8.76.2.33 locator_reachability_assert_period

```
final Duration_t locator_reachability_assert_period
```

<<***extension***>> *(*p. *138)* Period at which this DomainParticipant will assert the locators discovered from other DomainParticipants.

This setting configures the period at which this **com.rti.dds.domain.DomainParticipant** (p. 948) will ping all the locators that it has discovered from other DomainParticipants. This period should be strictly less than **com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.locator_reachability_lease_duration** (p. 935).

If **com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.locator_reachability_lease_duration** (p. 935) is **com.rti.dds.infrastructure.Duration_t.DURATION_INFINITE** (p. 1133) this parameter is ignored. The DomainParticipant will not assert remote locators.

[default] 20 seconds

[range] [1 nanosec,1 year]

See also

com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.locator_reachability_lease_duration (p. 935)

Categories

Immutable (p. 292), **Transports** (p. 285)

8.76.2.34 locator_reachability_lease_duration

```
final Duration_t locator_reachability_lease_duration
```

<<***extension***>> *(*p. *138)* The time period after which other DomainParticipants can consider one of their locators as "unreachable" if they do not receive a REACHABILITY PING from this DomainParticipant.

For the purpose of this explanation, we will use 'local' to refer to the DomainParticipant in which we configure locator_reachability_lease_duration and 'remote' to refer to the other DomainParticipants communicating with the local DomainParticipant.

This setting configures a timeout announced to the remote DomainParticipants. This timeout is used by the remote DomainParticipants as the maximum period by which a remote locator must be asserted by the local DomainParticipant (through a REACHABILITY PING message) before considering this locator as "unreachable" from the local DomainParticipant.

When a remote DomainParticipant detects that one of its locators is not reachable from the local DomainParticipant, it will notify the local DomainParticipant of this event. From that moment on, and until notified otherwise, the local DomainParticipant will not send RTPS messages to remote DomainParticipants using this locator.

If this value is set to **com.rti.dds.infrastructure.Duration_t.DURATION_INFINITE** (p. 1133), the local DomainParticipant will send RTPS messages to a remote DomainParticipant on the locators announced by the remote DomainParticipant, regardless of whether or not the remote DomainParticipant can be reached using these locators.

[default] com.rti.dds.infrastructure.Duration_t.DURATION_INFINITE (p. 1133)

[range] [1 nanosec,1 year] or **com.rti.dds.infrastructure.Duration_t.DURATION_INFINITE** (p. 1133)

8.76.2.35 locator_reachability_change_detection_period

```
final Duration_t locator_reachability_change_detection_period
```

<<***extension***>> *(*p. *138)* Period at which this DomainParticipant will check if its locators are reachable from other DomainParticipants.

This setting determines the maximum period at which this DomainParticipant will check to see if its locators are reachable from other DomainParticipants according to the other DomainParticipants' **com.rti.dds.infrastructure.↩ DiscoveryConfigQosPolicy.locator_reachability_lease_duration** (p. 935) value.

If **com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.locator_reachability_lease_duration** (p. 935) is **com.↩ rti.dds.infrastructure.Duration_t.DURATION_INFINITE** (p. 1133) this parameter is ignored. The DomainParticipant will not schedule an event to see if its locators are reachable from other DomainParticipants.

[default] 60 seconds

[range] [1 nanosec,1 year]

8.76.2.40 dns_tracker_polling_period

```
final  Duration_t dns_tracker_polling_period = new  Duration_t(20, 0)
```

<<***extension***>> *(p. 138)* Duration that specifies the period used by the DNS tracker to poll the DNS service and check for changes in the hostnames.

RTI Connext allows the use of hostnames instead of IP addresses when configuring initial peers for specific transports (e.g.: UDPv4 and UDPv6). The DNS tracker keeps the IP addresses of these hostnames updated. The DNS tracker builds a list of hostnames from the initial peers of a DomainParticipant, queries the DNS for those hostnames, and updates the resolved IP addresses when the IP addresses change. The frequency of these queries is defined by the DNS tracker polling period.

RTI Connext keeps information regarding the hostnames of peers if they are part of the **com.rti.dds.infrastructure.↩ DiscoveryQosPolicy.initial_peers** (p. 945). The information regarding peers added through the **com.rti.dds.↩ domain.DomainParticipant.add_peer** (p. 1007) operation is kept only if the DNS tracker has been enabled before adding a peer.

The DNS tracker is useful in situations where the IP address of an as-yet undiscovered peer may change. For example, if the **com.rti.dds.infrastructure.DiscoveryQosPolicy.initial_peers** (p. 945) of a participant is set to "hostname1" and the IP address associated with "hostname1" changes after the participant is created, the participant has no way of knowing about that change unless it queries the DNS again.

When two participants have already discovered each other, any IP address change is communicated directly between the participants and there is no need for the DNS tracker. In other words, they do not wait for the DNS tracker polling period to update the IP address–the change is communicated immediately between the participants so that communication can continue uninterrupted.

The value should be (but is not required to be) set to a value that is less than the **com.rti.dds.infrastructure.↩ DiscoveryConfigQosPolicy.participant_liveliness_assert_period** (p. 919) (if using SPDP) or **com.rti.dds.↩ infrastructure.DiscoveryConfigQosPolicy.participant_liveliness_assert_period** (p. 919) (is using SPDP2) so that multiple participant announcements are not sent to an outdated IP address.

When the period is set to **com.rti.dds.infrastructure.Duration_t.DURATION_INFINITE** (p. 1133), the tracker is disabled.

[default] 20 seconds

8.76.2.46 request_types_filter

```
String request_types_filter
```

<<***extension***>> *(*p. *138)* Topic name pattern for requesting all types via Type Lookup Service.

When using TypeObject v2 (enabled via **com.rti.dds.infrastructure.DiscoveryConfigBuiltinChannelKind.TYPE_↩ LOOKUP_SERVICE_CHANNEL** (p. 912)), this field configures a topic name pattern. Any remote endpoint whose topic name matches this pattern will have all of its types requested by the Type Lookup Service, even if no matching local endpoint exists.

By default, the Type Lookup Service only requests unknown types when a matching local endpoint exists. This setting allows you to proactively retrieve type information for remote endpoints matching specific topic names, which can be useful for applications where types are discovered on the wire (such as those using Dynamic Data).

This is a regex string, so you can use regex syntax to match multiple topic names (including wildcards).

If this is NULL or an empty string, the middleware will only request types for remote endpoints that have a matching local endpoint.

If you are using **com.rti.dds.dynamicdata.DynamicData** (p. 1134) and relying on discovering types on the wire, you should set this to a value that matches the topic names of your remote endpoints to ensure that you receive type information for those endpoints.

[default] NULL

8.77.1 Detailed Description

<<***extension***>> *(*p. *138)* Configures the mechanism used by the middleware to automatically discover and connect with new remote applications.

Entity:

com.rti.dds.domain.DomainParticipant (p. 948)

Properties:

RxO (p. 506) = N/A
Changeable (p. 507) = **NO** (p. 507)

8.77.2 Usage

This QoS policy identifies where on the network this application can *potentially* discover other applications with which to communicate.

The middleware will periodically send network packets to these locations, announcing itself to any remote applications that may be present, and will listen for announcements from those applications.

This QoS policy is an extension to the DDS standard.

com.rti.dds.infrastructure.DiscoveryConfigQosPolicy (p. 915)

8.77.3 Member Data Documentation

8.77.3.1 enabled_transports

```
final StringSeq enabled_transports
```

<<***extension***>> *(p. 138)* The transports available for use by the Discovery mechanism.

Only these transports can be used by the discovery mechanism to send meta-traffic via the builtin endpoints (built-in **com.rti.dds.subscription.DataReader** (p. 707) and **com.rti.dds.publication.DataWriter** (p. 818)).

Also determines the unicast addresses on which the Discovery mechanism will listen for meta-traffic. These along with the `domain_id` and `participant_id` determine the unicast locators on which the Discovery mechanism can receive meta-data.

Alias names for the builtin transports are defined in **TRANSPORT_BUILTIN** (p. 521). These alias names are case sensitive and should be written in lowercase.

[default] Empty sequence. All the transports available to the DomainParticipant are available for use by the Discovery mechanism.

[range] Sequence of non-null,non-empty strings.

Categories

Immutable (p. 292), **Transports** (p. 285), **Discovery** (p. 212)

8.77.3.2 multicast_receive_addresses

```
final  StringSeq multicast_receive_addresses
```

Initial value:

```
=
       new StringSeq()
```

<<***basic***>> *(*p. *123)* <<***extension***>> *(*p. *138)* Specifies the multicast group addresses on which discovery-related **meta-traffic** can be received by the DomainParticipant.

Each element of this list must be a valid multicast address (IPv4 or IPv6) in the proper format (see **Address Format** (p. 474)).

The `domain_id` determines the multicast port on which the Discovery mechanism can receive meta-data.

If NDDS_DISCOVERY_PEERS does *not* contain a multicast address, then the string sequence **com.rti.dds.infrastructure.DiscoveryQosPolicy.multicast_receive_addresses** (p. 944) is cleared and the RTI discovery process will not listen for discovery messages via multicast.

If NDDS_DISCOVERY_PEERS contains one or more multicast addresses, the addresses will be stored in **com.rti.dds.infrastructure.DiscoveryQosPolicy.multicast_receive_addresses** (p. 944), starting at element 0. They will be stored in the order they appear NDDS_DISCOVERY_PEERS.

Note: Currently, RTI Connext will only listen for discovery traffic on the first multicast address (element 0) in **com.rti.dds.infrastructure.DiscoveryQosPolicy.multicast_receive_addresses** (p. 944).

[default] builtin.udpv4://239.255.0.1 (See also **NDDS_DISCOVERY_PEERS** (p. 472))

[range] Sequence of length [0,1], whose elements are multicast addresses. Currently only the first multicast address (if any) is used. The rest are ignored.

See also

Address Format (p. 474)

8.77.3.3 metatraffic_transport_priority

```
int metatraffic_transport_priority
```

<<***extension***>> *(*p. *138)* The transport priority to use for the Discovery meta-traffic.

The discovery metatraffic will be sent by the built-in **com.rti.dds.publication.DataWriter** (p. 818) using this transport priority.

[default] 0

[range] [0, MAX_UINT]

Categories

Immutable (p. 292), **Transports** (p. 285), **Concurrency** (p. 195), **Discovery** (p. 212)

8.77.3.4 initial_peers

```
final StringSeq initial_peers
```

*<<**basic**>> (p. 123) <<**extension**>> (p. 138)* Determines the initial list of peers that will be contacted by the Discovery mechanism to send announcements about the presence of this participant.

As part of the participant discovery phase, the **com.rti.dds.domain.DomainParticipant** (p. 948) will announce itself to the domain by sending participant DATA messages. The initial_peers specifies the initial list of peers that will be contacted. A remote **com.rti.dds.domain.DomainParticipant** (p. 948) is discovered by receiving participant announcements from a remote peer. When the new remote **com.rti.dds.domain.DomainParticipant** (p. 948) has been added to the participant's database, the endpoint discovery phase commences and information about the DataWriters and DataReaders is exchanged.

Each element of this list must be a peer descriptor in the proper format (see **Peer Descriptor Format** (p. 473)).

[default] builtin.udpv4://239.255.0.1, builtin.udpv4://127.0.0.1, builtin.shmem:// (See also **NDDS_DISCOVERY_PEERS** (p. 472))

[range] Sequence of arbitrary length.

Peer Descriptor Format (p. 473)

com.rti.dds.domain.DomainParticipant.add_peer() (p. 1007)

Categories

Immutable (p. 292), **Transports** (p. 285), **Discovery Isolation** (p. 220), **Discovery** (p. 212)

8.77.3.5 accept_unknown_peers

```
boolean accept_unknown_peers
```

*<<**basic**>> (p. 123) <<**extension**>> (p. 138)* Whether to accept a new participant that is not in the initial peers list.

If com.rti.dds.infrastructure.false, the participant will only communicate with those in the initial peers list and those added via **com.rti.dds.domain.DomainParticipant.add_peer()** (p. 1007).

If com.rti.dds.infrastructure.true, the participant will also communicate with all discovered remote participants.

Note: If accept_unknown_peers is com.rti.dds.infrastructure.false and shared memory is disabled, applications on the same node will *not* communicate if only 'localhost' is specified in the peers list. If shared memory is disabled or 'shmem://' is not specified in the peers list, to communicate with other applications on the same node through the loopback interface, you must put the actual node address or hostname in **NDDS_DISCOVERY_PEERS** (p. 472).

[default] com.rti.dds.infrastructure.true

Categories

Immutable (p. 292), **Transports** (p. 285), **Discovery Isolation** (p. 220), **Discovery** (p. 212)

8.77.3.6 enable_endpoint_discovery

```
boolean enable_endpoint_discovery
```

[DEPRECATED] (p. **358**) <<***extension***>> *(p. 138)* Whether to automatically enable endpoint discovery for all the remote participants.

If com.rti.dds.infrastructure.true, endpoint discovery will automatically occur for every discovered remote participant.

If com.rti.dds.infrastructure.false, endpoint discovery will be initially disabled and manual activation is required for each discovered participant by calling **com.rti.dds.domain.DomainParticipant.resume_endpoint_discovery** (p. 1017).

[default] com.rti.dds.infrastructure.true

Categories

  *<<**extension**>> (p. 403) Returns a list of discovered **com.rti.dds.domain.DomainParticipant** (p. 948) entities that have the given **com.rti.dds.infrastructure.EntityNameQosPolicy.name** (p. 1329).*
- void **get_discovered_participant_data** (**ParticipantBuiltinTopicData** participant_data, **InstanceHandle_t** participant_handle)

  *Returns **com.rti.dds.domain.builtin.ParticipantBuiltinTopicData** (p. 1647) for the specified **com.rti.dds.domain.DomainParticipant** (p. 948).*
- String **get_discovered_participant_subject_name** (**InstanceHandle_t** participant_handle)

  *<<**extension**>> (p. 403) Returns **com.rti.dds.infrastructure.EntityNameQosPolicy.name** (p. 1329) for the specified **com.rti.dds.domain.DomainParticipant** (p. 948).*
- void **get_discovered_topics** (**InstanceHandleSeq** topic_handles)

  *Returns list of discovered **com.rti.dds.topic.Topic** (p. 2116) objects.*
- void **get_discovered_topic_data** (**TopicBuiltinTopicData** topic_data, **InstanceHandle_t** topic_handle)

  *Returns builtin.TopicBuiltinTopicData for the specified **com.rti.dds.topic.Topic** (p. 2116).*
- boolean **contains_entity** (**InstanceHandle_t** a_handle)

  *Completes successfully with com.rti.dds.infrastructure.true if the referenced **com.rti.dds.infrastructure.Entity** (p. 1320) is contained by the **com.rti.dds.domain.DomainParticipant** (p. 948).*
- void **register_durable_subscription** (**EndpointGroup_t** group, String topic_name)

  *<<**extension**>> (p. 403) Registers a Durable Subscription on the specified **com.rti.dds.topic.Topic** (p. 2116) on all Persistence Services.*
- void **delete_durable_subscription** (**EndpointGroup_t** group)

  *<<**extension**>> (p. 403) Deletes an existing Durable Subscription on all Persistence Services.*
- void **resume_endpoint_discovery** (**InstanceHandle_t** remote_participant_handle)

  *<<**extension**>> (p. 403) Initiates endpoint discovery with the specified remote **com.rti.dds.domain.DomainParticipant** (p. 948).*
- void **register_contentfilter** (String filter_name, **ContentFilter** contentfilter)

  *<<**extension**>> (p. 403) Register a content filter which can be used to create a **com.rti.dds.topic.ContentFilteredTopic** (p. 692).*
- **ContentFilter lookup_contentfilter** (String filter_name)

  *<<**extension**>> (p. 403) Lookup a content filter previously registered with **com.rti.dds.domain.DomainParticipant.register_contentfilter** (p. 1018).*
- void **unregister_contentfilter** (String filter_name)

  *<<**extension**>> (p. 403) Unregister a content filter previously registered with **com.rti.dds.domain.DomainParticipant.register_contentfilter** (p. 1018).*
- **TypeCode get_typecode** (String type_name)

  *<<**extension**>> (p. 403) Retrieves the **com.rti.dds.typecode.TypeCode** (p. 2183) of a type registered with the **com.rti.dds.domain.DomainParticipant** (p. 948) based on the registration name.*
- void **get_participant_protocol_status** (**DomainParticipantProtocolStatus** status)

  *<<**extension**>> (p. 403) Get the domain participant protocol status for this participant.*
- **Publisher get_implicit_publisher** ()

  *<<**extension**>> (p. 403) Returns the implicit **com.rti.dds.publication.Publisher** (p. 1767). If an implicit Publisher does not already exist, this creates one.*
- **Subscriber get_implicit_subscriber** ()

  *<<**extension**>> (p. 403) Returns the implicit **com.rti.dds.subscription.Subscriber** (p. 2039). If an implicit Subscriber does not already exist, this creates one.*
- abstract **Publisher lookup_publisher_by_name** (String publisher_name)

  *<<**extension**>> (p. 403) Looks up a **com.rti.dds.publication.Publisher** (p. 1767) by its entity name within this **com.rti.dds.domain.DomainParticipant** (p. 948).*
- abstract **Subscriber lookup_subscriber_by_name** (String subscriber_name)

*<<**extension**>> (p. 403) Retrieves a **com.rti.dds.subscription.Subscriber** (p. 2039) by its entity name within this **com.rti.dds.domain.DomainParticipant** (p. 948).*

- abstract **DataWriter lookup_datawriter_by_name** (String datawriter_full_name)

  *<<**extension**>> (p. 403) Looks up a **com.rti.dds.publication.DataWriter** (p. 818) by its entity name within this **com.rti.dds.domain.DomainParticipant** (p. 948).*

- abstract **DataReader lookup_datareader_by_name** (String datareader_full_name)

  *<<**extension**>> (p. 403) Retrieves up a **com.rti.dds.subscription.DataReader** (p. 707) by its entity name in this **com.rti.dds.domain.DomainParticipant** (p. 948).*

- void **take_discovery_snapshot** ()

  Take a snapshot of the remote participants discovered by a local one.

- void **take_discovery_snapshot** (String file_name)

  Take a snapshot of the remote participants discovered by a local one.

Static Public Attributes

- static final **TopicQos TOPIC_QOS_DEFAULT** = new **TopicQos**()

  *Special value for creating a **com.rti.dds.topic.Topic** (p. 2116) with default QoS.*

- static final **TopicQos TOPIC_QOS_PRINT_ALL** = new **TopicQos**()

  *Special value which can be supplied to **com.rti.dds.topic.TopicQos.toString(TopicQos baseQos, QosPrintFormat format)** (p. 2135) indicating that all of the QoS should be printed.*

- static final **PublisherQos PUBLISHER_QOS_DEFAULT** = new **PublisherQos**()

  *Special value for creating a **com.rti.dds.publication.Publisher** (p. 1767) with default QoS.*

- static final **PublisherQos PUBLISHER_QOS_PRINT_ALL** = new **PublisherQos**()

  *Special value which can be supplied to **com.rti.dds.publication.PublisherQos.toString(PublisherQos baseQos, QosPrintFormat format)** (p. 1792) indicating that all of the QoS should be printed.*

- static final **SubscriberQos SUBSCRIBER_QOS_PRINT_ALL**

  *Special value which can be supplied to **com.rti.dds.subscription.SubscriberQos.toString(SubscriberQos baseQos, QosPrintFormat format)** (p. 2066) indicating that all of the QoS should be printed.*

- static final **SubscriberQos SUBSCRIBER_QOS_DEFAULT**

  *Special value for creating a **com.rti.dds.subscription.Subscriber** (p. 2039) with default QoS.*

- static final **DomainParticipantQos DOMAINPARTICIPANT_QOS_PRINT_ALL**

  *Special value which can be supplied to **com.rti.dds.domain.DomainParticipantQos.toString(DomainParticipantQos baseQos, QosPrintFormat format)** (p. 1076) indicating that all of the QoS should be printed.*

- static final **DomainParticipantFactoryQos DOMAINPARTICIPANTFACTORY_QOS_PRINT_ALL**

  *Special value which can be supplied to **com.rti.dds.domain.DomainParticipantFactoryQos.toString(DomainParticipantFactoryQos baseQos, QosPrintFormat format)** (p. 1067) indicating that all of the QoS should be printed.*

- static final **FlowControllerProperty_t FLOW_CONTROLLER_PROPERTY_DEFAULT**

  *<<**extension**>> (p. 403) Special value for creating a **com.rti.dds.publication.FlowController** (p. 1348) with default property.*

- static final String **SQLFILTER_NAME**

  *<<**extension**>> (p. 403) The name of the built-in SQL filter that can be used with ContentFilteredTopics and MultiChannel DataWriters.*

- static final String **STRINGMATCHFILTER_NAME**

  *<<**extension**>> (p. 403) The name of the built-in StringMatch filter that can be used with ContentFilteredTopics and MultiChannel DataWriters.*

8.79.1 Detailed Description

<<***interface***>> *(p. 403)* Container for all **com.rti.dds.infrastructure.DomainEntity** (p. 947) objects.

The **DomainParticipant** (p. 948) object plays several roles:

- It acts as a container for all other **com.rti.dds.infrastructure.Entity** (p. 1320) objects.
- It acts as a *factory* for the **com.rti.dds.publication.Publisher** (p. 1767), **com.rti.dds.subscription.Subscriber** (p. 2039), **com.rti.dds.topic.Topic** (p. 2116) and **com.rti.dds.topic.MultiTopic** (p. 1618) **com.rti.dds.↩ infrastructure.Entity** (p. 1320) objects.
- It represents the participation of the application on a communication plane that isolates applications running on the same set of physical computers from each other. A domain establishes a virtual network linking all applications that share the same `domainId` and isolating them from applications running on different domains. In this way, several independent distributed applications can coexist in the same physical network without interfering, or even being aware of each other.
- It provides administration services in the domain, offering operations that allow the application to ignore locally any information about a given participant (**com.rti.dds.domain.DomainParticipant.ignore_participant** (p. 1001)), publication (**com.rti.dds.domain.DomainParticipant.ignore_publication** (p. 1003)), subscription (**com.rti.dds.domain.DomainParticipant.ignore_subscription()** (p. 1004)) or topic (**com.rti.dds.domain.↩ DomainParticipant.ignore_topic()** (p. 1002)).

The following operations may be called even if the **com.rti.dds.domain.DomainParticipant** (p. 948) is not enabled. Operations NOT in this list will fail with **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902) \ if called on a disabled **DomainParticipant** (p. 948).

- **com.rti.dds.infrastructure.Entity.enable** (p. 1323),
- **com.rti.dds.domain.DomainParticipant.set_qos** (p. 992), **com.rti.dds.domain.DomainParticipant.set_↩ qos_with_profile** (p. 992), **com.rti.dds.domain.DomainParticipant.get_qos** (p. 993),
- **com.rti.dds.domain.DomainParticipant.set_listener** (p. 996), **com.rti.dds.domain.DomainParticipant.get↩ _listener** (p. 997),
- Factory operations: **com.rti.dds.domain.DomainParticipant.create_flowcontroller** (p. 969), **com.rti.↩ dds.domain.DomainParticipant.create_topic** (p. 984), **com.rti.dds.domain.DomainParticipant.create↩ _topic_with_profile** (p. 986), **com.rti.dds.domain.DomainParticipant.create_publisher** (p. 971), **com.↩ rti.dds.domain.DomainParticipant.create_publisher_with_profile** (p. 972), **com.rti.dds.domain.Domain↩ Participant.create_subscriber** (p. 975), **com.rti.dds.domain.DomainParticipant.create_subscriber_with↩ _profile** (p. 976), **com.rti.dds.domain.DomainParticipant.delete_flowcontroller** (p. 970), **com.rti.dds.↩ domain.DomainParticipant.delete_topic** (p. 987), **com.rti.dds.domain.DomainParticipant.delete_publisher** (p. 974), **com.rti.dds.domain.DomainParticipant.delete_subscriber** (p. 977), **com.rti.dds.domain.Domain↩ Participant.set_default_topic_qos** (p. 957), **com.rti.dds.domain.DomainParticipant.set_default_topic_↩ qos_with_profile** (p. 958), **com.rti.dds.domain.DomainParticipant.get_default_topic_qos** (p. 957), **com.↩ rti.dds.domain.DomainParticipant.set_default_publisher_qos** (p. 960), **com.rti.dds.domain.Domain↩ Participant.set_default_publisher_qos_with_profile** (p. 961), **com.rti.dds.domain.DomainParticipant.↩ get_default_publisher_qos** (p. 959), **com.rti.dds.domain.DomainParticipant.set_default_subscriber_qos**

(p. 965), **com.rti.dds.domain.DomainParticipant.set_default_subscriber_qos_with_profile** (p. 966), **com.rti.dds.domain.DomainParticipant.get_default_subscriber_qos** (p. 967), **com.rti.dds.domain.DomainParticipant.delete_contained_entities** (p. 1006), **com.rti.dds.domain.DomainParticipant.set_default_datareader_qos** (p. 968), **com.rti.dds.domain.DomainParticipant.set_default_datareader_qos_with_profile** (p. 969), **com.rti.dds.domain.DomainParticipant.get_default_datareader_qos** (p. 964), **com.rti.dds.domain.DomainParticipant.set_default_datawriter_qos** (p. 963), **com.rti.dds.domain.DomainParticipant.set_default_datawriter_qos_with_profile** (p. 964), **com.rti.dds.domain.DomainParticipant.get_default_datawriter_qos** (p. 962), **com.rti.dds.domain.DomainParticipant.set_default_library** (p. 994), **com.rti.dds.domain.DomainParticipant.set_default_profile** (p. 995) **com.rti.dds.domain.DomainParticipant.set_default_flowcontroller_property** (p. 956), **com.rti.dds.domain.DomainParticipant.get_default_flowcontroller_property** (p. 955), ;

- Operations for looking up topics: **com.rti.dds.domain.DomainParticipant.lookup_topicdescription** (p. 1000);
- Operations that access status: **com.rti.dds.infrastructure.Entity.get_statuscondition** (p. 1325), **com.rti.dds.infrastructure.Entity.get_status_changes** (p. 1325).

QoS:

com.rti.dds.domain.DomainParticipantQos (p. 1073)

Status:

Status Kinds (p. 514)

Listener:

com.rti.dds.domain.DomainParticipantListener (p. 1070)

Operations Allowed in Listener Callbacks (p. 1530)

8.79.2 Member Function Documentation

8.79.2.1 get_default_flowcontroller_property()

```
void get_default_flowcontroller_property (
            FlowControllerProperty_t prop )
```

<<***extension***>> *(p. 403)* Copies the default **com.rti.dds.publication.FlowControllerProperty_t** (p. 1351) values for this domain participant into the given **com.rti.dds.publication.FlowControllerProperty_t** (p. 1351) instance.

The retrieved `property` will match the set of values specified on the last successful call to **com.rti.dds.domain.DomainParticipant.set_default_flowcontroller_property** (p. 956), or else, if the call was never made, the default values listed in **com.rti.dds.publication.FlowControllerProperty_t** (p. 1351).

MT Safety:

UNSAFE. It is not safe to retrieve the default flow controller properties from a **DomainParticipant** (p. 948) while another thread may be simultaneously calling **com.rti.dds.domain.DomainParticipant.set_default_flowcontroller_property** (p. 956)

Parameters

prop	<<***in***>> *(*p. *404)* Default property to be retrieved. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

com.rti.dds.domain.DomainParticipant.FLOW_CONTROLLER_PROPERTY_DEFAULT (p. 51)

com.rti.dds.domain.DomainParticipant.create_flowcontroller (p. 969)

8.79.2.2 set_default_flowcontroller_property()

```
void set_default_flowcontroller_property (
             FlowControllerProperty_t prop )
```

<<***extension***>> *(*p. *403)* Set the default **com.rti.dds.publication.FlowControllerProperty_t** (p. 1351) values for this domain participant.

This default value will be used for newly created **com.rti.dds.publication.FlowController** (p. 1348) if **com.rti.dds.domain.DomainParticipant.FLOW_CONTROLLER_PROPERTY_DEFAULT** (p. 51) is specified as the `property` parameter when **com.rti.dds.domain.DomainParticipant.create_flowcontroller** (p. 969) is called.

Precondition

The specified property values must be consistent, or else the operation will have no effect and fail with **com.rti.dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901)

MT Safety:

UNSAFE. It is not safe to set the default flow controller properties for a **DomainParticipant** (p. 948) while another thread may be simultaneously calling **com.rti.dds.domain.DomainParticipant.set_default_flowcontroller_property** (p. 956) , **com.rti.dds.domain.DomainParticipant.get_default_flowcontroller_property** (p. 955) or calling **com.rti.dds.domain.DomainParticipant.create_flowcontroller** (p. 969) with **com.rti.dds.domain.DomainParticipant.FLOW_CONTROLLER_PROPERTY_DEFAULT** (p. 51) as the `qos` parameter.

Parameters

prop	<<***in***>> *(*p. *404)* Default property to be set. The special value **com.rti.dds.domain.DomainParticipant.FLOW_CONTROLLER_PROPERTY_DEFAULT** (p. 51) may be passed as `property` to indicate that the default property should be reset to the default values the factory would use if **com.rti.dds.domain.DomainParticipant.set_default_flowcontroller_property** (p. 956) had never been called. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), or **com.rti.dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901)

See also

com.rti.dds.domain.DomainParticipant.FLOW_CONTROLLER_PROPERTY_DEFAULT (p. 51)

com.rti.dds.domain.DomainParticipant.create_flowcontroller (p. 969)

8.79.2.3 get_default_topic_qos()

```
void get_default_topic_qos (
              TopicQos qos )
```

Copies the default **com.rti.dds.topic.TopicQos** (p. 2133) values for this domain participant into the given **com.rti.dds.topic.TopicQos** (p. 2133) instance.

The retrieved `qos` will match the set of values specified on the last successful call to **com.rti.dds.domain.DomainParticipant.set_default_topic_qos** (p. 957), or **com.rti.dds.domain.DomainParticipant.set_default_topic_qos_with_profile** (p. 958) or else, if the call was never made, the default values listed in **com.rti.dds.topic.TopicQos** (p. 2133).

This method may potentially allocate memory depending on the sequences contained in some QoS policies.

MT Safety:

UNSAFE. It is not safe to retrieve the default Topic QoS from a **DomainParticipant** (p. 948) while another thread may be simultaneously calling **com.rti.dds.domain.DomainParticipant.set_default_topic_qos** (p. 957)

Parameters

qos	<<***in***>> *(p. 404)* Default qos to be retrieved. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

com.rti.dds.domain.DomainParticipant.TOPIC_QOS_DEFAULT (p. 47)

com.rti.dds.domain.DomainParticipant.create_topic (p. 984)

8.79.2.4 set_default_topic_qos()

```
void set_default_topic_qos (
              TopicQos qos )
```

Set the default **com.rti.dds.topic.TopicQos** (p. 2133) values for this domain participant.

This default value will be used for newly created **com.rti.dds.topic.Topic** (p. 2116) if **com.rti.dds.domain.Domain↩ Participant.TOPIC_QOS_DEFAULT** (p. 47) is specified as the qos parameter when **com.rti.dds.domain.Domain↩ Participant.create_topic** (p. 984) is called.

Precondition

The specified QoS policies must be consistent, or else the operation will have no effect and fail with **com.rti.↩ dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901)

MT Safety:

UNSAFE. It is not safe to set the default topic QoS for a **DomainParticipant** (p. 948) while another thread may be simultaneously calling **com.rti.dds.domain.DomainParticipant.set_default_topic_qos** (p. 957), **com.↩ rti.dds.domain.DomainParticipant.get_default_topic_qos** (p. 957) or calling **com.rti.dds.domain.Domain↩ Participant.create_topic** (p. 984) with **com.rti.dds.domain.DomainParticipant.TOPIC_QOS_DEFAULT** (p. 47) as the qos parameter.

Parameters

qos	<<***in***>> *(p. 404)* Default qos to be set. The special value **com.rti.dds.domain.DomainParticipant.TOPIC_QOS_DEFAULT** (p. 47) may be passed as qos to indicate that the default QoS should be reset back to the initial values the factory would used if **com.rti.dds.domain.DomainParticipant.set_default_topic_qos** (p. 957) had never been called. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), or **com.rti.dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901)

See also

com.rti.dds.domain.DomainParticipant.TOPIC_QOS_DEFAULT (p. 47)

com.rti.dds.domain.DomainParticipant.create_topic (p. 984)

8.79.2.5 set_default_topic_qos_with_profile()

```
void set_default_topic_qos_with_profile (
             String library_name,
             String profile_name )
```

<<***extension***>> *(p. 403)* Set the default **com.rti.dds.topic.TopicQos** (p. 2133) values for this domain participant based on the input XML QoS profile.

This default value will be used for newly created **com.rti.dds.topic.Topic** (p. 2116) if **com.rti.dds.domain.Domain↩ Participant.TOPIC_QOS_DEFAULT** (p. 47) is specified as the `qos` parameter when **com.rti.dds.domain.Domain↩ Participant.create_topic** (p. 984) is called.

Precondition

The **com.rti.dds.topic.TopicQos** (p. 2133) contained in the specified XML QoS profile must be consistent, or else the operation will have no effect and fail with **com.rti.dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901)

MT Safety:

UNSAFE. It is not safe to set the default topic QoS for a **DomainParticipant** (p. 948) while another thread may be simultaneously calling **com.rti.dds.domain.DomainParticipant.set_default_topic_qos** (p. 957), **com.↩ rti.dds.domain.DomainParticipant.get_default_topic_qos** (p. 957) or calling **com.rti.dds.domain.Domain↩ Participant.create_topic** (p. 984) with **com.rti.dds.domain.DomainParticipant.TOPIC_QOS_DEFAULT** (p. 47) as the `qos` parameter.

Parameters

library_name	<<***in***>> *(p. 404)* Library name containing the XML QoS profile. If library_name is null RTI Connext will use the default library (see **com.rti.dds.domain.DomainParticipant.set_default_library** (p. 994)).
profile_name	<<***in***>> *(p. 404)* XML QoS Profile name. If profile_name is null RTI Connext will use the default profile (see **com.rti.dds.domain.DomainParticipant.set_default_profile** (p. 995)).

If the input profile cannot be found the method fails with **com.rti.dds.infrastructure.RETCODE_ERROR** (p. 1900).

Exceptions

One	of the **Standard Return Codes** (p. 513), or **com.rti.dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901)

See also

com.rti.dds.domain.DomainParticipant.TOPIC_QOS_DEFAULT (p. 47)

com.rti.dds.domain.DomainParticipant.create_topic_with_profile (p. 986)

8.79.2.6 get_default_publisher_qos()

```
void get_default_publisher_qos (
             PublisherQos qos )
```

Copy the default **com.rti.dds.publication.PublisherQos** (p. 1791) values into the provided **com.rti.dds.publication.↩ PublisherQos** (p. 1791) instance.

The retrieved `qos` will match the set of values specified on the last successful call to **com.rti.dds.domain.↩ DomainParticipant.set_default_publisher_qos** (p. 960), or **com.rti.dds.domain.DomainParticipant.set_default↩ _publisher_qos_with_profile** (p. 961), or else, if the call was never made, the default values listed in **com.rti.dds.↩ publication.PublisherQos** (p. 1791).

This method may potentially allocate memory depending on the sequences contained in some QoS policies.

If **com.rti.dds.domain.DomainParticipant.PUBLISHER_QOS_DEFAULT** (p. 48) is specified as the `qos` parameter when **com.rti.dds.domain.DomainParticipant.create_topic** (p. 984) is called, the default value of the QoS set in the factory, equivalent to the value obtained by calling **com.rti.dds.domain.DomainParticipant.get_default_publisher↩ _qos** (p. 959), will be used to create the **com.rti.dds.publication.Publisher** (p. 1767).

MT Safety:

UNSAFE. It is not safe to retrieve the default publisher QoS from a **DomainParticipant** (p. 948) while another thread may be simultaneously calling **com.rti.dds.domain.DomainParticipant.set_default_publisher↩ _qos** (p. 960)

Parameters

qos	<<***inout***>> *(p. 404)* Qos to be filled up. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

com.rti.dds.domain.DomainParticipant.PUBLISHER_QOS_DEFAULT (p. 48)

com.rti.dds.domain.DomainParticipant.create_publisher (p. 971)

8.79.2.7 set_default_publisher_qos()

```
void set_default_publisher_qos (
             PublisherQos qos )
```

Set the default **com.rti.dds.publication.PublisherQos** (p. 1791) values for this **DomainParticipant** (p. 948).

This set of default values will be used for a newly created **com.rti.dds.publication.Publisher** (p. 1767) if **com.rti.dds.↩ domain.DomainParticipant.PUBLISHER_QOS_DEFAULT** (p. 48) is specified as the `qos` parameter when **com.rti.↩ dds.domain.DomainParticipant.create_publisher** (p. 971) is called.

Precondition

The specified QoS policies must be consistent, or else the operation will have no effect and fail with **com.rti.↩ dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901)

MT Safety:

UNSAFE. It is not safe to set the default publisher QoS for a **DomainParticipant** (p. 948) while another thread may be simultaneously calling **com.rti.dds.domain.DomainParticipant.set_default_publisher_qos** (p. 960), **com.rti.dds.domain.DomainParticipant.get_default_publisher_qos** (p. 959) or calling **com.rti.dds.domain.↩ DomainParticipant.create_publisher** (p. 971) with **com.rti.dds.domain.DomainParticipant.PUBLISHER_↩ QOS_DEFAULT** (p. 48) as the `qos` parameter.

Parameters

qos	<<***in***>> *(p. 404)* Default qos to be set. The special value **com.rti.dds.domain.DomainParticipant.PUBLISHER_QOS_DEFAULT** (p. 48) may be passed as `qos` to indicate that the default QoS should be reset back to the initial values the factory would used if **com.rti.dds.domain.DomainParticipant.set_default_publisher_qos** (p. 960) had never been called. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), or **com.rti.dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901)

8.79.2.8 set_default_publisher_qos_with_profile()

```
void set_default_publisher_qos_with_profile (
            String library_name,
            String profile_name )
```

<<***extension***>> *(p. 403)* Set the default **com.rti.dds.publication.PublisherQos** (p. 1791) values for this **Domain↩ Participant** (p. 948) based on the input XML QoS profile.

This set of default values will be used for a newly created **com.rti.dds.publication.Publisher** (p. 1767) if **com.rti.dds.↩ domain.DomainParticipant.PUBLISHER_QOS_DEFAULT** (p. 48) is specified as the `qos` parameter when **com.rti.↩ dds.domain.DomainParticipant.create_publisher** (p. 971) is called.

Precondition

The **com.rti.dds.publication.PublisherQos** (p. 1791) contained in the specified XML QoS profile must be consistent, or else the operation will have no effect and fail with **com.rti.dds.infrastructure.RETCODE_↩ INCONSISTENT_POLICY** (p. 1901)

MT Safety:

UNSAFE. It is not safe to set the default publisher QoS for a **DomainParticipant** (p. 948) while another thread may be simultaneously calling **com.rti.dds.domain.DomainParticipant.set_default_publisher_qos** (p. 960), **com.rti.dds.domain.DomainParticipant.get_default_publisher_qos** (p. 959) or calling **com.rti.dds.domain.↩ DomainParticipant.create_publisher** (p. 971) with **com.rti.dds.domain.DomainParticipant.PUBLISHER_↩ QOS_DEFAULT** (p. 48) as the `qos` parameter.

Parameters

library_name	<<***in***>> *(p. 404)* Library name containing the XML QoS profile. If library_name is null RTI Connext will use the default library (see **com.rti.dds.domain.DomainParticipant.set_default_library** (p. 994)).
profile_name	<<***in***>> *(p. 404)* XML QoS Profile name. If profile_name is null RTI Connext will use the default profile (see **com.rti.dds.domain.DomainParticipant.set_default_profile** (p. 995)).

If the input profile cannot be found, the method fails with **com.rti.dds.infrastructure.RETCODE_ERROR** (p. 1900).

Exceptions

One	of the **Standard Return Codes** (p. 513), or **com.rti.dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901)

See also

com.rti.dds.domain.DomainParticipant.PUBLISHER_QOS_DEFAULT (p. 48)

com.rti.dds.domain.DomainParticipant.create_publisher_with_profile (p. 972)

8.79.2.9 get_default_datawriter_qos()

```
void get_default_datawriter_qos (
               DataWriterQos qos )
```

<<***extension***>> *(p. 403)* Copy the default **com.rti.dds.publication.DataWriterQos** (p. 878) values into the provided **com.rti.dds.publication.DataWriterQos** (p. 878) instance.

The retrieved `qos` will match the set of values specified on the last successful call to **com.rti.dds.domain.↩ DomainParticipant.set_default_datawriter_qos** (p. 963), or **com.rti.dds.domain.DomainParticipant.set_default↩ _datawriter_qos_with_profile** (p. 964), or else, if the call was never made, the default values listed in **com.rti.dds.↩ publication.DataWriterQos** (p. 878).

This method may potentially allocate memory depending on the sequences contained in some QoS policies.

MT Safety:

UNSAFE. It is not safe to retrieve the default DataWriterQoS from a DomainPartipant while another thread may be simultaneously calling **com.rti.dds.domain.DomainParticipant.set_default_datawriter_qos** (p. 963).

Parameters

qos	<<***inout***>> *(p. 404)* Qos to be filled up. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513)

8.79.2.10 set_default_datawriter_qos()

```
void set_default_datawriter_qos (
              DataWriterQos qos )
```

<<***extension***>> *(p. 403)* Set the default DataWriterQos values for this **DomainParticipant** (p. 948).

This set of default values will be inherited for a newly created **com.rti.dds.publication.Publisher** (p. 1767).

Precondition

The specified QoS policies must be consistent, or else the operation will have no effect and fail with **com.rti.↩ dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901)

MT Safety:

UNSAFE. It is not safe to set the default DataWriter QoS for a **DomainParticipant** (p. 948) while another thread may be simultaneously calling **com.rti.dds.domain.DomainParticipant.set_default_datawriter_qos** (p. 963) or **com.rti.dds.domain.DomainParticipant.get_default_datawriter_qos** (p. 962) or calling **com.↩ rti.dds.domain.DomainParticipant.create_datawriter** (p. 978) with **com.rti.dds.publication.Publisher.↩ DATAWRITER_QOS_DEFAULT** (p. 72) as the `qos` parameter.

Parameters

qos	<<***in***>> *(p. 404)* Default qos to be set. The special value **com.rti.dds.publication.Publisher.DATAWRITER_QOS_DEFAULT** (p. 72) may be passed as `qos` to indicate that the default QoS should be reset back to the initial values the factory would used if **com.rti.dds.domain.DomainParticipant.set_default_datawriter_qos** (p. 963) had never been called. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), or **com.rti.dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901)

8.79.2.11 set_default_datawriter_qos_with_profile()

```
void set_default_datawriter_qos_with_profile (
            String library_name,
            String profile_name )
```

<<***extension***>> *(p. 403)* Set the default **com.rti.dds.publication.DataWriterQos** (p. 878) values for this domain participant based on the input XML QoS profile.

This set of default values will be inherited for a newly created **com.rti.dds.publication.Publisher** (p. 1767).

Precondition

The **com.rti.dds.publication.DataWriterQos** (p. 878) contained in the specified XML QoS profile must be consistent, or else the operation will have no effect and fail with **com.rti.dds.infrastructure.RETCODE_↩ INCONSISTENT_POLICY** (p. 1901)

MT Safety:

UNSAFE. It is not safe to set the default DataWriter QoS for a **DomainParticipant** (p. 948) while another thread may be simultaneously calling **com.rti.dds.domain.DomainParticipant.set_default_datawriter_qos** (p. 963) or **com.rti.dds.domain.DomainParticipant.get_default_datawriter_qos** (p. 962)

Parameters

library_name	<<***in***>> *(p. 404)* Library name containing the XML QoS profile. If library_name is null RTI Connext will use the default library (see **com.rti.dds.domain.DomainParticipant.set_default_library** (p. 994)).
profile_name	<<***in***>> *(p. 404)* XML QoS Profile name. If profile_name is null RTI Connext will use the default profile (see **com.rti.dds.domain.DomainParticipant.set_default_profile** (p. 995)).

