- Data tags are always propagated. You cannot select whether or not a particular pair should be propagated.
- Data tags are not exposed to API functions, such as `dds::pub::matched_subscription_data()` (p. 438), that receive `dds::topic::PublicationBuiltinTopicData` (p. 1703) or `dds::topic::SubscriptionBuiltinTopicData` (p. 2133) as a parameter.
- Connex passes data tags to the Access Control Security Plugin, which may use them to decide whether to allow or deny the corresponding entities.

There are helper functions to facilitate working with data tags. See the `DATA_TAG` (p. 316) page.

8.65.3 Member Typedef Documentation

8.65.3.1 Entry

```
typedef std::pair<std::string, std::string> dds::core::policy::DataTag::Entry
```

The type of the elements that `DataTag` (p. 902) contains.

Key/value string pairs.

8.65.4 Constructor & Destructor Documentation

8.65.4.1 DataTag() [1/3]

```
dds::core::policy::DataTag::DataTag ( ) [inline]
```

Creates a policy with an empty sequence of tags.

8.65.4.2 DataTag() [2/3]

```
template<typename EntryIter >
dds::core::policy::DataTag::DataTag (
    EntryIter begin,
    EntryIter end ) [inline]
```

Creates a **DataTag** (p. 902) container with the entries specified by an iterator range.

See also

set(EntryIter, EntryIter) (p. 906)

8.65.4.3 DataTag() [3/3]

```
dds::core::policy::DataTag::DataTag (
    std::initializer_list< Entry > entries ) [inline]
```

<<**C++11**>> (p. 155) Creates a **DataTag** (p. 902) container with entries from an `initializer_list`

For example:

```
DataTag my_tags {"key 1", "value 1"}, {"key 2", "value 2"};
```

If a key is duplicated, only one entry will be inserted, with the value that comes last.

8.65.5 Member Function Documentation

8.65.5.1 set() [1/3]

```
void dds::core::policy::DataTag::set (
    std::initializer_list< Entry > entries ) [inline]
```

<<**C++11**>> (p. 155) Adds tags from an `initializer_list`

8.65.5.2 exists()

```
bool dds::core::policy::DataTag::exists (
    const std::string & key ) const [inline]
```

Returns true if a tag exists.

8.65.5.3 get()

```
std::string dds::core::policy::DataTag::get (
    const std::string & key ) const [inline]
```

Returns the value of a tag identified by a key if it exists.

If the tag doesn't exist it throws **dds::core::PreconditionNotMetError** (p. 1669).

8.65.5.4 try_get()

```
rti::core::optional_value< std::string > dds::core::policy::DataTag::try_get (
    const std::string & key ) const [inline]
```

Returns the value of a tag identified by a key or an empty `optional_value` if it doesn't exist.

8.65.5.5 set() [2/3]

```
DataTag & dds::core::policy::DataTag::set (
    const Entry & tag ) [inline]
```

Adds or assigns a tag from a pair of strings.

If the key doesn't exist it adds the new entry. Otherwise it overrides its value with the new one.

Parameters

<i>tag</i>	<code>tag.first</code> is the key and <code>tag.second</code> is the value
------------	--

8.65.5.6 set() [3/3]

```
template<typename EntryIter >
DataTag & dds::core::policy::DataTag::set (
    EntryIter begin,
    EntryIter end ) [inline]
```

Adds a range of tags.

If a key is duplicated, only one entry will remain, with the value that comes last.

Template Parameters

<i>EntryIter</i>	A forward iterator whose value type is DataTag::Entry (p. 904), such as the iterators of a <code>std::map<std::string, std::string></code> .
------------------	---

Parameters

<i>begin</i>	Beginning of a range of Entry
<i>end</i>	End of that range

8.65.5.7 remove()

```
bool dds::core::policy::DataTag::remove (
    const std::string & key ) [inline]
```

Removes the tag identified by a key.

Returns

true if the tag was removed or false if it didn't exist.