If the input profile cannot be found, the method fails with **com.rti.dds.infrastructure.RETCODE_ERROR** (p. 1900).

Exceptions

One	of the **Standard Return Codes** (p. 513), or **com.rti.dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901)

8.79.2.12 get_default_datareader_qos()

```
void get_default_datareader_qos (
              DataReaderQos qos )
```

<<***extension***>> *(p. 403)* Copy the default **com.rti.dds.subscription.DataReaderQos** (p. 777) values into the provided **com.rti.dds.subscription.DataReaderQos** (p. 777) instance.

The retrieved `qos` will match the set of values specified on the last successful call to **com.rti.dds.domain.DomainParticipant.set_default_datareader_qos** (p. 968), or **com.rti.dds.domain.DomainParticipant.set_default_datareader_qos_with_profile** (p. 969), or else, if the call was never made, the default values listed in **com.rti.dds.subscription.DataReaderQos** (p. 777).

This method may potentially allocate memory depending on the sequences contained in some QoS policies.

MT Safety:

UNSAFE. It is not safe to retrieve the default DataReader QoS from a **DomainParticipant** (p. 948) while another thread may be simultaneously calling **com.rti.dds.domain.DomainParticipant.set_default_datareader_qos** (p. 968).

Parameters

qos	<<***inout***>> *(p. 404)* Qos to be filled up. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513)

8.79.2.13 set_default_subscriber_qos()

```
void set_default_subscriber_qos (
              SubscriberQos qos )
```

Set the default **com.rti.dds.subscription.SubscriberQos** (p. 2065) values for this **DomainParticipant** (p. 948).

This set of default values will be used for a newly created **com.rti.dds.subscription.Subscriber** (p. 2039) if **com.rti.dds.domain.DomainParticipant.SUBSCRIBER_QOS_DEFAULT** (p. 49) is specified as the `qos` parameter when **com.rti.dds.domain.DomainParticipant.create_subscriber** (p. 975) is called.

Precondition

The specified QoS policies must be consistent, or else the operation will have no effect and fail with **com.rti.dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901)

MT Safety:

UNSAFE. It is not safe to set the default Subscriber QoS for a **DomainParticipant** (p. 948) while another thread may be simultaneously calling **com.rti.dds.domain.DomainParticipant.set_default_subscriber_qos** (p. 965), **com.rti.dds.domain.DomainParticipant.get_default_subscriber_qos** (p. 967) or calling **com.rti.↩ dds.domain.DomainParticipant.create_subscriber** (p. 975) with **com.rti.dds.domain.DomainParticipant.↩ SUBSCRIBER_QOS_DEFAULT** (p. 49) as the `qos` parameter.

Parameters

qos	<<***in***>> *(p. 404)* Default qos to be set. The special value **com.rti.dds.domain.DomainParticipant.SUBSCRIBER_QOS_DEFAULT** (p. 49) may be passed as `qos` to indicate that the default QoS should be reset back to the initial values the factory would used if **com.rti.dds.domain.DomainParticipant.set_default_subscriber_qos** (p. 965) had never been called. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), or **com.rti.dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901)

8.79.2.14 set_default_subscriber_qos_with_profile()

```
void set_default_subscriber_qos_with_profile (
             String library_name,
             String profile_name )
```

<<***extension***>> *(p. 403)* Set the default **com.rti.dds.subscription.SubscriberQos** (p. 2065) values for this **DomainParticipant** (p. 948) based on the input XML QoS profile.

This set of default values will be used for a newly created **com.rti.dds.subscription.Subscriber** (p. 2039) if **com.↩ rti.dds.domain.DomainParticipant.SUBSCRIBER_QOS_DEFAULT** (p. 49) is specified as the `qos` parameter when **com.rti.dds.domain.DomainParticipant.create_subscriber** (p. 975) is called.

Precondition

The **com.rti.dds.subscription.SubscriberQos** (p. 2065) contained in the specified XML QoS profile must be consistent, or else the operation will have no effect and fail with **com.rti.dds.infrastructure.RETCODE_↩ INCONSISTENT_POLICY** (p. 1901)

MT Safety:

UNSAFE. It is not safe to set the default Subscriber QoS for a **DomainParticipant** (p. 948) while another thread may be simultaneously calling **com.rti.dds.domain.DomainParticipant.set_default_subscriber_qos** (p. 965), **com.rti.dds.domain.DomainParticipant.get_default_subscriber_qos** (p. 967) or calling **com.rti.↩ dds.domain.DomainParticipant.create_subscriber** (p. 975) with **com.rti.dds.domain.DomainParticipant.↩ SUBSCRIBER_QOS_DEFAULT** (p. 49) as the `qos` parameter.

Parameters

library_name	<<***in***>> *(p. 404)* Library name containing the XML QoS profile. If library_name is null RTI Connext will use the default library (see **com.rti.dds.domain.DomainParticipant.set_default_library** (p. 994)).
profile_name	<<***in***>> *(p. 404)* XML QoS Profile name. If profile_name is null RTI Connext will use the default profile (see **com.rti.dds.domain.DomainParticipant.set_default_profile** (p. 995)).

If the input profile cannot be found, the method fails with **com.rti.dds.infrastructure.RETCODE_ERROR** (p. 1900).

Exceptions

One	of the **Standard Return Codes** (p. 513), or **com.rti.dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901)

See also

com.rti.dds.domain.DomainParticipant.create_subscriber_with_profile (p. 976)

8.79.2.15 get_default_subscriber_qos()

```
void get_default_subscriber_qos (
               SubscriberQos qos )
```

Copy the default **com.rti.dds.subscription.SubscriberQos** (p. 2065) values into the provided **com.rti.dds.↩ subscription.SubscriberQos** (p. 2065) instance.

The retrieved `qos` will match the set of values specified on the last successful call to **com.rti.dds.domain.↩ DomainParticipant.set_default_subscriber_qos** (p. 965), or **com.rti.dds.domain.DomainParticipant.set_default↩ _subscriber_qos_with_profile** (p. 966), or else, if the call was never made, the default values listed in **com.rti.dds.↩ subscription.SubscriberQos** (p. 2065).

This method may potentially allocate memory depending on the sequences contained in some QoS policies.

If **com.rti.dds.domain.DomainParticipant.SUBSCRIBER_QOS_DEFAULT** (p. 49) is specified as the `qos` parameter when **com.rti.dds.domain.DomainParticipant.create_subscriber** (p. 975) is called, the default value of the QoS set in the factory, equivalent to the value obtained by calling **com.rti.dds.domain.DomainParticipant.get_default_↩ subscriber_qos** (p. 967), will be used to create the **com.rti.dds.subscription.Subscriber** (p. 2039).

MT Safety:

UNSAFE. It is not safe to retrieve the default Subscriber QoS from a **DomainParticipant** (p. 948) while another thread may be simultaneously calling **com.rti.dds.domain.DomainParticipant.set_default_subscriber↩ _qos** (p. 965).

Parameters

qos	<<***inout***>> *(*p. *404)* Qos to be filled up. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

8.79.2.16 set_default_datareader_qos()

```
void set_default_datareader_qos (
             DataReaderQos qos )
```

<<***extension***>> *(*p. *403)* Set the default **com.rti.dds.subscription.DataReaderQos** (p. 777) values for this domain participant.

This set of default values will be inherited for a newly created **com.rti.dds.subscription.Subscriber** (p. 2039).

Precondition

The specified QoS policies must be consistent, or else the operation will have no effect and fail with **com.rti.↩ dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901)

MT Safety:

UNSAFE. It is not safe to set the default DataReader QoS for a **DomainParticipant** (p. 948) while another thread may be simultaneously calling **com.rti.dds.domain.DomainParticipant.set_default_datareader_qos** (p. 968) or **com.rti.dds.domain.DomainParticipant.get_default_datareader_qos** (p. 964).

Parameters

qos	<<***in***>> *(*p. *404)* Default qos to be set. The special value **com.rti.dds.subscription.Subscriber.DATAREADER_QOS_DEFAULT** (p. 82) may be passed as `qos` to indicate that the default QoS should be reset back to the initial values the factory would used if **com.rti.dds.domain.DomainParticipant.set_default_datareader_qos** (p. 968) had never been called. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), or **com.rti.dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901)

8.79.2.17 set_default_datareader_qos_with_profile()

```
void set_default_datareader_qos_with_profile (
            String library_name,
            String profile_name )
```

<<***extension***>> *(p. 403)* Set the default **com.rti.dds.subscription.DataReaderQos** (p. 777) values for this **DomainParticipant** (p. 948) based on the input XML QoS profile.

This set of default values will be inherited for a newly created **com.rti.dds.subscription.Subscriber** (p. 2039).

Precondition

The **com.rti.dds.subscription.DataReaderQos** (p. 777) contained in the specified XML QoS profile must be consistent, or else the operation will have no effect and fail with **com.rti.dds.infrastructure.RETCODE_↩ INCONSISTENT_POLICY** (p. 1901)

MT Safety:

UNSAFE. It is not safe to set the default DataReader QoS for a **DomainParticipant** (p. 948) while another thread may be simultaneously calling **com.rti.dds.domain.DomainParticipant.set_default_datareader_qos** (p. 968) or **com.rti.dds.domain.DomainParticipant.get_default_datareader_qos** (p. 964).

Parameters

library_name	<<***in***>> *(p. 404)* Library name containing the XML QoS profile. If library_name is null RTI Connext will use the default library (see **com.rti.dds.domain.DomainParticipant.set_default_library** (p. 994)).
profile_name	<<***in***>> *(p. 404)* XML QoS Profile name. If profile_name is null RTI Connext will use the default profile (see **com.rti.dds.domain.DomainParticipant.set_default_profile** (p. 995)).

If the input profile cannot be found, the method fails with **com.rti.dds.infrastructure.RETCODE_ERROR** (p. 1900).

Exceptions

One	of the **Standard Return Codes** (p. 513), or **com.rti.dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901)

8.79.2.18 create_flowcontroller()

```
FlowController create_flowcontroller (
            String name,
             FlowControllerProperty_t prop )
```

<<***extension***>> *(*p. *403)* Creates a **com.rti.dds.publication.FlowController** (p. 1348) with the desired property.

The created **com.rti.dds.publication.FlowController** (p. 1348) is associated with a **com.rti.dds.publication.DataWriter** (p. 818) via **com.rti.dds.infrastructure.PublishModeQosPolicy.flow_controller_name** (p. 1798). A single FlowController may service multiple DataWriters instances, even if they belong to a different **com.rti.dds.publication.Publisher** (p. 1767). The `property` determines how the FlowController shapes the network traffic.

Precondition

The specified `property` must be consistent, or the operation will fail and no **com.rti.dds.publication.FlowController** (p. 1348) will be created.

MT Safety:

UNSAFE. If **com.rti.dds.domain.DomainParticipant.FLOW_CONTROLLER_PROPERTY_DEFAULT** (p. 51) is used for `property`, it is not safe to create the flow controller while another thread may be simultaneously calling **com.rti.dds.domain.DomainParticipant.set_default_flowcontroller_property** (p. 956) or trying to lookup that flow controller with **com.rti.dds.domain.DomainParticipant.lookup_flowcontroller** (p. 999).

Parameters

name	<<***in***>> *(*p. *404)* name of the **com.rti.dds.publication.FlowController** (p. 1348) to create. A **com.rti.dds.publication.DataWriter** (p. 818) is associated with a **com.rti.dds.publication.FlowController** (p. 1348) by name. Limited to 255 characters.
prop	<<***in***>> *(*p. *404)* property to be used for creating the new **com.rti.dds.publication.FlowController** (p. 1348). The special value **com.rti.dds.domain.DomainParticipant.FLOW_CONTROLLER_PROPERTY_DEFAULT** (p. 51) can be used to indicate that the **com.rti.dds.publication.FlowController** (p. 1348) should be created with the default **com.rti.dds.publication.FlowControllerProperty_t** (p. 1351) set in the **com.rti.dds.domain.DomainParticipant** (p. 948). Cannot be NULL.

Returns

Newly created flow controller object or NULL on failure.

See also

com.rti.dds.publication.FlowControllerProperty_t (p. 1351) for rules on consistency among property

com.rti.dds.domain.DomainParticipant.FLOW_CONTROLLER_PROPERTY_DEFAULT (p. 51)

8.79.2.19 delete_flowcontroller()

```
void delete_flowcontroller (
              FlowController fc )
```

<<***extension***>> *(*p. *403)* Deletes an existing **com.rti.dds.publication.FlowController** (p. 1348).

Precondition

The **com.rti.dds.publication.FlowController** (p. 1348) must not have any attached **com.rti.dds.publication.↩ DataWriter** (p. 818) objects. If there are any attached **com.rti.dds.publication.DataWriter** (p. 818) objects, it will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).

The **com.rti.dds.publication.FlowController** (p. 1348) must have been created by this **com.rti.dds.domain.↩ DomainParticipant** (p. 948), or else it will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_↩ NOT_MET** (p. 1903).

Postcondition

The **com.rti.dds.publication.FlowController** (p. 1348) is deleted if this method completes successfully.

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Parameters

fc	<<***in***>> *(*p. *404)* The **com.rti.dds.publication.FlowController** (p. 1348) to be deleted.

Exceptions

One	of the **Standard Return Codes** (p. 513), or **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).

8.79.2.20 create_publisher()

```
Publisher create_publisher (
             PublisherQos qos,
             PublisherListener listener,
            int mask )
```

Creates a **com.rti.dds.publication.Publisher** (p. 1767) with the desired QoS policies and attaches to it the specified **com.rti.dds.publication.PublisherListener** (p. 1789).

Precondition

The specified QoS policies must be consistent, or the operation will fail and no **com.rti.dds.publication.Publisher** (p. 1767) will be created.

MT Safety:

UNSAFE. If **com.rti.dds.domain.DomainParticipant.PUBLISHER_QOS_DEFAULT** (p. 48) is used for `qos`, it is not safe to create the publisher while another thread may be simultaneously calling **com.rti.dds.domain.DomainParticipant.set_default_publisher_qos** (p. 960).

Parameters

qos	<<***in***>> *(p. 404)* QoS to be used for creating the new **com.rti.dds.publication.Publisher** (p. 1767). The special value **com.rti.dds.domain.DomainParticipant.PUBLISHER_QOS_DEFAULT** (p. 48) can be used to indicate that the **com.rti.dds.publication.Publisher** (p. 1767) should be created with the default **com.rti.dds.publication.PublisherQos** (p. 1791) set in the **com.rti.dds.domain.DomainParticipant** (p. 948). Cannot be NULL.
listener	<<***in***>> *(p. 404)*. Listener to be attached to the newly created **com.rti.dds.publication.Publisher** (p. 1767).
mask	<<***in***>> *(p. 404)*. Changes of communication status to be invoked on the listener. See com.rti.dds.infrastructure.StatusMask.

Returns

newly created publisher object or NULL on failure.

See also

Specifying QoS on entities (p. 505) for information on setting QoS before entity creation

com.rti.dds.publication.Publisher.set_listener (p. 1781)

8.79.2.21 create_publisher_with_profile()

```
Publisher create_publisher_with_profile (
            String library_name,
            String profile_name,
             PublisherListener listener,
            int mask )
```

<<***extension***>> *(p. 403)* Creates a new **com.rti.dds.publication.Publisher** (p. 1767) object using the **com.rti.dds.publication.PublisherQos** (p. 1791) associated with the input XML QoS profile.

Precondition

The **com.rti.dds.publication.PublisherQos** (p. 1791) in the input profile must be consistent, or the operation will fail and no **com.rti.dds.publication.Publisher** (p. 1767) will be created.

Parameters

library_name	<<***in***>> *(*p. *404)* Library name containing the XML QoS profile. If library_name is null RTI Connext will use the default library (see **com.rti.dds.domain.DomainParticipant.set_default_library** (p. 994)).
profile_name	<<***in***>> *(*p. *404)* XML QoS Profile name. If profile_name is null RTI Connext will use the default profile (see **com.rti.dds.domain.DomainParticipant.set_default_profile** (p. 995)).
listener	<<***in***>> *(*p. *404).* Listener to be attached to the newly created **com.rti.dds.publication.Publisher** (p. 1767).
mask	<<***in***>> *(*p. *404).* Changes of communication status to be invoked on the listener. See com.rti.dds.infrastructure.StatusMask.

Returns

newly created publisher object or NULL on failure.

Specifying QoS on entities (p. 505) for information on setting QoS before entity creation

com.rti.dds.publication.PublisherQos (p. 1791) for rules on consistency among QoS

com.rti.dds.domain.DomainParticipant.create_publisher (p. 971)

com.rti.dds.domain.DomainParticipant.get_default_publisher_qos (p. 959)

com.rti.dds.publication.Publisher.set_listener (p. 1781)

8.79.2.22 delete_publisher()

```
void delete_publisher (
                Publisher p )
```

Deletes an existing **com.rti.dds.publication.Publisher** (p. 1767).

Precondition

The **com.rti.dds.publication.Publisher** (p. 1767) must not have any attached **com.rti.dds.publication.Data↩ Writer** (p. 818) objects. If there are existing **com.rti.dds.publication.DataWriter** (p. 818) objects, it will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).

com.rti.dds.publication.Publisher (p. 1767) must have been created by this **com.rti.dds.domain.Domain↩ Participant** (p. 948), or else it will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).

Postcondition

Listener installed on the **com.rti.dds.publication.Publisher** (p. 1767) will not be called after this method completes successfully.

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Parameters

p	<<***in***>> *(p. 404)* **com.rti.dds.publication.Publisher** (p. 1767) to be deleted.

Exceptions

One	of the **Standard Return Codes** (p. 513), or **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).

8.79.2.23 create_subscriber()

```
Subscriber create_subscriber (
             SubscriberQos qos,
             SubscriberListener listener,
            int mask )
```

Creates a **com.rti.dds.subscription.Subscriber** (p. 2039) with the desired QoS policies and attaches to it the specified **com.rti.dds.subscription.SubscriberListener** (p. 2063).

Precondition

The specified QoS policies must be consistent, or the operation will fail and no **com.rti.dds.subscription.↩ Subscriber** (p. 2039) will be created.

MT Safety:

UNSAFE. If **com.rti.dds.domain.DomainParticipant.SUBSCRIBER_QOS_DEFAULT** (p. 49) is used for `qos`, it is not safe to create the subscriber while another thread may be simultaneously calling **com.rti.dds.domain.↩ DomainParticipant.set_default_subscriber_qos** (p. 965).

Parameters

qos	<<***in***>> *(p. 404)* QoS to be used for creating the new **com.rti.dds.subscription.Subscriber** (p. 2039). The special value **com.rti.dds.domain.DomainParticipant.SUBSCRIBER_QOS_DEFAULT** (p. 49) can be used to indicate that the **com.rti.dds.subscription.Subscriber** (p. 2039) should be created with the default **com.rti.dds.subscription.SubscriberQos** (p. 2065) set in the **com.rti.dds.domain.DomainParticipant** (p. 948). Cannot be NULL.
listener	<<***in***>> *(p. 404)*. Listener to be attached to the newly created **com.rti.dds.subscription.Subscriber** (p. 2039).
mask	<<***in***>> *(p. 404)*. Changes of communication status to be invoked on the listener. See com.rti.dds.infrastructure.StatusMask.

Returns

newly created subscriber object or NULL on failure.

See also

Specifying QoS on entities (p. 505) for information on setting QoS before entity creation

com.rti.dds.domain.DomainParticipant.get_default_subscriber_qos (p. 967)

com.rti.dds.subscription.Subscriber.set_listener (p. 2057)

8.79.2.24 create_subscriber_with_profile()

```
Subscriber create_subscriber_with_profile (
            String library_name,
            String profile_name,
             SubscriberListener listener,
            int mask )
```

<<***extension***>> *(p. 403)* Creates a new **com.rti.dds.subscription.Subscriber** (p. 2039) object using the **com.rti.dds.publication.PublisherQos** (p. 1791) associated with the input XML QoS profile.

Precondition

The **com.rti.dds.subscription.SubscriberQos** (p. 2065) in the input profile must be consistent, or the operation will fail and no **com.rti.dds.subscription.Subscriber** (p. 2039) will be created.

Parameters

library_name	<<***in***>> *(p. 404)* Library name containing the XML QoS profile. If library_name is null RTI Connext will use the default library (see **com.rti.dds.domain.DomainParticipant.set_default_library** (p. 994)).
profile_name	<<***in***>> *(p. 404)* XML QoS Profile name. If profile_name is null RTI Connext will use the default profile (see **com.rti.dds.domain.DomainParticipant.set_default_profile** (p. 995)).
listener	<<***in***>> *(p. 404)*. Listener to be attached to the newly created **com.rti.dds.subscription.Subscriber** (p. 2039).
mask	<<***in***>> *(p. 404)*. Changes of communication status to be invoked on the listener. See com.rti.dds.infrastructure.StatusMask.

Returns

newly created subscriber object or NULL on failure.

See also

com.rti.dds.subscription.Subscriber.set_listener (p. 2057)

8.79.2.25 delete_subscriber()

```
void delete_subscriber (
              Subscriber s )
```

Deletes an existing **com.rti.dds.subscription.Subscriber** (p. 2039).

Precondition

The **com.rti.dds.subscription.Subscriber** (p. 2039) must not have any attached **com.rti.dds.subscription.↩ DataReader** (p. 707) objects. If there are existing **com.rti.dds.subscription.DataReader** (p. 707) objects, it will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903)

The **com.rti.dds.subscription.Subscriber** (p. 2039) must have been created by this **com.rti.dds.domain.↩ DomainParticipant** (p. 948), or else it will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION↩ _NOT_MET** (p. 1903).

Postcondition

A Listener installed on the **com.rti.dds.subscription.Subscriber** (p. 2039) will not be called after this method completes successfully.

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Parameters

s	<<***in***>> *(p. 404)* **com.rti.dds.subscription.Subscriber** (p. 2039) to be deleted.

Exceptions

One	of the **Standard Return Codes** (p. 513), or **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).

8.79.2.26 create_datawriter()

```
DataWriter create_datawriter (
            Topic topic,
            DataWriterQos qos,
            DataWriterListener listener,
           int mask )
```

<<***extension***>> *(*p. *403)* Creates a **com.rti.dds.publication.DataWriter** (p. 818) that will be attached and belong to the implicit **com.rti.dds.publication.Publisher** (p. 1767).

Precondition

The given **com.rti.dds.topic.Topic** (p. 2116) must have been created from the same **DomainParticipant** (p. 948) as the implicit Publisher. If it was created from a different **DomainParticipant** (p. 948), this method will fail.

The **com.rti.dds.publication.DataWriter** (p. 818) created using this method will be associated with the implicit Publisher. This Publisher is automatically created (if it does not exist) using **com.rti.dds.domain.DomainParticipant.↩ PUBLISHER_QOS_DEFAULT** (p. 48) when the following methods are called: **com.rti.dds.domain.Domain↩ Participant.create_datawriter** (p. 978), **com.rti.dds.domain.DomainParticipant.create_datawriter_with_profile** (p. 979), or **com.rti.dds.domain.DomainParticipant.get_implicit_publisher** (p. 1022).

MT Safety:

UNSAFE. If **com.rti.dds.publication.Publisher.DATAWRITER_QOS_DEFAULT** (p. 72) is used for the `qos` parameter, it is not safe to create the DataWriter while another thread may be simultaneously calling **com.rti.dds.↩ domain.DomainParticipant.set_default_datawriter_qos** (p. 963).

Parameters

topic	<<***in***>> *(*p. *404)* The **com.rti.dds.topic.Topic** (p. 2116) that the **com.rti.dds.publication.DataWriter** (p. 818) will be associated with. Cannot be NULL.
qos	<<***in***>> *(*p. *404)* QoS to be used for creating the new **com.rti.dds.publication.DataWriter** (p. 818). The special value **com.rti.dds.publication.Publisher.DATAWRITER_QOS_DEFAULT** (p. 72) can be used to indicate that the **com.rti.dds.publication.DataWriter** (p. 818) should be created with the default **com.rti.dds.publication.DataWriterQos** (p. 878) set in the implicit **com.rti.dds.publication.Publisher** (p. 1767). The special value **com.rti.dds.publication.Publisher.DATAWRITER_QOS_USE_TOPIC_QOS** (p. 73) can be used to indicate that the **com.rti.dds.publication.DataWriter** (p. 818) should be created with the combination of the default **com.rti.dds.publication.DataWriterQos** (p. 878) set on the **com.rti.dds.publication.Publisher** (p. 1767) and the **com.rti.dds.topic.TopicQos** (p. 2133) of the **com.rti.dds.topic.Topic** (p. 2116). Cannot be NULL.
listener	<<***in***>> *(*p. *404)* The listener of the **com.rti.dds.publication.DataWriter** (p. 818).
mask	<<***in***>> *(*p. *404)*. Changes of communication status to be invoked on the listener. See com.rti.dds.infrastructure.StatusMask.

Returns

A **com.rti.dds.publication.DataWriter** (p. 818) of a derived class specific to the data type associated with the **com.rti.dds.topic.Topic** (p. 2116) or NULL if an error occurred.

8.79.2.27 create_datawriter_with_profile()

```
DataWriter create_datawriter_with_profile (
              Topic topic,
             String library_name,
             String profile_name,
              DataWriterListener listener,
             int mask )
```

<<***extension***>> *(p. 403)* Creates a **com.rti.dds.publication.DataWriter** (p. 818) using a XML QoS profile that will be attached and belong to the implicit **com.rti.dds.publication.Publisher** (p. 1767).

Precondition

The given **com.rti.dds.topic.Topic** (p. 2116) must have been created from the same **DomainParticipant** (p. 948) as the implicit Publisher. If it was created from a different **DomainParticipant** (p. 948), this method will return NULL.

The **com.rti.dds.publication.DataWriter** (p. 818) created using this method will be associated with the implicit Publisher. This Publisher is automatically created (if it does not exist) using **com.rti.dds.domain.DomainParticipant.PUBLISHER_QOS_DEFAULT** (p. 48) when the following methods are called: **com.rti.dds.domain.DomainParticipant.create_datawriter** (p. 978), **com.rti.dds.domain.DomainParticipant.create_datawriter_with_profile** (p. 979), or **com.rti.dds.domain.DomainParticipant.get_implicit_publisher** (p. 1022)

Parameters

topic	<<***in***>> *(p. 404)* The **com.rti.dds.topic.Topic** (p. 2116) that the **com.rti.dds.publication.DataWriter** (p. 818) will be associated with. Cannot be NULL.

Parameters

library_name	<<***in***>> *(*p. *404)* Library name containing the XML QoS profile. If library_name is null RTI Connext will use the default library (see **com.rti.dds.domain.DomainParticipant.set_default_library** (p. 994)).
profile_name	<<***in***>> *(*p. *404)* XML QoS Profile name. If profile_name is null RTI Connext will use the default profile (see **com.rti.dds.domain.DomainParticipant.set_default_profile** (p. 995)).
listener	<<***in***>> *(*p. *404)* The listener of the **com.rti.dds.publication.DataWriter** (p. 818).
mask	<<***in***>> *(*p. *404).* Changes of communication status to be invoked on the listener. See com.rti.dds.infrastructure.StatusMask.

Returns

A **com.rti.dds.publication.DataWriter** (p. 818) of a derived class specific to the data type associated with the **com.rti.dds.topic.Topic** (p. 2116) or NULL if an error occurred.

8.79.2.28 delete_datawriter()

```
void delete_datawriter (
            DataWriter a_datawriter )
```

<<***extension***>> *(*p. *403)* Deletes a **com.rti.dds.publication.DataWriter** (p. 818) that belongs to the implicit **com.rti.dds.publication.Publisher** (p. 1767).

The deletion of the **com.rti.dds.publication.DataWriter** (p. 818) will automatically unregister all instances.

Precondition

If the **com.rti.dds.publication.DataWriter** (p. 818) does not belong to the implicit **com.rti.dds.publication.Publisher** (p. 1767), the operation will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).

Postcondition

Listener installed on the **com.rti.dds.publication.DataWriter** (p. 818) will not be called after this method completes successfully.

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Parameters

a_datawriter	<<***in***>> *(*p. *404)* The **com.rti.dds.publication.DataWriter** (p. 818) to be deleted.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).

See also

com.rti.dds.domain.DomainParticipant.get_implicit_publisher (p. 1022)

8.79.2.29 create_datareader()

```
DataReader create_datareader (
             TopicDescription topic,
             DataReaderQos qos,
             DataReaderListener listener,
            int mask )
```

<<***extension***>> *(*p. *403)* Creates a **com.rti.dds.subscription.DataReader** (p. 707) that will be attached and belong to the implicit **com.rti.dds.subscription.Subscriber** (p. 2039).

Precondition

The given **com.rti.dds.topic.TopicDescription** (p. 2129) must have been created from the same **Domain↩ Participant** (p. 948) as the implicit Subscriber. If it was created from a different **DomainParticipant** (p. 948), this method will return NULL.

The **com.rti.dds.subscription.DataReader** (p. 707) created using this method will be associated with the implicit Subscriber. This Subscriber is automatically created (if it does not exist) using **com.rti.dds.domain.DomainParticipant.↩ SUBSCRIBER_QOS_DEFAULT** (p. 49) when the following methods are called: **com.rti.dds.domain.Domain↩ Participant.create_datareader** (p. 981), **com.rti.dds.domain.DomainParticipant.create_datareader_with_profile** (p. 982), or **com.rti.dds.domain.DomainParticipant.get_implicit_subscriber** (p. 1022).

MT Safety:

UNSAFE. If **com.rti.dds.subscription.Subscriber.DATAREADER_QOS_DEFAULT** (p. 82) is used for the `qos` parameter, it is not safe to create the datareader while another thread may be simultaneously calling **com.rti.↩ dds.domain.DomainParticipant.set_default_datareader_qos** (p. 968).

Parameters

topic	<<***in***>> *(p. 404)* The **com.rti.dds.topic.TopicDescription** (p. 2129) that the **com.rti.dds.subscription.DataReader** (p. 707) will be associated with. Cannot be NULL.
qos	<<***in***>> *(p. 404)* The qos of the **com.rti.dds.subscription.DataReader** (p. 707). The special value **com.rti.dds.subscription.Subscriber.DATAREADER_QOS_DEFAULT** (p. 82) can be used to indicate that the **com.rti.dds.subscription.DataReader** (p. 707) should be created with the default **com.rti.dds.subscription.DataReaderQos** (p. 777) set in the implicit **com.rti.dds.subscription.Subscriber** (p. 2039). If **com.rti.dds.topic.TopicDescription** (p. 2129) is of type **com.rti.dds.topic.Topic** (p. 2116) or **com.rti.dds.topic.ContentFilteredTopic** (p. 692), the special value **com.rti.dds.subscription.Subscriber.DATAREADER_QOS_USE_TOPIC_QOS** (p. 82) can be used to indicate that the **com.rti.dds.subscription.DataReader** (p. 707) should be created with the combination of the default **com.rti.dds.subscription.DataReaderQos** (p. 777) set on the implicit **com.rti.dds.subscription.Subscriber** (p. 2039) and the **com.rti.dds.topic.TopicQos** (p. 2133) (in the case of a **com.rti.dds.topic.ContentFilteredTopic** (p. 692), the **com.rti.dds.topic.TopicQos** (p. 2133) of the related **com.rti.dds.topic.Topic** (p. 2116)). if **com.rti.dds.subscription.Subscriber.DATAREADER_QOS_USE_TOPIC_QOS** (p. 82) is used, `topic` cannot be a **com.rti.dds.topic.MultiTopic** (p. 1618). Cannot be NULL.
listener	<<***in***>> *(p. 404)* The listener of the **com.rti.dds.subscription.DataReader** (p. 707).
mask	<<***in***>> *(p. 404)*. Changes of communication status to be invoked on the listener. See com.rti.dds.infrastructure.StatusMask.

Returns

A **com.rti.dds.subscription.DataReader** (p. 707) of a derived class specific to the data-type associated with the **com.rti.dds.topic.Topic** (p. 2116) or NULL if an error occurred.

             TopicDescription topic,
            String library_name,
            String profile_name,
             DataReaderListener listener,
            int mask )
```

<<***extension***>> *(p. 403)* Creates a **com.rti.dds.subscription.DataReader** (p. 707) using a XML QoS profile that will be attached and belong to the implicit **com.rti.dds.subscription.Subscriber** (p. 2039).

Precondition

The given **com.rti.dds.topic.TopicDescription** (p. 2129) must have been created from the same **Domain↩ Participant** (p. 948) as the implicit subscriber. If it was created from a different **DomainParticipant** (p. 948), this method will return NULL.

The **com.rti.dds.subscription.DataReader** (p. 707) created using this method will be associated with the implicit Subscriber. This Subscriber is automatically created (if it does not exist) using **com.rti.dds.domain.DomainParticipant.↩ SUBSCRIBER_QOS_DEFAULT** (p. 49) when the following methods are called: **com.rti.dds.domain.Domain↩ Participant.create_datareader** (p. 981), **com.rti.dds.domain.DomainParticipant.create_datareader_with_profile** (p. 982), or **com.rti.dds.domain.DomainParticipant.get_implicit_subscriber** (p. 1022)

Parameters

topic	<<***in***>> *(*p. *404)* The **com.rti.dds.topic.TopicDescription** (p. 2129) that the **com.rti.dds.subscription.DataReader** (p. 707) will be associated with. Cannot be NULL.
library_name	<<***in***>> *(*p. *404)* Library name containing the XML QoS profile. If library_name is null RTI Connext will use the default library (see **com.rti.dds.domain.DomainParticipant.set_default_library** (p. 994)).
profile_name	<<***in***>> *(*p. *404)* XML QoS Profile name. If profile_name is null RTI Connext will use the default profile (see **com.rti.dds.domain.DomainParticipant.set_default_profile** (p. 995)).
listener	<<***in***>> *(*p. *404)* The listener of the **com.rti.dds.subscription.DataReader** (p. 707).
mask	<<***in***>> *(*p. *404)*. Changes of communication status to be invoked on the listener. See com.rti.dds.infrastructure.StatusMask.

Returns

A **com.rti.dds.subscription.DataReader** (p. 707) of a derived class specific to the data-type associated with the **com.rti.dds.topic.Topic** (p. 2116) or NULL if an error occurred.

8.79.2.31 delete_datareader()

```
void delete_datareader (
            DataReader a_datareader )
```

<<***extension***>> *(p. 403)* Deletes a **com.rti.dds.subscription.DataReader** (p. 707) that belongs to the implicit **com.rti.dds.subscription.Subscriber** (p. 2039).

Precondition

If the **com.rti.dds.subscription.DataReader** (p. 707) does not belong to the implicit **com.rti.dds.subscription.Subscriber** (p. 2039), or if ther are any existing **com.rti.dds.subscription.ReadCondition** (p. 1816) or **com.rti.dds.subscription.QueryCondition** (p. 1812) objects that are attached to the **com.rti.dds.subscription.DataReader** (p. 707), or if there are outstanding loans on samples (as a result of a call to read(), take(), or one of the variants thereof), the operation fails with the error **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).

Postcondition

Listener installed on the **com.rti.dds.subscription.DataReader** (p. 707) will not be called after this method completes successfully.

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Parameters

a_datareader	<<***in***>> *(p. 404)* The **com.rti.dds.subscription.DataReader** (p. 707) to be deleted.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).

See also

com.rti.dds.domain.DomainParticipant.get_implicit_subscriber (p. 1022)

8.79.2.32 create_topic()

```
Topic create_topic (
            String topic_name,
```

```
String type_name,
 TopicQos qos,
 TopicListener listener,
int mask )
```

Creates a **com.rti.dds.topic.Topic** (p. 2116) with the desired QoS policies and attaches to it the specified **com.rti.dds.topic.TopicListener** (p. 2131).

Precondition

The application is not allowed to create two **com.rti.dds.topic.Topic** (p. 2116) objects with the same `topic_name` attached to the same **com.rti.dds.domain.DomainParticipant** (p. 948). If the application attempts this, this method will fail and return a NULL topic.

The specified QoS policies must be consistent, or the operation will fail and no **com.rti.dds.topic.Topic** (p. 2116) will be created.

Prior to creating a **com.rti.dds.topic.Topic** (p. 2116), the type must have been registered with RTI Connext. This is done using the **com.rti.ndds.example.FooTypeSupport.register_type** (p. 1411) operation on a derived class of the **com.rti.dds.topic.TypeSupport** (p. 2252) interface.

MT Safety:

UNSAFE. It is not safe to create a topic while another thread is trying to lookup that topic description with **com.rti.dds.domain.DomainParticipant.lookup_topicdescription** (p. 1000).

MT Safety:

UNSAFE. If **com.rti.dds.domain.DomainParticipant.TOPIC_QOS_DEFAULT** (p. 47) is used for `qos`, it is not safe to create the topic while another thread may be simultaneously calling **com.rti.dds.domain.DomainParticipant.set_default_topic_qos** (p. 957).

Parameters

topic_name	<<***in***>> *(p. 404)* Name for the new topic, must not exceed 255 characters. Cannot be NULL.
type_name	<<***in***>> *(p. 404)* The type to which the new **com.rti.dds.topic.Topic** (p. 2116) will be bound. Cannot be NULL.
qos	<<***in***>> *(p. 404)* QoS to be used for creating the new **com.rti.dds.topic.Topic** (p. 2116). The special value **com.rti.dds.domain.DomainParticipant.TOPIC_QOS_DEFAULT** (p. 47) can be used to indicate that the **com.rti.dds.topic.Topic** (p. 2116) should be created with the default **com.rti.dds.topic.TopicQos** (p. 2133) set in the **com.rti.dds.domain.DomainParticipant** (p. 948). Cannot be NULL.
listener	<<***in***>> *(p. 404)*. Listener to be attached to the newly created **com.rti.dds.topic.Topic** (p. 2116).
mask	<<***in***>> *(p. 404)*. Changes of communication status to be invoked on the listener. See com.rti.dds.infrastructure.StatusMask.

Returns

newly created topic, or NULL on failure

See also

Specifying QoS on entities (p. 505) for information on setting QoS before entity creation

com.rti.dds.topic.TopicQos (p. 2133) for rules on consistency among QoS

com.rti.dds.domain.DomainParticipant.TOPIC_QOS_DEFAULT (p. 47)

com.rti.dds.domain.DomainParticipant.create_topic_with_profile (p. 986)

com.rti.dds.domain.DomainParticipant.get_default_topic_qos (p. 957)

com.rti.dds.topic.Topic.set_listener (p. 2120)

8.79.2.33 create_topic_with_profile()

```
Topic create_topic_with_profile (
            String topic_name,
            String type_name,
            String library_name,
            String profile_name,
             TopicListener listener,
            int mask )
```

<<***extension***>> *(p. 403)* Creates a new **com.rti.dds.topic.Topic** (p. 2116) object using the **com.rti.dds.publication.PublisherQos** (p. 1791) associated with the input XML QoS profile.

Precondition

The application is not allowed to create two **com.rti.dds.topic.TopicDescription** (p. 2129) objects with the same `topic_name` attached to the same **com.rti.dds.domain.DomainParticipant** (p. 948). If the application attempts this, this method will fail and return a NULL topic.

The **com.rti.dds.topic.TopicQos** (p. 2133) in the input profile must be consistent, or the operation will fail and no **com.rti.dds.topic.Topic** (p. 2116) will be created.

Prior to creating a **com.rti.dds.topic.Topic** (p. 2116), the type must have been registered with RTI Connext. This is done using the **com.rti.ndds.example.FooTypeSupport.register_type** (p. 1411) operation on a derived class of the **com.rti.dds.topic.TypeSupport** (p. 2252) interface.

MT Safety:

UNSAFE. It is not safe to create a topic while another thread is trying to lookup that topic description with **com.rti.dds.domain.DomainParticipant.lookup_topicdescription** (p. 1000).

Parameters

topic_name	<<***in***>> *(p. 404)* Name for the new topic, must not exceed 255 characters. Cannot be NULL.
type_name	<<***in***>> *(p. 404)* The type to which the new **com.rti.dds.topic.Topic** (p. 2116) will be bound. Cannot be NULL.
library_name	<<***in***>> *(p. 404)* Library name containing the XML QoS profile. If library_name is null RTI Connext will use the default library (see **com.rti.dds.domain.DomainParticipant.set_default_library** (p. 994)).
profile_name	<<***in***>> *(p. 404)* XML QoS Profile name. If profile_name is null RTI Connext will use the default
	profile (see **com.rti.dds.domain.DomainParticipant.set_default_profile** (p. 995)).
listener	<<***in***>> *(p. 404).* Listener to be attached to the newly created **com.rti.dds.topic.Topic** (p. 2116).
mask	<<***in***>> *(p. 404).* Changes of communication status to be invoked on the listener. See com.rti.dds.infrastructure.StatusMask.

Returns

newly created topic, or NULL on failure

See also

Specifying QoS on entities (p. 505) for information on setting QoS before entity creation

com.rti.dds.topic.TopicQos (p. 2133) for rules on consistency among QoS

com.rti.dds.domain.DomainParticipant.create_topic (p. 984)

com.rti.dds.domain.DomainParticipant.get_default_topic_qos (p. 957)

com.rti.dds.topic.Topic.set_listener (p. 2120)

8.79.2.34 delete_topic()

```
void delete_topic (
              Topic topic )
```

Deletes a **com.rti.dds.topic.Topic** (p. 2116).

Precondition

If the **com.rti.dds.topic.Topic** (p. 2116) does not belong to the application's **com.rti.dds.domain.Domain↩ Participant** (p. 948), this operation fails with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_↩ MET** (p. 1903).

Make sure no objects are using the topic. More specifically, there must be no existing **com.rti.dds.↩ subscription.DataReader** (p. 707), **com.rti.dds.publication.DataWriter** (p. 818), **com.rti.dds.topic.Content↩ FilteredTopic** (p. 692), or **com.rti.dds.topic.MultiTopic** (p. 1618) objects belonging to the same **com.rti.dds.↩ domain.DomainParticipant** (p. 948) that are using the **com.rti.dds.topic.Topic** (p. 2116). If delete_topic is called on a **com.rti.dds.topic.Topic** (p. 2116) with any of these existing objects attached to it, it will fail with **com.rti.↩ dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).

Postcondition

Listener installed on the **com.rti.dds.topic.Topic** (p. 2116) will not be called after this method completes successfully.

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Parameters

topic	<<***in***>> *(p. 404)* **com.rti.dds.topic.Topic** (p. 2116) to be deleted.

Exceptions

One	of the **Standard Return Codes** (p. 513), or **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903)

8.79.2.35 create_contentfilteredtopic()

```
ContentFilteredTopic create_contentfilteredtopic (
            String name,
             Topic related_topic,
            String filter_expression,
             StringSeq expression_parameters )
```

Creates a **com.rti.dds.topic.ContentFilteredTopic** (p. 692), that can be used to do content-based subscriptions.

The **com.rti.dds.topic.ContentFilteredTopic** (p. 692) only relates to samples published under that **com.rti.dds.topic.Topic** (p. 2116), filtered according to their content. The filtering is done by means of evaluating a logical expression that involves the values of some of the data-fields in the sample. The logical expression derived from the `filter_expression` and `expression_parameters` arguments.

Queries and Filters Syntax (p. 108) describes the syntax of `filter_expression` and `expression_parameters`.

Precondition

The application is not allowed to create two **com.rti.dds.topic.ContentFilteredTopic** (p. 692) objects with the same `topic_name` attached to the same **com.rti.dds.domain.DomainParticipant** (p. 948). If the application attempts this, this method will fail and returns NULL.

If `related_topic` does not belong to this **com.rti.dds.domain.DomainParticipant** (p. 948), this operation returns NULL.

This function will create a content filter using the builtin SQL filter which implements a superset of the DDS specification. This filter **requires** that all IDL types have been compiled with typecodes. If this precondition is not met, this operation returns NULL.

Parameters

name	<<***in***>> *(p. 404)* Name for the new content filtered topic, must not exceed 255 characters. Cannot be NULL.
related_topic	<<***in***>> *(p. 404)* **com.rti.dds.topic.Topic** (p. 2116) to be filtered. Cannot be NULL.
filter_expression	<<***in***>> *(p. 404)* Cannot be NULL
expression_parameters	<<***in***>> *(p. 404)* Cannot be NULL. An empty sequence **must** be used if the filter expression does not contain any parameters. Length of sequence cannot be greater than 100.

Returns

newly created **com.rti.dds.topic.ContentFilteredTopic** (p. 692), or NULL on failure

8.79.2.36 create_contentfilteredtopic_with_filter()

```
ContentFilteredTopic create_contentfilteredtopic_with_filter (
            String name,
             Topic related_topic,
            String filter_expression,
             StringSeq expression_parameters,
            String filter_name )
```

<<***extension***>> *(p. 403)* Creates a **com.rti.dds.topic.ContentFilteredTopic** (p. 692) using the specified filter to do content-based subscriptions.

Parameters

name	<<***in***>> *(p. 404)* Name for the new content filtered topic. Cannot exceed 255 characters. Cannot be NULL.
related_topic	<<***in***>> *(p. 404)* **com.rti.dds.topic.Topic** (p. 2116) to be filtered. Cannot be NULL.
filter_expression	<<***in***>> *(p. 404)* Cannot be NULL.
expression_parameters	<<***in***>> *(p. 404)* Cannot be NULL. . An empty sequence **must** be used if the filter expression does not contain any parameters. Length of the sequence cannot be greater than 100.
filter_name	<<***in***>> *(p. 404)* Name of content filter to use. Must previously have been registered with **com.rti.dds.domain.DomainParticipant.register_contentfilter** (p. 1018) on the same **com.rti.dds.domain.DomainParticipant** (p. 948). Cannot be NULL. Builtin filter names are **com.rti.dds.domain.DomainParticipant.SQLFILTER_NAME** (p. 52) and **com.rti.dds.domain.DomainParticipant.STRINGMATCHFILTER_NAME** (p. 52)

Returns

newly created **com.rti.dds.topic.ContentFilteredTopic** (p. 692), or NULL on failure

8.79.2.37 delete_contentfilteredtopic()

```
void delete_contentfilteredtopic (
             ContentFilteredTopic a_contentfilteredtopic )
```

Deletes a **com.rti.dds.topic.ContentFilteredTopic** (p. 692).

Precondition

The deletion of a **com.rti.dds.topic.ContentFilteredTopic** (p. 692) is not allowed if there are any existing **com.↩ rti.dds.subscription.DataReader** (p. 707) objects that are using the **com.rti.dds.topic.ContentFilteredTopic** (p. 692). If the operation is called on a **com.rti.dds.topic.ContentFilteredTopic** (p. 692) with existing **com.↩ rti.dds.subscription.DataReader** (p. 707) objects attached to it, it will fail with **com.rti.dds.infrastructure.↩ RETCODE_PRECONDITION_NOT_MET** (p. 1903).

The **com.rti.dds.topic.ContentFilteredTopic** (p. 692) must be created by this **com.rti.dds.domain.↩ DomainParticipant** (p. 948), or else this operation will fail with **com.rti.dds.infrastructure.RETCODE_↩ PRECONDITION_NOT_MET** (p. 1903).

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Parameters

a_contentfilteredtopic	*<<**in**>> (p. 404)*

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903)

8.79.2.38 create_multitopic()

```
MultiTopic create_multitopic (
            String name,
            String type_name,
            String subscription_expression,
             StringSeq expression_parameters )
```

[Not supported (optional)] Creates a MultiTopic that can be used to subscribe to multiple topics and combine/filter the received data into a resulting type.

The resulting type is specified by the `type_name` argument. The list of topics and the logic used to combine, filter, and rearrange the information from each **com.rti.dds.topic.Topic** (p. 2116) are specified using the `subscription↩ _expression` and `expression_parameters` arguments.

Queries and Filters Syntax (p. 108) describes the syntax of `subscription_expression` and `expression↩ _parameters`.

Precondition

The application is not allowed to create two **com.rti.dds.topic.TopicDescription** (p. 2129) objects with the same `name` attached to the same **com.rti.dds.domain.DomainParticipant** (p. 948). If the application attempts this, this method will fail and return NULL.

Prior to creating a **com.rti.dds.topic.MultiTopic** (p. 1618), the type must have been registered with RTI Connext. This is done using the **com.rti.ndds.example.FooTypeSupport.register_type** (p. 1411) operation on a derived class of the **com.rti.dds.topic.TypeSupport** (p. 2252) interface. Otherwise, this method will return NULL.

Parameters

name	<<***in***>> *(p. 404)* Name of the newly create **com.rti.dds.topic.MultiTopic** (p. 1618). Cannot be NULL.
type_name	<<***in***>> *(p. 404)* Cannot be NULL.
subscription_expression	<<***in***>> *(p. 404)* Cannot be NULL.
expression_parameters	<<***in***>> *(p. 404)* Cannot be NULL.

Returns

NULL

8.79.2.39 delete_multitopic()

```
void delete_multitopic (
              MultiTopic a_multitopic )
```

[Not supported (optional)] Deletes a **com.rti.dds.topic.MultiTopic** (p. 1618).

Precondition

The deletion of a **com.rti.dds.topic.MultiTopic** (p. 1618) is not allowed if there are any existing **com.rti.dds.↩ subscription.DataReader** (p. 707) objects that are using the **com.rti.dds.topic.MultiTopic** (p. 1618). If the delete_multitopic operation is called on a **com.rti.dds.topic.MultiTopic** (p. 1618) with existing **com.rti.dds.↩ subscription.DataReader** (p. 707) objects attached to it, it will fail with **com.rti.dds.infrastructure.RETCODE↩ _PRECONDITION_NOT_MET** (p. 1903).

The **com.rti.dds.topic.MultiTopic** (p. 1618) must be created by this **com.rti.dds.domain.DomainParticipant** (p. 948), or else this operation will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Parameters

a_multitopic	*<<**in**>> (p. 404)*

8.79.2.40 set_qos()

```
void set_qos (
              DomainParticipantQos qos )
```

Change the QoS of this **DomainParticipant** (p. 948).

The **com.rti.dds.domain.DomainParticipantQos.user_data** (p. 1077) and **com.rti.dds.domain.DomainParticipant↩ Qos.entity_factory** (p. 1077) can be changed. The other policies are immutable.

Parameters

qos	*<<**in**>> (p. 404)* Set of policies to be applied to **com.rti.dds.domain.DomainParticipant** (p. 948). Policies must be consistent. Immutable policies cannot be changed after **com.rti.dds.domain.DomainParticipant** (p. 948) is enabled. The special value **com.rti.dds.domain.DomainParticipantFactory.PARTICIPANT_QOS_DEFAULT** (p. 44) can be used to indicate that the QoS of the **com.rti.dds.domain.DomainParticipant** (p. 948) should be changed to match the current default **com.rti.dds.domain.DomainParticipantQos** (p. 1073) set in the **com.rti.dds.domain.DomainParticipantFactory** (p. 1039). Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_IMMUTABLE_POLICY** (p. 1901) if an immutable policy is changed, **com.rti.dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901) if policies are inconsistent, or **com.rti.dds.infrastructure.RETCODE_NOT_ALLOWED_BY_SECURITY** (p. 1902) if policies are not allowed by the Security Plugins

See also

com.rti.dds.domain.DomainParticipantQos (p. 1073) for rules on consistency among QoS policies

set_qos (abstract) (p. 1321)

8.79.2.41 set_qos_with_profile()

```
void set_qos_with_profile (
             String library_name,
             String profile_name )
```

<<***extension***>> *(p. 403)* Change the QoS of this domain participant using the input XML QoS profile.

The **com.rti.dds.domain.DomainParticipantQos.user_data** (p. 1077) and **com.rti.dds.domain.DomainParticipant↩ Qos.entity_factory** (p. 1077) can be changed. The other policies are immutable.

Parameters

library_name	<<***in***>> *(p. 404)* Library name containing the XML QoS profile. If library_name is null RTI Connext will use the default library (see **com.rti.dds.domain.DomainParticipantFactory.set_default_library** (p. 1051)).
profile_name	<<***in***>> *(p. 404)* XML QoS Profile name. If profile_name is null RTI Connext will use the default profile (see **com.rti.dds.domain.DomainParticipantFactory.set_default_profile** (p. 1052)).

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_IMMUTABLE_POLICY** (p. 1901) if immutable policy is changed, or **com.rti.dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901) if policies are inconsistent

See also

com.rti.dds.domain.DomainParticipantQos (p. 1073) for rules on consistency among QoS

8.79.2.42 get_qos()

```
void get_qos (
              DomainParticipantQos qos )
```

Get the participant QoS.

This method may potentially allocate memory depending on the sequences contained in some QoS policies.

Parameters

qos	<<***inout***>> *(p. 404)* QoS to be filled up. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

get_qos (abstract) (p. 1322)

8.79.2.43 get_default_library()

```
String get_default_library ( )
```

<<***extension***>> *(p. 403)* Gets the default XML library associated with a **com.rti.dds.domain.DomainParticipant** (p. 948).

Returns

The default library or null if the default library was not set.

See also

com.rti.dds.domain.DomainParticipant.set_default_library (p. 994)

8.79.2.44 set_default_library()

```
void set_default_library (
             String library_name )
```

<<***extension***>> *(p. 403)* Sets the default XML library for a **com.rti.dds.domain.DomainParticipant** (p. 948).

This method specifies the library that will be used as the default the next time a default library is needed during a call to one of this **DomainParticipant** (p. 948)'s operations.

Any API requiring a library_name as a parameter can use null to refer to the default library.

If the default library is not set, the **com.rti.dds.domain.DomainParticipant** (p. 948) inherits the default from the **com.rti.dds.domain.DomainParticipantFactory** (p. 1039) (see **com.rti.dds.domain.DomainParticipantFactory.↩ set_default_library** (p. 1051)).

Parameters

library_name	<<***in***>> *(p. 404)* Library name. If library_name is null any previous default is unset.

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

com.rti.dds.domain.DomainParticipant.get_default_library (p. 993)

8.79.2.45 get_default_profile()

```
String get_default_profile ( )
```

<<***extension***>> *(p. 403)* Gets the default XML profile associated with a **com.rti.dds.domain.DomainParticipant** (p. 948).

Returns

The default profile or null if the default profile was not set.

See also

com.rti.dds.domain.DomainParticipant.set_default_profile (p. 995)

8.79.2.46 set_default_profile()

```
void set_default_profile (
             String library_name,
             String profile_name )
```

<<***extension***>> *(p. 403)* Sets the default XML profile for a **com.rti.dds.domain.DomainParticipant** (p. 948).

This method specifies the profile that will be used as the default the next time a default **DomainParticipant** (p. 948) profile is needed during a call to one of this **DomainParticipant** (p. 948)'s operations. When calling a **com.rti.dds.↩ domain.DomainParticipant** (p. 948) method that requires a `profile_name` parameter, you can use NULL to refer to the default profile. (This same information applies to setting a default library.)

If the default profile is not set, the **com.rti.dds.domain.DomainParticipant** (p. 948) inherits the default from the **com.rti.dds.domain.DomainParticipantFactory** (p. 1039) (see **com.rti.dds.domain.DomainParticipantFactory.↩ set_default_profile** (p. 1052)).

This method does not set the default QoS for entities created by the **com.rti.dds.domain.DomainParticipant** (p. 948); for this functionality, use the methods set_default_<entity>_qos_with_profile (you may pass in NULL after having called **set_default_profile()** (p. 995)).

This method does not set the default QoS for newly created DomainParticipants; for this functionality, use **com.rti.↩ dds.domain.DomainParticipantFactory.set_default_participant_qos_with_profile** (p. 1046).

Parameters

library_name	<<***in***>> *(p. 404)* The library name containing the profile.
profile_name	<<***in***>> *(p. 404)* The profile name. If profile_name is null any previous default is unset.

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

com.rti.dds.domain.DomainParticipant.get_default_profile (p. 994)

com.rti.dds.domain.DomainParticipant.get_default_profile_library (p. 996)

8.79.2.47 get_default_profile_library()

```
String get_default_profile_library ( )
```

<<***extension***>> *(p. 403)* Gets the library where the default XML QoS profile is contained for a **com.rti.dds.domain.DomainParticipant** (p. 948).

The default profile library is automatically set when **com.rti.dds.domain.DomainParticipant.set_default_profile** (p. 995) is called.

This library can be different than the **com.rti.dds.domain.DomainParticipant** (p. 948) default library (see **com.rti.dds.domain.DomainParticipant.get_default_library** (p. 993)).

Returns

The default profile library or null if the default profile was not set.

See also

com.rti.dds.domain.DomainParticipant.set_default_profile (p. 995)

8.79.2.48 set_listener()

```
void set_listener (
            DomainParticipantListener l,
            int mask )
```

Sets the participant listener.

Parameters

l	<<***in***>> *(p. 404)* Listener to be installed on the entity.
mask	<<***in***>> *(p. 404)* Changes of communication status to be invoked on the listener. See com.rti.dds.infrastructure.StatusMask.

MT Safety:

Unsafe. This method is not synchronized with the listener callbacks, so it is possible to set a new listener on a participant when the old listener is in a callback.

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

set_listener (abstract) (p. 1322)

8.79.2.49 get_listener()

```
DomainParticipantListener get_listener ( )
```

Get the participant listener.

Returns

Existing listener attached to the **com.rti.dds.domain.DomainParticipant** (p. 948).

See also

get_listener (abstract) (p. 1323)

8.79.2.50 get_publishers()

```
void get_publishers (
            PublisherSeq publishers )
```

<<***extension***>> *(p. 403)* Allows the application to access all the publishers the participant has.

If the sequence doesn't own its buffer, and its maximum is less than the total number of publishers, it will be filled up to its maximum, and fail with **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903).

MT Safety:

Safe.

Parameters

publishers	<<***inout***>> *(*p. *404)* a PublisherSeq object where the set or list of publishers will be returned

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903)

8.79.2.51 get_subscribers()

```
void get_subscribers (
              SubscriberSeq subscribers )
```

<<***extension***>> *(*p. *403)* Allows the application to access all the subscribers the participant has.

If the sequence doesn't own its buffer, and its maximum is less than the total number of subscribers, it will be filled up to its maximum, and fail with **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903).

MT Safety:

Safe.

Parameters

subscribers	<<***inout***>> *(*p. *404)* a SubscriberSeq object where the set or list of subscribers will be returned

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903)

8.79.2.52 get_builtin_subscriber()

```
Subscriber get_builtin_subscriber ( )
```

Accesses the **built-in com.rti.dds.subscription.Subscriber** (p. 2039).

Each **com.rti.dds.domain.DomainParticipant** (p. 948) contains several built-in **com.rti.dds.topic.Topic** (p. 2116) objects as well as corresponding **com.rti.dds.subscription.DataReader** (p. 707) objects to access them. All of

these **com.rti.dds.subscription.DataReader** (p. 707) objects belong to a single built-in **com.rti.dds.subscription.↩ Subscriber** (p. 2039).

The built-in Topics are used to communicate information about other **com.rti.dds.domain.DomainParticipant** (p. 948), **com.rti.dds.topic.Topic** (p. 2116), **com.rti.dds.subscription.DataReader** (p. 707), and **com.rti.dds.publication.↩ DataWriter** (p. 818) objects.

The built-in subscriber is created when this operation is called for the first time. The built-in subscriber is deleted automatically when the **com.rti.dds.domain.DomainParticipant** (p. 948) is deleted.

Returns

The built-in **com.rti.dds.subscription.Subscriber** (p. 2039) singleton.

See also

com.rti.dds.subscription.builtin.SubscriptionBuiltinTopicData (p. 2070)

com.rti.dds.publication.builtin.PublicationBuiltinTopicData (p. 1753)

com.rti.dds.domain.builtin.ParticipantBuiltinTopicData (p. 1647)

builtin.TopicBuiltinTopicData

8.79.2.53 lookup_flowcontroller()

```
FlowController lookup_flowcontroller (
            String name )
```

<<***extension***>> *(p. 403)* Looks up an existing locally-created **com.rti.dds.publication.FlowController** (p. 1348), based on its name.

Looks up a previously created **com.rti.dds.publication.FlowController** (p. 1348), including the built-in ones. Once a **com.rti.dds.publication.FlowController** (p. 1348) has been deleted, subsequent lookups will fail.

MT Safety:

UNSAFE. It is not safe to lookup a flow controller description while another thread is creating that flow controller.

Parameters

name	<<***in***>> *(p. 404)* Name of **com.rti.dds.publication.FlowController** (p. 1348) to search for. Limited to 255 characters. Cannot be NULL.

Returns

The flow controller if it has already been created locally, or NULL otherwise.

8.79.2.54 find_topic()

```
Topic find_topic (
            String topic_name,
             Duration_t timeout )
```

Finds an existing (or ready to exist) **com.rti.dds.topic.Topic** (p. 2116), based on its name.

This call can be used to block for a specified duration to wait for the **com.rti.dds.topic.Topic** (p. 2116) to be created.

If the requested **com.rti.dds.topic.Topic** (p. 2116) already exists, it is returned. Otherwise, **find_topic()** (p. 999) waits until another thread creates it or else returns when the specified timeout occurs.

find_topic() (p. 999) is useful when multiple threads are concurrently creating and looking up topics. In that case, one thread can call **find_topic()** (p. 999) and, if another thread has not yet created the topic being looked up, it can wait for some period of time for it to do so. In almost all other cases, it is more straightforward to call **com.rti.dds.domain.DomainParticipant.lookup_topicdescription** (p. 1000).

The **com.rti.dds.domain.DomainParticipant** (p. 948) must already be enabled.

Note: *Each* **com.rti.dds.topic.Topic** (p. 2116) obtained by **com.rti.dds.domain.DomainParticipant.find_topic** (p. 999) must also be deleted by means of **com.rti.dds.domain.DomainParticipant.delete_topic** (p. 987). If **com.rti.dds.topic.Topic** (p. 2116) is obtained multiple times by means of **com.rti.dds.domain.DomainParticipant.find_topic** (p. 999) or **com.rti.dds.domain.DomainParticipant.create_topic** (p. 984), it must also be deleted that same number of times using **com.rti.dds.domain.DomainParticipant.delete_topic** (p. 987).

Parameters

topic_name	<<***in***>> *(p. 404)* Name of the **com.rti.dds.topic.Topic** (p. 2116) to search for. Cannot be NULL.
timeout	<<***in***>> *(p. 404)* The time to wait if the **com.rti.dds.topic.Topic** (p. 2116) does not exist already. Cannot be NULL.

Returns

the topic, if it exists, or NULL

8.79.2.55 lookup_topicdescription()

```
TopicDescription lookup_topicdescription (
            String topic_name )
```

Looks up an existing, locally created **com.rti.dds.topic.TopicDescription** (p. 2129), based on its name.

com.rti.dds.topic.TopicDescription (p. 2129) is the base class for **com.rti.dds.topic.Topic** (p. 2116), **com.rti.dds.topic.MultiTopic** (p. 1618) and **com.rti.dds.topic.ContentFilteredTopic** (p. 692). So you can narrow the **com.rti.dds.topic.TopicDescription** (p. 2129) returned from this operation to a **com.rti.dds.topic.Topic** (p. 2116) or **com.rti.dds.topic.ContentFilteredTopic** (p. 692) as appropriate.

Unlike **com.rti.dds.domain.DomainParticipant.find_topic** (p. 999), which logically returns a new **com.rti.dds.topic.Topic** (p. 2116) object that must be independently deleted, *this* operation returns a reference to the original local object.

The **com.rti.dds.domain.DomainParticipant** (p. 948) does not have to be enabled when you call **lookup_topicdescription()** (p. 1000).

The returned topic may be either enabled or disabled.

MT Safety:

UNSAFE. It is not safe to lookup a topic description while another thread is creating that topic.

Parameters

topic_name	<<***in***>> *(p. 404)* Name of **com.rti.dds.topic.TopicDescription** (p. 2129) to search for. This string must be no more than 255 characters; it cannot be NULL.

Returns

The topic description, if it has already been created locally, otherwise it returns NULL.

8.79.2.56 ignore_participant()

```
void ignore_participant (
               InstanceHandle_t handle )
```

Instructs RTI Connext to locally ignore a remote **com.rti.dds.domain.DomainParticipant** (p. 948).

From the time of this call onwards, RTI Connext will locally behave as if the remote participant did not exist. This means it will ignore any topic, publication, or subscription that originates on that **com.rti.dds.domain.DomainParticipant** (p. 948).

There is no way to reverse this operation.

This operation can be used in conjunction with the discovery of remote participants offered by means of the **com.rti.dds.domain.builtin.ParticipantBuiltinTopicData** (p. 1647) to provide access control.

Application data can be associated with a **com.rti.dds.domain.DomainParticipant** (p. 948) by means of the **USER_DATA** (p. 530) policy. This application data is propagated as a field in the built-in topic and can be used by an application to implement its own access control policy.

The **com.rti.dds.domain.DomainParticipant** (p. 948) to ignore is identified by the handle argument. This `handle` is the one that appears in the **com.rti.dds.subscription.SampleInfo** (p. 1944) retrieved when reading the data-samples available for the built-in **com.rti.dds.subscription.DataReader** (p. 707) to the **com.rti.dds.domain.DomainParticipant** (p. 948) topic. The built-in **com.rti.dds.subscription.DataReader** (p. 707) is read with the same **com.rti.ndds.example.FooDataReader.read** (p. 1361) and **com.rti.ndds.example.FooDataReader.take** (p. 1363) operations used for any **com.rti.dds.subscription.DataReader** (p. 707).

Parameters

handle	<<***in***>> *(p. 404)* **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443) of the **com.rti.dds.domain.DomainParticipant** (p. 948) to be ignored. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903), **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902)

See also

com.rti.dds.domain.builtin.ParticipantBuiltinTopicData (p. 1647)

com.rti.dds.domain.builtin.ParticipantBuiltinTopicDataTypeSupport.PARTICIPANT_TOPIC_NAME (p. 410)

com.rti.dds.domain.DomainParticipant.get_builtin_subscriber (p. 998)

8.79.2.57 banish_ignored_participants()

```
void banish_ignored_participants ( )
```

<<***extension***>> *(p. 403)* Prevents ignored remote DomainParticipants from receiving traffic from the local **com.rti.dds.domain.DomainParticipant** (p. 948).

This method complements **com.rti.dds.domain.DomainParticipant.ignore_participant** (p. 1001): ignore_participant prevents the local **com.rti.dds.domain.DomainParticipant** (p. 948) from processing traffic from the remote **DomainParticipant** (p. 948), while this method prevents already ignored remote DomainParticipants from processing traffic from the local **DomainParticipant** (p. 948).

Note: this method is currently only supported when enabling the RTI Security Plugins. Please refer to the `RTI Security Plugins User's Manual` for more information.

MT Safety:

Safe.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903), **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902)

See also

com.rti.dds.domain.DomainParticipant.ignore_participant (p. 1001)

8.79.2.58 ignore_topic()

```
void ignore_topic (
            InstanceHandle_t handle )
```

Instructs RTI Connext to locally ignore a **com.rti.dds.topic.Topic** (p. 2116).

This means it will locally ignore any publication, or subscription to the **com.rti.dds.topic.Topic** (p. 2116).

There is no way to reverse this operation.

This operation can be used to save local resources when the application knows that it will never publish or subscribe to data under certain topics.

The **com.rti.dds.topic.Topic** (p. 2116) to ignore is identified by the `handle` argument. This is the handle of a **com.rti.dds.topic.Topic** (p. 2116) that appears in the **com.rti.dds.subscription.SampleInfo** (p. 1944) retrieved when reading data samples from the built-in **com.rti.dds.subscription.DataReader** (p. 707) for the **com.rti.dds.topic.Topic** (p. 2116).

Parameters

handle	<<***in***>> *(p. 404)* Handle of the **com.rti.dds.topic.Topic** (p. 2116) to be ignored. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902)

See also

builtin.TopicBuiltinTopicData

com.rti.dds.topic.builtin.TopicBuiltinTopicDataTypeSupport.TOPIC_TOPIC_NAME (p. 413)

com.rti.dds.domain.DomainParticipant.get_builtin_subscriber (p. 998)

8.79.2.59 ignore_publication()

```
void ignore_publication (
            InstanceHandle_t handle )
```

Instructs RTI Connext to locally ignore a publication.

A publication is defined by the association of a topic name, user data, and partition set on the **com.rti.dds.↩ publication.Publisher** (p. 1767) (see **com.rti.dds.publication.builtin.PublicationBuiltinTopicData** (p. 1753)). After this call, any data written by that publication's **com.rti.dds.publication.DataWriter** (p. 818) will be ignored.

This operation can be used to ignore local *and* remote DataWriters.

The publication (DataWriter) to ignore is identified by the `handle` argument.

- To ignore a *remote* DataWriter, the `handle` can be obtained from the **com.rti.dds.subscription.SampleInfo** (p. 1944) retrieved when reading data samples from the built-in **com.rti.dds.subscription.DataReader** (p. 707) for the **com.rti.dds.publication** (p. 565) topic.

- To ignore a *local* DataWriter, the `handle` can be obtained by calling **com.rti.dds.infrastructure.Entity.get_↩ instance_handle** (p. 1325) for the local DataWriter.

There is no way to reverse this operation.

Parameters

handle	<<***in***>> *(*p. *404)* Handle of the **com.rti.dds.publication.DataWriter** (p. 818) to be ignored. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902)

See also

com.rti.dds.publication.builtin.PublicationBuiltinTopicData (p. 1753)

com.rti.dds.publication.builtin.PublicationBuiltinTopicDataTypeSupport.PUBLICATION_TOPIC_NAME (p. 411)

com.rti.dds.domain.DomainParticipant.get_builtin_subscriber (p. 998)

8.79.2.60 ignore_subscription()

```
void ignore_subscription (
            InstanceHandle_t handle )
```

Instructs RTI Connext to locally ignore a subscription.

A subscription is defined by the association of a topic name, user data, and partition set on the **com.rti.dds.↩ subscription.Subscriber** (p. 2039) (see **com.rti.dds.subscription.builtin.SubscriptionBuiltinTopicData** (p. 2070)). After this call, any data received related to that subscription's **com.rti.dds.subscription.DataReader** (p. 707) will be ignored.

This operation can be used to ignore local *and* remote DataReaders.

The subscription to ignore is identified by the `handle` argument.

- To ignore a *remote* DataReader, the `handle` can be obtained from the **com.rti.dds.subscription.SampleInfo** (p. 1944) retrieved when reading data samples from the built-in **com.rti.dds.subscription.DataReader** (p. 707) for the **com.rti.dds.subscription** (p. 566) topic.

- To ignore a *local* DataReader, the `handle` can be obtained by calling **com.rti.dds.infrastructure.Entity.get_↩ instance_handle** (p. 1325) for the local DataReader.

There is no way to reverse this operation.

Parameters

handle	*<<**in**>> (p. 404)* Handle of the **com.rti.dds.subscription.DataReader** (p. 707) to be ignored. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902)

See also

com.rti.dds.subscription.builtin.SubscriptionBuiltinTopicData (p. 2070)

com.rti.dds.subscription.builtin.SubscriptionBuiltinTopicDataTypeSupport.SUBSCRIPTION_TOPIC_NAME (p. 412)

com.rti.dds.domain.DomainParticipant.get_builtin_subscriber (p. 998)

8.79.2.61 get_domain_id()

```
int get_domain_id ( )
```

Get the unique domain identifier.

This operation retrieves the domain id used to create the **com.rti.dds.domain.DomainParticipant** (p. 948). The domain id identifies the DDS domain to which the **com.rti.dds.domain.DomainParticipant** (p. 948) belongs. Each DDS domain represents a separate data 'communication plane' isolated from other domains.

Returns

the unique `domainId` that was used to create the domain

See also

com.rti.dds.domain.DomainParticipantFactory.create_participant (p. 1043)

com.rti.dds.domain.DomainParticipantFactory.create_participant_with_profile (p. 1060)

8.79.2.62 assert_liveliness()

```
void assert_liveliness ( )
```

Manually asserts the liveliness of this **com.rti.dds.domain.DomainParticipant** (p. 948).

This is used in combination with the **com.rti.dds.infrastructure.LivelinessQosPolicy** (p. 1535) to indicate to RTI Connext that the entity remains active.

You need to use this operation if the **com.rti.dds.domain.DomainParticipant** (p. 948) contains **com.rti.dds.publication.DataWriter** (p. 818) entities with the **com.rti.dds.infrastructure.LivelinessQosPolicy.kind** (p. 1538) set to com.rti.dds.infrastructure.LivelinessQosPolicyKind.LivelinessQosPolicyKind.MANUAL_BY_PARTICIPANT_LIVELINESS_QOS and it only affects the liveliness of those **com.rti.dds.publication.DataWriter** (p. 818) entities. Otherwise, it has no effect.

Note: writing data via the **com.rti.ndds.example.FooDataWriter.write** (p. 1397) or **com.rti.ndds.example.FooDataWriter.write_w_timestamp** (p. 1401) operation asserts liveliness on the **com.rti.dds.publication.DataWriter** (p. 818) itself and its **com.rti.dds.domain.DomainParticipant** (p. 948). Consequently the use of **assert_liveliness()** (p. 1005) is only needed if the application is not writing data regularly.

Exceptions

One	of the **Standard Return Codes** (p. 513), or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902)

See also

com.rti.dds.infrastructure.LivelinessQosPolicy (p. 1535)

8.79.2.63 delete_contained_entities()

```
void delete_contained_entities ( )
```

Delete all the entities that were created by means of the "create" operations on the **com.rti.dds.domain.DomainParticipant** (p. 948).

This operation deletes all contained **com.rti.dds.publication.Publisher** (p. 1767) (including an implicit Publisher, if one exists), **com.rti.dds.subscription.Subscriber** (p. 2039) (including implicit Subscriber), **com.rti.dds.topic.Topic** (p. 2116), **com.rti.dds.topic.ContentFilteredTopic** (p. 692), and **com.rti.dds.topic.MultiTopic** (p. 1618) objects.

Prior to deleting each contained entity, this operation will recursively call the corresponding **delete_contained_entities()** (p. 1006) operation on each contained entity (if applicable). This pattern is applied recursively. In this manner the operation **delete_contained_entities()** (p. 1006) on the **com.rti.dds.domain.DomainParticipant** (p. 948) will end up recursively deleting all the entities contained in the **com.rti.dds.domain.DomainParticipant** (p. 948), including the **com.rti.dds.publication.DataWriter** (p. 818), **com.rti.dds.subscription.DataReader** (p. 707), as well as the **com.rti.dds.subscription.QueryCondition** (p. 1812), **com.rti.dds.subscription.ReadCondition** (p. 1816), and **com.rti.dds.subscription.TopicQuery** (p. 2139) objects belonging to the contained **com.rti.dds.subscription.DataReader** (p. 707).

The operation will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903) if any of the contained entities is in a state where it cannot be deleted .

If **delete_contained_entities()** (p. 1006) completes successfully, the application may delete the **com.rti.dds.domain.DomainParticipant** (p. 948).

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Exceptions

One	of the **Standard Return Codes** (p. 513), or **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).

8.79.2.64 add_peer()

```
void add_peer (
             String peer_desc_string )
```

<<***extension***>> *(p. 403)* Attempt to contact one or more additional peer participants.

Add the given peer description to the list of peers with which this **com.rti.dds.domain.DomainParticipant** (p. 948) will try to communicate.

This method may be called at any time after this **com.rti.dds.domain.DomainParticipant** (p. 948) has been created (before or after it has been enabled).

If this method is called after **com.rti.dds.infrastructure.Entity.enable** (p. 1323), an attempt will be made to contact the new peer(s) immediately.

If this method is called *before* the **DomainParticipant** (p. 948) is enabled, the peer description will simply be added to the list that was populated by **com.rti.dds.infrastructure.DiscoveryQosPolicy.initial_peers** (p. 945); the first attempted contact will take place after this **com.rti.dds.domain.DomainParticipant** (p. 948) is enabled.

Any peers added with the add_peer operation are equivalent to entries in the initial_peers list. Therefore, the participant will only discover remote participants using the newly added peer descriptor if a remote participant exists at that location and is configured to accept new peers (i.e., **com.rti.dds.infrastructure.DiscoveryQosPolicy.accept_unknown_↩peers** (p. 946) is set to com.rti.dds.infrastructure.true). If multiple remote participants exist at that location (for example, if add_peer is called with a multicast address), the participant may discover multiple remote participants.

To be informed of the exact remote participants that are discovered, regardless of which peers this **com.rti.dds.↩domain.DomainParticipant** (p. 948) *attempts* to discover, use the built-in participant topic: **com.rti.dds.domain.↩builtin.ParticipantBuiltinTopicDataTypeSupport.PARTICIPANT_TOPIC_NAME** (p. 410).

To remove specific peer locators, you may use **com.rti.dds.domain.DomainParticipant.remove_peer** (p. 1008). If a peer is removed, the add_peer operation will add it back to the list of peers.

To stop communicating with a peer **com.rti.dds.domain.DomainParticipant** (p. 948) that has been discovered, use **com.rti.dds.domain.DomainParticipant.ignore_participant** (p. 1001).

Adding a peer description with this method has no effect on the **com.rti.dds.infrastructure.DiscoveryQosPolicy.↩initial_peers** (p. 945) that may be subsequently retrieved with **com.rti.dds.domain.DomainParticipant.get_qos()** (p. 993) (because **com.rti.dds.infrastructure.DiscoveryQosPolicy** (p. 943) is immutable).

Parameters

peer_desc_string	<<***in***>> *(p. 404)* New peer descriptor to be added. The format is specified in **Peer Descriptor Format** (p. 473). Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

Peer Descriptor Format (p. 473)

com.rti.dds.infrastructure.DiscoveryQosPolicy.initial_peers (p. 945)

com.rti.dds.domain.builtin.ParticipantBuiltinTopicDataTypeSupport.PARTICIPANT_TOPIC_NAME (p. 410)

com.rti.dds.domain.DomainParticipant.get_builtin_subscriber (p. 998)

8.79.2.65 remove_peer()

```
void remove_peer (
             String peer_desc_string )
```

<<***extension***>> *(p. 403)* Remove one or more peer participants from the list of peers with which this **com.rti.dds.↩ domain.DomainParticipant** (p. 948) will try to communicate.

This method may be called any time after this **com.rti.dds.domain.DomainParticipant** (p. 948) has been enabled

Calling this method has the following effects:

- If a **com.rti.dds.domain.DomainParticipant** (p. 948) was already discovered, it will be locally removed along with all its entities.
- Any further requests coming from a **com.rti.dds.domain.DomainParticipant** (p. 948) located on any of the removed peers will be ignored.
- All the locators contained in the peer description will be removed from the peer list. The local **com.rti.dds.↩ domain.DomainParticipant** (p. 948) will stop sending announcement to those locators.

If remote participants located on a peer that was previously removed are discovered, they will be ignored untill the related peer is added back by using **com.rti.dds.domain.DomainParticipant.add_peer** (p. 1007).

Removing a peer description with this method has no effect on the **com.rti.dds.infrastructure.DiscoveryQosPolicy.↩ initial_peers** (p. 945) that may be subsequently retrieved with **com.rti.dds.domain.DomainParticipant.get_qos()** (p. 993) (because **com.rti.dds.infrastructure.DiscoveryQosPolicy** (p. 943) is immutable).

Parameters

peer_desc_string	<<***in***>> *(p. 404)* Peer descriptor to be removed. The format is specified in **Peer Descriptor Format** (p. 473). Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

Peer Descriptor Format (p. 473)

com.rti.dds.infrastructure.DiscoveryQosPolicy.initial_peers (p. 945)

com.rti.dds.domain.DomainParticipant.add_peer (p. 1007)

8.79.2.66 get_dns_tracker_polling_period()

```
void get_dns_tracker_polling_period (
              Duration_t polling_period )
```

<<***extension***>> *(p. 403)* Retrieves the frequency used by the DNS tracker thread to query the DNS service.

The DNS tracker queries the DNS for hostnames specified in the initial peers of a **DomainParticipant** (p. 948). The frequency of these queries is defined by **com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.dns_tracker_polling_period** (p. 938). If the value returned is **com.rti.dds.infrastructure.Duration_t.DURATION_INFINITE** (p. 1133), the DNS tracker is disabled.

Parameters

polling_period	<<***out***>> *(p. 404)* Duration that the API populates with the period of the DNS tracker.

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.dns_tracker_polling_period (p. 938)

8.79.2.67 set_dns_tracker_polling_period()

```
void set_dns_tracker_polling_period (
            Duration_t polling_period )
```

<<***extension***>> *(p. 403)* Configures the frequency in which the DNS tracker queries the DNS service.

This API allows you to change the frequency of the polling period for the DNS tracker. The range of accepted values, in seconds, goes from 1 second to 1 year. **com.rti.dds.infrastructure.Duration_t.DURATION_INFINITE** (p. 1133) is also accepted as a valid value. If the duration is set to **com.rti.dds.infrastructure.Duration_t.DURATION_INFINITE** (p. 1133), the DNS tracker is disabled.

Modifying the DNS tracker polling period through this has no effect on the **com.rti.dds.infrastructure.Discovery↩ ConfigQosPolicy.dns_tracker_polling_period** (p. 938) when it is retrieved with **com.rti.dds.domain.Domain↩ Participant.get_qos()** (p. 993).

Parameters

polling_period	<<***in***>> *(p. 404)* Duration that is set as the polling period for the DNS tracker.

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.dns_tracker_polling_period (p. 938)

com.rti.dds.domain.DomainParticipant.add_peer (p. 1007)

8.79.2.68 get_current_time()

```
void get_current_time (
            Time_t current_time )
```

Returns the current value of the time.

The current value of the time that RTI Connext uses to time-stamp **com.rti.dds.publication.DataWriter** (p. 818) and to set the reception-timestamp for the data updates that it receives.

Parameters

current_time	<<***inout***>> *(p. 404)* Current time to be filled up. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513)

8.79.2.69 get_discovered_participants()

```
void get_discovered_participants (
              InstanceHandleSeq participant_handles )
```

Returns a list of discovered **com.rti.dds.domain.DomainParticipant** (p. 948) entities.

This operation retrieves the list of **com.rti.dds.domain.DomainParticipant** (p. 948) entities that have been discovered in the domain and that the application has not indicated should be "ignored" by means of the **com.rti.dds.domain.DomainParticipant.ignore_participant** (p. 1001) operation. When using **com.rti.dds.infrastructure.DiscoveryConfigBuiltinPluginKind.SPDP2** (p. 914), this list only includes **com.rti.dds.domain.DomainParticipant** (p. 948) entities that the application has received configuration information from.

Parameters

participant_handles	<<***inout***>> *(p. 404)* **com.rti.dds.infrastructure.InstanceHandleSeq** (p. 1447) to be filled with handles of the discovered **com.rti.dds.domain.DomainParticipant** (p. 948) entities.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902)

8.79.2.70 get_discovered_participants_from_subject_name()

```
void get_discovered_participants_from_subject_name (
              InstanceHandleSeq participant_handles,
             String subject_name )
```

<<***extension***>> *(p. 403)* Returns a list of discovered **com.rti.dds.domain.DomainParticipant** (p. 948) entities that have the given **com.rti.dds.infrastructure.EntityNameQosPolicy.name** (p. 1329).

This operation retrieves the same list as **com.rti.dds.domain.DomainParticipant.get_discovered_participants** (p. 1011), except this list contains only the participants that have the given **com.rti.dds.infrastructure.EntityNameQosPolicy.name** (p. 1329).

Note: this method has different functionality when enabling the RTI Security Plugins. Please refer to the `RTI Security Plugins User's Manual` for more information.

MT Safety:

Safe.

Parameters

participant_handles	*<<**inout**>> (p. 404)* **com.rti.dds.infrastructure.InstanceHandleSeq** (p. 1447) to be filled with handles of the discovered **com.rti.dds.domain.DomainParticipant** (p. 948) entities.
subject_name	*<<**in**>> (p. 404)* The **com.rti.dds.infrastructure.EntityNameQosPolicy.name** (p. 1329) by which to filter the list.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902)

8.79.2.71 get_discovered_participant_data()

```
void get_discovered_participant_data (
              ParticipantBuiltinTopicData participant_data,
              InstanceHandle_t participant_handle )
```

Returns **com.rti.dds.domain.builtin.ParticipantBuiltinTopicData** (p. 1647) for the specified **com.rti.dds.domain.↩ DomainParticipant** (p. 948).

This operation retrieves information on a **com.rti.dds.domain.DomainParticipant** (p. 948) that has been discovered on the network. The participant must be in the same domain as the participant on which this operation is invoked and must not have been "ignored" by means of the **com.rti.dds.domain.DomainParticipant.ignore_participant** (p. 1001) operation.

The `participant_handle` must correspond to such a **DomainParticipant** (p. 948). Otherwise, the operation will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).

Use the operation **com.rti.dds.domain.DomainParticipant.get_discovered_participants** (p. 1011) to find the **com.↩ rti.dds.domain.DomainParticipant** (p. 948) entities that are currently discovered.

MT Safety:

Safe.

Parameters

participant_data	*<<**inout**>> (p. 404)* **com.rti.dds.domain.builtin.ParticipantBuiltinTopicData** (p. 1647) to be filled in with the data for the specified **com.rti.dds.domain.DomainParticipant** (p. 948).
participant_handle	*<<**in**>> (p. 404)* **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443) of **com.rti.dds.domain.DomainParticipant** (p. 948).

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902)

See also

com.rti.dds.domain.builtin.ParticipantBuiltinTopicData (p. 1647)

com.rti.dds.domain.DomainParticipant.get_discovered_participants (p. 1011)

8.79.2.72 get_discovered_participant_subject_name()

```
String get_discovered_participant_subject_name (
            InstanceHandle_t participant_handle )
```

<<***extension***>> *(p. 403)* Returns **com.rti.dds.infrastructure.EntityNameQosPolicy.name** (p. 1329) for the specified **com.rti.dds.domain.DomainParticipant** (p. 948).

This operation retrieves the **com.rti.dds.infrastructure.EntityNameQosPolicy.name** (p. 1329) of a **com.rti.dds.domain.DomainParticipant** (p. 948) that has been discovered on the network. The participant must be in the same domain as the participant on which this operation is invoked and must not have been "ignored" by means of the **com.rti.dds.domain.DomainParticipant.ignore_participant** (p. 1001) operation.

The `participant_handle` must correspond to such a **DomainParticipant** (p. 948). If the `participant_handle` is **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447) or is not a valid **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443) for a **DomainParticipant** (p. 948), then the operation will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899). If the `participant_handle` corresponds to a **DomainParticipant** (p. 948) that has not been discovered, then the operation will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).

Use the operation **com.rti.dds.domain.DomainParticipant.get_discovered_participants** (p. 1011) to find the **com.rti.dds.domain.DomainParticipant** (p. 948) entities that are currently discovered.

Note: this method has different functionality when enabling the RTI Security Plugins. Please refer to the `RTI Security Plugins User's Manual` for more information.

MT Safety:

Safe.

Parameters

participant_handle	<<***in***>> *(p. 404)* **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443) of **com.rti.dds.domain.DomainParticipant** (p. 948).

Returns

The **com.rti.dds.infrastructure.EntityNameQosPolicy.name** (p. 1329) for the `participant_handle`

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902)

See also

com.rti.dds.infrastructure.EntityNameQosPolicy.name (p. 1329)

com.rti.dds.domain.DomainParticipant.get_discovered_participants (p. 1011)

8.79.2.73 get_discovered_topics()

```
void get_discovered_topics (
            InstanceHandleSeq topic_handles )
```

Returns list of discovered **com.rti.dds.topic.Topic** (p. 2116) objects.

This operation retrieves the list of **com.rti.dds.topic.Topic** (p. 2116) s that have been discovered in the domain and that the application has not indicated should be "ignored" by means of the **com.rti.dds.domain.DomainParticipant.↩ ignore_topic** (p. 1002) operation.

Parameters

topic_handles	<<***inout***>> *(p. 404)* **com.rti.dds.infrastructure.InstanceHandleSeq** (p. 1447) to be filled with handles of the discovered **com.rti.dds.topic.Topic** (p. 2116) objects

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902)

8.79.2.74 get_discovered_topic_data()