8.65.5.8 size()

```
size_t dds::core::policy::DataTag::size ( ) const [inline]
```

Returns the number of tags.

8.65.5.9 get_all()

```
std::map< std::string, std::string > dds::core::policy::DataTag::get_all ( ) const [inline]
```

Retrieves a copy of all the entries in a `std::map`.

8.66 dds::pub::DataWriter< T > Class Template Reference

<<*reference-type*>> (p. 153) Allows an application to publish data for a `dds::topic::Topic` (p. 2178)

```
#include <dds/pub/DataReader.hpp>
```

Inheritance diagram for `dds::pub::DataWriter< T >`:

Public Member Functions

- **DataReader** (const `dds::pub::Publisher` &pub, const `dds::topic::Topic< T >` &the_topic)

*Creates a **DataReader** (p. 908).*
- **DataReader** (const `dds::pub::Publisher` &pub, const `dds::topic::Topic< T >` &the_topic, const `dds::pub::qos::DataWriterQos` &the_qos, `dds::pub::DataWriterListener< T >` *the_listener=NULL, const `dds::core::status::StatusMask` &mask= `dds::core::status::StatusMask::all()`)

*Creates a **DataReader** (p. 908) with QoS and listener.*
- **DataReader** (const `dds::pub::Publisher` &pub, const `dds::topic::Topic< T >` &the_topic, const `dds::pub::qos::DataWriterQos` &the_qos, `std::shared_ptr< Listener >` the_listener, const `dds::core::status::StatusMask` &mask= `dds::core::status::StatusMask::all()`)

*Creates a **DataReader** (p. 908) with QoS and listener.*
- **DataReader** (const `dds::topic::Topic< T >` &topic)

*Creates a **DataReader** (p. 908).*
- **DataReader** (const `dds::topic::Topic< T >` &topic, const `dds::pub::qos::DataWriterQos` &qos)

*Creates a **DataReader** (p. 908) with QoS.*
- **DataReader** (const `dds::topic::Topic< T >` &topic, const `dds::pub::qos::DataWriterQos` &qos, `std::shared_ptr< Listener >` listener, const `dds::core::status::StatusMask` &mask= `dds::core::status::StatusMask::all()`)

*Creates a **DataReader** (p. 908) with QoS and listener.*
- void **write** (const T &instance_data)

Modifies the value of a data instance.
- void **write** (const T &instance_data, const `dds::core::Time` ×tamp)

Modifies the value of a data instance and specifies the timestamp.
- void **write** (const T &instance_data, const `dds::core::InstanceHandle` &handle)

Modifies the value of a data instance.
- void **write** (const T &instance_data, const `dds::core::InstanceHandle` &handle, const `dds::core::Time` &source_timestamp)

Modifies the value of a data instance and specifies the timestamp.
- void **write** (const `dds::topic::TopicInstance< T >` &topic_instance)

*Write a **dds::topic::TopicInstance** (p. 2209).*
- void **write** (const `dds::topic::TopicInstance< T >` &topic_instance, const `dds::core::Time` ×tamp)

Write a topic instance with time stamp.