```
void get_discovered_topic_data (
            TopicBuiltinTopicData topic_data,
            InstanceHandle_t topic_handle )
```

Returns builtin.TopicBuiltinTopicData for the specified **com.rti.dds.topic.Topic** (p. 2116).

This operation retrieves information on a **com.rti.dds.topic.Topic** (p. 2116) that has been discovered by the local Participant and must not have been "ignored" by means of the **com.rti.dds.domain.DomainParticipant.ignore_topic** (p. 1002) operation.

The `topic_handle` must correspond to such a topic. Otherwise, the operation will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).

This call is not supported for remote topics. If a remote `topic_handle` is used, the operation will fail with **com.rti.dds.infrastructure.RETCODE_UNSUPPORTED** (p. 1904).

Use the operation **com.rti.dds.domain.DomainParticipant.get_discovered_topics** (p. 1014) to find the topics that are currently discovered.

Parameters

topic_data	*<<**inout**>> (p. 404)* builtin.TopicBuiltinTopicData to be filled with the specified **com.rti.dds.topic.Topic** (p. 2116)'s data.
topic_handle	*<<**in**>> (p. 404)* **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443) of **com.rti.dds.topic.Topic** (p. 2116).

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902)

See also

builtin.TopicBuiltinTopicData

com.rti.dds.domain.DomainParticipant.get_discovered_topics (p. 1014)

8.79.2.75 contains_entity()

```
boolean contains_entity (
            InstanceHandle_t a_handle )
```

Completes successfully with com.rti.dds.infrastructure.true if the referenced **com.rti.dds.infrastructure.Entity** (p. 1320) is contained by the **com.rti.dds.domain.DomainParticipant** (p. 948).

This operation checks whether or not the given `a_handle` represents an **com.rti.dds.infrastructure.Entity** (p. 1320) that was created from the **com.rti.dds.domain.DomainParticipant** (p. 948). The containment applies recursively. That is, it applies both to entities (**com.rti.dds.topic.TopicDescription** (p. 2129), **com.rti.dds.publication.Publisher** (p. 1767), or **com.rti.dds.subscription.Subscriber** (p. 2039)) created directly using the **com.rti.dds.domain.DomainParticipant** (p. 948) as well as entities created using a contained **com.rti.dds.publication.Publisher** (p. 1767), or **com.rti.dds.subscription.Subscriber** (p. 2039) as the factory, and so forth.

The `instance` handle for an **com.rti.dds.infrastructure.Entity** (p. 1320) may be obtained from built-in topic data, from various statuses, or from the operation **com.rti.dds.infrastructure.Entity.get_instance_handle** (p. 1325).

Parameters

a_handle	<<***in***>> *(p. 404)* **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443) of the **com.rti.dds.infrastructure.Entity** (p. 1320) to be checked.

Returns

com.rti.dds.infrastructure.true if **com.rti.dds.infrastructure.Entity** (p. 1320) is contained by the **com.rti.dds.↩ domain.DomainParticipant** (p. 948), or com.rti.dds.infrastructure.false otherwise.

8.79.2.76 register_durable_subscription()

```
void register_durable_subscription (
              EndpointGroup_t group,
             String topic_name )
```

<<***extension***>> *(p. 403)* Registers a Durable Subscription on the specified **com.rti.dds.topic.Topic** (p. 2116) on all Persistence Services.

If you need to receive all samples published on a **com.rti.dds.topic.Topic** (p. 2116), including the ones published while a **com.rti.dds.subscription.DataReader** (p. 707) is inactive or before it may be created, create a Durable Subscription using this method.

In this way, the Persistence Service will ensure that all the samples on that **com.rti.dds.topic.Topic** (p. 2116) are retained until they are acknowledged by at least *N* DataReaders belonging to the Durable Subscription where *N* is the quorum count.

If the same Durable Subscription is created on a different **com.rti.dds.topic.Topic** (p. 2116), the Persistence Service will implicitly delete the previous Durable Subscription and create a new one on the new **com.rti.dds.topic.Topic** (p. 2116).

Parameters

group	<<***in***>> *(p. 404)* **com.rti.dds.infrastructure.EndpointGroup_t** (p. 1313) The Durable Subscription name and quorum.
topic_name	<<***in***>> *(p. 404)* The topic name for which the Durable Subscription is created.

Exceptions

One	of the **Standard Return Codes** (p. 513)

8.79.2.77 delete_durable_subscription()

```
void delete_durable_subscription (
```

```
            EndpointGroup_t group )
```

<<***extension***>> *(*p. *403)* Deletes an existing Durable Subscription on all Persistence Services.

The Persistence Service will delete the Durable Subscription and the quorum of the existing samples will be considered satisfied.

Parameters

group	<<***in***>> *(*p. *404)* **com.rti.dds.infrastructure.EndpointGroup_t** (p. 1313) specifying the Durable Subscription name. Quorum is not required for this operation.

Exceptions

One	of the **Standard Return Codes** (p. 513)

8.79.2.78 resume_endpoint_discovery()

```
void resume_endpoint_discovery (
            InstanceHandle_t remote_participant_handle )
```

<<***extension***>> *(*p. *403)* Initiates endpoint discovery with the specified remote **com.rti.dds.domain.Domain↩ Participant** (p. 948).

If the operation returns com.rti.dds.infrastructure.RETCODE_OK, the **com.rti.dds.domain.DomainParticipant** (p. 948) will initiate endpoint discovery with the remote **com.rti.dds.domain.DomainParticipant** (p. 948) provided as a parameter.

When **com.rti.dds.infrastructure.DiscoveryQosPolicy.enable_endpoint_discovery** (p. 946) is set to com.rti.dds.↩ infrastructure.false, this operation allows the RTI Connext application to select for which remote DomainParticipants endpoint discovery is performed. By disabling endpoint discovery, the **DomainParticipant** (p. 948) will not store any state about remote endpoints and will not send local endpoint information to remote DomainParticipants.

If **com.rti.dds.infrastructure.DiscoveryQosPolicy.enable_endpoint_discovery** (p. 946) is set to com.rti.dds.↩ infrastructure.true, endpoint discovery will automatically occur for every discovered **com.rti.dds.domain.Domain↩ Participant** (p. 948). In this case, invoking this operation will have no effect and will return com.rti.dds.infrastructure.↩ RETCODE_OK.

When **com.rti.dds.infrastructure.DiscoveryQosPolicy.enable_endpoint_discovery** (p. 946) is set to com.rti.↩ dds.infrastructure.false, you have two options after a remote **com.rti.dds.domain.DomainParticipant** (p. 948) is discovered:

- Call this operation to enable endpoint discovery. After invoking this operation, the **com.rti.dds.domain.Domain↩ Participant** (p. 948) will start to exchange endpoint information so that matching and communication can occur with the remote **com.rti.dds.domain.DomainParticipant** (p. 948).
- Call the **com.rti.dds.domain.DomainParticipant.ignore_participant** (p. 1001) operation to permanently ignore endpoint discovery with the remote **com.rti.dds.domain.DomainParticipant** (p. 948).

Setting **com.rti.dds.infrastructure.DiscoveryQosPolicy.enable_endpoint_discovery** (p. 946) to com.rti.dds.↩ infrastructure.false enables application-level authentication use cases, in which a **com.rti.dds.domain.Domain**↩ **Participant** (p. 948) will initiate endpoint discovery with a remote **com.rti.dds.domain.DomainParticipant** (p. 948) after successful authentication at the application level.

The `remote_participant_handle` paremeter is the one that appears in the **com.rti.dds.subscription.**↩ **SampleInfo** (p. 1944) retrieved when reading the data samples available for the built-in **builtin.ParticipantBuiltin**↩ **TopicDataDataReader** (p. 1653).

If the specified remote **com.rti.dds.domain.DomainParticipant** (p. 948) is not in the database of discovered Domain↩ Participants or has been previously ignored, this operation will fail with **com.rti.dds.infrastructure.RETCODE_ERROR** (p. 1900).

This operation can be called multiple times on the same remote participant. If endpoint discovery has already been resumed, successive calls will have no effect and will return com.rti.dds.infrastructure.RETCODE_OK.

Parameters

remote_participant_handle	<<***in***>> *(*p. *404)* Handle of a discovered **com.rti.dds.domain.DomainParticipant** (p. 948) for which endpoint discovery is to be resumed. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513),or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902)

See also

com.rti.dds.infrastructure.DiscoveryQosPolicy (p. 943)

8.79.2.79 register_contentfilter()

```
void register_contentfilter (
             String filter_name,
              ContentFilter contentfilter )
```

<<***extension***>> *(*p. *403)* Register a content filter which can be used to create a **com.rti.dds.topic.ContentFiltered**↩ **Topic** (p. 692).

DDS specifies a SQL-like content filter for use by content filtered topics. If this filter does not meet your filtering requirements, you can register a custom filter.

To use a custom filter, it must be registered in the following places:

- In any application that uses the custom filter to create a **com.rti.dds.topic.ContentFilteredTopic** (p. 692) and the corresponding **com.rti.dds.subscription.DataReader** (p. 707).
- In each application that writes the data to the applications mentioned above.

For example, suppose Application A on the subscription side creates a Topic named X and a ContentFilteredTopic named filteredX (and a corresponding DataReader), using a previously registered content filter, myFilter. With only that, you will have filtering at the subscription side. If you also want to perform filtering in any application that publishes Topic X, then you also need to register the same definition of the ContentFilter myFilter in that application.

Each `filter_name` can only be used to registered a content filter once with a **com.rti.dds.domain.Domain↩ Participant** (p. 948).

Parameters

filter_name	*<<**in**>> (p. 404)* Name of the filter. The name must be unique within the **com.rti.dds.domain.DomainParticipant** (p. 948) and must not exceed 255 characters. Cannot be NULL.
contentfilter	*<<**in**>> (p. 404)* Content filter to be registered. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

com.rti.dds.domain.DomainParticipant.unregister_contentfilter (p. 1019)

8.79.2.80 lookup_contentfilter()

```
ContentFilter lookup_contentfilter (
            String filter_name )
```

*<<**extension**>> (p. 403)* Lookup a content filter previously registered with **com.rti.dds.domain.Domain↩ Participant.register_contentfilter** (p. 1018).

Parameters

filter_name	*<<**in**>> (p. 404)* Name of the filter. Cannot be NULL.

Returns

NULL if the given filter_name has not been previously registered to the **com.rti.dds.domain.DomainParticipant** (p. 948) with **com.rti.dds.domain.DomainParticipant.register_contentfilter** (p. 1018). Otherwise, return the **com.rti.dds.topic.ContentFilter** (p. 689) that has been previosuly registered with the given filter_name.

See also

com.rti.dds.domain.DomainParticipant.register_contentfilter (p. 1018)

8.79.2.81 unregister_contentfilter()

```
void unregister_contentfilter (
            String filter_name )
```

<<***extension***>> *(p. 403)* Unregister a content filter previously registered with **com.rti.dds.domain.Domain↩ Participant.register_contentfilter** (p. 1018).

A `filter_name` can be unregistered only if it has been previously registered to the **com.rti.dds.domain.Domain↩ Participant** (p. 948) with **com.rti.dds.domain.DomainParticipant.register_contentfilter** (p. 1018).

The unregistration of filter is not allowed if there are any existing **com.rti.dds.topic.ContentFilteredTopic** (p. 692) objects that are using the filter. If the operation is called on a filter with existing **com.rti.dds.topic.ContentFilteredTopic** (p. 692) objects attached to it, this operation will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_↩ NOT_MET** (p. 1903).

If there are still existing discovered **com.rti.dds.subscription.DataReader** (p. 707) s with the same `filter_name` and the filter's compile method of the filter have previously been called on the discovered **com.rti.dds.subscription.↩ DataReader** (p. 707) s, finalize method of the filter will be called on those discovered **com.rti.dds.subscription.Data↩ Reader** (p. 707) s before the content filter is unregistered. This means filtering will now be performed on the application that is creating the **com.rti.dds.subscription.DataReader** (p. 707).

Parameters

filter_name	<<***in***>> *(p. 404)* Name of the filter. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903)

See also

com.rti.dds.domain.DomainParticipant.register_contentfilter (p. 1018)

8.79.2.82 get_typecode()

```
TypeCode get_typecode (
            String type_name )
```

<<***extension***>> *(p. 403)* Retrieves the **com.rti.dds.typecode.TypeCode** (p. 2183) of a type registered with the **com.rti.dds.domain.DomainParticipant** (p. 948) based on the registration name.

Every data type used in a **com.rti.dds.domain.DomainParticipant** (p. 948) has a registered type name which is the name specified at the time the type is registered with the **com.rti.dds.domain.DomainParticipant** (p. 948).

This operation retrieves the **com.rti.dds.typecode.TypeCode** (p. 2183) for the type given the registared type name. The `type_name` argument must correspond to a name used to register a type with the **com.rti.dds.domain.Domain**↩ **Participant** (p. 948). Otherwise, this method will return NULL.

Type registration in a **com.rti.dds.domain.DomainParticipant** (p. 948) is performed by a call to the **com.rti.ndds.**↩ **example.FooTypeSupport.register_type** (p. 1411) operation on a derived class of the **com.rti.dds.topic.Type**↩ **Support** (p. 2252) interface.

Type registration might occur directly via an application call to the **com.rti.ndds.example.FooTypeSupport.register**↩ **_type** (p. 1411) operation, or indirectly by the RTI Connext infrastructure as a result of parsing an XML configuration file that refers to that type.

If a type is registered by the RTI Connext infrastructure as a result of parsing an XML configuration file, the **com.**↩ **rti.dds.topic.TypeSupport** (p. 2252) can be created either from a type description found in the XML files, or else by calling the **com.rti.ndds.example.FooTypeSupport.register_type** (p. 1411) operation on a **com.rti.dds.topic.Type**↩ **Support** (p. 2252) that has been registered with **com.rti.dds.domain.DomainParticipantFactory** (p. 1039). If a **com.**↩ **rti.dds.topic.TypeSupport** (p. 2252) is registered with the **com.rti.dds.domain.DomainParticipantFactory** (p. 1039) this mechanism takes precedence over the creation of a **com.rti.dds.topic.TypeSupport** (p. 2252) from a type decription in the XML file.

To register a **com.rti.dds.topic.TypeSupport** (p. 2252) with the **com.rti.dds.domain.DomainParticipantFactory** (p. 1039) use the operation **com.rti.dds.domain.DomainParticipantFactory.register_type_support** (p. 1064).

If the **com.rti.dds.topic.TypeSupport** (p. 2252) is created from a type description found in the XML files, the resulting type support will be a **com.rti.dds.dynamicdata.DynamicDataTypeSupport** (p. 1286). In this case the **com.rti.dds.**↩ **publication.DataWriter** (p. 818) and **com.rti.dds.subscription.DataReader** (p. 707) uses to write and read data of that type will be the **com.rti.dds.dynamicdata.DynamicDataWriter** (p. 1294) and **com.rti.dds.dynamicdata.Dynamic**↩ **DataReader** (p. 1249), respectively.

Parameters

type_name	<<***in***>> *(p. 404)* Name of the type whose TypeCode is retrieved.

Returns

The TypeCode of a registered type with the **com.rti.dds.domain.DomainParticipant** (p. 948) or NULL if no type was registered with the participant under that name.

8.79.2.83 get_participant_protocol_status()

```
void get_participant_protocol_status (
            DomainParticipantProtocolStatus status )
```

<<***extension***>> *(p. 403)* Get the domain participant protocol status for this participant.

This also resets the status so that it is no longer considered changed.

Parameters

status	<<***inout***>> *(p. 404)* **com.rti.dds.domain.DomainParticipantProtocolStatus** (p. 1072) to be filled in. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

8.79.2.84 get_implicit_publisher()

```
Publisher get_implicit_publisher ( )
```

<<***extension***>> *(p. 403)* Returns the implicit **com.rti.dds.publication.Publisher** (p. 1767). If an implicit Publisher does not already exist, this creates one.

There can only be one implicit Publisher per **DomainParticipant** (p. 948).

The implicit Publisher is created with **com.rti.dds.domain.DomainParticipant.PUBLISHER_QOS_DEFAULT** (p. 48) and no Listener.

This implicit Publisher will be deleted automatically when the following methods are called: **com.rti.dds.domain.DomainParticipant.delete_contained_entities** (p. 1006), or **com.rti.dds.domain.DomainParticipant.delete_publisher** (p. 974) with the implicit publisher as a parameter. Additionally, when a **DomainParticipant** (p. 948) is deleted, if there are no attached DataWriters that belong to the implicit Publisher, the implicit Publisher will be implicitly deleted.

Returns

The implicit publisher

See also

com.rti.dds.domain.DomainParticipant.PUBLISHER_QOS_DEFAULT (p. 48)

com.rti.dds.domain.DomainParticipant.create_publisher (p. 971)

8.79.2.85 get_implicit_subscriber()

```
Subscriber get_implicit_subscriber ( )
```

<<***extension***>> *(p. 403)* Returns the implicit **com.rti.dds.subscription.Subscriber** (p. 2039). If an implicit Subscriber does not already exist, this creates one.

There can only be one implicit Subscriber per **DomainParticipant** (p. 948).

The implicit Subscriber is created with **com.rti.dds.domain.DomainParticipant.SUBSCRIBER_QOS_DEFAULT** (p. 49) and no Listener.

This implicit Subscriber will be deleted automatically when the following methods are called: **com.rti.dds.domain.DomainParticipant.delete_contained_entities** (p. 1006), or **com.rti.dds.domain.DomainParticipant.delete_subscriber** (p. 977) with the subscriber as a parameter. Additionally, when a **DomainParticipant** (p. 948) is deleted, if there are no attached DataReaders that belong to the implicit Subscriber, the implicit Subscriber will be implicitly deleted.

MT Safety:

UNSAFE. it is not safe to create the implicit subscriber while another thread may be simultaneously calling **com.rti.dds.domain.DomainParticipant.set_default_subscriber_qos** (p. 965).

Returns

The implicit subscriber

com.rti.dds.domain.DomainParticipant.SUBSCRIBER_QOS_DEFAULT (p. 49)

com.rti.dds.domain.DomainParticipant.create_subscriber (p. 975)

8.79.2.86 lookup_publisher_by_name()

```
abstract  Publisher lookup_publisher_by_name (
             String publisher_name )  [abstract]
```

<<***extension***>> *(p. 403)* Looks up a **com.rti.dds.publication.Publisher** (p. 1767) by its entity name within this **com.rti.dds.domain.DomainParticipant** (p. 948).

Every **com.rti.dds.publication.Publisher** (p. 1767) in the system has an entity name which is configured and stored in the EntityName policy, **ENTITY_NAME** (p. 485).

This operation retrieves a **com.rti.dds.publication.Publisher** (p. 1767) within the **com.rti.dds.domain.DomainParticipant** (p. 948) given the entity's name. If there are several **com.rti.dds.publication.Publisher** (p. 1767) with the same name within the **com.rti.dds.domain.DomainParticipant** (p. 948), this function returns the first matching occurrence.

Parameters

publisher_name	<<***in***>> *(*p. *404)* Entity name of the **com.rti.dds.publication.Publisher** (p. 1767).

Returns

The first **com.rti.dds.publication.Publisher** (p. 1767) found with the specified name or NULL if it is not found.

See also

com.rti.dds.domain.DomainParticipant.lookup_datawriter_by_name (p. 1024)

8.79.2.87 lookup_subscriber_by_name()

```
abstract  Subscriber lookup_subscriber_by_name (
              String subscriber_name )  [abstract]
```

<<***extension***>> *(*p. *403)* Retrieves a **com.rti.dds.subscription.Subscriber** (p. 2039) by its entity name within this **com.rti.dds.domain.DomainParticipant** (p. 948).

Every **com.rti.dds.subscription.Subscriber** (p. 2039) in the system has an entity name which is configured and stored in the EntityName policy, **ENTITY_NAME** (p. 485).

This operation retrieves a **com.rti.dds.subscription.Subscriber** (p. 2039) within the **com.rti.dds.domain.Domain↩ Participant** (p. 948) given the entity's name. If there are several **com.rti.dds.subscription.Subscriber** (p. 2039) with the same name within the **com.rti.dds.domain.DomainParticipant** (p. 948), this function returns the first matching occurrence.

Parameters

subscriber_name	<<***in***>> *(*p. *404)* Entity name of the **com.rti.dds.subscription.Subscriber** (p. 2039).

Returns

The first **com.rti.dds.subscription.Subscriber** (p. 2039) found with the specified name or NULL if it is not found.

See also

com.rti.dds.domain.DomainParticipant.lookup_datareader_by_name (p. 1025)

8.79.2.88 lookup_datawriter_by_name()

```
abstract  DataWriter lookup_datawriter_by_name (
            String datawriter_full_name )  [abstract]
```

<<***extension***>> *(p. 403)* Looks up a **com.rti.dds.publication.DataWriter** (p. 818) by its entity name within this **com.rti.dds.domain.DomainParticipant** (p. 948).

Every **com.rti.dds.publication.DataWriter** (p. 818) in the system has an entity name which is configured and stored in the EntityName policy, **ENTITY_NAME** (p. 485).

Every **com.rti.dds.publication.Publisher** (p. 1767) in the system has an entity name which is also configured and stored in the EntityName policy.

This operation retrieves a **com.rti.dds.publication.DataWriter** (p. 818) within a **com.rti.dds.publication.Publisher** (p. 1767) given the specified name which encodes both to the **com.rti.dds.publication.DataWriter** (p. 818) and the **com.rti.dds.publication.Publisher** (p. 1767) name.

If there are several **com.rti.dds.publication.DataWriter** (p. 818) with the same name within the corresponding **com.↩ rti.dds.publication.Publisher** (p. 1767) this function returns the first matching occurrence.

The specified name might be given as a fully-qualified entity name or as a plain name.

The fully qualified entity name is a concatenation of the **com.rti.dds.publication.Publisher** (p. 1767) to which the **com.rti.dds.publication.DataWriter** (p. 818) belongs and the entity name of of the **com.rti.dds.publication.Data↩ Writer** (p. 818) itself, separated by a double colon "::". For example: MyPublisherName::MyDataWriterName

The plain name contains the **com.rti.dds.publication.DataWriter** (p. 818) name only. In this situation it is implied that the **com.rti.dds.publication.DataWriter** (p. 818) belongs to the implicit **com.rti.dds.publication.Publisher** (p. 1767) so the use of a plain name is equivalent to specifying a fully qualified name with the **com.rti.dds.publication.Publisher** (p. 1767) name part being "implicit". For example: the plain name "MyDataWriterName" is equivalent to specifiying the fully qualified name "implicit::MyDataWriterName"

The **com.rti.dds.publication.DataWriter** (p. 818) is only looked up within the **com.rti.dds.publication.Publisher** (p. 1767) specified in the fully qualified name, or within the implicit **com.rti.dds.publication.Publisher** (p. 1767) if the name was not fully qualified.

Parameters

datawriter_full_name	<<***in***>> *(p. 404)* Entity name or fully-qualified entity name of the **com.rti.dds.publication.DataWriter** (p. 818).

Returns

The first **com.rti.dds.publication.DataWriter** (p. 818) found with the specified name or NULL if it is not found.

See also

com.rti.dds.publication.Publisher.lookup_datawriter_by_name (p. 1788)

com.rti.dds.domain.DomainParticipant.lookup_publisher_by_name (p. 1023)

8.79.2.89 lookup_datareader_by_name()

```
abstract  DataReader lookup_datareader_by_name (
            String datareader_full_name )  [abstract]
```

<<***extension***>> *(p. 403)* Retrieves up a **com.rti.dds.subscription.DataReader** (p. 707) by its entity name in this **com.rti.dds.domain.DomainParticipant** (p. 948).

Every **com.rti.dds.subscription.DataReader** (p. 707) in the system has an entity name which is configured and stored in the EntityName policy, **ENTITY_NAME** (p. 485).

Every **com.rti.dds.subscription.Subscriber** (p. 2039) in the system has an entity name which is also configured and stored in the EntityName policy, **ENTITY_NAME** (p. 485).

This operation retrieves a **com.rti.dds.subscription.DataReader** (p. 707) within a **com.rti.dds.subscription.↩ Subscriber** (p. 2039) given the specified name which encodes both to the **com.rti.dds.subscription.DataReader** (p. 707) and the **com.rti.dds.subscription.Subscriber** (p. 2039) name.

If there are several **com.rti.dds.subscription.DataReader** (p. 707) with the same name within the corresponding **com.rti.dds.subscription.Subscriber** (p. 2039) this function returns the first matching occurrence.

The specified name might be given as a fully-qualified entity name or as a plain name.

The fully qualified entity name is a concatenation of the **com.rti.dds.subscription.Subscriber** (p. 2039) to which the **com.rti.dds.subscription.DataReader** (p. 707) belongs and the entity name of of the **com.rti.dds.subscription.↩ DataReader** (p. 707) itself, separated by a double colon "::". For example: MySubscriberName::MyDataReaderName

The plain name contains the **com.rti.dds.subscription.DataReader** (p. 707) name only. In this situation it is implied that the **com.rti.dds.subscription.DataReader** (p. 707) belongs to the implicit **com.rti.dds.subscription.Subscriber** (p. 2039) so the use of a plain name is equivalent to specifying a fully qualified name with the **com.rti.dds.↩ subscription.Subscriber** (p. 2039) name part being "implicit". For example: the plain name "MyDataReaderName" is equivalent to specifiying the fully qualified name "implicit::MyDataReaderName"

The **com.rti.dds.subscription.DataReader** (p. 707) is only looked up within the **com.rti.dds.subscription.Subscriber** (p. 2039) specified in the fully qualified name, or within the implicit **com.rti.dds.subscription.Subscriber** (p. 2039) if the name was not fully qualified.

Parameters

datareader_full_name	<<***in***>> *(p. 404)* Full entity name of the **com.rti.dds.subscription.DataReader** (p. 707).

Returns

The first **com.rti.dds.subscription.DataReader** (p. 707) found with the specified name or NULL if it is not found.

8.79.2.90 take_discovery_snapshot() [1/2]

```
void take_discovery_snapshot ( )
```

Take a snapshot of the remote participants discovered by a local one.

The snapshot will be printed through the **com.rti.ndds.config.Logger** (p. 1560). A possible output may be the following:

```
Remote participants that match the local participant domain=0

name="participantTestName" role="participantTestRole" id="1"

guid_prefix="0x0101D8D1,0x20B83C0D,0x4495246E"

------------------------------------------------------------------------

1. 0x0101542A,0x2C59B595,0xA1693BDF name="participantTestName"

role="participantTestRole"

unicastLocators="udpv4://192.168.1.170:7411"

------------------------------------------------------------------------
```

Exceptions

One	of the **Standard Return Codes** (p. 513).

8.79.2.91 take_discovery_snapshot() [2/2]

```
void take_discovery_snapshot (
             String file_name )
```

Take a snapshot of the remote participants discovered by a local one.

The snapshot will be printed in the file specified by file_name. A possible output may be the following:

```
Remote participants that match the local participant domain=0

name="participantTestName" role="participantTestRole" id="1"

guid_prefix="0x0101D8D1,0x20B83C0D,0x4495246E"

------------------------------------------------------------------------

1. 0x0101542A,0x2C59B595,0xA1693BDF name="participantTestName"

role="participantTestRole"

unicastLocators="udpv4://192.168.1.170:7411"

------------------------------------------------------------------------
```

Parameters

file_name	<<***in***>> *(p. 404)* Name of the file where snapshot should be printed.

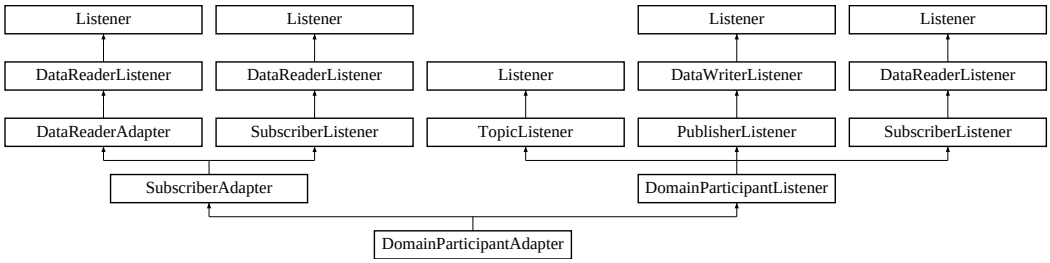
Exceptions

One	of the **Standard Return Codes** (p. 513).

8.80 DomainParticipantAdapter Class Reference

<<***extension***>> *(p. 403)* A listener adapter in the spirit of the Java AWT listener adapters. (The Adapter provides empty implementations for the listener methods)

Inheritance diagram for DomainParticipantAdapter:



Public Member Functions

- void **on_invalid_local_status_advance_notice** (**DomainParticipant** participant, InvalidLocalAdvanceNotice↩ Status invalidLocalAdvanceNoticeStatus)

  *Notifies the user that one of the local **com.rti.dds.domain.DomainParticipant** (p. 948) trusted artifacts (identity or permissions) is about to expire.*
- void **on_inconsistent_topic** (**Topic** topic, **InconsistentTopicStatus** status)

  Handle the com.rti.dds.infrastructure.StatusKind.StatusKind.INCONSISTENT_TOPIC_STATUS status.
- void **on_offered_deadline_missed** (**DataWriter** writer, **OfferedDeadlineMissedStatus** status)

  Handles the com.rti.dds.infrastructure.StatusKind.StatusKind.OFFERED_DEADLINE_MISSED_STATUS status.
- void **on_offered_incompatible_qos** (**DataWriter** writer, **OfferedIncompatibleQosStatus** status)

  Handles the com.rti.dds.infrastructure.StatusKind.StatusKind.OFFERED_INCOMPATIBLE_QOS_STATUS status.
- void **on_liveliness_lost** (**DataWriter** writer, **LivelinessLostStatus** status)

  Handles the com.rti.dds.infrastructure.StatusKind.StatusKind.LIVELINESS_LOST_STATUS status.
- void **on_publication_matched** (**DataWriter** writer, **PublicationMatchedStatus** status)

  Handles the com.rti.dds.infrastructure.StatusKind.StatusKind.PUBLICATION_MATCHED_STATUS status.
- void **on_reliable_reader_activity_changed** (**DataWriter** writer, **ReliableReaderActivityChangedStatus** status)

  <<***extension***>> *(p. 403) A matched reliable reader has become active or become inactive.*
- void **on_reliable_writer_cache_changed** (**DataWriter** writer, **ReliableWriterCacheChangedStatus** status)

  <<***extension***>> *(p. 403) A change has occurred in the writer's cache of unacknowledged samples.*
- void **on_sample_removed** (**DataWriter** writer, **Cookie_t** cookie)

  <<***extension***>> *(p. 403) Called when a sample is removed from the DataWriter queue.*
- void **on_instance_replaced** (**DataWriter** writer, **InstanceHandle_t** handle)

  <<***extension***>> *(p. 403) Notifies when an instance is replaced in DataWriter queue.*

- void **on_application_acknowledgment** (**DataWriter** writer, **AcknowledgmentInfo** ackInfo)

  *<<**extension**>> (p. 403) Called when a sample is application-acknowledged*
- void **on_service_request_accepted** (**DataWriter** writer, **ServiceRequestAcceptedStatus** status)

  *<<**extension**>> (p. 403) Called when a **com.rti.dds.topic.builtin.ServiceRequest** (p. 1985) for the **com.rti.dds.subscription.TopicQuery** (p. 2139) service is dispatched to this **com.rti.dds.publication.DataWriter** (p. 818) for processing.*

8.80.1 Detailed Description

*<<**extension**>> (p. 403)* A listener adapter in the spirit of the Java AWT listener adapters. (The Adapter provides empty implementations for the listener methods)

Clients who do not wish to implement all listener methods can subclass this class and override only the methods of interest.

8.80.2 Member Function Documentation

8.80.2.1 on_invalid_local_status_advance_notice()

```
void on_invalid_local_status_advance_notice (
              DomainParticipant participant,
             InvalidLocalAdvanceNoticeStatus invalidLocalAdvanceNoticeStatus )
```

Notifies the user that one of the local **com.rti.dds.domain.DomainParticipant** (p. 948) trusted artifacts (identity or permissions) is about to expire.

Implements **DomainParticipantListener** (p. 1071).

8.80.2.2 on_inconsistent_topic()

```
void on_inconsistent_topic (
              Topic topic,
              InconsistentTopicStatus status )
```

Handle the com.rti.dds.infrastructure.StatusKind.StatusKind.INCONSISTENT_TOPIC_STATUS status.

This callback is called when a remote **com.rti.dds.topic.Topic** (p. 2116) is discovered but is inconsistent with the locally created **com.rti.dds.topic.Topic** (p. 2116) of the same topic name.

Parameters

topic	*<<**out**>> (p. 404)* Locally created **com.rti.dds.topic.Topic** (p. 2116) that triggers the listener callback
status	*<<**out**>> (p. 404)* Current inconsistent status of locally created **com.rti.dds.topic.Topic** (p. 2116)

Implements **TopicListener** (p. 2132).

8.80.2.3 on_offered_deadline_missed()

```
void on_offered_deadline_missed (
              DataWriter writer,
              OfferedDeadlineMissedStatus status )
```

Handles the com.rti.dds.infrastructure.StatusKind.StatusKind.OFFERED_DEADLINE_MISSED_STATUS status.

This callback is called when the deadline that the **com.rti.dds.publication.DataWriter** (p. 818) has committed through its **DEADLINE** (p. 467) qos policy was not respected for a specific instance. This callback is called for each deadline period elapsed during which the **com.rti.dds.publication.DataWriter** (p. 818) failed to provide data for an instance.

Parameters

writer	<<***out***>> *(p. 404)* Locally created **com.rti.dds.publication.DataWriter** (p. 818) that triggers the listener callback
status	<<***out***>> *(p. 404)* Current deadline missed status of locally created **com.rti.dds.publication.DataWriter** (p. 818)

Implements **DataWriterListener** (p. 855).

8.80.2.4 on_offered_incompatible_qos()

```
void on_offered_incompatible_qos (
              DataWriter writer,
              OfferedIncompatibleQosStatus status )
```

Handles the com.rti.dds.infrastructure.StatusKind.StatusKind.OFFERED_INCOMPATIBLE_QOS_STATUS status.

This callback is called when the **com.rti.dds.publication.DataWriterQos** (p. 878) of the **com.rti.dds.publication.↩ DataWriter** (p. 818) was incompatible with what was requested by a **com.rti.dds.subscription.DataReader** (p. 707). This callback is called when a **com.rti.dds.publication.DataWriter** (p. 818) has discovered a **com.rti.dds.↩ subscription.DataReader** (p. 707) for the same **com.rti.dds.topic.Topic** (p. 2116) and common partition, but with a requested QoS that is incompatible with that offered by the **com.rti.dds.publication.DataWriter** (p. 818).

Parameters

writer	<<***out***>> *(p. 404)* Locally created **com.rti.dds.publication.DataWriter** (p. 818) that triggers the listener callback
status	<<***out***>> *(p. 404)* Current incompatible qos status of locally created **com.rti.dds.publication.DataWriter** (p. 818)

Implements **DataWriterListener** (p. 855).

8.80.2.5 on_liveliness_lost()

```
void on_liveliness_lost (
            DataWriter writer,
            LivelinessLostStatus status )
```

Handles the com.rti.dds.infrastructure.StatusKind.StatusKind.LIVELINESS_LOST_STATUS status.

This callback is called when the liveliness that the **com.rti.dds.publication.DataWriter** (p. 818) has committed through its **LIVELINESS** (p. 489) qos policy was not respected; this **com.rti.dds.subscription.DataReader** (p. 707) entities will consider the **com.rti.dds.publication.DataWriter** (p. 818) as no longer "alive/active". This callback will not be called when an already not alive **com.rti.dds.publication.DataWriter** (p. 818) simply remains not alive for another liveliness period.

Parameters

writer	<<***out***>> *(p. 404)* Locally created **com.rti.dds.publication.DataWriter** (p. 818) that triggers the listener callback
status	<<***out***>> *(p. 404)* Current liveliness lost status of locally created **com.rti.dds.publication.DataWriter** (p. 818)

Implements **DataWriterListener** (p. 856).

8.80.2.6 on_publication_matched()

```
void on_publication_matched (
            DataWriter writer,
            PublicationMatchedStatus status )
```

Handles the com.rti.dds.infrastructure.StatusKind.StatusKind.PUBLICATION_MATCHED_STATUS status.

This callback is called when the **com.rti.dds.publication.DataWriter** (p. 818) has found a **com.rti.dds.subscription.↩ DataReader** (p. 707) that matches the **com.rti.dds.topic.Topic** (p. 2116), has a common partition and compatible QoS, or has ceased to be matched with a **com.rti.dds.subscription.DataReader** (p. 707) that was previously considered to be matched.

Parameters

writer	<<***out***>> *(p. 404)* Locally created **com.rti.dds.publication.DataWriter** (p. 818) that triggers the listener callback
status	<<***out***>> *(p. 404)* Current publication match status of locally created **com.rti.dds.publication.DataWriter** (p. 818)

Implements **DataWriterListener** (p. 856).

8.80.2.7 on_reliable_reader_activity_changed()

```
void on_reliable_reader_activity_changed (
            DataWriter writer,
            ReliableReaderActivityChangedStatus status )
```

<<***extension***>> *(p. 403)* A matched reliable reader has become active or become inactive.

Parameters

writer	<<***out***>> *(p. 404)* Locally created **com.rti.dds.publication.DataWriter** (p. 818) that triggers the listener callback
status	<<***out***>> *(p. 404)* Current reliable reader activity changed status of locally created **com.rti.dds.publication.DataWriter** (p. 818)

Implements **DataWriterListener** (p. 857).

8.80.2.8 on_reliable_writer_cache_changed()

```
void on_reliable_writer_cache_changed (
            DataWriter writer,
            ReliableWriterCacheChangedStatus status )
```

<<***extension***>> *(p. 403)* A change has occurred in the writer's cache of unacknowledged samples.

This listener callback is triggered when:

- The cache is empty (contains no unacknowledged samples).
- The cache is full (the number of unacknowledged samples has reached the value specified in **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_samples** (p. 1896)).
- The number of unacknowledged samples has reached **com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t.high_watermark** (p. 1913) or **com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t.low_watermark** (p. 1913).

Parameters

writer	<<***out***>> *(p. 404)* Locally created **com.rti.dds.publication.DataWriter** (p. 818) that triggers the listener callback
status	<<***out***>> *(p. 404)* Current reliable writer cache changed status of locally created **com.rti.dds.publication.DataWriter** (p. 818)

Implements **DataWriterListener** (p. 857).

8.80.2.9 on_sample_removed()

```
void on_sample_removed (
            DataWriter writer,
            Cookie_t cookie )
```

<<***extension***>> *(p. 403)* Called when a sample is removed from the DataWriter queue.

This callback is called only if the sample was written with a **com.rti.dds.infrastructure.Cookie_t** (p. 699) with **com.rti.ndds.example.FooDataWriter.write_w_params** (p. 1402), or if this writer uses **Zero Copy** (p. 58) transfer over shared memory" or **FlatData Topic-Types** (p. 57) "FlatData language binding".

Parameters

writer	<<***out***>> *(p. 404)* Locally created **com.rti.dds.publication.DataWriter** (p. 818) that triggers the listener callback
cookie	<<***out***>> *(p. 404)* • If this sample was written with **com.rti.ndds.example.FooDataWriter.write_w_params** (p. 1402), this field contains a copy of the cookie set in **com.rti.dds.infrastructure.WriteParams_t** (p. 2308). • If this writer uses **Zero Copy transfer over shared memory** (p. 58) or **FlatData language binding** (p. 57), this field contains the absolute address of the sample that is removed. The address of the sample can be obtained by using com.rti.dds.infrastructure.Cookie_t.to_pointer

See also

com.rti.ndds.example.FooDataWriter.get_loan

Implements **DataWriterListener** (p. 858).

8.80.2.10 on_instance_replaced()

```
void on_instance_replaced (
            DataWriter writer,
            InstanceHandle_t handle )
```

<<***extension***>> *(p. 403)* Notifies when an instance is replaced in DataWriter queue.

This callback is called when an instance is replaced by the **com.rti.dds.publication.DataWriter** (p. 818) due to instance resource limits being reached. This callback returns to the user the handle of the replaced instance, which can be used to get the key of the replaced instance using the **com.rti.ndds.example.FooDataWriter.get_key_value** (p. 1406) API.

Because this callback can be called within the context of an in-progress write, dispose, or unregister call, most APIs on the DataWriter must not be used. The only DataWriter APIs that are safe to call within this callback are:

- **com.rti.ndds.example.FooDataWriter.get_key_value** (p. 1406)
- com.rti.ndds.example.FooDataWriter.create_data
- com.rti.ndds.example.FooDataWriter.delete_data
- **com.rti.dds.publication.DataWriter.get_matched_subscriptions** (p. 830)
- **com.rti.dds.publication.DataWriter.is_matched_subscription_active** (p. 831)
- **com.rti.dds.publication.DataWriter.get_matched_subscription_participant_data** (p. 833)
- **com.rti.dds.publication.DataWriter.get_topic** (p. 834)
- **com.rti.dds.publication.DataWriter.get_publisher** (p. 834)
- **com.rti.dds.publication.DataWriter.is_sample_app_acknowledged** (p. 835)

Parameters

writer	<<***out***>> *(*p. *404)* Locally created **com.rti.dds.publication.DataWriter** (p. 818) that triggers the listener callback
handle	<<***out***>> *(*p. *404)* Handle of the replaced instance

Implements **DataWriterListener** (p. 858).

8.80.2.11 on_application_acknowledgment()

```
void on_application_acknowledgment (
              DataWriter writer,
              AcknowledgmentInfo info )
```

<<***extension***>> *(*p. *403)* Called when a sample is application-acknowledged

Applicable only when **com.rti.dds.infrastructure.ReliabilityQosPolicy.acknowledgment_kind** (p. 1832) = **com.rti.dds.infrastructure.ReliabilityQosPolicyAcknowledgmentModeKind.APPLICATION_AUTO_ACKNOWLEDGMENT_MODE** (p. 1834) or **com.rti.dds.infrastructure.ReliabilityQosPolicyAcknowledgmentModeKind.APPLICATION_EXPLICIT_ACKNOWLEDGMENT_MODE** (p. 1835)

Called when a sample is application-level acknowledged. Provides identities of the sample and the acknowledging **com.rti.dds.subscription.DataReader** (p. 707). Also provides user-specified response data sent from the **com.rti.dds.subscription.DataReader** (p. 707) by the acknowledgment message.

Parameters

writer	<<***out***>> *(*p. *404)* Locally created **com.rti.dds.publication.DataWriter** (p. 818) that triggers the listener callback
info	<<***out***>> *(*p. *404)* **com.rti.dds.publication.AcknowledgmentInfo** (p. 584) of the acknowledged sample

Implements **DataWriterListener** (p. 859).

8.80.2.12 on_service_request_accepted()

```
void on_service_request_accepted (
              DataWriter writer,
              ServiceRequestAcceptedStatus status )
```

<<***extension***>> *(*p. *403)* Called when a **com.rti.dds.topic.builtin.ServiceRequest** (p. 1985) for the **com.rti.dds.↩ subscription.TopicQuery** (p. 2139) service is dispatched to this **com.rti.dds.publication.DataWriter** (p. 818) for processing.

Parameters

writer	<<***out***>> *(*p. *404)* Locally created **com.rti.dds.publication.DataWriter** (p. 818) that triggers the listener callback
status	<<***out***>> *(*p. *404)* Current service request accepted status of locally created **com.rti.dds.publication.DataWriter** (p. 818)

See also

Topic Queries (p. 86)

Implements **DataWriterListener** (p. 860).

8.81 DomainParticipantConfigParams_t Class Reference

<<***extension***>> *(*p. *403)* Input paramaters for creating a participant from configuration. It allows to modify or override some of the properties of the entities defined in the configuration.

Inherits Struct.

Public Attributes

- int **domain_id** = **DOMAIN_ID_USE_XML_CONFIG**

  *Domain ID from which the **com.rti.dds.domain.DomainParticipant** (*p. *948) is created.*
- String **participant_name**

  *Name assigned to the **com.rti.dds.domain.DomainParticipant** (*p. *948).*
- String **participant_qos_library_name**

  *QoS library name containing the QoS profile from which the **com.rti.dds.domain.DomainParticipant** (*p. *948) is created.*
- String **participant_qos_profile_name**

  *QoS profile name from which the **com.rti.dds.domain.DomainParticipant** (*p. *948) is created.*
- String **domain_entity_qos_library_name**

  *QoS library name containing the QoS profile from which the all the **com.rti.dds.infrastructure.DomainEntity** (*p. *947) defined under the participant configuration are created.*
- String **domain_entity_qos_profile_name**

  *QoS profile name from which the all the **com.rti.dds.infrastructure.DomainEntity** (*p. *947) defined under the participant configuration are created.*

Static Public Attributes

- static final int **DOMAIN_ID_USE_XML_CONFIG** = -1

  <<***extension***>> *(p. 403) Special value to be used with* ***com.rti.dds.infrastructure.DomainParticipantConfig↩ Params_t*** *(p. 1035) to indicate that a participant is created using the domain ID specified in the participant configuration.*
- static final String **ENTITY_NAME_USE_XML_CONFIG**

  <<***extension***>> *(p. 403) Special value to be used with* ***com.rti.dds.infrastructure.DomainParticipantConfig↩ Params_t*** *(p. 1035) to indicate that a participant created is with an autogenerated entity name.*
- static final String **QOS_ELEMENT_NAME_USE_XML_CONFIG**

  <<***extension***>> *(p. 403) Special value to be used with* ***com.rti.dds.infrastructure.DomainParticipantConfig↩ Params_t*** *(p. 1035) to indicate that entities are created from the QoS profile specified in the participant configuration.*

8.81.1 Detailed Description

<<***extension***>> *(p. 403)* Input paramaters for creating a participant from configuration. It allows to modify or override some of the properties of the entities defined in the configuration.

8.81.2 Member Data Documentation

8.81.2.1 DOMAIN_ID_USE_XML_CONFIG

```
final int DOMAIN_ID_USE_XML_CONFIG = -1  [static]
```

<<***extension***>> *(p. 403)* Special value to be used with **com.rti.dds.infrastructure.DomainParticipantConfig↩ Params_t** (p. 1035) to indicate that a participant is created using the domain ID specified in the participant configuration.

This variable contains a constant sentinel value that is compared when creating the entities from configuration.

8.81.2.2 ENTITY_NAME_USE_XML_CONFIG

```
final String ENTITY_NAME_USE_XML_CONFIG  [static]
```

Initial value:

```
=
            "com.rti.dds.domain.entity_name_use_xml_config"
```

<<***extension***>> *(p. 403)* Special value to be used with **com.rti.dds.infrastructure.DomainParticipantConfig↩ Params_t** (p. 1035) to indicate that a participant created is with an autogenerated entity name.

This variable contains a constant sentinel value that is lexicographically compared when creating the entities from configuration.

8.81.2.3 QOS_ELEMENT_NAME_USE_XML_CONFIG

```
final String QOS_ELEMENT_NAME_USE_XML_CONFIG  [static]
```

Initial value:

```
=
            "com.rti.dds.domain.qos_element_name_use_xml_config"
```

<<***extension***>> *(p. 403)* Special value to be used with **com.rti.dds.infrastructure.DomainParticipantConfig↩ Params_t** (p. 1035) to indicate that entities are created from the QoS profile specified in the participant configuration.

This variable contains a constant sentinel value that is lexicographically compared when creating the entities from configuration.

8.81.2.4 domain_id

```
int domain_id =  DOMAIN_ID_USE_XML_CONFIG
```

Domain ID from which the **com.rti.dds.domain.DomainParticipant** (p. 948) is created.

Allows overriding the domain ID defined in the configuration for the participant to be created. If the special value **com.rti.dds.infrastructure.DomainParticipantConfigParams_t.DOMAIN_ID_USE_XML_CONFIG** (p. 1036) is specified then the ID in the configuration will be used.

8.81.2.5 participant_name

```
String participant_name
```

Initial value:

```
= new String(
            ENTITY_NAME_USE_XML_CONFIG)
```

Name assigned to the **com.rti.dds.domain.DomainParticipant** (p. 948).

This is the name the name that will be set in the **com.rti.dds.domain.DomainParticipantQos.participant_name** (p. 1079). It allows overriding the participant name that is generated automatically.

When this member is lexicographically equal to the special value **com.rti.dds.infrastructure.DomainParticipant↩ ConfigParams_t.ENTITY_NAME_USE_XML_CONFIG** (p. 1036) then an automatically generated name will be assigned.

8.81.2.6 participant_qos_library_name

```
String participant_qos_library_name
```

Initial value:

```
= new String(
            QOS_ELEMENT_NAME_USE_XML_CONFIG)
```

QoS library name containing the QoS profile from which the **com.rti.dds.domain.DomainParticipant** (p. 948) is created.

Allows overriding the QoS defined in the configuration for the participant to be created. This value only affects to the **com.rti.dds.domain.DomainParticipant** (p. 948).

When this member is lexicographically equal to the special value **com.rti.dds.infrastructure.DomainParticipant↩ ConfigParams_t.QOS_ELEMENT_NAME_USE_XML_CONFIG** (p. 1036) then the QoS library from the configuration will be applied. Also, the same action will apply for the QoS profile and the value in **com.rti.dds.infrastructure.↩ DomainParticipantConfigParams_t.participant_qos_profile_name** (p. 1037) will be ignored.

8.81.2.7 participant_qos_profile_name

```
String participant_qos_profile_name
```

Initial value:
```
= new String(
            QOS_ELEMENT_NAME_USE_XML_CONFIG)
```

QoS profile name from which the **com.rti.dds.domain.DomainParticipant** (p. 948) is created.

Allows overriding the QoS defined in the configuration for the participant to be created.This value only affects to the **com.rti.dds.domain.DomainParticipant** (p. 948).

When this member is lexicographically equal to the special value **com.rti.dds.infrastructure.DomainParticipant↩ ConfigParams_t.QOS_ELEMENT_NAME_USE_XML_CONFIG** (p. 1036) then the QoS profile from the configuration will be applied. Also, the same action will apply for the QoS library and the value in **com.rti.dds.infrastructure.↩ DomainParticipantConfigParams_t.participant_qos_library_name** (p. 1037) will be ignored.

8.81.2.8 domain_entity_qos_library_name

```
String domain_entity_qos_library_name
```

Initial value:
```
= new String(
            QOS_ELEMENT_NAME_USE_XML_CONFIG)
```

QoS library name containing the QoS profile from which the all the **com.rti.dds.infrastructure.DomainEntity** (p. 947) defined under the participant configuration are created.

Allows overriding the QoS defined in the configuration for the domain entities to be created. This value only affects to the **com.rti.dds.infrastructure.DomainEntity** (p. 947).

When this member is lexicographically equal to the special value **com.rti.dds.infrastructure.DomainParticipant↩ ConfigParams_t.QOS_ELEMENT_NAME_USE_XML_CONFIG** (p. 1036) then the QoS library from the configuration will be applied. Also, the same action will apply for the QoS profile and the value in **com.rti.dds.infrastructure.↩ DomainParticipantConfigParams_t.domain_entity_qos_profile_name** (p. 1038) will be ignored.

8.81.2.9 domain_entity_qos_profile_name

```
String domain_entity_qos_profile_name
```

Initial value:
```
= new String(
            QOS_ELEMENT_NAME_USE_XML_CONFIG)
```

QoS profile name from which the all the **com.rti.dds.infrastructure.DomainEntity** (p. 947) defined under the participant configuration are created.

Allows overriding the QoS defined in the configuration for the domain entities to be created. This value only affects to the **com.rti.dds.infrastructure.DomainEntity** (p. 947).

When this member is lexicographically equal to the special value **com.rti.dds.infrastructure.DomainParticipant↩ ConfigParams_t.QOS_ELEMENT_NAME_USE_XML_CONFIG** (p. 1036) then the QoS profile from the configuration will be applied. Also, the same action will apply for the QoS library and the value in **com.rti.dds.infrastructure.↩ DomainParticipantConfigParams_t.domain_entity_qos_library_name** (p. 1038) will be ignored.

8.82 DomainParticipantFactory Class Reference

<<***singleton***>> (p. *403*) <<***interface***>> (p. *403*) Allows creation and destruction of **com.rti.dds.domain.Domain↩ Participant** (p. 948) objects.

Public Member Functions

- abstract **DomainParticipant** **create_participant** (int domainId, **DomainParticipantQos** qos, **Domain↩ ParticipantListener** listener, int mask)

  *Creates a new **com.rti.dds.domain.DomainParticipant** (p. 948) object.*
- abstract void **delete_participant** (**DomainParticipant** a_participant)

  *Deletes an existing **com.rti.dds.domain.DomainParticipant** (p. 948).*
- abstract void **get_default_participant_qos** (**DomainParticipantQos** qos)

  *Initializes the **com.rti.dds.domain.DomainParticipantQos** (p. 1073) instance with default values.*
- abstract void **set_default_participant_qos** (**DomainParticipantQos** qos)

  *Sets the default **com.rti.dds.domain.DomainParticipantQos** (p. 1073) values for this domain participant factory.*
- abstract void **set_default_participant_qos_with_profile** (String library_name, String profile_name)

  <<***extension***>> (p. *403*) *Sets the default **com.rti.dds.domain.DomainParticipantQos** (p. 1073) values for this domain participant factory based on the input XML QoS profile.*
- abstract **DomainParticipant** **lookup_participant** (int domainId)

  *Locates an existing **com.rti.dds.domain.DomainParticipant** (p. 948).*
- abstract void **get_qos** (**DomainParticipantFactoryQos** qos)

  Gets the value for participant factory QoS.
- abstract void **set_qos** (**DomainParticipantFactoryQos** qos)

  Sets the value for a participant factory QoS.
- abstract void **load_profiles** ()

  <<***extension***>> (p. *403*) *Loads the XML QoS profiles.*
- abstract void **reload_profiles** ()

  <<***extension***>> (p. *403*) *Reloads the XML QoS profiles.*
- abstract void **unload_profiles** ()

  <<***extension***>> (p. *403*) *Unloads the XML QoS profiles.*
- abstract String **get_default_library** ()

  <<***extension***>> (p. *403*) *Gets the default XML library associated with a **com.rti.dds.domain.DomainParticipant↩ Factory** (p. 1039).*
- abstract void **set_default_library** (String library_name)

  <<***extension***>> (p. *403*) *Sets the default XML library for a **com.rti.dds.domain.DomainParticipantFactory** (p. 1039).*
- abstract String **get_default_profile** ()

  <<***extension***>> (p. *403*) *Gets the default XML profile associated with a **com.rti.dds.domain.DomainParticipant↩ Factory** (p. 1039).*
- abstract void **set_default_profile** (String library_name, String profile_name)

  <<***extension***>> (p. *403*) *Sets the default XML profile for a **com.rti.dds.domain.DomainParticipantFactory** (p. 1039).*
- abstract String **get_default_profile_library** ()

  <<***extension***>> (p. *403*) *Gets the library where the default XML profile is contained for a **com.rti.dds.domain.↩ DomainParticipantFactory** (p. 1039).*
- abstract void **get_participant_factory_qos_from_profile** (**DomainParticipantFactoryQos** qos, String library_name, String profile_name)

*<<**extension**>> (p. 403) Gets the **com.rti.dds.domain.DomainParticipantFactoryQos** (p. 1065) values associated with the input XML QoS profile.*

- abstract void **get_participant_qos_from_profile** (**DomainParticipantQos** qos, String library_name, String profile_name)

  *<<**extension**>> (p. 403) Gets the **com.rti.dds.domain.DomainParticipantQos** (p. 1073) values associated with the input XML QoS profile.*

- abstract void **get_publisher_qos_from_profile** (**PublisherQos** qos, String library_name, String profile_name)

  *<<**extension**>> (p. 403) Gets the **com.rti.dds.publication.PublisherQos** (p. 1791) values associated with the input XML QoS profile.*

- abstract void **get_subscriber_qos_from_profile** (**SubscriberQos** qos, String library_name, String profile_↩ name)

  *<<**extension**>> (p. 403) Gets the **com.rti.dds.subscription.SubscriberQos** (p. 2065) values associated with the input XML QoS profile.*

- abstract void **get_datawriter_qos_from_profile** (**DataWriterQos** qos, String library_name, String profile_↩ name)

  *<<**extension**>> (p. 403) Gets the **com.rti.dds.publication.DataWriterQos** (p. 878) values associated with the input XML QoS profile.*

- abstract void **get_datawriter_qos_from_profile_w_topic_name** (**DataWriterQos** qos, String library_name, String profile_name, String topic_name)

  *<<**extension**>> (p. 403) Gets the **com.rti.dds.publication.DataWriterQos** (p. 878) values associated with the input XML QoS profile while applying topic filters to the input topic name.*

- abstract void **get_datareader_qos_from_profile** (**DataReaderQos** qos, String library_name, String profile_↩ name)

  *<<**extension**>> (p. 403) Gets the **com.rti.dds.subscription.DataReaderQos** (p. 777) values associated with the input XML QoS profile.*

- abstract void **get_datareader_qos_from_profile_w_topic_name** (**DataReaderQos** qos, String library_name, String profile_name, String topic_name)

  *<<**extension**>> (p. 403) Gets the **com.rti.dds.subscription.DataReaderQos** (p. 777) values associated with the input XML QoS profile while applying topic filters to the input topic name.*

- abstract void **get_topic_qos_from_profile** (**TopicQos** qos, String library_name, String profile_name)

  *<<**extension**>> (p. 403) Gets the **com.rti.dds.topic.TopicQos** (p. 2133) values associated with the input XML QoS profile.*

- abstract void **get_topic_qos_from_profile_w_topic_name** (**TopicQos** qos, String library_name, String profile_name, String topic_name)

  *<<**extension**>> (p. 403) Gets the **com.rti.dds.topic.TopicQos** (p. 2133) values associated with the input XML QoS profile while applying topic filters to the input topic name.*

- abstract void **get_qos_profile_libraries** (**StringSeq** library_names)

  *<<**extension**>> (p. 403) Gets the names of all XML QoS profile libraries associated with the **com.rti.dds.domain.**↩ **DomainParticipantFactory** (p. 1039)*

- abstract void **get_qos_profiles** (**StringSeq** profile_names, String library_name)

  *<<**extension**>> (p. 403) Gets the names of all XML QoS profiles associated with the input XML QoS profile library.*

- abstract **DomainParticipant** **create_participant_with_profile** (int domainId, String library_name, String profile_name, **DomainParticipantListener** listener, int mask)

  *<<**extension**>> (p. 403) Creates a new **com.rti.dds.domain.DomainParticipant** (p. 948) object using the **com.rti.**↩ **dds.domain.DomainParticipantQos** (p. 1073) associated with the input XML QoS profile.*

- abstract void **unregister_thread** ()

  *<<**extension**>> (p. 403) Allows you to release thread-specific resources kept by RTI Connext on platforms that do not support automatic thread-specific storage (TSS) cleanup.*

- abstract **DomainParticipant** **create_participant_from_config** (String configuration_name)

  *<<**extension**>> (p. 403) Creates a **com.rti.dds.domain.DomainParticipant** (p. 948) given its configuration name from a description provided in an XML configuration file.*

- abstract **DomainParticipant create_participant_from_config_w_params** (String configuration_name, **DomainParticipantConfigParams_t** params)

  *<<**extension**>> (p. 403) Creates a **com.rti.dds.domain.DomainParticipant** (p. 948) given its configuration name from a description provided in an XML configuration file and a set of parameters that allow changing some properties of such configuration.*
- abstract **DomainParticipant lookup_participant_by_name** (String participant_name)

  *<<**extension**>> (p. 403) Looks up a **com.rti.dds.domain.DomainParticipant** (p. 948) by its entity name in the **com.rti.dds.domain.DomainParticipantFactory** (p. 1039).*
- abstract void **register_type_support** (**TypeSupport** type_support, String type_name)

  *<<**extension**>> (p. 403) Registers a **com.rti.dds.topic.TypeSupport** (p. 2252) with the **com.rti.dds.domain.DomainParticipantFactory** (p. 1039) to enable automatic registration if the corresponding type, should it be needed by a **com.rti.dds.domain.DomainParticipant** (p. 948).*

Static Public Member Functions

- static final **DomainParticipantFactory get_instance** ()

  Gets the singleton instance of this class.
- static final void **finalize_instance** ()

  *<<**extension**>> (p. 403) Destroys the singleton instance of this class.*

Static Public Attributes

- static final **DomainParticipantQos PARTICIPANT_QOS_DEFAULT**

  *Special value for creating a **DomainParticipant** (p. 948) with default QoS.*
- static **DomainParticipantFactory TheParticipantFactory** = create_singletonI()

  *Can be used as an alias for the singleton factory returned by the operation **com.rti.dds.domain.DomainParticipantFactory.get_instance** (p. 1042).*
- static **DomainParticipantConfigParams_t PARTICIPANT_CONFIG_PARAMS_DEFAULT**

  *Special value for creating a **com.rti.dds.domain.DomainParticipant** (p. 948) from configuration using default parameters.*

8.82.1 Detailed Description

*<<**singleton**>> (p. 403) <<**interface**>> (p. 403)* Allows creation and destruction of **com.rti.dds.domain.DomainParticipant** (p. 948) objects.

The sole purpose of this class is to allow the creation and destruction of **com.rti.dds.domain.DomainParticipant** (p. 948) objects. This class itself is a *<<**singleton**>> (p. 403)*, and accessed via the **get_instance()** (p. 1042) method, and destroyed with **finalize_instance()** (p. 1042) method.

A single application can participate in multiple domains by instantiating multiple **com.rti.dds.domain.DomainParticipant** (p. 948) objects.

An application may even instantiate multiple participants in the same domain. Participants in the same domain exchange data in the same way regardless of whether they are in the same application or different applications or on the same node or different nodes; their location is transparent.

There are two important caveats:

- When there are multiple participants on the same node (in the same application or different applications) in the same domain, the application(s) must make sure that the participants do not try to bind to the same port numbers. You must disambiguate between the participants by setting a participant ID for each participant (**com.rti.dds.infrastructure.WireProtocolQosPolicy.participant_id** (p. 2303)). The port numbers used by a participant are calculated based on both the participant index and the domain ID, so if all participants on the same node have different participant indexes, they can coexist in the same domain.
- You cannot mix entities from different participants. For example, you cannot delete a topic on a different participant than you created it from, and you cannot ask a subscriber to create a reader for a topic created from a participant different than the subscriber's own participant. (Note that it is permissable for an application built on top of RTI Connext to know about entities from different participants. For example, an application could keep references to a reader from one domain and a writer from another and then bridge the domains by writing the data received in the reader callback.)

See also

com.rti.dds.domain.DomainParticipant (p. 948)

8.82.2 Member Function Documentation

8.82.2.1 get_instance()

```
static final DomainParticipantFactory get_instance ( ) [static]
```

Gets the singleton instance of this class.

com.rti.dds.domain.DomainParticipantFactory.TheParticipantFactory (p. 44) can be used as an alias for the singleton factory returned by this operation.

Returns

The singleton **com.rti.dds.domain.DomainParticipantFactory** (p. 1039) instance.

See also

com.rti.dds.domain.DomainParticipantFactory.TheParticipantFactory (p. 44)

References **DomainParticipantFactory.TheParticipantFactory**.

8.82.2.2 finalize_instance()

```
static final void finalize_instance ( )  [static]
```

<<***extension***>> *(*p. *403)* Destroys the singleton instance of this class.

Only necessary to explicitly reclaim resources used by the participant factory singleton. Note that on many OSs, these resources are automatically reclaimed by the OS when the program terminates. However, some memory-check tools still flag these as unreclaimed. So this method provides a way to clean up memory used by the participant factory.

Precondition

All participants created from the factory have been deleted.

Postcondition

All resources belonging to the factory have been reclaimed. Another call to **com.rti.dds.domain.DomainParticipantFactory.get_instance** (p. 1042) will return a new lifecycle of the singleton.

Exceptions

One	of the **Standard Return Codes** (p. 513), or **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903)

See also

com.rti.dds.domain.DomainParticipantFactory.TheParticipantFactory (p. 44)

References **DomainParticipantFactory.TheParticipantFactory**.

8.82.2.3 create_participant()

```
abstract  DomainParticipant create_participant (
              int domainId,
               DomainParticipantQos qos,
               DomainParticipantListener listener,
              int mask )  [abstract]
```

Creates a new **com.rti.dds.domain.DomainParticipant** (p. 948) object.

Precondition

The specified QoS policies must be consistent or the operation will fail and no **com.rti.dds.domain.Domain↩ Participant** (p. 948) will be created.

If you want to create multiple participants on a given host in the same domain, make sure each one has a different participant index (set in the **com.rti.dds.infrastructure.WireProtocolQosPolicy** (p. 2299)). This in turn will ensure each participant uses a different port number (since the unicast port numbers are calculated from the participant index and the domain ID).

Note that if there is a single participant per host in a given domain, the participant index can be left at the default value (-1).

MT Safety:

UNSAFE. On VxWorks, when enabling the RTI Security Plugins, it is not safe for multiple threads to attempt to create a **com.rti.dds.domain.DomainParticipant** (p. 948) when there are no other DomainParticipants in the **com.rti.dds.domain.DomainParticipantFactory** (p. 1039).

Parameters

domain↩ Id	<<***in***>> *(p. 404)* ID of the domain that the application intends to join. **[range]** [>=0], and does not violate guidelines stated in **com.rti.dds.infrastructure.RtpsWellKnownPorts_t** (p. 1931).
qos	<<***in***>> *(p. 404)* the **DomainParticipant** (p. 948)'s QoS. The special value **com.rti.dds.domain.DomainParticipantFactory.PARTICIPANT_QOS_DEFAULT** (p. 44) can be used to indicate that the **com.rti.dds.domain.DomainParticipant** (p. 948) should be created with the default **com.rti.dds.domain.DomainParticipantQos** (p. 1073) set in the **com.rti.dds.domain.DomainParticipantFactory** (p. 1039). Cannot be NULL.
listener	<<***in***>> *(p. 404)* the domain participant's listener.
mask	<<***in***>> *(p. 404)*. Changes of communication status to be invoked on the listener. See **com.rti.dds.infrastructure.StatusKind** (p. 2010).

Returns

domain participant or NULL on failure

See also

NDDS_DISCOVERY_PEERS (p. 472)

com.rti.dds.domain.DomainParticipantFactory.create_participant_with_profile (p. 1060)

com.rti.dds.domain.DomainParticipantFactory.get_default_participant_qos (p. 1045)

com.rti.dds.domain.DomainParticipant.set_listener (p. 996)

8.82.2.4 delete_participant()

```
abstract void delete_participant (
              DomainParticipant a_participant )  [abstract]
```

Deletes an existing **com.rti.dds.domain.DomainParticipant** (p. 948).

Precondition

All domain entities belonging to the participant must have already been deleted. Otherwise it fails with the error **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).

Postcondition

Listener installed on the **com.rti.dds.domain.DomainParticipant** (p. 948) will not be called after this method returns successfully.

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity. On VxWorks, when enabling the RTI Security Plugins, if two threads attempt to delete the last two DomainParticipants of the **com.rti.dds.domain.DomainParticipantFactory** (p. 1039), it is possible for memory to be leaked.

Parameters

a_participant	*<<**in**>> (p. 404)* **com.rti.dds.domain.DomainParticipant** (p. 948) to be deleted.

Exceptions

One	of the **Standard Return Codes** (p. 513), or **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).

8.82.2.5 get_default_participant_qos()

```
abstract void get_default_participant_qos (
              DomainParticipantQos qos )  [abstract]
```

Initializes the **com.rti.dds.domain.DomainParticipantQos** (p. 1073) instance with default values.

The retrieved `qos` will match the set of values specified on the last successful call to **com.rti.dds.domain.Domain↩ ParticipantFactory.set_default_participant_qos** (p. 1046), or **com.rti.dds.domain.DomainParticipantFactory.↩ set_default_participant_qos_with_profile** (p. 1046), or else, if the call was never made, the default values listed in **com.rti.dds.domain.DomainParticipantQos** (p. 1073).

This method may potentially allocate memory depending on the sequences contained in some QoS policies.

Parameters

qos	<<***out***>> *(*p. *404)* the domain participant's QoS Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

com.rti.dds.domain.DomainParticipantFactory.PARTICIPANT_QOS_DEFAULT (p. 44)

com.rti.dds.domain.DomainParticipantFactory.create_participant (p. 1043)

8.82.2.6 set_default_participant_qos()

```
abstract void set_default_participant_qos (
              DomainParticipantQos qos )  [abstract]
```

Sets the default **com.rti.dds.domain.DomainParticipantQos** (p. 1073) values for this domain participant factory.

This method may potentially allocate memory depending on the sequences contained in some QoS policies.

Parameters

qos	<<***inout***>> *(*p. *404)* Qos to be filled up. The special value **com.rti.dds.domain.DomainParticipantFactory.PARTICIPANT_QOS_DEFAULT** (p. 44) may be passed as `qos` to indicate that the default QoS should be reset back to the initial values the factory would used if **com.rti.dds.domain.DomainParticipantFactory.set_default_participant_qos** (p. 1046) had never been called. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

com.rti.dds.domain.DomainParticipantFactory.PARTICIPANT_QOS_DEFAULT (p. 44)

com.rti.dds.domain.DomainParticipantFactory.create_participant (p. 1043)

8.82.2.7 set_default_participant_qos_with_profile()

```
abstract void set_default_participant_qos_with_profile (
            String library_name,
            String profile_name )  [abstract]
```

<<***extension***>> *(p. 403)* Sets the default **com.rti.dds.domain.DomainParticipantQos** (p. 1073) values for this domain participant factory based on the input XML QoS profile.

This method may potentially allocate memory depending on the sequences contained in some QoS policies.

This default value will be used for newly created **com.rti.dds.domain.DomainParticipant** (p. 948) if **com.rti.dds.domain.DomainParticipantFactory.PARTICIPANT_QOS_DEFAULT** (p. 44) is specified as the `qos` parameter when **com.rti.dds.domain.DomainParticipantFactory.create_participant** (p. 1043) is called.

Precondition

The **com.rti.dds.domain.DomainParticipantQos** (p. 1073) contained in the specified XML QoS profile must be consistent, or else the operation will have no effect and fail with **com.rti.dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901)

MT Safety:

UNSAFE. It is not safe to retrieve the default QoS value from a domain participant factory while another thread may be simultaneously calling **com.rti.dds.domain.DomainParticipantFactory.set_default_participant_qos** (p. 1046)

Parameters

library_name	<<***in***>> *(p. 404)* Library name containing the XML QoS profile. If library_name is null RTI Connext will use the default library (see **com.rti.dds.domain.DomainParticipantFactory.set_default_library** (p. 1051)).
profile_name	<<***in***>> *(p. 404)* XML QoS Profile name. If profile_name is null RTI Connext will use the default profile (see **com.rti.dds.domain.DomainParticipantFactory.set_default_profile** (p. 1052)).

If the input profile cannot be found the method fails with **com.rti.dds.infrastructure.RETCODE_ERROR** (p. 1900).

Exceptions

One	of the **Standard Return Codes** (p. 513), or **com.rti.dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901)

See also

com.rti.dds.domain.DomainParticipantFactory.PARTICIPANT_QOS_DEFAULT (p. 44)

com.rti.dds.domain.DomainParticipantFactory.create_participant_with_profile (p. 1060)

8.82.2.8 lookup_participant()

```
abstract  DomainParticipant lookup_participant (
            int domainId )  [abstract]
```

Locates an existing **com.rti.dds.domain.DomainParticipant** (p. 948).

If no such **com.rti.dds.domain.DomainParticipant** (p. 948) exists, the operation will return NULL value.

If multiple **com.rti.dds.domain.DomainParticipant** (p. 948) entities belonging to that domainId exist, then the operation will return one of them. It is not specified which one.

Parameters

domain↩ Id	<<***in***>> *(p. 404)* ID of the domain participant to lookup.

Returns

domain participant if it exists, or NULL

8.82.2.9 get_qos()

```
abstract void get_qos (
              DomainParticipantFactoryQos qos )  [abstract]
```

Gets the value for participant factory QoS.

Parameters

qos	<<***inout***>> *(p. 404)* QoS to be filled up. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513)

8.82.2.10 set_qos()

```
abstract void set_qos (
              DomainParticipantFactoryQos qos )  [abstract]
```

Sets the value for a participant factory QoS.

The **com.rti.dds.domain.DomainParticipantFactoryQos.entity_factory** (p. 1069) can be changed. The other policies are immutable.

Note that despite having QoS, the **com.rti.dds.domain.DomainParticipantFactory** (p. 1039) is not an **com.rti.dds.infrastructure.Entity** (p. 1320).

Parameters

qos	<<***in***>> *(p. 404)* Set of policies to be applied to **com.rti.dds.domain.DomainParticipantFactory** (p. 1039). Policies must be consistent. Immutable policies can only be changed before calling any other RTI Connext methods except for **com.rti.dds.domain.DomainParticipantFactory.get_qos** (p. 1048) Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_IMMUTABLE_POLICY** (p. 1901) if immutable policy is changed, or **com.rti.dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901) if policies are inconsistent

com.rti.dds.domain.DomainParticipantFactoryQos (p. 1065) for rules on consistency among QoS

8.82.2.11 load_profiles()

```
abstract void load_profiles ( )  [abstract]
```

<<***extension***>> *(p. 403)* Loads the XML QoS profiles.

The XML QoS profiles are loaded implicitly after the first **com.rti.dds.domain.DomainParticipant** (p. 948) is created or explicitly, after a call to this method.

This has the same effect as **com.rti.dds.domain.DomainParticipantFactory.reload_profiles()** (p. 1049).

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

com.rti.dds.infrastructure.ProfileQosPolicy (p. 1692)

8.82.2.12 reload_profiles()

```
abstract void reload_profiles ( )  [abstract]
```

<<***extension***>> *(p. 403)* Reloads the XML QoS profiles.

The XML QoS profiles are loaded implicitly after the first **com.rti.dds.domain.DomainParticipant** (p. 948) is created or explicitly, after a call to this method.

This has the same effect as **com.rti.dds.domain.DomainParticipantFactory.load_profiles()** (p. 1049).

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

com.rti.dds.infrastructure.ProfileQosPolicy (p. 1692)

8.82.2.13 unload_profiles()

```
abstract void unload_profiles ( )  [abstract]
```

<<***extension***>> *(p. 403)* Unloads the XML QoS profiles.

The resources associated with the XML QoS profiles are freed. Any reference to the profiles after calling this method will fail with an error.

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

com.rti.dds.infrastructure.ProfileQosPolicy (p. 1692)

8.82.2.14 get_default_library()

```
abstract String get_default_library ( )  [abstract]
```

<<***extension***>> *(p. 403)* Gets the default XML library associated with a **com.rti.dds.domain.DomainParticipant↩ Factory** (p. 1039).

Returns

The returned library name is determined as follows:

- If it was previously set with **com.rti.dds.domain.DomainParticipantFactory.set_default_library** (p. 1051), this function returns that library name
- Otherwise, if one or more profiles have the XML attribute `is_default_qos="true"`, this function returns the library where the last one is contained.
- Otherwise, this function returns null.

See also

com.rti.dds.domain.DomainParticipantFactory.set_default_library (p. 1051)

8.82.2.15 set_default_library()

```
abstract void set_default_library (
            String library_name )  [abstract]
```

<<***extension***>> *(p. 403)* Sets the default XML library for a **com.rti.dds.domain.DomainParticipantFactory** (p. 1039).

Any API requiring a library_name as a parameter can use null to refer to the default library set with this function.

Note: if the library set with this function no longer exists after reloading the QoS profiles (for example, by changing **com.rti.dds.domain.DomainParticipantFactoryQos.profile** (p. 1069)) the default library will be set to the last library containing a profile with the attribute `is_default_qos=true` or null no such library exists.

See also

com.rti.dds.domain.DomainParticipantFactory.set_default_profile (p. 1052) for more information.

Parameters

library_name	<<***in***>> *(p. 404)* Library name. If library_name is null any previous default is unset.

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

com.rti.dds.domain.DomainParticipantFactory.get_default_library (p. 1050)

8.82.2.16 get_default_profile()

```
abstract String get_default_profile ( )  [abstract]
```

<<***extension***>> *(p. 403)* Gets the default XML profile associated with a **com.rti.dds.domain.DomainParticipant↩ Factory** (p. 1039).

Returns

The returned profile name is determined as follows:

- If it was previously set with **com.rti.dds.domain.DomainParticipantFactory.set_default_profile** (p. 1052), this function returns that profile name
- Otherwise, if one or more profiles have the XML attribute `is_default_qos="true"`, this function returns the name of one of them
- Otherwise, this function returns null.

See also

com.rti.dds.domain.DomainParticipantFactory.set_default_profile (p. 1052)

8.82.2.17 set_default_profile()

```
abstract void set_default_profile (
             String library_name,
             String profile_name )  [abstract]
```

<<***extension***>> *(p. 403)* Sets the default XML profile for a **com.rti.dds.domain.DomainParticipantFactory** (p. 1039).

This method specifies the profile that will be used as the default the next time a default **DomainParticipantFactory** (p. 1039) profile is needed during a call to a **DomainParticipantFactory** (p. 1039) method. When calling a **com.rti.↩ dds.domain.DomainParticipantFactory** (p. 1039) method that requires a `profile_name` parameter, you can use null to refer to the default profile. (This same information applies to setting a default library.)

This method does not set the default QoS for newly created DomainParticipants; for this functionality, use **com.rti.↩ dds.domain.DomainParticipantFactory.set_default_participant_qos_with_profile** (p. 1046) (you may pass in null after having called **set_default_profile()** (p. 1052)).

Note: if the profile set with this function no longer exists after reloading the QoS profiles (for example, by changing **com.rti.dds.domain.DomainParticipantFactoryQos.profile** (p. 1069)) the default profile will be set to the last one marked with the attribute `is_default_qos=true` or null no such profile exists.

Parameters

library_name	<<***in***>> *(p. 404)* The library name containing the profile.
profile_name	<<***in***>> *(p. 404)* The profile name. If profile_name is null any previous default is unset.

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

com.rti.dds.domain.DomainParticipantFactory.get_default_profile (p. 1051)

com.rti.dds.domain.DomainParticipantFactory.get_default_profile_library (p. 1053)

8.82.2.18 get_default_profile_library()

```
abstract String get_default_profile_library ( )  [abstract]
```

<<***extension***>> *(p. 403)* Gets the library where the default XML profile is contained for a **com.rti.dds.domain.DomainParticipantFactory** (p. 1039).

The default profile library is automatically set when **com.rti.dds.domain.DomainParticipantFactory.set_default_profile** (p. 1052) is called.

This library can be different than the **com.rti.dds.domain.DomainParticipantFactory** (p. 1039) default library (see **com.rti.dds.domain.DomainParticipantFactory.get_default_library** (p. 1050)).

Returns

The default profile library for the profile returned by **com.rti.dds.domain.DomainParticipantFactory.get_default_profile** (p. 1051), or null if that profile is null.

See also

com.rti.dds.domain.DomainParticipantFactory.get_default_profile (p. 1051)

8.82.2.19 get_participant_factory_qos_from_profile()

```
abstract void get_participant_factory_qos_from_profile (
              DomainParticipantFactoryQos qos,
             String library_name,
             String profile_name )  [abstract]
```

<<***extension***>> *(p. 403)* Gets the **com.rti.dds.domain.DomainParticipantFactoryQos** (p. 1065) values associated with the input XML QoS profile.

Parameters

qos	<<***out***>> *(p. 404)* Qos to be filled up. Cannot be NULL.
library_name	<<***in***>> *(p. 404)* Library name containing the XML QoS profile. If library_name is null RTI Connext will use the default library (see **com.rti.dds.domain.DomainParticipantFactory.set_default_library** (p. 1051)).
profile_name	<<***in***>> *(p. 404)* XML QoS Profile name. If profile_name is null RTI Connext will use the default profile (see **com.rti.dds.domain.DomainParticipantFactory.set_default_profile** (p. 1052)).

If the input profile cannot be found, the method fails with **com.rti.dds.infrastructure.RETCODE_ERROR** (p. 1900).

Exceptions

One	of the **Standard Return Codes** (p. 513)

8.82.2.20 get_participant_qos_from_profile()

```
abstract void get_participant_qos_from_profile (
              DomainParticipantQos qos,
             String library_name,
             String profile_name )  [abstract]
```

<<***extension***>> *(p. 403)* Gets the **com.rti.dds.domain.DomainParticipantQos** (p. 1073) values associated with the input XML QoS profile.

Parameters

qos	<<***out***>> *(p. 404)* Qos to be filled up. Cannot be NULL.
library_name	<<***in***>> *(p. 404)* Library name containing the XML QoS profile. If library_name is null RTI Connext will use the default library (see **com.rti.dds.domain.DomainParticipantFactory.set_default_library** (p. 1051)).
profile_name	<<***in***>> *(p. 404)* XML QoS Profile name. If profile_name is null RTI Connext will use the default profile (see **com.rti.dds.domain.DomainParticipantFactory.set_default_profile** (p. 1052)).

If the input profile cannot be found, the method fails with **com.rti.dds.infrastructure.RETCODE_ERROR** (p. 1900).

Exceptions

One	of the **Standard Return Codes** (p. 513)

8.82.2.21 get_publisher_qos_from_profile()

```
abstract void get_publisher_qos_from_profile (
              PublisherQos qos,
             String library_name,
             String profile_name )  [abstract]
```

<<***extension***>> *(p. 403)* Gets the **com.rti.dds.publication.PublisherQos** (p. 1791) values associated with the input XML QoS profile.

Parameters

qos	<<***out***>> *(p. 404)* Qos to be filled up. Cannot be NULL.
library_name	<<***in***>> *(p. 404)* Library name containing the XML QoS profile. If library_name is null RTI Connext will use the default library (see **com.rti.dds.domain.DomainParticipantFactory.set_default_library** (p. 1051)).
profile_name	<<***in***>> *(p. 404)* XML QoS Profile name. If profile_name is null RTI Connext will use the default profile (see **com.rti.dds.domain.DomainParticipantFactory.set_default_profile** (p. 1052)).

If the input profile cannot be found, the method fails with **com.rti.dds.infrastructure.RETCODE_ERROR** (p. 1900).

Exceptions

One	of the **Standard Return Codes** (p. 513)

8.82.2.22 get_subscriber_qos_from_profile()

```
abstract void get_subscriber_qos_from_profile (
              SubscriberQos qos,
             String library_name,
             String profile_name )  [abstract]
```

<<***extension***>> *(p. 403)* Gets the **com.rti.dds.subscription.SubscriberQos** (p. 2065) values associated with the input XML QoS profile.

Parameters

qos	<<***out***>> *(p. 404)* Qos to be filled up. Cannot be NULL.
library_name	<<***in***>> *(p. 404)* Library name containing the XML QoS profile. If library_name is null RTI Connext will use the default library (see **com.rti.dds.domain.DomainParticipantFactory.set_default_library** (p. 1051)).
profile_name	<<***in***>> *(p. 404)* XML QoS Profile name. If profile_name is null RTI Connext will use the default profile (see **com.rti.dds.domain.DomainParticipantFactory.set_default_profile** (p. 1052)).

If the input profile cannot be found, the method fails with **com.rti.dds.infrastructure.RETCODE_ERROR** (p. 1900).

Exceptions

One	of the **Standard Return Codes** (p. 513)

8.82.2.23 get_datawriter_qos_from_profile()

```
abstract void get_datawriter_qos_from_profile (
              DataWriterQos qos,
             String library_name,
             String profile_name )  [abstract]
```

<<***extension***>> *(p. 403)* Gets the **com.rti.dds.publication.DataWriterQos** (p. 878) values associated with the input XML QoS profile.

Parameters

qos	<<***out***>> *(p. 404)* Qos to be filled up. Cannot be NULL.
library_name	<<***in***>> *(p. 404)* Library name containing the XML QoS profile. If library_name is null RTI Connext will use the default library (see **com.rti.dds.domain.DomainParticipantFactory.set_default_library** (p. 1051)).
profile_name	<<***in***>> *(p. 404)* XML QoS Profile name. If profile_name is null RTI Connext will use the default profile (see **com.rti.dds.domain.DomainParticipantFactory.set_default_profile** (p. 1052)).

If the input profile cannot be found, the method fails with **com.rti.dds.infrastructure.RETCODE_ERROR** (p. 1900).

Exceptions

One	of the **Standard Return Codes** (p. 513)

8.82.2.24 get_datawriter_qos_from_profile_w_topic_name()

```
abstract void get_datawriter_qos_from_profile_w_topic_name (
              DataWriterQos qos,
             String library_name,
             String profile_name,
             String topic_name )  [abstract]
```

<<***extension***>> *(p. 403)* Gets the **com.rti.dds.publication.DataWriterQos** (p. 878) values associated with the input XML QoS profile while applying topic filters to the input topic name.

Parameters

qos	<<***out***>> *(p. 404)* Qos to be filled up. Cannot be NULL.
library_name	<<***in***>> *(p. 404)* Library name containing the XML QoS profile. If library_name is null RTI Connext will use the default library (see **com.rti.dds.domain.DomainParticipantFactory.set_default_library** (p. 1051)).
profile_name	<<***in***>> *(p. 404)* XML QoS Profile name. If profile_name is null RTI Connext will use the default profile (see **com.rti.dds.domain.DomainParticipantFactory.set_default_profile** (p. 1052)).
topic_name	<<***in***>> *(p. 404)* Topic name that will be evaluated against the topic_filter attribute in the XML QoS profile. If topic_name is null, RTI Connext will match only QoSs without explicit topic_filter expressions.

If the input profile cannot be found, the method fails with **com.rti.dds.infrastructure.RETCODE_ERROR** (p. 1900).

Exceptions

One	of the **Standard Return Codes** (p. 513)

8.82.2.25 get_datareader_qos_from_profile()

```
abstract void get_datareader_qos_from_profile (
              DataReaderQos qos,
             String library_name,
             String profile_name )  [abstract]
```

<<***extension***>> *(p. 403)* Gets the **com.rti.dds.subscription.DataReaderQos** (p. 777) values associated with the input XML QoS profile.

Parameters

qos	<<***out***>> *(p. 404)* Qos to be filled up. Cannot be NULL.
library_name	<<***in***>> *(p. 404)* Library name containing the XML QoS profile. If library_name is null RTI Connext will use the default library (see **com.rti.dds.domain.DomainParticipantFactory.set_default_library** (p. 1051)).
profile_name	<<***in***>> *(p. 404)* XML QoS Profile name. If profile_name is null RTI Connext will use the default profile (see **com.rti.dds.domain.DomainParticipantFactory.set_default_profile** (p. 1052)).

If the input profile cannot be found, the method fails with **com.rti.dds.infrastructure.RETCODE_ERROR** (p. 1900).

Exceptions

One	of the **Standard Return Codes** (p. 513)

8.82.2.26 get_datareader_qos_from_profile_w_topic_name()