- `template<typename FWIterator >`
`void write (const FWIterator &begin, const FWIterator &end)`
- `template<typename FWIterator >`
`void write (const FWIterator &begin, const FWIterator &end, const dds::core::Time ×tamp)`
- `template<typename SamplesFWIterator , typename HandlesFWIterator >`
`void write (const SamplesFWIterator &data_begin, const SamplesFWIterator &data_end, const HandlesFWIterator &handle_begin, const HandlesFWIterator &handle_end)`
Write a series of samples and their parallel instance handles.
- `template<typename SamplesFWIterator , typename HandlesFWIterator >`
`void write (const SamplesFWIterator &data_begin, const SamplesFWIterator &data_end, const HandlesFWIterator &handle_begin, const HandlesFWIterator &handle_end, const dds::core::Time ×tamp)`
Write a series of samples and their parallel instance handles and a timestamp.
- **DataWriter** & **operator**<< (const T &data)
Writes a sample.
- **DataWriter** & **operator**<< (const std::pair< T, **dds::core::Time** > &data)
Writes a sample with a timestamp.
- **DataWriter** & **operator**<< (const std::pair< T, **dds::core::InstanceHandle** > &data)
Writes a sample with an instance handle.
- const **dds::core::InstanceHandle** **register_instance** (const T &instance_data)
Informs RTI Connexx that the application will be modifying a particular instance.
- const **dds::core::InstanceHandle** **register_instance** (const T &instance_data, const **dds::core::Time** &source_timestamp)
Informs RTI Connexx that the application will be modifying a particular instance and specifies the timestamp.
- **DataWriter** & **unregister_instance** (const **dds::core::InstanceHandle** &handle)
Unregister an instance.
- **DataWriter** & **unregister_instance** (const **dds::core::InstanceHandle** &handle, const **dds::core::Time** &source_timestamp)
Unregister an instance with timestamp.
- **DataWriter** & **dispose_instance** (const **dds::core::InstanceHandle** &handle)
Requests the middleware to delete the instance identified by the instance handle.
- **DataWriter** & **dispose_instance** (const **dds::core::InstanceHandle** &the_instance_handle, const **dds::core::Time** &source_timestamp)
Dispose an instance with a timestamp.
- T & **key_value** (T &key_holder, const **dds::core::InstanceHandle** &handle)
Retrieve the instance key that corresponds to an instance handle.
- **dds::topic::TopicInstance**< T > & **key_value** (**dds::topic::TopicInstance**< T > &key_holder, const **dds::core::InstanceHandle** &handle)
Retrieve the instance key that corresponds to an instance handle.
- **dds::core::InstanceHandle** **lookup_instance** (const T &key_holder)
Retrieve the instance handle that corresponds to an instance key_holder.
- const **dds::pub::qos::DataWriterQos** **qos** () const
Gets the DataWriterQos.
- void **qos** (const **dds::pub::qos::DataWriterQos** &the_qos)
Sets the DataWriterQos.
- **DataWriter** & **operator**<< (const **dds::pub::qos::DataWriterQos** &the_qos)
Set the DataWriterQos.
- const **DataWriter** & **operator**>> (**dds::pub::qos::DataWriterQos** &the_qos) const
Get the DataWriterQos.