```
abstract void get_datareader_qos_from_profile_w_topic_name (
              DataReaderQos qos,
             String library_name,
             String profile_name,
             String topic_name )  [abstract]
```

<<***extension***>> *(p. 403)* Gets the **com.rti.dds.subscription.DataReaderQos** (p. 777) values associated with the input XML QoS profile while applying topic filters to the input topic name.

Parameters

qos	<<***out***>> *(p. 404)* Qos to be filled up. Cannot be NULL.
library_name	<<***in***>> *(p. 404)* Library name containing the XML QoS profile. If library_name is null RTI Connext will use the default library (see **com.rti.dds.domain.DomainParticipantFactory.set_default_library** (p. 1051)).
profile_name	<<***in***>> *(p. 404)* XML QoS Profile name. If profile_name is null RTI Connext will use the default profile (see **com.rti.dds.domain.DomainParticipantFactory.set_default_profile** (p. 1052)).
topic_name	<<***in***>> *(p. 404)* Topic name that will be evaluated against the topic_filter attribute in the XML QoS profile. If topic_name is null, RTI Connext will match only QoSs without explicit topic_filter expressions.

If the input profile cannot be found, the method fails with **com.rti.dds.infrastructure.RETCODE_ERROR** (p. 1900).

Exceptions

One	of the **Standard Return Codes** (p. 513)

8.82.2.27 get_topic_qos_from_profile()

```
abstract void get_topic_qos_from_profile (
              TopicQos qos,
             String library_name,
             String profile_name )  [abstract]
```

<<***extension***>> *(p. 403)* Gets the **com.rti.dds.topic.TopicQos** (p. 2133) values associated with the input XML QoS profile.

Parameters

qos	<<***out***>> *(p. 404)* Qos to be filled up. Cannot be NULL.
library_name	<<***in***>> *(p. 404)* Library name containing the XML QoS profile. If library_name is null RTI Connext will use the default library (see **com.rti.dds.domain.DomainParticipantFactory.set_default_library** (p. 1051)).
profile_name	<<***in***>> *(p. 404)* XML QoS Profile name. If profile_name is null RTI Connext will use the default profile (see **com.rti.dds.domain.DomainParticipantFactory.set_default_profile** (p. 1052)).

If the input profile cannot be found, the method fails with **com.rti.dds.infrastructure.RETCODE_ERROR** (p. 1900).

Exceptions

One	of the **Standard Return Codes** (p. 513)

8.82.2.28 get_topic_qos_from_profile_w_topic_name()

```
abstract void get_topic_qos_from_profile_w_topic_name (
              TopicQos qos,
             String library_name,
             String profile_name,
             String topic_name )  [abstract]
```

<<***extension***>> *(p. 403)* Gets the **com.rti.dds.topic.TopicQos** (p. 2133) values associated with the input XML QoS profile while applying topic filters to the input topic name.

Parameters

qos	<<***out***>> *(p. 404)* Qos to be filled up. Cannot be NULL.
library_name	<<***in***>> *(p. 404)* Library name containing the XML QoS profile. If library_name is null RTI Connext will use the default library (see **com.rti.dds.domain.DomainParticipantFactory.set_default_library** (p. 1051)).
profile_name	<<***in***>> *(p. 404)* XML QoS Profile name. If profile_name is null RTI Connext will use the default profile (see **com.rti.dds.domain.DomainParticipantFactory.set_default_profile** (p. 1052)).
topic_name	<<***in***>> *(p. 404)* Topic name that will be evaluated against the topic_filter attribute in the XML QoS profile. If topic_name is null, RTI Connext will match only QoSs without explicit topic_filter expressions.

If the input profile cannot be found, the method fails with **com.rti.dds.infrastructure.RETCODE_ERROR** (p. 1900).

Exceptions

One	of the **Standard Return Codes** (p. 513)

8.82.2.29 get_qos_profile_libraries()

```
abstract void get_qos_profile_libraries (
              StringSeq library_names )  [abstract]
```

<<***extension***>> *(p. 403)* Gets the names of all XML QoS profile libraries associated with the **com.rti.dds.domain.↩ DomainParticipantFactory** (p. 1039)

Parameters

library_names	<<***out***>> *(p. 404)* **com.rti.dds.infrastructure.StringSeq** (p. 2027) to be filled with names of XML QoS profile libraries. Cannot be NULL.

8.82.2.30 get_qos_profiles()

```
abstract void get_qos_profiles (
              StringSeq profile_names,
             String library_name )  [abstract]
```

<<***extension***>> *(p. 403)* Gets the names of all XML QoS profiles associated with the input XML QoS profile library.

Parameters

profile_names	<<***out***>> *(p. 404)* **com.rti.dds.infrastructure.StringSeq** (p. 2027) to be filled with names of XML QoS profiles. Cannot be NULL.
library_name	<<***in***>> *(p. 404)* Library name containing the XML QoS profile. If library_name is null RTI Connext will use the default library (see **com.rti.dds.domain.DomainParticipantFactory.set_default_library** (p. 1051)).

8.82.2.31 create_participant_with_profile()

```
abstract  DomainParticipant create_participant_with_profile (
             int domainId,
             String library_name,
             String profile_name,
              DomainParticipantListener listener,
             int mask )  [abstract]
```

<<***extension***>> *(p. 403)* Creates a new **com.rti.dds.domain.DomainParticipant** (p. 948) object using the **com.rti.dds.domain.DomainParticipantQos** (p. 1073) associated with the input XML QoS profile.

Precondition

The **com.rti.dds.domain.DomainParticipantQos** (p. 1073) in the input profile must be consistent, or the operation will fail and no **com.rti.dds.domain.DomainParticipant** (p. 948) will be created.

If you want to create multiple participants on a given host in the same domain, make sure each one has a different participant index (set in the **com.rti.dds.infrastructure.WireProtocolQosPolicy** (p. 2299)). This in turn will ensure each participant uses a different port number (since the unicast port numbers are calculated from the participant index and the domain ID).

Note that if there is a single participant per host in a given domain, the participant index can be left at the default value (-1).

MT Safety:

UNSAFE. On VxWorks, when enabling the RTI Security Plugins, it is not safe for multiple threads to attempt to create a **com.rti.dds.domain.DomainParticipant** (p. 948) when there are no other DomainParticipants in the **com.rti.dds.domain.DomainParticipantFactory** (p. 1039).

Parameters

domainId	<<***in***>> *(*p. *404)* ID of the domain that the application intends to join. **[range]** [>=0], and does not violate guidelines stated in **com.rti.dds.infrastructure.RtpsWellKnownPorts_t** (p. 1931).
library_name	<<***in***>> *(*p. *404)* Library name containing the XML QoS profile. If library_name is null RTI Connext will use the default library (see **com.rti.dds.domain.DomainParticipantFactory.set_default_library** (p. 1051)).
profile_name	<<***in***>> *(*p. *404)* XML QoS Profile name. If profile_name is null RTI Connext will use the default profile (see **com.rti.dds.domain.DomainParticipantFactory.set_default_profile** (p. 1052)).
listener	<<***in***>> *(*p. *404)* the **DomainParticipant** (p. 948)'s listener.
mask	<<***in***>> *(*p. *404).* Changes of communication status to be invoked on the listener. See **com.rti.dds.infrastructure.StatusKind** (p. 2010).

Returns

domain participant or NULL on failure

See also

Specifying QoS on entities (p. 505) for information on setting QoS before entity creation

NDDS_DISCOVERY_PEERS (p. 472)

com.rti.dds.domain.DomainParticipantFactory.create_participant() (p. 1043)

com.rti.dds.domain.DomainParticipantFactory.get_default_participant_qos() (p. 1045)

com.rti.dds.domain.DomainParticipant.set_listener() (p. 996)

8.82.2.32 unregister_thread()

```
abstract void unregister_thread ( )  [abstract]
```

<<***extension***>> *(*p. *403)* Allows you to release thread-specific resources kept by RTI Connext on platforms that do not support automatic thread-specific storage (TSS) cleanup.

Refer to the `Platform Notes` to see if your platform supports automatic TSS cleanup. It will be mentioned in the 'Thread Configuration' sub-section of the platform you are using.

On platforms that do not support automatic TSS cleanup, you should call this function right before exiting a thread where any DDS API was used. It is safe to call this function even if no DDS API was used, in cases where you are unsure if

a DDS API was called or not. It is also safe, although unnecessary, to call this API on platforms that support automatic TSS cleanup.

RTI Connext stores some resources in TSS. For internal threads, these resources are cleaned up by the middleware when the threads exit. For user threads, calling this API will free all the resources related to the specific thread.

The best approach is to call the function during the thread deletion after all the DDS APIs have been called.

See `Unregistering Threads`, in the Core Libraries User's Manual, for the equivalent API call in each of the supported language bindings.

Exceptions

One	of the **Standard Return Codes** (p. 513)

8.82.2.33 create_participant_from_config()

```
abstract  DomainParticipant create_participant_from_config (
              String configuration_name )  [abstract]
```

<<***extension***>> *(p. 403)* Creates a **com.rti.dds.domain.DomainParticipant** (p. 948) given its configuration name from a description provided in an XML configuration file.

This operation creates a **com.rti.dds.domain.DomainParticipant** (p. 948) registering all the necessary data types and creating all the contained entities (**com.rti.dds.topic.Topic** (p. 2116), **com.rti.dds.publication.Publisher** (p. 1767), **com.rti.dds.subscription.Subscriber** (p. 2039), **com.rti.dds.publication.DataWriter** (p. 818), **com.rti.dds.subscription.DataReader** (p. 707)) from a description given in an XML configuration file.

The configuration name is the fully qualified name of the XML participant object, consisting of the name of the participant library plus the name of participant configuration.

For example the name "MyParticipantLibrary::PublicationParticipant" can be used to create the domain participant from the description in an XML file with contents shown in the snippet below:

```
<participant_library name="MyParticipantLibrary">

    <domain_participant name="PublicationParticipant" domain_ref="MyDomainLibrary::HelloWorldDomain">

        <publisher name="MyPublisher">

            <data_writer name="HelloWorldWriter" topic_ref="HelloWorldTopic"/>

        </publisher>

    </domain_participant>

</participant_library>
```

The entities belonging to the newly created **com.rti.dds.domain.DomainParticipant** (p. 948) can be retrieved with the help of lookup operations such as: **com.rti.dds.domain.DomainParticipant.lookup_datareader_by_name** (p. 1025).

This operation is equivalent to call **com.rti.dds.domain.DomainParticipantFactory.create_participant_from_config_w_params** (p. 1063) passing **com.rti.dds.domain.DomainParticipantFactory.PARTICIPANT_CONFIG_PARAMS_DEFAULT** (p. 45) as parameters.

MT Safety:

UNSAFE. On VxWorks, when enabling the RTI Security Plugins, it is not safe for multiple threads to attempt to create a **com.rti.dds.domain.DomainParticipant** (p. 948) when there are no other DomainParticipants in the **com.rti.dds.domain.DomainParticipantFactory** (p. 1039).

Parameters

configuration_name	<<***in***>> *(p. 404)* Name of the participant configuration in the XML file.

Returns

The created **com.rti.dds.domain.DomainParticipant** (p. 948) or NULL on error.

See also

com.rti.dds.domain.DomainParticipant.lookup_subscriber_by_name (p. 1024)

com.rti.dds.domain.DomainParticipant.lookup_datareader_by_name (p. 1025)

com.rti.dds.domain.DomainParticipant.lookup_datawriter_by_name (p. 1024)

com.rti.dds.publication.Publisher.lookup_datawriter_by_name (p. 1788)

com.rti.dds.subscription.Subscriber.lookup_datareader_by_name (p. 2061)

8.82.2.34 create_participant_from_config_w_params()

```
abstract  DomainParticipant create_participant_from_config_w_params (
             String configuration_name,
              DomainParticipantConfigParams_t params )  [abstract]
```

<<***extension***>> *(p. 403)* Creates a **com.rti.dds.domain.DomainParticipant** (p. 948) given its configuration name from a description provided in an XML configuration file and a set of parameters that allow changing some properties of such configuration.

The operation will create a **com.rti.dds.domain.DomainParticipant** (p. 948) the same way specified in **com.rti.dds.↩ domain.DomainParticipantFactory.create_participant_from_config** (p. 1062).

In addition, this operation allows overriding the domain ID, participant name, and entities QoS specified in the configuration.

MT Safety:

UNSAFE. On VxWorks, when enabling the RTI Security Plugins, it is not safe for multiple threads to attempt to create a **com.rti.dds.domain.DomainParticipant** (p. 948) when there are no other DomainParticipants in the **com.rti.dds.domain.DomainParticipantFactory** (p. 1039).

Parameters

configuration_name	<<***in***>> *(p. 404)* Name of the participant configuration in the XML file.
params	<<***in***>> *(p. 404)* input parameters that allow changing some properties of the configuration
Generated by Doxygen	referred to by `configuration_name`.

Returns

The created **com.rti.dds.domain.DomainParticipant** (p. 948) or NULL on error.

8.82.2.35 lookup_participant_by_name()

```
abstract  DomainParticipant lookup_participant_by_name (
             String participant_name )  [abstract]
```

<<***extension***>> *(p. 403)* Looks up a **com.rti.dds.domain.DomainParticipant** (p. 948) by its entity name in the **com.rti.dds.domain.DomainParticipantFactory** (p. 1039).

Every **com.rti.dds.domain.DomainParticipant** (p. 948) in the system has an entity name which is configured and stored in the EntityName policy, **ENTITY_NAME** (p. 485).

This operation retrieves a **com.rti.dds.domain.DomainParticipant** (p. 948) within the **com.rti.dds.domain.Domain↩ ParticipantFactory** (p. 1039) given the entity's name. If there are several **com.rti.dds.domain.DomainParticipant** (p. 948) with the same name within the **com.rti.dds.domain.DomainParticipantFactory** (p. 1039) this function returns the first matching occurrence.

Parameters

participant_name	<<***in***>> *(p. 404)* Entity name of the **com.rti.dds.domain.DomainParticipant** (p. 948). Cannot be null.

Returns

The first **com.rti.dds.domain.DomainParticipant** (p. 948) found with the specified name or NULL if it is not found.

8.82.2.36 register_type_support()

```
abstract void register_type_support (
              TypeSupport type_support,
             String type_name )  [abstract]
```

<<***extension***>> *(p. 403)* Registers a **com.rti.dds.topic.TypeSupport** (p. 2252) with the **com.rti.dds.domain.↩ DomainParticipantFactory** (p. 1039) to enable automatic registration if the corresponding type, should it be needed by a **com.rti.dds.domain.DomainParticipant** (p. 948).

Types refered by the **com.rti.dds.topic.Topic** (p. 2116) entities within a **com.rti.dds.domain.DomainParticipant** (p. 948) must be registered with the **com.rti.dds.domain.DomainParticipant** (p. 948).

Type registration in a **com.rti.dds.domain.DomainParticipant** (p. 948) is performed by a call to the **com.rti.ndds.↩ example.FooTypeSupport.register_type** (p. 1411) operation. This can be done directly from the application code or indirectly by the RTI Connext infrastructure as a result of parsing an XML configuration file that refers to that type.

The **com.rti.dds.domain.DomainParticipantFactory.register_type_support** (p. 1064) operation provides the **com.↩ rti.dds.domain.DomainParticipantFactory** (p. 1039) with the information it needs to automatically call the **com.rti.↩ ndds.example.FooTypeSupport.register_type** (p. 1411) operation and register the corresponding type if the type is needed as a result of parsing an XML configuration file.

Automatic type registration while parsing XML files can also be done by the RTI Connext infrastructure based on the type description provided in the XML files. If the **com.rti.dds.topic.TypeSupport** (p. 2252) has been registered with the **com.rti.dds.domain.DomainParticipantFactory** (p. 1039) this definition takes precedence over the description of the type given in the XML file.

The **com.rti.dds.domain.DomainParticipantFactory.register_type_support** (p. 1064) operation receives a **com.↩ rti.ndds.example.FooTypeSupport** (p. 1410) object as a parameter. This object's class is normally generated using rtiddsgen from a description of the corresponsing type in IDL, XML, or XSD.

The typical workflow when using this function is as follows: Define the data-type in IDL (or XML, or XSD) in a file. E.g. Foo.idl Run rtiddsgen in that file to generate the TypeSupport files, for the desired programming language. E.g. in C++ FooTypeSupport.h FooTypeSupport.cxx Include the proper header file (e.g. FooTypeSupport.h) in your program and call **com.rti.dds.domain.DomainParticipantFactory.register_type_support** (p. 1064) passing the function that was generated by rtiddsgen. E.g. FooTypeSupport::register_type Include the TypeSupport source file in your project such that it is compiled and linked. E.g. FooTypeSupport.cxx

You may refer to the `Getting Started Guide` for additional details in this process.

Note that only one register function is allowed per registered type name.

Parameters

type_support	*<<**in**>> (p. 404)* **com.rti.dds.topic.TypeSupport** (p. 2252) object to be used for registering the type with a **com.rti.dds.domain.DomainParticipant** (p. 948).

Parameters

type_name	*<<**in**>> (p. 404)* Name the type is registered with.

Exceptions

One	of the **Standard Return Codes** (p. 513)

8.83 DomainParticipantFactoryQos Class Reference

QoS policies supported by a **com.rti.dds.domain.DomainParticipantFactory** (p. 1039).

Inheritance diagram for DomainParticipantFactoryQos:

8.83.1 Detailed Description

QoS policies supported by a **com.rti.dds.domain.DomainParticipantFactory** (p. 1039).

Entity:

com.rti.dds.domain.DomainParticipantFactory (p. 1039)

See also

All QoS Policies (p. 501) and allowed ranges within each Qos.

8.83.2 Member Function Documentation

8.83.2.1 toString() [1/4]

```
String toString ( )
```

Overrides the builtin Object.toString method.

The various **toString()** (p. 1066) overloads allow formatting the output and printing only the differences with respect to another **DomainParticipantFactoryQos** (p. 1065) object.

```
DomainParticipantFactoryQos qos = new DomainParticipantFactoryQos();
String theString = new String();
// The most basic version of the API simply overrides the builtin
// Object.toString method. Only the differences with respect to the
// documented default are printed to the string. The string is formatted
// according to the default values for QosPrintFormat.
theString = qos.toString();
// This overload allows us to specify a base profile. Only the differences
// with respect to this base profile are printed to the string. If the two
// Qos objects are equal, the resultant string will be empty.
DomainParticipantFactoryQos baseQos = new DomainParticipantFactoryQos(); // ...;
theString = qos.toString(baseQos);
// It is also possible to supply a custom format at this point
QosPrintFormat printFormat = new QosPrintFormat(); // ...;
theString = qos.toString(baseQos, format);
// The sentinel value DOMAINPARTICIPANTFACTORY_QOS_PRINT_ALL can be used as
// the base in order to print the entire qos object
theString = qos.toString(DOMAINPARTICIPANTFACTORY_QOS_PRINT_ALL);
```

This overload uses the default print format and only prints the differences between the supplied **DomainParticipant↩ FactoryQos** (p. 1065) and the documented default.

Returns

The string representation of the Qos.

References **DomainParticipantFactoryQos.toString()**.

Referenced by **DomainParticipantFactoryQos.toString()**.

8.83.2.2 toString() [2/4]

```
String toString (
            DomainParticipantFactoryQos baseQos,
            QosPrintFormat format )
```

Obtains a string representation of a **DomainParticipantFactoryQos** (p. 1065) object.

Parameters

format	The print format used to format the output.
baseQos	Only the differences between baseQos and the Qos object are included in the output string. If you want to print everything within the Qos, use the **com.rti.dds.domain.DomainParticipant.DOMAINPARTICIPANTFACTORY_QOS_PRINT_ALL** (p. 51) sentinel value.

This overload prints the differences between the qos and the supplied baseQos. The output string is formatted using the supplied **com.rti.dds.infrastructure.QosPrintFormat** (p. 1809).

Returns

The string representation of the Qos.

References **DomainParticipant.DOMAINPARTICIPANTFACTORY_QOS_PRINT_ALL**.

8.83.2.3 toString() [3/4]

```
String toString (
              QosPrintFormat format )
```

Obtains a string representation of a **DomainParticipantFactoryQos** (p. 1065) object.

Parameters

format	The print format used to format the output.

This overload prints the differences between the qos and the documented. default. The output string is formatted using the supplied **com.rti.dds.infrastructure.QosPrintFormat** (p. 1809).

Returns

The string representation of the Qos.

References **DomainParticipantFactoryQos.toString()**.

8.83.2.4 toString() [4/4]

```
String toString (
              DomainParticipantFactoryQos baseQos )
```

Obtains a string representation of a **DomainParticipantFactoryQos** (p. 1065) object.

Parameters

baseQos	Only the differences between baseQos and the Qos object are included in the output string. If you want to print everything within the Qos, use the **com.rti.dds.domain.DomainParticipant.DOMAINPARTICIPANTFACTORY_QOS_PRINT_ALL** (p. 51) sentinel value.

This overload prints the differences between the qos and the supplied baseQos. The output string is formatted using the default value for **com.rti.dds.infrastructure.QosPrintFormat** (p. 1809).

Returns

The string representation of the Qos.

References **DomainParticipantFactoryQos.toString()**.

8.83.3 Member Data Documentation

8.83.3.1 entity_factory

```
final EntityFactoryQosPolicy entity_factory
```

Entity factory policy, **ENTITY_FACTORY** (p. 484).

8.83.3.2 resource_limits

```
final SystemResourceLimitsQosPolicy resource_limits
```

<<***extension***>> *(p. 403)* System resource limits, **SYSTEM_RESOURCE_LIMITS** (p. 518).

Note: This QoS policy cannot be configured from XML configuration files.

8.83.3.3 profile

```
final ProfileQosPolicy profile
```

<<***extension***>> *(p. 403)* Qos profile policy, **PROFILE** (p. 498).

Note: This QoS policy cannot be configured from XML configuration files.

8.83.3.4 logging

```
final LoggingQosPolicy logging
```

<<***extension***>> *(p. 403)* Logging qos policy, **LOGGING** (p. 491).

8.83.3.5 monitoring

```
final MonitoringQosPolicy monitoring
```

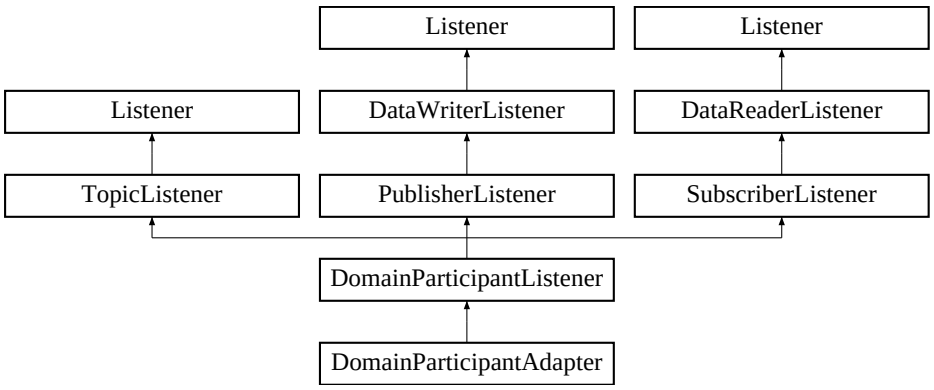
<<***extension***>> *(*p. *403)* Monitoring qos policy, **MONITORING** (p. 492).

This QoS policy is used to collect and emit telemetry data of a Connext application using RTI Monitoring Library 2.0.

8.84 DomainParticipantListener Interface Reference

<<***interface***>> *(*p. *403)* Listener for participant status.

Inheritance diagram for DomainParticipantListener:



Public Member Functions

- void **on_invalid_local_status_advance_notice** (**DomainParticipant** participant, InvalidLocalAdvanceNotice↩ Status invalidLocalAdvanceNoticeStatus)

  *Notifies the user that one of the local **com.rti.dds.domain.DomainParticipant** (*p. *948) trusted artifacts (identity or permissions) is about to expire.*

8.84.1 Detailed Description

<<***interface***>> *(*p. *403)* Listener for participant status.

Entity:

com.rti.dds.domain.DomainParticipant (p. 948)

Status:

Status Kinds (p. 514)

This is the interface that can be implemented by an application-provided class and then registered with the **com.rti.dds.domain.DomainParticipant** (p. 948) such that the application can be notified by RTI Connext of relevant status changes.

The **com.rti.dds.domain.DomainParticipantListener** (p. 1070) interface extends all other Listener interfaces and has no additional operation beyond the ones defined by the more general listeners.

The purpose of the **com.rti.dds.domain.DomainParticipantListener** (p. 1070) is to be the listener of last resort that is notified of all status changes not captured by more specific listeners attached to the **com.rti.dds.infrastructure.DomainEntity** (p. 947) objects. When a relevant status change occurs, RTI Connext will first attempt to notify the listener attached to the concerned **com.rti.dds.infrastructure.DomainEntity** (p. 947) if one is installed. Otherwise, RTI Connext will notify the Listener attached to the **com.rti.dds.domain.DomainParticipant** (p. 948).

Important: Because a **com.rti.dds.domain.DomainParticipantListener** (p. 1070) may receive callbacks pertaining to many different entities, it is possible for the same listener to receive multiple callbacks simultaneously in different threads. (Such is not the case for listeners of other types.) It is therefore critical that users of this listener provide their own protection for any thread-unsafe activities undertaken in a **com.rti.dds.domain.DomainParticipantListener** (p. 1070) callback.

Note: Due to a thread-safety issue, the destruction of a **DomainParticipantListener** (p. 1070) from an enabled **DomainParticipant** (p. 948) should be avoided – even if the **DomainParticipantListener** (p. 1070) has been removed from the **DomainParticipant** (p. 948). (This limitation does not affect the Java API.)

com.rti.dds.infrastructure.Listener (p. 1528)

com.rti.dds.domain.DomainParticipant.set_listener (p. 996)

8.84.2 Member Function Documentation

8.84.2.1 on_invalid_local_status_advance_notice()

```
void on_invalid_local_status_advance_notice (
              DomainParticipant participant,
             InvalidLocalAdvanceNoticeStatus invalidLocalAdvanceNoticeStatus )
```

Notifies the user that one of the local **com.rti.dds.domain.DomainParticipant** (p. 948) trusted artifacts (identity or permissions) is about to expire.

Implemented in **DomainParticipantAdapter** (p. 1029).

8.85 DomainParticipantProtocolStatus Class Reference

<<***extension***>> *(p. 403)* The status of a participant's protocol related metrics, like the number of corrupted messages, change in corrupted messages and timestamp of the last corrupted message.

Inherits Struct.

Public Attributes

- long **corrupted_rtps_message_count**

  The number of corrupted RTPS messages detected by the domain participant.
- long **corrupted_rtps_message_count_change**

  The incremental change in the number of corrupted RTPS messages detected by the domain participant since the last time the status was read.
- **Time_t last_corrupted_message_timestamp**

  The timestamp when the last corrupted RTPS message was detected by the domain participant.

8.85.1 Detailed Description

<<***extension***>> *(p. 403)* The status of a participant's protocol related metrics, like the number of corrupted messages, change in corrupted messages and timestamp of the last corrupted message.

Entity:

com.rti.dds.domain.DomainParticipant (p. 948) The corrupted messages are detected by validating the received CRC. The participant protocol status can be obtained by enabling **com.rti.dds.infrastructure.WireProtocolQosPolicy.compute_crc** (p. 2307) and **com.rti.dds.infrastructure.WireProtocolQosPolicy.check_crc** (p. 2307) at the publishing and subscribing application respectively.

8.85.2 Member Data Documentation

8.85.2.1 corrupted_rtps_message_count

```
long corrupted_rtps_message_count
```

The number of corrupted RTPS messages detected by the domain participant.

Counts the corrupted RTPS messages received by the participant. It includes messages belonging to discovery and user traffic.

8.85.2.2 corrupted_rtps_message_count_change

```
long corrupted_rtps_message_count_change
```

The incremental change in the number of corrupted RTPS messages detected by the domain participant since the last time the status was read.

8.85.2.3 last_corrupted_message_timestamp

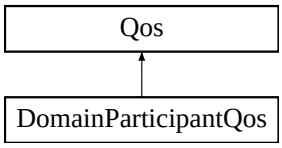
```
Time_t last_corrupted_message_timestamp
```

The timestamp when the last corrupted RTPS message was detected by the domain participant.

8.86 DomainParticipantQos Class Reference

QoS policies supported by a **com.rti.dds.domain.DomainParticipant** (p. 948) entity.

Inheritance diagram for DomainParticipantQos:



Public Member Functions

- String **toString** ()

  Overrides the builtin Object.toString method.
- String **toString** (**DomainParticipantQos** baseQos, **QosPrintFormat** format)

  *Obtains a string representation of a **DomainParticipantQos** (p. 1073) object.*
- String **toString** (**QosPrintFormat** format)

  *Obtains a string representation of a **DomainParticipantQos** (p. 1073) object.*
- String **toString** (**DomainParticipantQos** baseQos)

  *Obtains a string representation of a **DomainParticipantQos** (p. 1073) object.*

8.86.1 Detailed Description

QoS policies supported by a **com.rti.dds.domain.DomainParticipant** (p. 948) entity.

Certain members must be set in a consistent manner:

Length of **com.rti.dds.domain.DomainParticipantQos.user_data** (p. 1077) .value <= **com.rti.dds.domain.↩ DomainParticipantQos.resource_limits** (p. 1078) .participant_user_data_max_length

For **com.rti.dds.domain.DomainParticipantQos.discovery_config** (p. 1079) .publication_writer high_watermark <= **com.rti.dds.domain.DomainParticipantQos.resource_limits** (p. 1078) .local_writer_allocation .max_count heartbeats_per_max_samples <= **com.rti.dds.domain.DomainParticipantQos.resource_limits** (p. 1078) .local_writer_allocation.max_count

For **com.rti.dds.domain.DomainParticipantQos.discovery_config** (p. 1079) .suscription_writer high_watermark <= **com.rti.dds.domain.DomainParticipantQos.resource_limits** (p. 1078) .local_reader_allocation.max_count heartbeats_per_max_samples <= **com.rti.dds.domain.DomainParticipantQos.resource_limits** (p. 1078) .local_reader_allocation.max_count

If any of the above are not true, **com.rti.dds.domain.DomainParticipant.set_qos** (p. 992) and **com.rti.dds.domain.DomainParticipant.set_qos_with_profile** (p. 992) and **com.rti.dds.domain.DomainParticipantFactory.set_default_participant_qos** (p. 1046) will fail with **com.rti.dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901), and **com.rti.dds.domain.DomainParticipantFactory.create_participant** (p. 1043) will fail.

Entity:

com.rti.dds.domain.DomainParticipant (p. 948)

See also

All QoS Policies (p. 501) and allowed ranges within each Qos.

NDDS_DISCOVERY_PEERS (p. 472)

8.86.2 Member Function Documentation

8.86.2.1 toString() [1/4]

```
String toString ( )
```

Overrides the builtin Object.toString method.

The various **toString()** (p. 1075) overloads allow formatting the output and printing only the differences with respect to another **DomainParticipantQos** (p. 1073) object.

```
DomainParticipantQos qos = new DomainParticipantQos();
String theString = new String();
// The most basic version of the API simply overrides the builtin
// Object.toString method. Only the differences with respect to the
// documented default are printed to the string. The string is formatted
// according to the default values for QosPrintFormat.
theString = qos.toString();
// This overload allows us to specify a base profile. Only the differences
// with respect to this base profile are printed to the string. If the two
// Qos objects are equal, the resultant string will be empty.
DomainParticipantQos baseQos = new DomainParticipantQos(); // ...;
theString = qos.toString(baseQos);
// It is also possible to supply a custom format at this point
QosPrintFormat printFormat = new QosPrintFormat(); // ...;
theString = qos.toString(baseQos, format);
// The sentinel value DOMAINPARTICIPANT_QOS_PRINT_ALL can be used as
// the base in order to print the entire qos object
theString = qos.toString(DOMAINPARTICIPANT_QOS_PRINT_ALL);
```

This overload uses the default print format and only prints the differences between the supplied **DomainParticipantQos** (p. 1073) and the documented default.

Returns

The string representation of the Qos.

References **DomainParticipantQos.toString()**.

Referenced by **DomainParticipantQos.toString()**.

8.86.2.2 toString() [2/4]

```
String toString (
              DomainParticipantQos baseQos,
              QosPrintFormat format )
```

Obtains a string representation of a **DomainParticipantQos** (p. 1073) object.

Parameters

format	The print format used to format the output.
baseQos	Only the differences between baseQos and the Qos object are included in the output string. If you want to print everything within the Qos, use the **com.rti.dds.domain.DomainParticipant.DOMAINPARTICIPANT_QOS_PRINT_ALL** (p. 50) sentinel value.

This overload prints the differences between the qos and the supplied baseQos. The output string is formatted using the supplied **com.rti.dds.infrastructure.QosPrintFormat** (p. 1809).

Returns

The string representation of the Qos.

References **DomainParticipant.DOMAINPARTICIPANT_QOS_PRINT_ALL**.

8.86.2.3 toString() [3/4]

```
String toString (
              QosPrintFormat format )
```

Obtains a string representation of a **DomainParticipantQos** (p. 1073) object.

Parameters

format	The print format used to format the output.

This overload prints the differences between the qos and the documented. default. The output string is formatted using the supplied **com.rti.dds.infrastructure.QosPrintFormat** (p. 1809).

Returns

The string representation of the Qos.

References **DomainParticipantQos.toString()**.

8.86.2.4 toString() [4/4]

```
String toString (
              DomainParticipantQos baseQos )
```

Obtains a string representation of a **DomainParticipantQos** (p. 1073) object.

Parameters

baseQos	Only the differences between baseQos and the Qos object are included in the output string. If you want to print everything within the Qos, use the **com.rti.dds.domain.DomainParticipant.DOMAINPARTICIPANT_QOS_PRINT_ALL** (p. 50) sentinel value.

This overload prints the differences between the qos and the supplied baseQos. The output string is formatted using the default value for **com.rti.dds.infrastructure.QosPrintFormat** (p. 1809).

Returns

The string representation of the Qos.

References **DomainParticipantQos.toString()**.

8.86.3 Member Data Documentation

8.86.3.1 user_data

```
final  UserDataQosPolicy user_data
```

User data policy, **USER_DATA** (p. 530).

8.86.3.2 entity_factory

```
final  EntityFactoryQosPolicy entity_factory
```

<<***basic***>> *(*p. *123)* Entity factory policy, **ENTITY_FACTORY** (p. 484).

8.86.3.3 wire_protocol

```
final  WireProtocolQosPolicy wire_protocol
```

<<***extension***>> *(*p. *403)* Wire Protocol policy, **WIRE_PROTOCOL** (p. 532).

The wire protocol (RTPS) attributes associated with the participant.

8.86.3.4 transport_builtin

```
final  TransportBuiltinQosPolicy transport_builtin
```

<<***extension***>> *(*p. *403)* Transport Builtin policy, **TRANSPORT_BUILTIN** (p. 521).

8.86.3.5 default_unicast

```
final  TransportUnicastQosPolicy default_unicast
```

<<***extension***>> *(*p. *403)* Default Unicast Transport policy, **TRANSPORT_UNICAST** (p. 528).

8.86.3.6 discovery

```
final  DiscoveryQosPolicy discovery
```

<<***extension***>> *(*p. *403)* Discovery policy, **DISCOVERY** (p. 470).

8.86.3.7 resource_limits

```
final  DomainParticipantResourceLimitsQosPolicy resource_limits
```

<<***extension***>> *(*p. *403)* Domain participant resource limits policy, **DOMAIN_PARTICIPANT_RESOURCE_LIMITS** (p. 479).

8.86.3.8 event

```
final EventQosPolicy event
```

<<***extension***>> *(*p. *403)* Event policy, **EVENT** (p. 485).

8.86.3.9 receiver_pool

```
final ReceiverPoolQosPolicy receiver_pool
```

<<***extension***>> *(*p. *403)* Receiver pool policy, **RECEIVER_POOL** (p. 509).

8.86.3.10 database

```
final DatabaseQosPolicy database
```

<<***extension***>> *(*p. *403)* Database policy, **DATABASE** (p. 460).

8.86.3.11 discovery_config

```
final DiscoveryConfigQosPolicy discovery_config
```

<<***extension***>> *(*p. *403)* Discovery config policy, **DISCOVERY_CONFIG** (p. 468).

8.86.3.12 property

```
final PropertyQosPolicy property
```

<<***basic***>> *(*p. *123)* <<***extension***>> *(*p. *403)* Property policy, **PROPERTY** (p. 499). See also `Property Reference Guide`.

8.86.3.13 participant_name

```
final EntityNameQosPolicy participant_name
```

<<***basic***>> *(*p. *123)* <<***extension***>> *(*p. *403)* The participant name. **ENTITY_NAME** (p. 485)

8.86.3.14 service

```
final ServiceQosPolicy service
```

<<***extension***>> *(*p. *403)* The service qos policy. **SERVICE** (p. 514)

8.86.3.15 type_support

```
final TypeSupportQosPolicy type_support
```

<<***extension***>> *(*p. *403)* Type support data, **TYPESUPPORT** (p. 529).

Optional value that is passed to a type plugin's on_participant_attached function.

8.86.3.16 multicast_mapping

```
final TransportMulticastMappingQosPolicy multicast_mapping
```

<<***extension***>> *(*p. *403)* The multicast mapping policy. **TRANSPORT_MULTICAST_MAPPING** (p. 524)

8.86.3.17 partition

```
final PartitionQosPolicy partition
```

<<***basic***>> *(*p. *123)* <<***extension***>> *(*p. *403)* The partition qos policy. **PARTITION** (p. 496)

8.87 DomainParticipantResourceLimitsIgnoredEntityReplacementKind Class Reference

Available replacement policies for the ignored entities.

8.88.1 Detailed Description

<<***extension***>> *(*p. *138)* Various settings that configure how a **com.rti.dds.domain.DomainParticipant** (p. 948) allocates and uses physical memory for internal resources, including the maximum sizes of various properties.

This QoS policy sets maximum size limits on variable-length parameters used by the participant and its contained Entities. It also controls the initial and maximum sizes of data structures used by the participant to store information about locally-created and remotely-discovered entities (such as DataWriters/DataReaders), as well as parameters used by the internal database to size the hash tables it uses.

By default, a **com.rti.dds.domain.DomainParticipant** (p. 948) is allowed to dynamically allocate memory as needed as users create local Entities such as **com.rti.dds.publication.DataWriter** (p. 818) and **com.rti.dds.subscription.Data↩ Reader** (p. 707) or as the participant discovers new applications to store their information. By setting fixed values for the maximum parameters in this **QosPolicy** (p. 1802), you can bound the memory that can be allocated by a Domain↩ Participant. In addition, by setting the initial values to the maximum values, you can reduce the amount of memory allocated by DomainParticipants after the initialization period. Notice that memory can still be allocated dynamically after the initialization period. For example, when a new local **com.rti.dds.publication.DataWriter** (p. 818) or **com.rti.↩ dds.subscription.DataReader** (p. 707) is created, the initial memory required for its queue is allocated dynamically.

The maximum sizes of different variable-length parameters such as the number of partitions that can be stored in the **com.rti.dds.infrastructure.PartitionQosPolicy** (p. 1664), the maximum length of data store in the **com.rti.dds.↩ infrastructure.UserDataQosPolicy** (p. 2272) and **com.rti.dds.infrastructure.GroupDataQosPolicy** (p. 1419), and many others can be changed from their defaults using this QoS policy. However, it is important that all Domain↩ Participants that need to communicate with each other use the *same set* of maximum values. Otherwise, when these parameters are propagated from one **com.rti.dds.domain.DomainParticipant** (p. 948) to another, a **com.rti.dds.↩ domain.DomainParticipant** (p. 948) with a smaller maximum length may reject the parameter, resulting in an error.

An important parameter in this QoS policy that is often changed by users is **com.rti.dds.infrastructure.Domain↩ ParticipantResourceLimitsQosPolicy.type_object_max_serialized_length** (p. 1099).

This QoS policy is an extension to the DDS standard.

Entity:

com.rti.dds.domain.DomainParticipant (p. 948)

Properties:

RxO (p. 506) = N/A
Changeable (p. 507) = **NO** (p. 507)

Immutable (p. 292), **Middleware Memory Management** (p. 244), **Discovery Isolation** (p. 220)

8.88.2.41 type_code_max_serialized_length

```
int type_code_max_serialized_length
```

[DEPRECATED] (p. **358)** <<***extension***>> *(*p. *138)* Maximum size of serialized string for type code.

This parameter is an alternative to **com.rti.dds.infrastructure.DomainParticipantResourceLimitsQosPolicy.type_object_max_serialized_length** (p. 1099) for limiting the size of the type code that a **com.rti.dds.domain.DomainParticipant** (p. 948) is able to store and propagate for user data types. Type codes can be used by external applications to understand user data types without having the data type predefined in compiled form. However, since type codes contain all of the information of a data structure, including the strings that define the names of the members of a structure, complex data structures can result in large type codes. So it is common for users to set this parameter to a large value, if used (by default, it is set to 0). However, as with all parameters in this QoS policy defining maximum sizes for variable-length elements, all DomainParticipants in the same domain should use the same value for this parameter.

Note: TypeObject v2 is now the standard, and default, method of exchanging type information in RTI Connext. It is recommended to keep **com.rti.dds.infrastructure.DiscoveryConfigBuiltinChannelKind.TYPE_LOOKUP_SERVICE_CHANNEL** (p. 912) in **com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.enabled_builtin_channels** (p. 928) enabled in DomainParticipants requiring type information.

int type_object_max_serialized_length
```

<<***extension***>> *(*p. *138)* The maximum length, in bytes, that the buffer to serialize a TypeObject v1 can consume.

Type codes contain complete information about a data structure, including all member names; as a result, complex data structures can produce large type codes. This parameter limits the size of the resulting TypeObject v1 that a DomainParticipant is able to propagate.

If this parameter is set to a value between 1 and 0x7fffffff, the DomainParticipant will propagate TypeObject v1 for types that don't exceed the specified size. The desired size for a given **com.rti.dds.typecode.TypeCode** (p. 2183) can be obtained using **com.rti.dds.typecode.TypeCode.get_type_object_serialized_size** (p. 2224). If **com.rti.dds.infrastructure.DiscoveryConfigBuiltinChannelKind.TYPE_LOOKUP_SERVICE_CHANNEL** (p. 912) is also enabled, both TypeObject v1 and TypeObject v2 will be propagated (TypeObject v2s are not subject to this size limit).

If set to **com.rti.dds.infrastructure.ReceiverPoolQosPolicy.LENGTH_AUTO** (p. 509), the DomainParticipant will not propagate TypeObject v1. If **com.rti.dds.infrastructure.DiscoveryConfigBuiltinChannelKind.TYPE_LOOKUP_SERVICE_CHANNEL** (p. 912) is also enabled, only TypeObject v2 will be propagated.

If explicitly set to 0, the DomainParticipant won't propagate any TypeObject (neither TypeObject v1 nor TypeObject v2), regardless of whether **com.rti.dds.infrastructure.DiscoveryConfigBuiltinChannelKind.TYPE_LOOKUP_SERVICE_CHANNEL** (p. 912) is enabled.

Note: TypeObject v2 is now the standard, and default, method of exchanging type information in RTI Connext. It is recommended to enable **com.rti.dds.infrastructure.DiscoveryConfigBuiltinChannelKind.TYPE_LOOKUP_SERVICE_CHANNEL** (p. 912) in **com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.enabled_builtin_channels** (p. 928) in DomainParticipants requiring type validation.

[default] com.rti.dds.infrastructure.ReceiverPoolQosPolicy.LENGTH_AUTO (p. 509)

[range] [0,0x7fffffff], or **com.rti.dds.infrastructure.ReceiverPoolQosPolicy.LENGTH_AUTO** (p. 509)

Categories

Immutable (p. 292), **Middleware Memory Management** (p. 244), **Type System** (p. 289)

8.88.2.43 serialized_type_object_dynamic_allocation_threshold

```
int serialized_type_object_dynamic_allocation_threshold
```

<<***extension***>> *(*p. *138)* A threshold, in bytes, for dynamic memory allocation for the serialized TypeObject v1.

Above this threshold, the memory for a TypeObject v1 is allocated dynamically. Below it, the memory is obtained from a pool of fixed-size buffers. The size of the buffers is equal to this threshold.

The effective threshold value used by the middleware is determined as follows:

- If **com.rti.dds.infrastructure.DomainParticipantResourceLimitsQosPolicy.type_object_max_serialized_length** (p. 1099) is **com.rti.dds.infrastructure.ReceiverPoolQosPolicy.LENGTH_AUTO** (p. 509) or 0, the effective threshold is 0 (no pre-allocated buffers).
- If this threshold is set to **com.rti.dds.infrastructure.ReceiverPoolQosPolicy.LENGTH_AUTO** (p. 509) and **com.rti.dds.infrastructure.DomainParticipantResourceLimitsQosPolicy.type_object_max_serialized_length** (p. 1099) is set to a specific value, the effective threshold is min(type_object_max_serialized_length, 8192).
- If the specified threshold exceeds type_object_max_serialized_length, it is automatically capped and adjusted down to match the maximum serialized length.

If **com.rti.dds.infrastructure.DiscoveryConfigBuiltinChannelKind.TYPE_LOOKUP_SERVICE_CHANNEL** (p. 912) is also enabled, this threshold does not affect memory allocation of TypeObject v2s.

[default] com.rti.dds.infrastructure.ReceiverPoolQosPolicy.LENGTH_AUTO (p. 509)

[range] [0,0x7fffffff], or **com.rti.dds.infrastructure.ReceiverPoolQosPolicy.LENGTH_AUTO** (p. 509)

Categories

Immutable (p. 292), **Middleware Memory Management** (p. 244), **Type System** (p. 289)

8.88.2.44 type_object_max_deserialized_length

```
int type_object_max_deserialized_length
```

<<***extension***>> *(p. 138)* The maximum number of bytes that a deserialized TypeObject v1 can consume.

This parameter limits the size of the TypeObject v1 that a DomainParticipant is able to store.

Setting this field to 0 disables the ability of a DomainParticipant to receive TypeObject v1.

If **com.rti.dds.infrastructure.DiscoveryConfigBuiltinChannelKind.TYPE_LOOKUP_SERVICE_CHANNEL** (p. 912) is also enabled, the DomainParticipant will always send/receive TypeObject v2 (deserialized TypeObject v2s are not subject to this size limit), but will only receive TypeObject v1 if this parameter is set to a value greater than 0.

[default] com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED (p. 511)

[range] [0,0x7fffffff] or **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511)

Categories

Immutable (p. 292), **Middleware Memory Management** (p. 244), **Type System** (p. 289)

8.88.2.45 deserialized_type_object_dynamic_allocation_threshold

```
int deserialized_type_object_dynamic_allocation_threshold
```

<<***extension***>> *(p. 138)* A threshold, in bytes, for dynamic memory allocation for the deserialized TypeObject v1.

Above this threshold, the memory for a TypeObject v1 is allocated dynamically. Below it, the memory is obtained from a pool of fixed-size buffers. The size of the buffers is equal to this threshold.

In case **com.rti.dds.infrastructure.DomainParticipantResourceLimitsQosPolicy.type_object_max_deserialized_length** (p. 1101) is different than **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511) and is smaller than **com.rti.dds.infrastructure.DomainParticipantResourceLimitsQosPolicy.deserialized_type_object_dynamic_allocation_threshold** (p. 1101), **com.rti.dds.infrastructure.DomainParticipantResourceLimitsQosPolicy.deserialized_type_object_dynamic_allocation_threshold** (p. 1101) will be adjusted to **com.rti.dds.infrastructure.DomainParticipantResourceLimitsQosPolicy.type_object_max_deserialized_length** (p. 1101).

If **com.rti.dds.infrastructure.DiscoveryConfigBuiltinChannelKind.TYPE_LOOKUP_SERVICE_CHANNEL** (p. 912) is also enabled, this threshold does not affect memory allocation of TypeObject v2s.

[default] 4096

[range] [0,0x7fffffff] <= **com.rti.dds.infrastructure.DomainParticipantResourceLimitsQosPolicy.type_object_max_deserialized_length** (p. 1101)

Categories

Immutable (p. 292), **Middleware Memory Management** (p. 244), **Type System** (p. 289)

8.88.2.46 contentfilter_property_max_length

```
int contentfilter_property_max_length
```

<<***extension***>> *(p. 138)* This field is the maximum length of all data related to a Content-filtered topic.

This is the sum of the length of the ContentFilteredTopic name, the length of the related topic name, the length of the filter expression, the length of the filter parameters, and the length of the filter name. The maximum number of combined characters should account for a terminating NULL ('\0') character for each string.

[default] 256

[range] [0,0xffff]

Categories

Immutable (p. 292), **Middleware Memory Management** (p. 244), **Content Filtering** (p. 198)

8.88.2.47 channel_seq_max_length

```
int channel_seq_max_length
```

<<***extension***>> *(p. 138)* Maximum number of channels that can be specified in **com.rti.dds.infrastructure.Multi↩ ChannelQosPolicy** (p. 1616) for MultiChannel DataWriters.

[default] 32

[range] [0,0xffff]

Categories

Immutable (p. 292), **Middleware Memory Management** (p. 244), **Content Filtering** (p. 198)

8.88.2.48 channel_filter_expression_max_length

```
int channel_filter_expression_max_length
```

<<***extension***>> *(p. 138)* Maximum length of a channel **com.rti.dds.infrastructure.ChannelSettings_t.filter_↩ expression** (p. 668) in a MultiChannel DataWriter.

The length should account for a terminating NULL ('\0') character.

[default] 256

[range] [0,0xffff]

8.89 DoubleSeq Class Reference

Instantiates `com.rti.dds.infrastructure.com.rti.dds.util.Sequence` < double >

Inheritance diagram for DoubleSeq:

Public Member Functions

- **DoubleSeq** ()

  Constructs an empty sequence of doubles with an initial maximum of zero.
- **DoubleSeq** (int initialMaximum)

  Constructs an empty sequence of doubles with the given initial maximum.
- **DoubleSeq** (double[ ] doubles)

  Constructs a new sequence containing the given doubles.
- final boolean **addAllDouble** (double[ ] elements, int offset, int length)

  Append `length` elements from the given array to this sequence, starting at index `offset` in that array.

- final boolean **addAllDouble** (double[ ] elements)
- final void **addDouble** (double element)

  Append the element to the end of the sequence.
- final void **addDouble** (int index, double element)

  Shift all elements in the sequence starting from the given index and add the element to the given index.
- final double **getDouble** (int index)

  Returns the double at the given index.
- final double **setDouble** (int index, double element)

  Set the new double at the given index and return the old double.
- final void **setDouble** (int dstIndex, double[ ] elements, int srcIndex, int length)

  Copy a portion of the given array into this sequence.
- final double[ ] **toArrayDouble** (double[ ] array)

  Return an array containing copy of the contents of this sequence.
- final int **getMaximum** ()

  Get the current maximum number of elements that can be stored in this sequence.
- final Object **get** (int index)

  *A wrapper for **getDouble(int)** (*p. *1112) that returns a java.lang.Double.*
- final Object **set** (int index, Object element)

  *A wrapper for **setDouble()** (*p. *1113).*
- final void **add** (int index, Object element)

  A wrapper for addDouble(int, int).

8.89.1 Detailed Description

com.rti.dds.infrastructure.com.rti.dds.util.Sequence

8.89.2 Constructor & Destructor Documentation

8.89.2.1 DoubleSeq() [1/3]

```
DoubleSeq ( )
```

Constructs an empty sequence of doubles with an initial maximum of zero.

8.89.2.2 DoubleSeq() [2/3]

```
DoubleSeq (
            int initialMaximum )
```

Constructs an empty sequence of doubles with the given initial maximum.

8.89.2.3 DoubleSeq() [3/3]

```
DoubleSeq (
            double[] doubles )
```

Constructs a new sequence containing the given doubles.

Parameters

doubles	the initial contents of this sequence

Exceptions

NullPointerException	if the input array is null

References **DoubleSeq.addAllDouble()**.

8.89.3 Member Function Documentation

8.89.3.1 addAllDouble() [1/2]

```
final boolean addAllDouble (
            double[] elements,
            int offset,
            int length )
```

Append `length` elements from the given array to this sequence, starting at index `offset` in that array.

Exceptions

NullPointerException	if the given array is null.

Referenced by **DoubleSeq.addAllDouble()**, and **DoubleSeq.DoubleSeq()**.

8.89.3.2 addAllDouble() [2/2]

```
final boolean addAllDouble (
            double[] elements )
```

Exceptions

NullPointerException	if the given array is null

References **DoubleSeq.addAllDouble()**.

8.89.3.3 addDouble() [1/2]

```
final void addDouble (
            double element )
```

Append the element to the end of the sequence.

Referenced by **DoubleSeq.add()**.

8.89.3.4 addDouble() [2/2]

```
final void addDouble (
            int index,
            double element )
```

Shift all elements in the sequence starting from the given index and add the element to the given index.

8.89.3.5 getDouble()

```
final double getDouble (
            int index )
```

Returns the double at the given index.

Exceptions

IndexOutOfBoundsException	if the index is out of bounds.

Referenced by **DoubleSeq.get()**.

8.89.3.6 setDouble() [1/2]

```
final double setDouble (
            int index,
            double element )
```

Set the new double at the given index and return the old double.

Exceptions

IndexOutOfBoundsException	if the index is out of bounds.

Referenced by **DoubleSeq.set()**.

8.89.3.7 setDouble() [2/2]

```
final void setDouble (
            int dstIndex,
            double[] elements,
            int srcIndex,
            int length )
```

Copy a portion of the given array into this sequence.

Parameters

dstIndex	the index at which to start copying into this sequence.
elements	an array of primitive elements.
srcIndex	the index at which to start copying from the given array.
length	the number of elements to copy.

Exceptions

IndexOutOfBoundsException	if copying would cause access of data outside array bounds.

8.89.3.8 toArrayDouble()

```
final double[] toArrayDouble (
            double[] array )
```

Return an array containing copy of the contents of this sequence.

Parameters

array	The array into which this sequence should be copied. It may be null. If it is, or if array length is too small, the array will be ignored, and a new array of the necessary length will be created and copied into instead.

Returns

A non-null array containing a copy of the contents of this sequence.

8.89.3.9 getMaximum()

```
final int getMaximum ( )
```

Get the current maximum number of elements that can be stored in this sequence.

The `maximum` of the sequence represents the maximum number of elements that the underlying buffer can hold. It does not represent the current number of elements.

The `maximum` is a non-negative number. It is initialized when the sequence is first created.

The `maximum` can be changed implicitly by adding an element to the sequence with **`add()`** (p. 1115), or explicitly by calling com.rti.dds.infrastructure.com.rti.dds.util.Sequence.Sequence.setMaximum.

Returns

the current maximum of the sequence.

See also

com.rti.dds.infrastructure.com.rti.dds.util.Sequence.Sequence.size()

Implements **Sequence** (p. 1974).

Referenced by **DynamicData.get_double_seq()**, and **DynamicData.set_double_seq()**.

8.89.3.10 get()

```
final Object get (
            int index )
```

A wrapper for **getDouble(int)** (p. 1112) that returns a java.lang.Double.

See also

java.util.List::get(int)

Reimplemented from **AbstractPrimitiveSequence** (p. 576).

References **DoubleSeq.getDouble()**.

8.89.3.11 set()

```
final Object set (
            int index,
            Object element )
```

A wrapper for **setDouble()** (p. 1113).

Exceptions

ClassCastException	if the element is not of type Double.

See also

java.util.List::set(int, java.lang.Object)

Reimplemented from **AbstractPrimitiveSequence** (p. 576).

References **DoubleSeq.setDouble()**.

8.89.3.12 add()

```
final void add (
            int index,
            Object element )
```

A wrapper for addDouble(int, int).

Exceptions

ClassCastException	if the element is not of type Double.

See also

java.util.List::add(int, java.lang.Object)

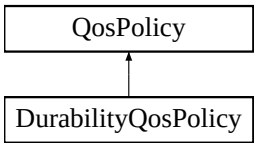
Reimplemented from **AbstractPrimitiveSequence** (p. 577).

References **DoubleSeq.addDouble()**.

8.90 DurabilityQosPolicy Class Reference

*<<**spec**>> (p. 132)* This QoS policy specifies whether or not RTI Connext will store and deliver previously published data samples to new **com.rti.dds.subscription.DataReader** (p. 707) entities that join the network later.

Inheritance diagram for DurabilityQosPolicy:



Public Attributes

- **DurabilityQosPolicyKind kind**

  *<<**basic**>> (p. 123) <<**spec**>> (p. 132) The kind of durability.*
- boolean **direct_communication**

  *<<**extension**>> (p. 138) Indicates whether or not a TRANSIENT or PERSISTENT **com.rti.dds.subscription.DataReader** (p. 707) should receive samples directly from a TRANSIENT or PERSISTENT **com.rti.dds.publication.DataWriter** (p. 818)*
- int **writer_depth**

  *<<**basic**>> (p. 123) <<**extension**>> (p. 138) Indicates the number of samples per instance that a durable **com.rti.dds.publication.DataWriter** (p. 818) will send to a late-joining **com.rti.dds.subscription.DataReader** (p. 707).*
- **PersistentStorageSettings storage_settings**

  *<<**extension**>> (p. 138) Configures durable writer history and durable reader state.*

Static Public Attributes

- static final int **AUTO_WRITER_DEPTH**

  *A special value used as the default value for **com.rti.dds.infrastructure.DurabilityQosPolicy.writer_depth** (p. 1119).*

8.90.1 Detailed Description

<<***spec***>> *(p. 132)* This QoS policy specifies whether or not RTI Connext will store and deliver previously published data samples to new **com.rti.dds.subscription.DataReader** (p. 707) entities that join the network later.

Entity:

com.rti.dds.topic.Topic (p. 2116), **com.rti.dds.subscription.DataReader** (p. 707), **com.rti.dds.publication.↩ DataWriter** (p. 818)

Status:

com.rti.dds.infrastructure.StatusKind.StatusKind.OFFERED_INCOMPATIBLE_QOS_STATUS, com.rti.dds.↩ infrastructure.StatusKind.StatusKind.REQUESTED_INCOMPATIBLE_QOS_STATUS

Properties:

RxO (p. 506) = YES
Changeable (p. 507) = **UNTIL ENABLE** (p. 507)

See also

DURABILITY_SERVICE (p. 482)

8.90.2 Usage

It is possible for a **com.rti.dds.publication.DataWriter** (p. 818) to start publishing data before all (or any) **com.rti.↩ dds.subscription.DataReader** (p. 707) entities have joined the network.

Moreover, a **com.rti.dds.subscription.DataReader** (p. 707) that joins the network after some data has been written could potentially be interested in accessing the most current values of the data, as well as potentially some history.

This policy makes it possible for a late-joining **com.rti.dds.subscription.DataReader** (p. 707) to obtain previously published samples.

By helping to ensure that DataReaders get all data that was sent by DataWriters, regardless of when it was sent, using this QoS policy can increase system tolerance to failure conditions.

Note that although related, this does not strictly control what data RTI Connext will maintain internally. That is, RTI Connext may choose to maintain some data for its own purposes (e.g., flow control) and yet not make it available to late-joining readers if the **DURABILITY** (p. 481) policy is set to com.rti.dds.infrastructure.DurabilityQosPolicyKind.↩ DurabilityQosPolicyKind.VOLATILE_DURABILITY_QOS.

8.90.2.1 Transient and Persistent Durability

For the purpose of implementing the DURABILITY QoS kind TRANSIENT or PERSISTENT, RTI Connext behaves *as if* for each Topic that has **com.rti.dds.infrastructure.DurabilityQosPolicy.kind** (p. 1119) of com.rti.dds.infrastructure.↩ DurabilityQosPolicyKind.DurabilityQosPolicyKind.TRANSIENT_DURABILITY_QOS or com.rti.dds.infrastructure.↩ DurabilityQosPolicyKind.DurabilityQosPolicyKind.PERSISTENT_DURABILITY_QOS there is a corresponding "built-in" **com.rti.dds.subscription.DataReader** (p. 707) and **com.rti.dds.publication.DataWriter** (p. 818) configured with the same DURABILITY kind. In other words, it is *as if* somewhere in the system, independent of the original **com.rti.dds.↩ publication.DataWriter** (p. 818), there is a built-in durable **com.rti.dds.subscription.DataReader** (p. 707) subscribing to that Topic and a built-in durable DataWriter re-publishing it as needed for the new subscribers that join the system. This functionality is provided by the *RTI Persistence Service*.

The Persistence Service can configure itself based on the QoS of your application's **com.rti.dds.publication.Data↩ Writer** (p. 818) and **com.rti.dds.subscription.DataReader** (p. 707) entities. For each transient or persistent **com.↩ rti.dds.topic.Topic** (p. 2116), the built-in fictitious Persistence Service **com.rti.dds.subscription.DataReader** (p. 707) and **com.rti.dds.publication.DataWriter** (p. 818) have their QoS configured from the QoS of your application's **com.↩ rti.dds.publication.DataWriter** (p. 818) and **com.rti.dds.subscription.DataReader** (p. 707) entities that communicate on that **com.rti.dds.topic.Topic** (p. 2116).

For a given **com.rti.dds.topic.Topic** (p. 2116), the usual request/offered semantics apply to the matching between any **com.rti.dds.publication.DataWriter** (p. 818) in the domain that writes the **com.rti.dds.topic.Topic** (p. 2116) and the built-in transient/persistent **com.rti.dds.subscription.DataReader** (p. 707) for that **com.rti.dds.topic.Topic** (p. 2116); similarly for the built-in transient/persistent **com.rti.dds.publication.DataWriter** (p. 818) for a **com.rti.dds.topic.Topic** (p. 2116) and any **com.rti.dds.subscription.DataReader** (p. 707) for the **com.rti.dds.topic.Topic** (p. 2116). As a consequence, a **com.rti.dds.publication.DataWriter** (p. 818) that has an incompatible QoS will not send its data to the *RTI Persistence Service*, and a **com.rti.dds.subscription.DataReader** (p. 707) that has an incompatible QoS will not get data from it.

Incompatibilities between local **com.rti.dds.subscription.DataReader** (p. 707) and **com.rti.dds.publication.Data↩ Writer** (p. 818) entities and the corresponding fictitious built-in transient/persistent entities cause the com.rti.dds.↩ infrastructure.StatusKind.StatusKind.REQUESTED_INCOMPATIBLE_QOS_STATUS and com.rti.dds.infrastructure.↩ StatusKind.StatusKind.OFFERED_INCOMPATIBLE_QOS_STATUS to change and the corresponding **Listener** (p. 1528) invocations and/or signaling of **com.rti.dds.infrastructure.Condition** (p. 686) objects as they would with your application's own entities.

The value of **com.rti.dds.infrastructure.DurabilityServiceQosPolicy.service_cleanup_delay** (p. 1124) controls when *RTI Persistence Service* is able to remove all information regarding a data instances.

Information on a data instance is maintained until the following conditions are met:

1. The instance has been explicitly disposed (instance_state = NOT_ALIVE_DISPOSED),

and

1. All samples for the disposed instance have been acknowledged, including the dispose sample itself,

and

1. A time interval longer that **com.rti.dds.infrastructure.DurabilityServiceQosPolicy.service_cleanup_delay** (p. 1124) has elapsed since the moment RTI Connext detected that the previous two conditions were met. (Note: Only values of zero or **com.rti.dds.infrastructure.Duration_t.DURATION_INFINITE** (p. 1133) are currently supported for the service_cleanup_delay)

The utility of **com.rti.dds.infrastructure.DurabilityServiceQosPolicy.service_cleanup_delay** (p. 1124) is apparent in the situation where an application disposes an instance and it crashes before it has a chance to complete additional tasks related to the disposition. Upon restart, the application may ask for initial data to regain its state and the delay introduced by the service_cleanup_delay will allow the restarted application to receive the information on the disposed instance and complete the interrupted tasks.

8.90.3 Compatibility

The value offered is considered compatible with the value requested if and only if the inequality *offered kind >= requested kind* evaluates to 'TRUE'. For the purposes of this inequality, the values of DURABILITY kind are considered ordered such that com.rti.dds.infrastructure.DurabilityQosPolicyKind.DurabilityQosPolicyKind.↩ VOLATILE_DURABILITY_QOS < com.rti.dds.infrastructure.DurabilityQosPolicyKind.DurabilityQosPolicyKind.↩ TRANSIENT_LOCAL_DURABILITY_QOS < com.rti.dds.infrastructure.DurabilityQosPolicyKind.DurabilityQosPolicy↩ Kind.TRANSIENT_DURABILITY_QOS < com.rti.dds.infrastructure.DurabilityQosPolicyKind.DurabilityQosPolicy↩ Kind.PERSISTENT_DURABILITY_QOS.

8.90.4 Member Data Documentation

8.90.4.1 kind

DurabilityQosPolicyKind kind

<<***basic***>> *(*p. *123)* <<***spec***>> *(*p. *132)* The kind of durability.

[default] com.rti.dds.infrastructure.DurabilityQosPolicyKind.DurabilityQosPolicyKind.VOLATILE_DURABILITY_QOS

Categories

Immutable (p. 292), **Matching** (p. 355), **Discovery Metadata** (p. 348), **Durability** (p. 221), **Data Availability** (p. 200)

8.90.4.2 direct_communication

boolean direct_communication

<<***extension***>> *(*p. *138)* Indicates whether or not a TRANSIENT or PERSISTENT **com.rti.dds.subscription.Data↩ Reader** (p. 707) should receive samples directly from a TRANSIENT or PERSISTENT **com.rti.dds.publication.Data↩ Writer** (p. 818)

When direct_communication is set to com.rti.dds.infrastructure.true, a TRANSIENT or PERSISTENT **com.rti.dds.↩ subscription.DataReader** (p. 707) will receive samples from both the original **com.rti.dds.publication.DataWriter** (p. 818) configured with TRANSIENT or PERSISTENT durability and the **com.rti.dds.publication.DataWriter** (p. 818) created by the persistence service. This peer-to-peer communication pattern provides low latency between end-points.

If the same sample is received from the original **com.rti.dds.publication.DataWriter** (p. 818) and the persistence service, the middleware will discard the duplicate.

When direct_communication is set to com.rti.dds.infrastructure.false, a TRANSIENT or PERSISTENT **com.rti.dds.↩ subscription.DataReader** (p. 707) will only receive samples from the **com.rti.dds.publication.DataWriter** (p. 818) created by the persistence service. This brokered communication pattern provides a way to guarantee eventual consistency.

[default] com.rti.dds.infrastructure.true

Categories

Immutable (p. 292), **Discovery Metadata** (p. 348), **Durability** (p. 221), **Data Availability** (p. 200)

8.90.4.3 writer_depth

```
int writer_depth
```

<<***basic***>> *(*p. *123)* <<***extension***>> *(*p. *138)* Indicates the number of samples per instance that a durable **com.rti.dds.publication.DataWriter** (p. 818) will send to a late-joining **com.rti.dds.subscription.DataReader** (p. 707).

The default value, **com.rti.dds.infrastructure.DurabilityQosPolicy.AUTO_WRITER_DEPTH** (p. 481), makes this parameter equal to the following:

- **com.rti.dds.infrastructure.HistoryQosPolicy.depth** (p. 1438) if the history kind is com.rti.dds.infrastructure.HistoryQosPolicyKind.HistoryQosPolicyKind.KEEP_LAST_HISTORY_QOS.
- **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_samples_per_instance** (p. 1897) in the **com.rti.dds.infrastructure.ResourceLimitsQosPolicy** (p. 1894) if the history kind is com.rti.dds.infrastructure.HistoryQosPolicyKind.HistoryQosPolicyKind.KEEP_ALL_HISTORY_QOS.

The `writer_depth` must be <= **com.rti.dds.infrastructure.HistoryQosPolicy.depth** (p. 1438).

`writer_depth` applies only to non-volatile DataWriters (those for which the kind is TRANSIENT_LOCAL, TRANSIENT, or PERSISTENT).

When **com.rti.dds.infrastructure.BatchQosPolicy.enable** (p. 608) is set to true, `writer_depth` acts as a minimum number of samples per instance that will be sent to late joiners, as opposed to the maximum. As long as a batch contains a single sample that falls within the `writer_depth` for the instance to which it belongs, then the entire batch will be sent. This means that batches sent to late-joining DataReaders may contain more samples per instance than is specified by the `writer_depth` QoS setting.

When a DataWriter responds to a TopicQuery, the samples that are evaluated against the TopicQuery filter are only those samples that fall within the `writer_depth`, not the **com.rti.dds.infrastructure.HistoryQosPolicy.depth** (p. 1438).

Setting `writer_depth` on the DataReader side will be ignored.

[default] com.rti.dds.infrastructure.DurabilityQosPolicy.AUTO_WRITER_DEPTH (p. 481)

Categories

Immutable (p. 292), **Durability** (p. 221), **Applied Per-Instance** (p. 346), **Data Availability** (p. 200)

8.90.4.4 storage_settings

```
PersistentStorageSettings storage_settings
```

Initial value:

```
=
            new PersistentStorageSettings()
```

<<***extension***>> *(*p. *138)* Configures durable writer history and durable reader state.

By default, durable writer history and durable reader state are disabled. This means that a DataWriter will not persist its historical cache and a DataReader will not persist its state.

To enable durable writer history and durable reader state set **com.rti.dds.infrastructure.PersistentStorageSettings.enable** (p. 1671) to com.rti.dds.infrastructure.true.

Categories

Immutable (p. 292), **Durability** (p. 221), **Data Availability** (p. 200)

Additional Inherited Members

8.91.1 Detailed Description

Kinds of durability.

QoS:

com.rti.dds.infrastructure.DurabilityQosPolicy (p. 1116)

8.91.2 Member Data Documentation

8.91.2.1 VOLATILE_DURABILITY_QOS

```
final DurabilityQosPolicyKind VOLATILE_DURABILITY_QOS [static]
```

[default] RTI Connext does not need to keep any samples of data instances on behalf of any **com.rti.dds.subscription.DataReader** (p. 707) that is unknown by the **com.rti.dds.publication.DataWriter** (p. 818) at the time the instance is written.

In other words, RTI Connext will only attempt to provide the data to existing subscribers.

This option does not require RTI Persistence Service.

8.91.2.2 TRANSIENT_LOCAL_DURABILITY_QOS

```
final DurabilityQosPolicyKind TRANSIENT_LOCAL_DURABILITY_QOS [static]
```

RTI Connext will attempt to keep some samples so that they can be delivered to any potential late-joining **com.rti.dds.subscription.DataReader** (p. 707).

Which particular samples are kept depends on other QoS such as **com.rti.dds.infrastructure.HistoryQosPolicy** (p. 1435) and **com.rti.dds.infrastructure.ResourceLimitsQosPolicy** (p. 1894). RTI Connext is only required to keep the data in memory of the **com.rti.dds.publication.DataWriter** (p. 818) that wrote the data.

Data is not required to survive the **com.rti.dds.publication.DataWriter** (p. 818).

For this setting to be effective, you must also set the **com.rti.dds.infrastructure.ReliabilityQosPolicy.kind** (p. 1831) to **com.rti.dds.infrastructure.ReliabilityQosPolicyKind.RELIABLE_RELIABILITY_QOS** (p. 1836).

This option does not require RTI Persistence Service.

8.91.2.3 TRANSIENT_DURABILITY_QOS

```
final DurabilityQosPolicyKind TRANSIENT_DURABILITY_QOS [static]
```

RTI Connext will attempt to keep some samples so that they can be delivered to any potential late-joining **com.rti.dds.subscription.DataReader** (p. 707).

Which particular samples are kept depends on other QoS such as **com.rti.dds.infrastructure.HistoryQosPolicy** (p. 1435) and **com.rti.dds.infrastructure.ResourceLimitsQosPolicy** (p. 1894). RTI Connext is only required to keep the data in memory and not in permanent storage.

Data is not tied to the lifecycle of the **com.rti.dds.publication.DataWriter** (p. 818).

Data will survive the **com.rti.dds.publication.DataWriter** (p. 818).

This option requires RTI Persistence Service.

8.91.2.4 PERSISTENT_DURABILITY_QOS

```
final DurabilityQosPolicyKind PERSISTENT_DURABILITY_QOS [static]
```

Data is kept on permanent storage, so that they can outlive a system session.

This option requires RTI Persistence Service.

DURABILITY (p. 481)

HISTORY (p. 487)

RESOURCE_LIMITS (p. 511)

8.92.2 Usage

When a DataWriter's **com.rti.dds.infrastructure.DurabilityQosPolicy.kind** (p. 1119) is com.rti.dds.infrastructure.↩ DurabilityQosPolicyKind.DurabilityQosPolicyKind.PERSISTENT_DURABILITY_QOS or com.rti.dds.infrastructure.↩ DurabilityQosPolicyKind.DurabilityQosPolicyKind.TRANSIENT_DURABILITY_QOS, an external service, the *RTI Persistence Service*, is used to store and possibly forward the data sent by the **com.rti.dds.publication.DataWriter** (p. 818) to **com.rti.dds.subscription.DataReader** (p. 707) objects that are created *after* the data was initially sent.

This QoS policy is used to configure certain parameters of the Persistence Service when it operates on the behalf of the **com.rti.dds.publication.DataWriter** (p. 818), such as how much data to store. For example, it configures the **DURABILITY** (p. 481), **HISTORY** (p. 487), and the **RESOURCE_LIMITS** (p. 511) used by the fictitious DataReader and DataWriter used by the Persistence Service. Note, however, that the Persistence Service itself may be configured to ignore these values and instead use values from its own configuration file.

8.92.3 Member Data Documentation

8.92.3.1 service_cleanup_delay

```
final  Duration_t service_cleanup_delay
```

Initial value:

```
= new Duration_t(
        Duration_t.DURATION_INFINITE_SEC, Duration_t.DURATION_INFINITE_NSEC)
```

<<***spec***>> *(*p. *132)* Controls when the service is able to remove all information regarding a data instances.

When the service cleanup delay is set to 0, disposed instances will be completely removed from the service. Only values of 0 and **com.rti.dds.infrastructure.Duration_t.DURATION_INFINITE** (p. 1133) are currently supported.

8.93.1 Detailed Description

Type for *duration* representation.

Represents a time interval.

8.93.2 Constructor & Destructor Documentation

8.93.2.1 Duration_t() [1/2]

```
Duration_t (
            Duration_t duration )
```

Copy constructor.

Parameters

duration	The duration instance to copy. It must not be null.

References **Duration_t.nanosec**, and **Duration_t.sec**.

8.93.2.2 Duration_t() [2/2]

```
Duration_t (
            int sec,
            int nanosec )
```

Parameters

sec	must be >=0
nanosec	must be >=0 and < 1000000000

References **Duration_t.nanosec**, and **Duration_t.sec**.

8.93.3 Member Function Documentation

8.93.3.1 from_micros()

```
static  Duration_t from_micros (
             long micros )  [static]
```

Creates a new duration object from a duration expressed in microseconds.

In case of an overflow this function returns **com.rti.dds.infrastructure.Duration_t.DURATION_INFINITE** (p. 1133).

References **Duration_t.DURATION_INFINITE**.

8.93.3.2 from_nanos()

```
static  Duration_t from_nanos (
             long nanos )  [static]
```

Creates a new duration object from a duration expressed in nanoseconds.

In case of an overflow this function returns **com.rti.dds.infrastructure.Duration_t.DURATION_INFINITE** (p. 1133).

References **Duration_t.DURATION_INFINITE**.

8.93.3.3 from_millis()

```
static  Duration_t from_millis (
             long millis )  [static]
```

Creates a new duration object from a duration expressed in milliseconds.

In case of an overflow this function returns **com.rti.dds.infrastructure.Duration_t.DURATION_INFINITE** (p. 1133).

References **Duration_t.DURATION_INFINITE**.

8.93.3.4 from_seconds()

```
static  Duration_t from_seconds (
             int seconds )  [static]
```

Creates a new duration object from a duration expressed in seconds.

8.93.3.5 is_zero()

```
boolean is_zero ( )
```

Returns

com.rti.dds.infrastructure.true if the given duration is of zero length.

References **Duration_t.nanosec**, and **Duration_t.sec**.

8.93.3.6 is_infinite()

```
boolean is_infinite ( )
```

Returns

com.rti.dds.infrastructure.true if the given duration is of infinite length.

References **Duration_t.DURATION_INFINITE_NSEC**, **Duration_t.DURATION_INFINITE_SEC**, **Duration_t.↩ nanosec**, and **Duration_t.sec**.

Referenced by **Duration_t.add()**, and **Duration_t.subtract()**.

8.93.3.7 is_auto()

```
boolean is_auto ( )
```

Returns

com.rti.dds.infrastructure.true if the given duration has auto value.

References **Duration_t.DURATION_AUTO_NSEC**, **Duration_t.DURATION_AUTO_SEC**, **Duration_t.nanosec**, and **Duration_t.sec**.

8.93.3.8 add()

```
Duration_t add (
            Duration_t other )
```

Calculates a duration as the result of adding other and this.

Special case:

- d.add(**Duration_t.DURATION_INFINITE** (p. 1133)).**is_infinite()** (p. 1130)

References **Duration_t.DURATION_INFINITE**, **Duration_t.DURATION_INFINITE_SEC**, **Duration_t.is_infinite()**, **Duration_t.nanosec**, and **Duration_t.sec**.

8.93.3.9 subtract()

```
Duration_t subtract (
            Duration_t other )
```

Calculates a duration as the result of substracting other to this.

Special cases:

- d.substract(**Duration_t.DURATION_INFINITE** (p. 1133)).**is_zero()** (p. 1129)
- Duration_t.DURATION_INFINITE.substract(d).**is_infinite()** (p. 1130)
- Duration_t.DURATION_INFINITE.substract(**Duration_t.DURATION_INFINITE** (p. 1133)).**is_infinite()** (p. 1130)
- d1.substract(d2).**is_zero()** (p. 1129) if d2 is greater or equal than d1

References **Duration_t.DURATION_ZERO**, **Duration_t.is_infinite()**, **Duration_t.nanosec**, and **Duration_t.sec**.

8.93.4 Member Data Documentation

8.93.4.1 DURATION_ZERO_SEC

```
final int DURATION_ZERO_SEC  [static]
```

A zero-length second period of time.

8.93.4.2 DURATION_ZERO_NSEC

```
final int DURATION_ZERO_NSEC  [static]
```

A zero-length nano-second period of time.

8.93.4.3 DURATION_INFINITE_SEC

```
final int DURATION_INFINITE_SEC  [static]
```

An infinite second period of time.

Referenced by **Duration_t.add()**, and **Duration_t.is_infinite()**.

8.93.4.4 DURATION_INFINITE_NSEC

```
final int DURATION_INFINITE_NSEC  [static]
```

An infinite nano-second period of time.

Referenced by **Duration_t.is_infinite()**.

8.93.4.5 DURATION_AUTO_SEC

```
final int DURATION_AUTO_SEC  [static]
```

An auto second period of time.

Referenced by **Duration_t.is_auto()**.

8.93.4.6 DURATION_AUTO_NSEC

```
final int DURATION_AUTO_NSEC  [static]
```

An auto nano-second period of time.

Referenced by **Duration_t.is_auto()**.

8.93.4.7 DURATION_ZERO

```
final Duration_t DURATION_ZERO [static]
```

A zero-length period of time.

Referenced by **Duration_t.subtract()**.

8.93.4.8 DURATION_INFINITE

```
final Duration_t DURATION_INFINITE [static]
```

An infinite period of time.

Referenced by **Duration_t.add()**, **Duration_t.from_micros()**, **Duration_t.from_millis()**, and **Duration_t.from_↩ nanos()**.

8.93.4.9 DURATION_AUTO

```
final Duration_t DURATION_AUTO [static]
```

Duration is automatically assigned.

8.93.4.10 sec

```
int sec
```

seconds

Referenced by **Duration_t.add()**, **Duration_t.Duration_t()**, **Duration_t.is_auto()**, **Duration_t.is_infinite()**, **Duration_t.is_zero()**, **Duration_t.subtract()**, and **WaitSet.wait()**.

8.93.4.11 nanosec

```
int nanosec
```

nanoseconds

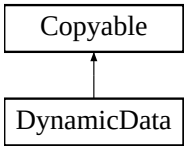
[range] [0,1000000000)

Referenced by **Duration_t.add()**, **Duration_t.Duration_t()**, **Duration_t.is_auto()**, **Duration_t.is_infinite()**, **Duration_t.is_zero()**, **Duration_t.subtract()**, and **WaitSet.wait()**.

8.94 DynamicData Class Reference

A sample of any complex data type, which can be inspected and manipulated reflectively.

Inheritance diagram for DynamicData:



Public Member Functions

- void **delete** ()

  *Finalize and deallocate this **com.rti.dds.dynamicdata.DynamicData*** (p. *1134*) *sample.*
- boolean **equals** (Object o)

  *Indicate whether the contents of another **com.rti.dds.dynamicdata.DynamicData*** (p. *1134*) *sample are the same as those of this one.*
- Object **copy_from** (Object src)

  Deeply copy from the given object to this object.
- void **clear_all_members** ()

  Clear the contents of all data members of this object.
- void **clear_member** (String member_name, int member_id)

  Clear the contents of a single data member of this object.
- void **clear_optional_member** (String member_name, int member_id)

  Clear the contents of a single optional data member of this object.
- void **print** (File fp, int indent)

  Output a textual representation of this object and its contents to the given file.
- void **get_info** (**DynamicDataInfo** info_out)

  *Fill in the given descriptor with information about this **com.rti.dds.dynamicdata.DynamicData*** (p. *1134*).
- void **bind_type** (**TypeCode** type)

  *If this **com.rti.dds.dynamicdata.DynamicData*** (p. *1134*) *object is not yet associated with a data type, set that type now to the given **com.rti.dds.typecode.TypeCode*** (p. *2183*).
- void **unbind_type** ()

  *Dissociate this **com.rti.dds.dynamicdata.DynamicData*** (p. *1134*) *object from any particular data type.*
- void **bind_complex_member** (**DynamicData** value_out, String member_name, int member_id)

  *Use another **com.rti.dds.dynamicdata.DynamicData*** (p. *1134*) *object to provide access to a complex field of this **com.rti.dds.dynamicdata.DynamicData*** (p. *1134*) *object.*
- void **unbind_complex_member** (**DynamicData** value)

  *Tear down the association created by a **com.rti.dds.dynamicdata.DynamicData.bind_complex_member*** (p. *1154*) *operation, committing any changes to the outer object since then.*
- synchronized **TypeCode get_type** ()

  *Get the data type, of which this **com.rti.dds.dynamicdata.DynamicData*** (p. *1134*) *represents an instance.*
- **TCKind get_type_kind** ()

  Get the kind of this object's data type.
- int **get_member_count** ()

Get the number of members in the type.

- int **get_discriminator** ()

  Get the current value of the union discriminator.

- void **set_discriminator** (int discriminator)

  Set the value of the union discriminator (UnionType only)

- boolean **member_exists** (String member_name, int member_id)

  Indicates whether a member exists in this sample.

- boolean **member_exists_in_type** (String member_name, int member_id)

  Indicates whether a member of a particular name/ID exists in this data sample's type.

- void **get_member_info** (**DynamicDataMemberInfo** info, String member_name, int member_id)

  *Fill in the given descriptor with information about the identified member of this **com.rti.dds.dynamicdata.DynamicData** (p. 1134) sample.*

- void **get_member_info_by_index** (**DynamicDataMemberInfo** info, int index)

  *Fill in the given descriptor with information about the identified member of this **com.rti.dds.dynamicdata.DynamicData** (p. 1134) sample.*

- **TypeCode** **get_member_type** (String member_name, int member_id)

  Get the type of the given member of this sample.

- boolean **is_member_key** (String member_name, int member_id)

  Indicates whether a given member forms part of the key of this sample's data type.

- int **get_int** (String member_name, int member_id)

  *Get the value of the given field, which is of type com.rti.dds.infrastructure.int or another type implicitly convertible to it (byte, char, short, com.rti.dds.infrastructure.short, or **com.rti.dds.util.Enum** (p. 1330)).*

- long **get_uint** (String member_name, int member_id)

  *Get the value of the given field, which is of type com.rti.dds.infrastructure.int or another type implicitly convertible to it (byte, char, short, com.rti.dds.infrastructure.short, or **com.rti.dds.util.Enum** (p. 1330)).*

- int **get_int_array** (int[ ] array, String member_name, int member_id)

  *Get a copy of the given array member. The array may contain members of type com.rti.dds.infrastructure.int or **com.rti.dds.util.Enum** (p. 1330).*

- int **get_uint_array** (long[ ] array, String member_name, int member_id)

  *Get a copy of the given array member. The array may contain members of type com.rti.dds.infrastructure.long or **com.rti.dds.util.Enum** (p. 1330).*

- void **get_int_seq** (**IntSeq** seq, String member_name, int member_id)

  Get a copy of the given sequence member.

- void **get_uint_seq** (**LongSeq** seq, String member_name, int member_id)

  Get a copy of the given sequence member.

- short **get_short** (String member_name, int member_id)

  Get the value of the given field, which is of type short or another type implicitly convertible to it (byte or char).

- int **get_ushort** (String member_name, int member_id)

  Get the value of the given field, which is of type com.rti.dds.infrastructure.short or another type implicitly convertible to it (byte or char).

- int **get_short_array** (short[ ] array, String member_name, int member_id)

  Get a copy of the given array member.

- int **get_ushort_array** (int[ ] array, String member_name, int member_id)

  Get a copy of the given array member.

- void **get_short_seq** (**ShortSeq** seq, String member_name, int member_id)

  Get a copy of the given sequence member.

- void **get_ushort_seq** (**IntSeq** seq, String member_name, int member_id)

  Get a copy of the given sequence member.