- const **dds::topic::Topic**< T > & **topic** () const
*Get the Topic associated with this **DataWriter** (p. 908).*
- const **dds::pub::Publisher** & **publisher** () const
*Get the **Publisher** (p. 1719) that owns this **DataWriter** (p. 908).*
- void **wait_for_acknowledgments** (const **dds::core::Duration** &max_wait)
*Blocks the calling thread until all data written by reliable **DataWriter** (p. 908) entity is acknowledged, or until timeout expires.*
- void **listener** (**DataReaderListener**< T > *l, const **dds::core::status::StatusMask** &mask)
*Sets the **DataWriter** (p. 908) listener.*
- **DataReaderListener**< T > * **listener** () const
*Returns the listener currently associated with this **DataWriter** (p. 908).*
- void **set_listener** (std::shared_ptr< **Listener** > the_listener, const **dds::core::status::StatusMask** &event_mask)
Sets the listener associated with this writer.
- void **set_listener** (std::shared_ptr< **Listener** > the_listener)
Sets the listener associated with this writer.
- std::shared_ptr< **Listener** > **get_listener** () const
Returns the listener currently associated with this writer.
- const **dds::core::status::LivelinessLostStatus** **liveliness_lost_status** ()
Get the LivelinessLostStatus.
- const **dds::core::status::OfferedDeadlineMissedStatus** **offered_deadline_missed_status** ()
Get the OfferedDeadlineMissedStatus.
- const **dds::core::status::OfferedIncompatibleQosStatus** **offered_incompatible_qos_status** ()
Get the OfferedIncompatibleQosStatus.
- const **dds::core::status::PublicationMatchedStatus** **publication_matched_status** ()
Get the PublicationMatchedStatus.
- void **assert_liveliness** ()
*Manually asserts the liveliness of this **DataWriter** (p. 908).*
- void **unregister_instance** (**rti::pub::WriteParams** ¶ms)
<<extension>> (p. 156) Unregister an instance with parameters
- void **dispose_instance** (**rti::pub::WriteParams** ¶ms)
<<extension>> (p. 156) Dispose an instance with parameters
- bool **is_sample_app_acked** (const **rti::core::SampleIdentity** &sample_id)
<<extension>> (p. 156) Indicates if a sample is considered application-acknowledged
- void **wait_for_asynchronous_publishing** (const **dds::core::Duration** &max_wait)
<<extension>> (p. 156) Blocks the calling thread until asynchronous sending is complete.
- **rti::core::status::ReliableWriterCacheChangedStatus** **reliable_writer_cache_changed_status** ()
<<extension>> (p. 156) Get the reliable cache status for this writer.
- **rti::core::status::ReliableReaderActivityChangedStatus** **reliable_reader_activity_changed_status** ()
<<extension>> (p. 156) Get the reliable reader activity changed status for this writer
- **rti::core::status::DataWriterCacheStatus** **datawriter_cache_status** ()
<<extension>> (p. 156) Get the cache status for this writer
- **rti::core::status::DataWriterProtocolStatus** **datawriter_protocol_status** ()
<<extension>> (p. 156) Get the protocol status for this writer
- **rti::core::status::DataWriterProtocolStatus** **matched_subscription_datawriter_protocol_status** (const **dds::core::InstanceHandle** &subscription_handle)
<<extension>> (p. 156) Get the datawriter protocol status for this writer, per matched subscription identified by the subscription_handle.

- **rti::core::status::DataWriterProtocolStatus** **matched_subscription_datawriter_protocol_status** (const **rti::core::Locator** &subscription_locator)
 - <<extension>> (p. 156) Get the datawriter protocol status for this writer, per matched subscription identified by the locator
- **rti::core::status::ServiceRequestAcceptedStatus** **service_request_accepted_status** ()
 - <<extension>> (p. 156) Get the service request accepted status for this writer
- void **flush** ()
 - <<extension>> (p. 156) Flushes the batch in progress in the context of the calling thread.
- void **write** (const T &instance_data, **rti::pub::WriteParams** ¶ms)
 - <<extension>> (p. 156) Write with advanced parameters
- **rti::core::Result**< void > **write_noexcept** (const T &sample) noexcept
 - <<extension>> (p. 156) Alternative to **write()** (p. 918) that doesn't throw exceptions.
- **rti::core::Result**< void > **write_noexcept** (const T &sample, const **dds::core::Time** ×tamp) noexcept
 - <<extension>> (p. 156) Alternative to **write()** (p. 918) that doesn't throw exceptions.
- **rti::core::Result**< void > **write_noexcept** (const T &sample, const **dds::core::InstanceHandle** &instance) noexcept
 - <<extension>> (p. 156) Alternative to **write()** (p. 918) that doesn't throw exceptions.
- **rti::core::Result**< void > **write_noexcept** (const T &sample, const **dds::core::InstanceHandle** &instance, const **dds::core::Time** ×tamp) noexcept
 - <<extension>> (p. 156) Alternative to **write()** (p. 918) that doesn't throw exceptions.
- **rti::core::Result**< void > **write_noexcept** (const T &instance_data, **rti::pub::WriteParams** ¶ms) noexcept
 - <<extension>> (p. 156) Alternative to **write()** (p. 918) that doesn't throw exceptions.
- T * **create_data** ()
 - <<extension>> (p. 156) Create data from this writer and initialize it
- bool **delete_data** (T *sample)
 - <<extension>> (p. 156) Delete data created with **create_data()** (p. 952).
- T * **get_loan** ()
 - <<extension>> (p. 156) Get a loaned sample from this writer
- void **discard_loan** (T &sample)
 - <<extension>> (p. 156) Discard a loaned sample from this writer
- const **dds::core::InstanceHandle** **register_instance** (const T &key, **rti::pub::WriteParams** ¶ms)
 - <<extension>> (p. 156) Registers and instance with parameters

Related Functions

(Note that these are not member functions.)

- void **ignore** (**dds::domain::DomainParticipant** &participant, const **dds::core::InstanceHandle** &handle)
 - Instructs RTI Connex to locally ignore a publication.

8.66.1 Detailed Description

```
template<typename T>
class dds::pub::DataWriter< T >
```

<<*reference-type*>> (p. 153) Allows an application to publish data for a **dds::topic::Topic** (p. 2178)

Template Parameters

<i>T</i>	The topic-type that the DataWriter (p. 908) publishes
----------	--

QoS:

dds::pub::qos::DataWriterQos (p. 994)

Status:

dds::core::status::StatusMask::liveliness_lost() (p. 2090), **dds::core::status::LivelinessLostStatus** (p. 1398);
dds::core::status::StatusMask::offered_deadline_missed() (p. 2086), **dds::core::status::OfferedDeadlineMissedStatus** (p. 1603);
dds::core::status::StatusMask::offered_incompatible_qos() (p. 2087), **dds::core::status::OfferedIncompatibleQosStatus** (p. 1604);
dds::core::status::StatusMask::publication_matched() (p. 2091), **dds::core::status::PublicationMatchedStatus** (p. 1717);
dds::core::status::StatusMask::reliable_reader_activity_changed() (p. 2092), **rti::core::status::ReliableReaderActivityChangedStatus** (p. 1881);
dds::core::status::StatusMask::reliable_writer_cache_changed() (p. 2092), **rti::core::status::ReliableWriterCacheChangedStatus** (p. 1883).

Listener:

dds::pub::DataWriterListener (p. 972)

A **dds::pub::DataWriter** (p. 908) is attached to exactly one **dds::pub::Publisher** (p. 1719), that acts as a factory for it.

A **dds::pub::DataWriter** (p. 908) is bound to exactly one **dds::topic::Topic** (p. 2178) and therefore to exactly one data type. The **dds::topic::Topic** (p. 2178) must exist prior to the **dds::pub::DataWriter** (p. 908)'s creation.

The following operations may be called even if the **dds::pub::DataWriter** (p. 908) is not enabled. Other operations will fail with **dds::core::NotEnabledError** (p. 1601) if called on a disabled **dds::pub::DataWriter** (p. 908):

- **dds::pub::DataWriter::qos(const dds::pub::qos::DataWriterQos&)** (p. 936), **dds::pub::DataWriter::qos(const)** (p. 936), **dds::pub::DataWriter::set_listener** (p. 939), **dds::pub::DataWriter::get_listener** (p. 940), **dds::core::Entity::enable** (p. 1269), **dds::core::cond::StatusCondition::StatusCondition(const dds::core::Entity&)** (p. 2080) and **dds::core::Entity::status_changes()** (p. 1270) **dds::pub::DataWriter::liveliness_lost_status()** (p. 941), **dds::pub::DataWriter::offered_deadline_missed_status()** (p. 941), **dds::pub::DataWriter::offered_incompatible_qos_status()** (p. 941), **dds::pub::DataWriter::publication_matched_status()** (p. 942), **dds::pub::DataWriter::reliable_writer_cache_changed_status()** (p. 945), **dds::pub::DataWriter::reliable_reader_activity_changed_status()** (p. 945) **dds::pub::DataWriter::service_request_accepted_status()** (p. 948)

Several **dds::pub::DataWriter** (p. 908) may operate in different threads. If they share the same **dds::pub::Publisher** (p. 1719), the middleware guarantees that its operations are thread-safe.

Operations Allowed in Listener Callbacks (p. 1383)

8.66.2 Notes about DataWriter destruction

The deletion of the **dds::pub::DataWriter** (p. 908) will automatically unregister all instances.

The **DataWriter** (p. 908) destructor will not throw any exceptions even if the destruction fails. Calling **close()** (p. 1270) will throw in case of failure

Examples

Foo_publisher.cxx.

8.66.3 Constructor & Destructor Documentation

8.66.3.1 DataWriter() [1/6]

```
template<typename T >
dds::pub::DataWriter< T >::DataWriter (
    const dds::pub::Publisher & pub,
    const dds::topic::Topic< T > & the_topic ) [inline]
```

Creates a **DataWriter** (p. 908).

It uses the default DataWriterQos, and sets no listener.

Parameters

<i>pub</i>	The publisher that this DataWriter (p. 908) belongs to
<i>the_topic</i>	The Topic associated with this DataWriter (p. 908)

See also

DataWriter(const dds::pub::Publisher& pub,const dds::topic::Topic<T>& topic,const dds::pub::qos←
::DataWriterQos& qos,dds::pub::DataWriterListener<T>* listener,const dds::core::status::StatusMask&
mask) (p. 915)

8.66.3.2 DataWriter() [2/6]

```
template<typename T >
dds::pub::DataWriter< T >::DataWriter (
    const dds::pub::Publisher & pub,
    const dds::topic::Topic< T > & the_topic,
    const dds::pub::qos::DataWriterQos & the_qos,
    dds::pub::DataWriterListener< T > * the_listener = NULL,
    const dds::core::status::StatusMask & mask = dds::core::status::StatusMask::all() )
[inline]
```

Creates a **DataWriter** (p. 908) with QoS and listener.

[DEPRECATED] When using a listener, prefer the constructor that receives a `shared_ptr<Listener` (p. 1381) > instead of a regular `Listener*` pointer.

When a **DataWriter** (p. 908) is created, only those transports already registered are available to the **DataWriter** (p. 908). See **Built-in Transport Plugins** (p. 81) for details on when a builtin transport is registered.

Precondition

If publisher is enabled, topic must have been enabled. Otherwise, this operation will fail and no **DataWriter** (p. 908) will be created.

The given **dds::topic::Topic** (p. 2178) must have been created from the same participant as this publisher. If it was created from a different participant, this method will fail.

Parameters

<i>pub</i>	The publisher that this DataWriter (p. 908) belongs to
<i>the_topic</i>	The Topic associated with this DataWriter (p. 908)
<i>the_qos</i>	QoS to be used for creating the new Datawriter.
<i>the_listener</i>	The DataWriter (p. 908) listener. The caller owns the listener and is responsible for deleting it only after resetting it or after deleting the DataWriter (p. 908).
<i>mask</i>	Changes of communication status to be invoked on the listener

listener() (p. 939)

8.66.3.3 DataWriter() [3/6]

```
template<typename T >
dds::pub::DataWriter< T >::DataWriter (
    const dds::pub::Publisher & pub,
    const dds::topic::Topic< T > & the_topic,
    const dds::pub::qos::DataWriterQos & the_qos,
    std::shared_ptr< Listener > the_listener,
    const dds::core::status::StatusMask & mask = dds::core::status::StatusMask::all() )
```

[inline]

Creates a **DataWriter** (p. 908) with QoS and listener.

When a **DataWriter** (p. 908) is created, only those transports already registered are available to the **DataWriter** (p. 908). See **Built-in Transport Plugins** (p. 81) for details on when a builtin transport is registered.

Precondition

If publisher is enabled, topic must have been enabled. Otherwise, this operation will fail and no **DataWriter** (p. 908) will be created.

The given **dds::topic::Topic** (p. 2178) must have been created from the same participant as this publisher. If it was created from a different participant, this method will fail.

Parameters

<i>pub</i>	The publisher that this DataWriter (p. 908) belongs to
<i>the_topic</i>	The Topic associated with this DataWriter (p. 908)
<i>the_qos</i>	QoS to be used for creating the new Datawriter.
<i>the_listener</i>	A shared_ptr to the listener. See set_listener() (p. 939) for more information.
<i>mask</i>	Indicates which status updates the listener will receive

listener() (p. 939)

8.66.3.4 DataWriter() [4/6]

```
template<typename T >
dds::pub::DataWriter< T >::DataWriter (
    const dds::topic::Topic< T > & topic ) [inline], [explicit]
```

Creates a **DataWriter** (p. 908).

It uses the default DataWriterQos, and sets no listener.

This constructor uses the implicit publisher to create this **DataWriter** (p. 908) (`rti::pub::implicit_publisher` (p. 525) (`topic.participant()`)).

Parameters

<i>topic</i>	The Topic associated with this DataWriter (p. 908)
--------------	---

**DataWriter(const dds::pub::Publisher& pub,const dds::topic::Topic<T>& topic,const dds::pub::qos←
::DataWriterQos& qos,dds::pub::DataWriterListener<T>* listener,const dds::core::status::StatusMask&
mask)** (p. 915)

8.66.3.5 DataWriter() [5/6]

```
template<typename T >
dds::pub::DataWriter< T >::DataWriter (
    const dds::topic::Topic< T > & topic,
    const dds::pub::qos::DataWriterQos & qos ) [inline]
```

Creates a **DataWriter** (p. 908) with QoS.

This constructor uses the implicit publisher to create this **DataWriter** (p. 908)

Parameters

<i>topic</i>	The Topic associated with this DataWriter (p. 908)
<i>qos</i>	QoS to be used for creating the new Datawriter.

See also

DataWriter(const dds::pub::Publisher& pub,const dds::topic::Topic<T>& topic,const dds::pub::qos←
::DataWriterQos& qos,dds::pub::DataWriterListener<T>* listener,const dds::core::status::StatusMask&
mask) (p. 915)

8.66.3.6 DataWriter() [6/6]

```
template<typename T >
dds::pub::DataWriter< T >::DataWriter (
    const dds::topic::Topic< T > & topic,
    const dds::pub::qos::DataWriterQos & qos,
    std::shared_ptr< Listener > listener,
    const dds::core::status::StatusMask & mask = dds::core::status::StatusMask::all() )
[inline]
```

Creates a **DataWriter** (p. 908) with QoS and listener.

This constructor uses the implicit publisher to create this **DataWriter** (p. 908)

Parameters

<i>topic</i>	The Topic associated with this DataWriter (p. 908)
<i>qos</i>	QoS to be used for creating the new Datawriter.
<i>listener</i>	A shared_ptr to the listener. See set_listener() (p. 939) for more information.
<i>mask</i>	Indicates which status updates the listener will receive

mask) (p. 915)

8.66.4 Member Function Documentation

8.66.4.1 write() [1/11]

```
template<typename T >
void dds::pub::DataWriter< T >::write (
    const T & instance_data ) [inline]
```

Modifies the value of a data instance.

This operations does the same as **write(const T&, const dds::core::InstanceHandle&)** (p. 919) except that it deduces the identity of the instance from *instance_data* (by means of the key).

Parameters

<i>instance_data</i>	The data sample to write.
----------------------	---------------------------

See also

write(const T&, const dds::core::InstanceHandle&) (p. 919)

Examples

Foo_publisher.cxx.

8.66.4.2 write() [2/11]

```
template<typename T >
void dds::pub::DataWriter< T >::write (
    const T & instance_data,
    const dds::core::Time & timestamp ) [inline]
```

Modifies the value of a data instance and specifies the timestamp.

See also

void write(const T&, const dds::core::InstanceHandle&, const dds::core::Time&) (p. 923)