- float **get_float** (String member_name, int member_id)

  Get the value of the given field, which is of type float.
- int **get_float_array** (float[ ] array, String member_name, int member_id)

  Get a copy of the given array member.
- void **get_float_seq** (**FloatSeq** seq, String member_name, int member_id)

  Get a copy of the given sequence member.
- double **get_double** (String member_name, int member_id)

  Get the value of the given field, which is of type double or another type implicitly convertible to it (float).
- int **get_double_array** (double[ ] array, String member_name, int member_id)

  Get a copy of the given array member.
- void **get_double_seq** (**DoubleSeq** seq, String member_name, int member_id)

  Get a copy of the given sequence member.
- boolean **get_boolean** (String member_name, int member_id)

  Get the value of the given field, which is of type boolean.
- int **get_boolean_array** (boolean[ ] array, String member_name, int member_id)

  Get a copy of the given array member.
- void **get_boolean_seq** (**BooleanSeq** seq, String member_name, int member_id)

  Get a copy of the given sequence member.
- char **get_char** (String member_name, int member_id)

  Get the value of the given field, which is of type char.
- int **get_char_array** (char[ ] array, String member_name, int member_id)

  Get a copy of the given array member.
- void **get_char_seq** (**CharSeq** seq, String member_name, int member_id)

  Get a copy of the given sequence member.
- byte **get_byte** (String member_name, int member_id)

  Get the value of the given field, which is of type byte.
- short **get_uint8** (String member_name, int member_id)

  Get the value of the given field, which is of type com.rti.dds.infrastructure.byte.
- byte **get_int8** (String member_name, int member_id)

  Get the value of the given field, which is of type com.rti.dds.infrastructure.byte.
- int **get_byte_array** (byte[ ] array, String member_name, int member_id)

  Get a copy of the given array member.
- int **get_int8_array** (byte[ ] array, String member_name, int member_id)

  Get a copy of the given array member.
- int **get_uint8_array** (short[ ] array, String member_name, int member_id)

  Get a copy of the given array member.
- void **get_byte_seq** (**ByteSeq** seq, String member_name, int member_id)

  Get a copy of the given sequence member.
- void **get_int8_seq** (**ByteSeq** seq, String member_name, int member_id)

  Get a copy of the given sequence member.
- void **get_uint8_seq** (**ShortSeq** seq, String member_name, int member_id)

  Get a copy of the given sequence member.
- long **get_long** (String member_name, int member_id)

  Get the value of the given field, which is of type long or another type implicitly convertible to it (byte, char, short, com.rti.↩ dds.infrastructure.short, com.rti.dds.infrastructure.int, com.rti.dds.infrastructure.long, or ***com.rti.dds.util.Enum*** *(*p. *1330)).*
- BigInteger **get_ulong** (String member_name, int member_id)

*Get the value of the given field, which is of type com.rti.dds.infrastructure.long or another type implicitly convertible to it (byte, char, short, com.rti.dds.infrastructure.short, com.rti.dds.infrastructure.int, com.rti.dds.infrastructure.long, or **com.↩ rti.dds.util.Enum** (p. 1330)).*

- int **get_long_array** (long[ ] array, String member_name, int member_id)

  Get a copy of the given array member.
- int **get_ulong_array** (BigInteger[ ] array, String member_name, int member_id)

  Get a copy of the given array member.
- void **get_long_seq** (**LongSeq** seq, String member_name, int member_id)

  Get a copy of the given sequence member.
- void **get_ulong_seq** (List< BigInteger > seq, String member_name, int member_id)

  Get a copy of the given sequence member.
- String **get_string** (String member_name, int member_id)

  Get the value of the given field, which is of type com.rti.dds.infrastructure.String.
- void **get_complex_member** (**DynamicData** value_out, String member_name, int member_id)

  Get a copy of the value of the given field, which is of some composed type.
- void **set_int** (String member_name, int member_id, int value)

  Set the value of the given field, which is of type com.rti.dds.infrastructure.int.
- void **set_uint** (String member_name, int member_id, long value)

  Set the value of the given field, which is of type com.rti.dds.infrastructure.long.
- void **set_int_array** (String member_name, int member_id, int[ ] array)

  *Set the contents of the given array member. The array may contain members of type com.rti.dds.infrastructure.int or **com.rti.dds.util.Enum** (p. 1330).*
- void **set_uint_array** (String member_name, int member_id, long[ ] array)

  *Set the contents of the given array member. The array may contain members of type com.rti.dds.infrastructure.long or **com.rti.dds.util.Enum** (p. 1330).*
- void **set_int_seq** (String member_name, int member_id, **IntSeq** value)

  Set the contents of the given sequence member.
- void **set_uint_seq** (String member_name, int member_id, **LongSeq** value)

  Set the contents of the given sequence member.
- void **set_short** (String member_name, int member_id, short value)

  Set the value of the given field, which is of type short.
- void **set_ushort** (String member_name, int member_id, int value)

  Set the value of the given field, which is of type com.rti.dds.infrastructure.short.
- void **set_short_array** (String member_name, int member_id, short[ ] array)

  Set the contents of the given array member.
- void **set_ushort_array** (String member_name, int member_id, int[ ] array)

  Set the contents of the given array member.
- void **set_short_seq** (String member_name, int member_id, **ShortSeq** value)

  Set the contents of the given sequence member.
- void **set_ushort_seq** (String member_name, int member_id, **IntSeq** value)

  Set the contents of the given sequence member.
- void **set_float** (String member_name, int member_id, float value)

  Set the value of the given field, which is of type float.
- void **set_float_array** (String member_name, int member_id, float[ ] array)

  Set the contents of the given array member.
- void **set_float_seq** (String member_name, int member_id, **FloatSeq** value)

  Set the contents of the given sequence member.
- void **set_double** (String member_name, int member_id, double value)

Set the value of the given field, which is of type double.

- void **set_double_array** (String member_name, int member_id, double[ ] array)

  Set the contents of the given array member.

- void **set_double_seq** (String member_name, int member_id, **DoubleSeq** value)

  Set the contents of the given sequence member.

- void **set_boolean** (String member_name, int member_id, boolean value)

  Set the value of the given field, which is of type boolean.

- void **set_boolean_array** (String member_name, int member_id, boolean[ ] array)

  Set the contents of the given array member.

- void **set_boolean_seq** (String member_name, int member_id, **BooleanSeq** value)

  Set the contents of the given sequence member.

- void **set_char** (String member_name, int member_id, char value)

  Set the value of the given field, which is of type char.

- void **set_char_array** (String member_name, int member_id, char[ ] array)

  Set the contents of the given array member.

- void **set_char_seq** (String member_name, int member_id, **CharSeq** value)

  Set the contents of the given sequence member.

- void **set_byte** (String member_name, int member_id, byte value)

  Set the value of the given field, which is of type byte.

- void **set_uint8** (String member_name, int member_id, short value)

  Set the value of the given field, which is of type com.rti.dds.infrastructure.byte.

- void **set_int8** (String member_name, int member_id, byte value)

  Set the value of the given field, which is of type com.rti.dds.infrastructure.byte.

- void **set_byte_array** (String member_name, int member_id, byte[ ] array)

  Set the contents of the given array member.

- void **set_int8_array** (String member_name, int member_id, byte[ ] array)

  Set the contents of the given array member.

- void **set_uint8_array** (String member_name, int member_id, short[ ] array)

  Set the contents of the given array member.

- void **set_byte_seq** (String member_name, int member_id, **ByteSeq** value)

  Set the contents of the given sequence member.

- void **set_int8_seq** (String member_name, int member_id, **ByteSeq** value)

  Set the contents of the given sequence member.

- void **set_uint8_seq** (String member_name, int member_id, **ShortSeq** value)

  Set the contents of the given sequence member.

- void **set_long** (String member_name, int member_id, long value)

  Set the value of the given field, which is of type long.

- void **set_ulong** (String member_name, int member_id, BigInteger value)

  Set the value of the given field, which is of type com.rti.dds.infrastructure.long.

- void **set_long_array** (String member_name, int member_id, long[ ] array)

  Set the contents of the given array member.

- void **set_ulong_array** (String member_name, int member_id, BigInteger[ ] array)

  Set the contents of the given array member.

- void **set_long_seq** (String member_name, int member_id, **LongSeq** value)

  Set the contents of the given sequence member.

- void **set_ulong_seq** (String member_name, int member_id, List< BigInteger > value)

  Set the contents of the given sequence member.

- void **set_string** (String member_name, int member_id, String value)

  Set the value of the given field of type com.rti.dds.infrastructure.String.
- void **set_complex_member** (String member_name, int member_id, **DynamicData** value)

  *Copy the state of the given **com.rti.dds.dynamicdata.DynamicData** (p. 1134) object into a member of this object.*
- int **to_cdr_buffer** (byte[ ] buffer, short representation)

  *Serializes a **DynamicData** (p. 1134) object into a buffer of octets.*
- int **to_cdr_buffer** (byte[ ] buffer)

  *Serializes a **DynamicData** (p. 1134) object into a CDR buffer of octets.*
- void **from_cdr_buffer** (byte[ ] buffer)

  *Deserializes a **DynamicData** (p. 1134) object from a buffer of octets.*
- void **to_cdr_buffer** (**ByteSeq** sequence, short representation)

  *Serializes a **DynamicData** (p. 1134) object into a sequence of octets.*
- void **to_cdr_buffer** (**ByteSeq** sequence)

  *Serializes a **DynamicData** (p. 1134) object into a CDR sequence of octets.*
- void **from_cdr_buffer** (**ByteSeq** sequence)

  *Deserializes a **DynamicData** (p. 1134) object from a sequence octets.*
- String **to_string** (**PrintFormatProperty** property)

  *Get a string representation of a **DynamicData** (p. 1134) object.*
- String **to_string** ()

  *Get a string representation of a **DynamicData** (p. 1134) object using the default values for **com.rti.dds.topic.PrintFormatProperty** (p. 1686).*
- void **from_string** (String str, **PrintFormatKind** format_kind)

  *Populates a **DynamicData** (p. 1134) object from a JSON string representation.*
- void **from_string** (String str)

  *Populates a **DynamicData** (p. 1134) object from a JSON string representation.*
- **DynamicData** (**TypeCode** type, **DynamicDataProperty_t** property)

  *The constructor for new **com.rti.dds.dynamicdata.DynamicData** (p. 1134) objects.*

Static Public Attributes

- static final int **MEMBER_ID_UNSPECIFIED**

  A sentinel value that indicates that no member ID is needed in order to perform some operation.
- static final **DynamicDataProperty_t** **PROPERTY_DEFAULT**

  *Sentinel constant indicating default values for **com.rti.dds.dynamicdata.DynamicDataProperty_t** (p. 1246).*

8.94.1 Detailed Description

A sample of any complex data type, which can be inspected and manipulated reflectively.

Objects of type **com.rti.dds.dynamicdata.DynamicData** (p. 1134) represent corresponding objects of the type identified by their **com.rti.dds.typecode.TypeCode** (p. 2183). Because the definition of these types may not have existed at compile time on the system on which the application is running, you will interact with the data using an API of reflective getters and setters.

For example, if you had access to your data types at compile time, you could do this:

```
theValue = theObject.theField;
```

Instead, you will do something like this:
```
theValue = get(theObject, "theField");
```

com.rti.dds.dynamicdata.DynamicData (p. 1134) objects can represent any complex data type, including those of type kinds **com.rti.dds.typecode.TCKind.TK_ARRAY** (p. 2099), **com.rti.dds.typecode.TCKind.TK_SEQUENCE** (p. 2099), **com.rti.dds.typecode.TCKind.TK_STRUCT** (p. 2098), **com.rti.dds.typecode.TCKind.TK_UNION** (p. 2098), and **com.rti.dds.typecode.TCKind.TK_VALUE** (p. 2101). They cannot represent objects of basic types (e.g., integers and strings). Since those type definitions always exist on every system, you can examine their objects directly.

8.94.2 Member Names and IDs

The members of a data type can be identified in one of two ways: by their name or by their numeric ID. The former is often more transparent to human users; the latter is typically faster.

You define the name and ID of a type member when you add that member to that type. If you define your type in IDL or XML, the name will be the field name that appears in the type definition; the ID will be the one-based index of the field in declaration order. For example, in the following IDL structure, the ID of `theLong` is 2.
```
struct MyNestedType {
    char theChar;
    octet theOctetArray[10];
    long long theMultidimensionalArray[4][6][12];
    sequence<long> myArrayOfSeq[8];
};

struct MyType {
    short theShort;
    long theLong;
    MyNestedType theNestedType;
};
```

8.94.2.1 Getting and Setting Union Discriminator Values

For unions (**com.rti.dds.typecode.TCKind.TK_UNION** (p. 2098)), the ID of a member is the discriminator value corresponding to that member. To access the current discriminator of a union, use the **com.rti.dds.dynamicdata.DynamicData.get_discriminator** (p. 1157) operation. Once you know the value of the discriminator, you can use it in the proper get/set_xxx() operations to access and set the member's value. Here is an example of accessing the discriminator and then using it to get a member value:
```
DynamicDataMemberId discriminatorValue = myDynamicData.get_discriminator();
DDS_Long myMemberValue = myDynamicData.get_long(NULL, discriminatorValue);
```

To get information, like the **com.rti.dds.typecode.TCKind** (p. 2094), about the member that the discriminator value selects, use the **com.rti.dds.dynamicdata.DynamicData.get_member_info** (p. 1161) API, passing in NULL for the name and the discriminator for the member ID. If the discriminator value does not select any member in the union, **com.rti.dds.dynamicdata.DynamicData.get_member_info** (p. 1161) will return **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902).

The discriminator value is automatically set as a side-effect of setting a member using one of the set_xxx() operations. For example, given the following IDL Union:
```
union Foo switch (short) {
case 1:
    long x;
case 2:
case 3:
    string y;
};
```

Setting member "x" using the com.rti.dds.dynamicdata.DynamicData.DynamicData.set_int API, passing either "x" as the name or 1 as the member ID, will set the discriminator value to 1. When members can be selected by multiple case values, like "y" in our example, if the memeber is set by name, the first case label is chosen as the discriminator. For example, if member "y" is set by name, the discriminator value will be set to 2. To set the discriminator to a different value you can either set the member by ID, passing in the desired discriminator value, or use the **com.rti.dds.dynamicdata.↩ DynamicData.set_discriminator** (p. 1158) API.

Note: In past releases, accessing the discriminator value required passing in index 0 to the **com.rti.dds.dynamicdata.↩ DynamicData.get_member_info_by_index** (p. 1163) operation and then looking at the populated info.member_↩ id. That functionality has been deprecated and replaced with the **com.rti.dds.dynamicdata.DynamicData.get_↩ discriminator** (p. 1157) operation.

8.94.2.2 Hierarchical Member Names

It is possible to refer to a nested member in a type without first having to use the **com.rti.dds.dynamicdata.Dynamic↩ Data.bind_complex_member** (p. 1154) API. You can do this by using a hierarchical name. A hierarchical member name is a concatenation of member names separated by the '.' character. The hierarchical name describes the complete path from a top-level type to the nested member. For example, in the above type, any **DynamicData** (p. 1134) API that receives a member name will accept "theNestedType.theChar" to refer to the char member in MyNestedType:

```
char myChar = myDynamicData.get_char("theNestedType.theChar", DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED);
```

In order to access the value of `theChar` without using a hierarchical name, you would have to first bind to theNested↩ Type and then get the value:

```
myDynamicData.bind_complex_member(myBoundData, "theNestedType", DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED);

DDS_Char myChar = myBoundData.get_char("theChar", DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED);
```

As you can see, using a hierarchical member name removes the need to call the **com.rti.dds.dynamicdata.↩ DynamicData.bind_complex_member** (p. 1154) and **com.rti.dds.dynamicdata.DynamicData.unbind_complex_↩ member** (p. 1156) APIs, and allows for access to nested members at any depth directly from the top-level type.

The member name can also contain indexes to address members in arrays and sequences. For example, to set the third member in the array `theOctetArray`, you can pass in "theNestedType.theOctetArray[2]" as the member name to the com.rti.dds.dynamicdata.DynamicData.DynamicData.set_byte API. The index values when used as part of the member name are 0-based.

For multi-dimensional arrays, the indexes for each dimension should be listed comma-separated in between brackets. For example, to address a member of `theMultidimensionalArray`, the member name should be something like "theNestedType.theMultidimensionalArray[3,2,5]".

In complex types with arrays and sequences that contain other arrays and sequences, the hierarchical name may include multiple index values, one right after another. For example, in MyNestedType, `myArrayOfSeq` is an array of sequences. In order to set the third member of the sequence in the fourth member of the array, the member name would be "myNestedType.myArrayOfSeq[3][2]".

8.94.3 Arrays and Sequences

The "members" of array and sequence types, unlike those of structure and union types, don't have names or explicit member IDs. However, they may nevertheless be accessed by "ID": the ID is one more than the index. (The first element has ID 1, the second 2, etc.)

Multi-dimensional arrays are effectively flattened by this pattern. For example, for an array `theArray`[4][5], accessing ID 7 is equivalent to index 6, or the second element of the second group of 5.

To determine the length of a collection-typed member of a structure or union, you have two choices:

1. Get the length along with the data: call the appropriate array accessor (see **Getters and Setters** (p. 1143)) and check the resulting length.
2. Get the length without getting the data itself: call **com.rti.dds.dynamicdata.DynamicData.get_member_info** (p. 1161) and check the resulting **com.rti.dds.dynamicdata.DynamicDataMemberInfo.element_count** (p. 1245).

8.94.4 Available Functionality

The Dynamic Data API is large when measured by the number of methods it contains. But each method falls into one of a very small number of categories. You will find it easier to navigate this documentation if you understand these categories.

8.94.4.1 Lifecycle and Utility Methods

Managing the lifecycle of **com.rti.dds.dynamicdata.DynamicData** (p. 1134) objects is simple. You have two choices:

1. Usually, you will go through a **com.rti.dds.dynamicdata.DynamicDataTypeSupport** (p. 1286) factory object, which will ensure that the type and property information for the new **com.rti.dds.dynamicdata.DynamicData** (p. 1134) object corresponds to a registered type in your system.
2. In certain advanced cases, such as when you're navigating a nested structure, you will want to have a **com.rti.dds.dynamicdata.DynamicData** (p. 1134) object that is not bound up front to any particular type, or you will want to initialize the object in a custom way. In that case, you can call the constructor directly.

Table 8.443 Lifecycle

com.rti.dds.dynamicdata.DynamicDataTypeSupport (p. 1286)	**com.rti.dds.dynamicdata.DynamicData (p. 1134)**
com.rti.dds.dynamicdata.DynamicDataTypeSupport.create_data (p. 1289)	com.rti.dds.dynamicdata.DynamicData.DynamicData.DynamicData

You can also copy **com.rti.dds.dynamicdata.DynamicData** (p. 1134) objects:

- com.rti.dds.dynamicdata.DynamicData.copy

You can test them for equality:

- com.rti.dds.dynamicdata.DynamicData.DynamicData.equals

And you can print their contents:

- **com.rti.dds.dynamicdata.DynamicData.print** (p. 1151)
- **com.rti.dds.dynamicdata.DynamicDataTypeSupport.print_data** (p. 1290)

8.94.4.2 Getters and Setters

Most methods get or set the value of some field. These methods are named according to the type of the field they access.

The names of types vary across languages. The programming API for each language reflects that programming language. However, if your chosen language does not use the same names as the language that you used to define your types (e.g., IDL), or if you need to interoperate among programming languages, you will need to understand these differences. They are explained the following table. (Note: for modern C++, see the RTI Connext Modern C++ API reference.)

Table 8.444 Type Names Across Languages

Type	IDL	C, Traditional C++	Java	Ada
16-bit integer	short	DDS_Short	short	Standard.DDS.↩ Short
32-bit integer	long	DDS_Long	int	Standard.DDS.Long
64-bit integer	long long	DDS_LongLong	long	Standard.DDS.↩ Long_Long
Unsigned 16-bit integer	unsigned short	DDS_Unsigned↩ Short	short	Standard.DDS.↩ Unsigned_Short
Unsigned 32-bit integer	unsigned long	DDS_Unsigned↩ Long	int	Standard.DDS.Long
Unsigned 64-bit integer	unsigned long long	DDS_Unsigned↩ LongLong	long	Standard.DDS.↩ Unsigned_Long_↩ Long
float	float	DDS_Float	float	Standard.DDS.Float
double	double	DDS_Double	double	Standard.DDS.↩ Double
long double	long double	DDS_LongDouble	N/A (see CORE-14091 known issue)	Standard.DDS.↩ Long_Double
character	char	DDS_Char	char	Standard.DDS.Char
wide character	wchar	DDS_Wchar	char	Standard.DDS.↩ Wchar
octet	octet	DDS_Octet	byte	Standard.DDS.Octet
boolean	boolean	DDS_Boolean	boolean	Standard.DDS.↩ Boolean
string	string	DDS_Char*	String	Standard.DDS.↩ String
wstring	wstring	DDS_Wchar*	String	Standard.DDS.↩ Wide_String

When working with a **com.rti.dds.dynamicdata.DynamicData** (p. 1134) object representing an array or sequence, calling one of the "get" methods below for an index that is out of bounds will result in **com.rti.dds.infrastructure.↩ RETCODE_NO_DATA** (p. 1902). Calling "set" for an index that is past the end of a sequence will cause that sequence to automatically lengthen (filling with default contents).

When working with a **com.rti.dds.dynamicdata.DynamicData** (p. 1134) object whose type contains optional members, calling one of the "get" methods below on an unset optional member or any member that is part of an unset complex optional member will result in **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902).

Table 8.445 Basic Types

Get	Set
com.rti.dds.dynamicdata.DynamicData.DynamicData.↩ get_int	com.rti.dds.dynamicdata.DynamicData.DynamicData.↩ set_int
com.rti.dds.dynamicdata.DynamicData.DynamicData.↩ get_uint	**com.rti.dds.dynamicdata.DynamicData.set_ulong** (p. 1229)
com.rti.dds.dynamicdata.DynamicData.get_short (p. 1171)	**com.rti.dds.dynamicdata.DynamicData.set_short** (p. 1206)
com.rti.dds.dynamicdata.DynamicData.DynamicData.↩ get_ushort	**com.rti.dds.dynamicdata.DynamicData.set_ushort** (p. 1207)
com.rti.dds.dynamicdata.DynamicData.DynamicData.↩ get_long	com.rti.dds.dynamicdata.DynamicData.DynamicData.↩ set_long
com.rti.dds.dynamicdata.DynamicData.DynamicData.↩ get_ulong	com.rti.dds.dynamicdata.DynamicData.set_ulonglong
com.rti.dds.dynamicdata.DynamicData.get_float (p. 1176)	**com.rti.dds.dynamicdata.DynamicData.set_float** (p. 1211)
com.rti.dds.dynamicdata.DynamicData.get_double (p. 1178)	**com.rti.dds.dynamicdata.DynamicData.set_double** (p. 1213)
com.rti.dds.dynamicdata.DynamicData.get_longdouble	com.rti.dds.dynamicdata.DynamicData.set_longdouble
com.rti.dds.dynamicdata.DynamicData.get_boolean (p. 1181)	**com.rti.dds.dynamicdata.DynamicData.set_boolean** (p. 1216)
com.rti.dds.dynamicdata.DynamicData.DynamicData.↩ get_byte	com.rti.dds.dynamicdata.DynamicData.DynamicData.↩ set_byte
com.rti.dds.dynamicdata.DynamicData.get_char (p. 1183)	**com.rti.dds.dynamicdata.DynamicData.set_char** (p. 1218)
com.rti.dds.dynamicdata.DynamicData.get_string (p. 1199)	**com.rti.dds.dynamicdata.DynamicData.set_string** (p. 1234)

Table 8.446 Structures, Arrays, and Other Complex Types

Get	Set
com.rti.dds.dynamicdata.DynamicData.get_↩ complex_member (p. 1200)	**com.rti.dds.dynamicdata.DynamicData.set_↩ complex_member** (p. 1234)

Table 8.447 Arrays of Basic Types

Get	Set
com.rti.dds.dynamicdata.DynamicData.DynamicData.↩ get_int_array	com.rti.dds.dynamicdata.DynamicData.DynamicData.↩ set_int_array
com.rti.dds.dynamicdata.DynamicData.DynamicData.↩ get_int_array	**com.rti.dds.dynamicdata.DynamicData.set_ulong↩ _array** (p. 1231)
com.rti.dds.dynamicdata.DynamicData.get_short_↩ array (p. 1172)	**com.rti.dds.dynamicdata.DynamicData.set_short_↩ array** (p. 1208)

Get	Set
com.rti.dds.dynamicdata.DynamicData.DynamicData.↩ get_ushort_array	**com.rti.dds.dynamicdata.DynamicData.set_ushort↩ _array** (p. 1208)
com.rti.dds.dynamicdata.DynamicData.DynamicData.↩ get_long_array	com.rti.dds.dynamicdata.DynamicData.DynamicData.↩ set_long_array
com.rti.dds.dynamicdata.DynamicData.DynamicData.↩ get_ulong_array	com.rti.dds.dynamicdata.DynamicData.set_ulonglong↩ _array
com.rti.dds.dynamicdata.DynamicData.get_float_↩ array (p. 1177)	**com.rti.dds.dynamicdata.DynamicData.set_float_↩ array** (p. 1212)
com.rti.dds.dynamicdata.DynamicData.get_↩ double_array (p. 1179)	**com.rti.dds.dynamicdata.DynamicData.set_↩ double_array** (p. 1214)
com.rti.dds.dynamicdata.DynamicData.get_↩ boolean_array (p. 1182)	**com.rti.dds.dynamicdata.DynamicData.set_boolean** (p. 1216)
com.rti.dds.dynamicdata.DynamicData.DynamicData.↩ get_byte_array	com.rti.dds.dynamicdata.DynamicData.DynamicData.↩ set_byte_array
com.rti.dds.dynamicdata.DynamicData.get_char_↩ array (p. 1184)	**com.rti.dds.dynamicdata.DynamicData.set_char_↩ array** (p. 1219)

Table 8.448 Sequences of Basic Types

Get	Set
com.rti.dds.dynamicdata.DynamicData.DynamicData.↩ get_int_seq	com.rti.dds.dynamicdata.DynamicData.DynamicData.↩ set_int_seq
com.rti.dds.dynamicdata.DynamicData.DynamicData.↩ get_uint_seq	**com.rti.dds.dynamicdata.DynamicData.set_ulong↩ _seq** (p. 1233)
com.rti.dds.dynamicdata.DynamicData.get_short_↩ seq (p. 1174)	**com.rti.dds.dynamicdata.DynamicData.set_short_↩ seq** (p. 1209)
com.rti.dds.dynamicdata.DynamicData.get_↩ ushort_seq (p. 1175)	**com.rti.dds.dynamicdata.DynamicData.set_ushort↩ _seq** (p. 1210)
com.rti.dds.dynamicdata.DynamicData.DynamicData.↩ get_long_seq	com.rti.dds.dynamicdata.DynamicData.DynamicData.↩ set_long_seq
com.rti.dds.dynamicdata.DynamicData.get_ulonglong↩ _seq	com.rti.dds.dynamicdata.DynamicData.set_ulonglong↩ _seq
com.rti.dds.dynamicdata.DynamicData.get_float_↩ seq (p. 1177)	**com.rti.dds.dynamicdata.DynamicData.set_float_↩ seq** (p. 1213)
com.rti.dds.dynamicdata.DynamicData.get_↩ double_seq (p. 1180)	**com.rti.dds.dynamicdata.DynamicData.set_↩ double_seq** (p. 1215)
com.rti.dds.dynamicdata.DynamicData.get_↩ boolean_seq (p. 1182)	**com.rti.dds.dynamicdata.DynamicData.set_↩ boolean_seq** (p. 1217)
com.rti.dds.dynamicdata.DynamicData.DynamicData.↩ get_byte_seq	com.rti.dds.dynamicdata.DynamicData.DynamicData.↩ set_byte_seq
com.rti.dds.dynamicdata.DynamicData.get_char_↩ seq (p. 1185)	**com.rti.dds.dynamicdata.DynamicData.set_char_↩ seq** (p. 1220)

In addition to getting or setting a field, you can "clear" its value; that is, set it to a default zero value.

- **com.rti.dds.dynamicdata.DynamicData.clear_all_members** (p. 1149)
- **com.rti.dds.dynamicdata.DynamicData.clear_optional_member** (p. 1150)

8.94.4.3 Query and Iteration

Not all components of your application will have static knowledge of all of the fields of your type. Sometimes, you will want to query meta-data about the fields that appear in a given data sample.

- **com.rti.dds.dynamicdata.DynamicData.get_type** (p. 1156)
- **com.rti.dds.dynamicdata.DynamicData.get_type_kind** (p. 1156)
- **com.rti.dds.dynamicdata.DynamicData.get_member_type** (p. 1164)
- **com.rti.dds.dynamicdata.DynamicData.get_member_info** (p. 1161)
- **com.rti.dds.dynamicdata.DynamicData.get_member_count** (p. 1157)
- **com.rti.dds.dynamicdata.DynamicData.get_member_info_by_index** (p. 1163)
- **com.rti.dds.dynamicdata.DynamicData.member_exists** (p. 1160)
- **com.rti.dds.dynamicdata.DynamicData.member_exists_in_type** (p. 1161)
- **com.rti.dds.dynamicdata.DynamicData.is_member_key** (p. 1165)

8.94.4.4 Type/Object Association

Sometimes, you may want to change the association between a data object and its type. This is not something you can do with a typical object, but with **com.rti.dds.dynamicdata.DynamicData** (p. 1134) objects, it is a powerful capability. It allows you to, for example, examine nested structures without copying them by using a "bound" **com.rti.↩ dds.dynamicdata.DynamicData** (p. 1134) object as a view into an enclosing **com.rti.dds.dynamicdata.DynamicData** (p. 1134) object.

- **com.rti.dds.dynamicdata.DynamicData.bind_type** (p. 1152)
- **com.rti.dds.dynamicdata.DynamicData.unbind_type** (p. 1153)
- **com.rti.dds.dynamicdata.DynamicData.bind_complex_member** (p. 1154)
- **com.rti.dds.dynamicdata.DynamicData.unbind_complex_member** (p. 1156)

MT Safety:

UNSAFE. In general, using a single **com.rti.dds.dynamicdata.DynamicData** (p. 1134) object concurrently from multiple threads is *unsafe*.

8.94.5 Constructor & Destructor Documentation

8.94.5.1 DynamicData()

```
DynamicData (
            TypeCode type,
            DynamicDataProperty_t property )
```

The constructor for new **com.rti.dds.dynamicdata.DynamicData** (p. 1134) objects.

The type parameter may be null. In that case, this **com.rti.dds.dynamicdata.DynamicData** (p. 1134) must be *bound* with **com.rti.dds.dynamicdata.DynamicData.bind_type** (p. 1152) or **com.rti.dds.dynamicdata.Dynamic↩ Data.bind_complex_member** (p. 1154) before it can be used.

If the **com.rti.dds.typecode.TypeCode** (p. 2183) is not null, the newly constructed **com.rti.dds.dynamicdata.↩ DynamicData** (p. 1134) object will retain a reference to it. It is *not* safe to delete the **com.rti.dds.typecode.TypeCode** (p. 2183) until all samples that use it have themselves been deleted. You have two options:

- Keep a reference to the **com.rti.dds.typecode.TypeCode** (p. 2183) object yourself, and delete it with **com.rti.↩ dds.typecode.TypeCodeFactory.delete_tc** (p. 2245) after you've deleted all of the objects that use it.
- Do not keep a reference to the **com.rti.dds.typecode.TypeCode** (p. 2183). The garbage collector will delete it when it's eligible for collection.

In most cases, it is not necessary to call this constructor explicitly. Instead, use **com.rti.dds.dynamicdata.Dynamic↩ DataTypeSupport.create_data** (p. 1289), and the **com.rti.dds.typecode.TypeCode** (p. 2183) and properties will be specified for you. Using the factory method also ensures that the memory management contract documented above is followed correctly, because the **com.rti.dds.dynamicdata.DynamicDataTypeSupport** (p. 1286) object maintains the **com.rti.dds.typecode.TypeCode** (p. 2183) used by the samples it creates.

Parameters

type	*<<**in**>> (p. 404)* The type of which the new object will represent an object.
property	*<<**in**>> (p. 404)* Properties that configure the behavior of the new object. Most users can simply use com.rti.dds.dynamicdata.DYNAMIC_DATA_PROPERTY_DEFAULT.

com.rti.dds.dynamicdata.DynamicDataTypeSupport.create_data (p. 1289)

8.94.6 Member Function Documentation

8.94.6.1 delete()

```
void delete ( )
```

Finalize and deallocate this **com.rti.dds.dynamicdata.DynamicData** (p. 1134) sample.

MT Safety:

UNSAFE.

See also

com.rti.dds.dynamicdata.DynamicData.DynamicData.DynamicData

Referenced by **DynamicDataTypeSupport.destroy_data()**.

8.94.6.2 equals()

```
boolean equals (
             Object o )
```

Indicate whether the contents of another **com.rti.dds.dynamicdata.DynamicData** (p. 1134) sample are the same as those of this one.

This operation compares the data and type of existing members.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with com.rti.dds.↩ infrastructure.false. See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

See also

http://java.sun.com/javase/6/docs/api/java/lang/Object.html#equals(java.↩ lang.Object)

8.94.6.3 copy_from()

```
Object copy_from (
             Object src )
```

Deeply copy from the given object to this object.

MT Safety:

UNSAFE.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903)

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

Implements **Copyable** (p. 701).

8.94.6.4 clear_all_members()

```
void clear_all_members ( )
```

Clear the contents of all data members of this object.

MT Safety:

UNSAFE.

Exceptions

One	of the **Standard Return Codes** (p. 513)

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

See also

com.rti.dds.dynamicdata.DynamicData.clear_optional_member (p. 1150)

8.94.6.5 clear_member()

```
void clear_member (
            String member_name,
            int member_id )
```

Clear the contents of a single data member of this object.

This method can be used to clear both optional and non-optional members.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	*<<**in**>> (p. 404)* The name of the member to clear or null to look up the member by its ID.
member_id	*<<**in**>> (p. 404)* The ID of the member to clear or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

com.rti.dds.dynamicdata.DynamicData.clear_all_members (p. 1149)

8.94.6.6 clear_optional_member()

```
void clear_optional_member (
             String member_name,
             int member_id )
```

Clear the contents of a single optional data member of this object.

This method is only applicable to optional members. Members of unions, sequences, and arrays are not considered optional.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	*<<**in**>> (p. 404)* The name of the member (to look up the member by name), or null (to look up the member by its ID).
member_id	*<<**in**>> (p. 404)* The ID of the member (to look up the member by its ID), or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) (to look up the member by name). See **Member Names and IDs** (p. 1140).

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

com.rti.dds.dynamicdata.DynamicData.clear_all_members (p. 1149)

8.94.6.7 print()

```
void print (
             File fp,
             int indent )
```

Output a textual representation of this object and its contents to the given file.

This method is equivalent to **com.rti.dds.dynamicdata.DynamicDataTypeSupport.print_data** (p. 1290).

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

Precondition

The type must be an aggregation or collection. That is, its **com.rti.dds.typecode.TCKind** (p. 2094) must be one of: **com.rti.dds.typecode.TCKind.TK_STRUCT** (p. 2098), **com.rti.dds.typecode.TCKind.TK_VALUE** (p. 2101), **com.rti.dds.typecode.TCKind.TK_UNION** (p. 2098), **com.rti.dds.typecode.TCKind.TK_SEQUENCE** (p. 2099) or **com.rti.dds.typecode.TCKind.TK_ARRAY** (p. 2099), otherwise this function fails with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).

MT Safety:

UNSAFE.

Parameters

fp	<<***in***>> *(*p. *404)* The file into which the object should be printed (to print to standard output, provide the stream pointer 'stdout')
indent	<<***in***>> *(*p. *404)* The output of this method will be pretty-printed. This argument indicates the amount of initial indentation of the output.

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

com.rti.dds.dynamicdata.DynamicDataTypeSupport.print_data (p. 1290)

8.94.6.8 get_info()

```
void get_info (
                DynamicDataInfo info_out )
```

Fill in the given descriptor with information about this **com.rti.dds.dynamicdata.DynamicData** (p. 1134).

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will print an error log. See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

info_out	<<***out***>> *(p. 404)* The descriptor object whose contents will be overwritten by this operation.

8.94.6.9 bind_type()

```
void bind_type (
                TypeCode type )
```

If this **com.rti.dds.dynamicdata.DynamicData** (p. 1134) object is not yet associated with a data type, set that type now to the given **com.rti.dds.typecode.TypeCode** (p. 2183).

This advanced operation allows you to reuse a single **com.rti.dds.dynamicdata.DynamicData** (p. 1134) object with multiple data types.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

```
DynamicData myData = new DynamicData(null, myProperties);

TypeCode myType = ...;

myData.bind_type(myType);

try {

    // Do something...

} finally {
```

```
    myData.unbind_type();
}
myData.delete();
```

Note that the **com.rti.dds.dynamicdata.DynamicData** (p. 1134) object will retain a reference to the **com.rti.dds.typecode.TypeCode** (p. 2183) object you provide. It is *not* safe to delete the **com.rti.dds.typecode.TypeCode** (p. 2183) until after it is unbound. You have two options:

- Keep a reference to the **com.rti.dds.typecode.TypeCode** (p. 2183) object yourself, and delete it with **com.rti.dds.typecode.TypeCodeFactory.delete_tc** (p. 2245) after you've finished using it.
- Do not keep a reference to the **com.rti.dds.typecode.TypeCode** (p. 2183). The garbage collector will delete it when it's eligible for collection.

MT Safety:

UNSAFE.

Parameters

type	*<<**in**>> (p. 404)* The type to associate with this **com.rti.dds.dynamicdata.DynamicData** (p. 1134) object.

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

com.rti.dds.dynamicdata.DynamicData.unbind_type (p. 1153)

8.94.6.10 unbind_type()

```
void unbind_type ( )
```

Dissociate this **com.rti.dds.dynamicdata.DynamicData** (p. 1134) object from any particular data type.

This step is necessary before the object can be associated with a new data type.

This operation clears all members as a side effect.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

com.rti.dds.dynamicdata.DynamicData.bind_type (p. 1152)

com.rti.dds.dynamicdata.DynamicData.clear_all_members (p. 1149)

8.94.6.11 bind_complex_member()

```
void bind_complex_member (
              DynamicData value_out,
             String member_name,
             int member_id )
```

Use another **com.rti.dds.dynamicdata.DynamicData** (p. 1134) object to provide access to a complex field of this **com.rti.dds.dynamicdata.DynamicData** (p. 1134) object.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

For example, consider the following data types:

```
struct MyFieldType {

    float theFloat;

};

struct MyOuterType {

    MyFieldType complexMember;

};
```

Suppose you have an instance of `MyOuterType`, and you would like to examine the contents of its member `complexMember`. To do this, you must *bind* another **com.rti.dds.dynamicdata.DynamicData** (p. 1134) object to that member. This operation will bind the type code of the member to the provided **com.rti.dds.dynamicdata.DynamicData** (p. 1134) object and perform additional initialization.

The following example demonstrates the usage pattern. Note that error handling has been omitted for brevity.

```
DynamicData outer = ...;

DynamicData toBeBound = new DynamicData(null, myProperties);

outer.bind_complex_member(

    toBeBound,

    "complexMember",

    DynamicData.MEMBER_ID_UNSPECIFIED);

try {
```

```
    float theFloatValue = toBeBound.get_float(
        "theFloat"
        DynamicData.MEMBER_ID_UNSPECIFIED);
} finally {
    outer.unbind_complex_member(toBeBound);
}
toBeBound.delete();
```

This operation is only permitted when the object toBeBound (named as in the example above) is not currently associated with any type, including already being bound to another member. You can see in the example that this object is created directly with the constructer and is not provided with a **com.rti.dds.typecode.TypeCode** (p. 2183).

Only a single member of a given **com.rti.dds.dynamicdata.DynamicData** (p. 1134) object may be bound at one time – however, members *of* members may be recursively bound to any depth. Furthermore, while the outer object has a bound member, it may only be modified through that bound member. That is, after calling this member, all "set" operations on the outer object will be disabled until **com.rti.dds.dynamicdata.DynamicData.unbind_complex_member** (p. 1156) has been called. Furthermore, any bound member must be unbound before a sample can be written or deleted.

This method is logically related to **com.rti.dds.dynamicdata.DynamicData.get_complex_member** (p. 1200) in that both allow you to examine the state of nested objects. They are different in an important way: this method provides a view into an outer object, such that any change made to the inner object will be reflected in the outer. But the **com.↩ rti.dds.dynamicdata.DynamicData.get_complex_member** (p. 1200) operation *copies* the state of the nested object; changes to it will not be reflected in the source object.

Note that you can bind to a member of a sequence at an index that is past the current length of that sequence. In that case, this method behaves like a "set" method: it automatically lengthens the sequence (filling in default elements) to allow the bind to take place. See **Getters and Setters** (p. 1143).

MT Safety:

UNSAFE.

Parameters

value_out	<<***out***>> *(p. 404)* The object that you wish to bind to the field.
member_name	<<***in***>> *(p. 404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

com.rti.dds.dynamicdata.DynamicData.unbind_complex_member (p. 1156)

com.rti.dds.dynamicdata.DynamicData.get_complex_member (p. 1200)

8.94.6.12 unbind_complex_member()

```
void unbind_complex_member (
            DynamicData value )
```

Tear down the association created by a **com.rti.dds.dynamicdata.DynamicData.bind_complex_member** (p. 1154) operation, committing any changes to the outer object since then.

Some changes to the outer object will not be observable until after you have performed this operation.

If you have called **com.rti.dds.dynamicdata.DynamicData.bind_complex_member** (p. 1154) on a data sample, you must unbind before writing or deleting the sample.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

value	<<***in***>> *(p. 404)* The same object you passed to **com.rti.dds.dynamicdata.DynamicData.bind_complex_member** (p. 1154). This argument is used for error checking purposes.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903)

See also

com.rti.dds.dynamicdata.DynamicData.bind_complex_member (p. 1154)

8.94.6.13 get_type()

```
synchronized TypeCode get_type ( )
```

Get the data type, of which this **com.rti.dds.dynamicdata.DynamicData** (p. 1134) represents an instance.

MT Safety:

UNSAFE.

8.94.6.14 get_type_kind()

```
TCKind get_type_kind ( )
```

Get the kind of this object's data type.

This is a convenience method. It's equivalent to calling **com.rti.dds.dynamicdata.DynamicData.get_type** (p. 1156) followed by **com.rti.dds.typecode.TypeCode.kind** (p. 2186).

MT Safety:

UNSAFE.

8.94.6.15 get_member_count()

```
int get_member_count ( )
```

Get the number of members in the type.

For objects of type kind **com.rti.dds.typecode.TCKind.TK_ARRAY** (p. 2099) or **com.rti.dds.typecode.TCKind.TK_SEQUENCE** (p. 2099), this method returns the number of elements in the collection.

For objects of type kind **com.rti.dds.typecode.TCKind.TK_STRUCT** (p. 2098) or **com.rti.dds.typecode.TCKind.TK_VALUE** (p. 2101), it returns the number of fields in the type.

For objects of type kind **com.rti.dds.typecode.TCKind.TK_UNION** (p. 2098), it returns 1 if the current discriminator selects a member in the union, and 0 if it does not.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

See also

com.rti.dds.dynamicdata.DynamicData.get_member_info_by_index (p. 1163)

8.94.6.16 get_discriminator()

```
int get_discriminator ( )
```

Get the current value of the union discriminator.

This operation is valid only for objects of **com.rti.dds.typecode.TCKind** (p. 2094) **com.rti.dds.typecode.TCKind.↩ TK_UNION** (p. 2098).

This API should be used instead of **com.rti.dds.dynamicdata.DynamicData.get_member_info_by_index** (p. 1163), which provides the discriminator value for unions when passing in 0 for the index value. That functionality has been deprecated in favor of this API.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

discriminator	<<***out***>> *(p. 404)* The current value of the union discriminator.

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

com.rti.dds.dynamicdata.DynamicData.set_discriminator (p. 1158)

Getting and Setting Union Discriminator Values (p. 1140)

8.94.6.17 set_discriminator()

```
void set_discriminator (
            int discriminator )
```

Set the value of the union discriminator (UnionType only)

This operation is valid only for objects of **com.rti.dds.typecode.TCKind** (p. 2094) **com.rti.dds.typecode.TCKind.↩ TK_UNION** (p. 2098).

If the discriminator value identifies the same member in the union, the previously set value for the member is preserved and only the discriminator value is updated.

If the discriminator value identifies a different member in the union, the previously set member in the union will be finalized and the identified member will be initialized to its default value.

If the discriminator doesn't identify any member in the union, then the previously set member will be finalized and the discriminator will be set to the provided value.

For example, given the following IDL Union:

```
union Foo switch (short) {
case 1:
    long x;
case 2:
case 3:
    string y;
};
```

We can set the active member to "y" as follows (all code omits error checking for brevity):

```
// Set the discriminator to 2 and select member "y"
DDS_DynamicData_set_discriminator(sample, 2);

DDS_DynamicData_get_string(
        sample,
        &outString,
        size,
        "y",
        DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED);
assert(outString == "");

DDS_DynamicData_set_string(
        sample,
        "y",
        DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED,
        "hello");
```

Setting the discriminator to 3 also selects "y" and preserves the previous value of "hello".

```
DDS_DynamicData_set_discriminator(sample, 3);

DDS_DynamicData_get_string(
        sample,
        &outString,
        size,
        "y",
        DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED);
assert(outString == "hello");
```

Setting the discriminator to a new value that selects a different member, "x", finalizes the previous member's value and initializes the new member to its default.

```
DDS_DynamicData_set_discriminator(sample, 1);

DDS_DynamicData_get_long(
        sample,
        &outLong,
        "x",
        DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED);
assert(outLong == 0);

retCode = DDS_DynamicData_get_string(
        sample,
        &outString,
        size,
        "y",
        DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED);
assert(retCode == DDS_RETCODE_NO_DATA);
```

The discriminator can also be set to a value that does not select any member.

```
DDS_DynamicData_set_discriminator(sample, 100);
DDS_DynamicData_get_discriminator(sample, &discValue);
assert(discValue == 100);
assert(DDS_DynamicData_get_member_count(sample) == 0);
```

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

discriminator	<<***in***>> *(*p. *404)* The discriminator value to set

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

com.rti.dds.dynamicdata.DynamicData.get_discriminator (p. 1157)

Getting and Setting Union Discriminator Values (p. 1140)

com.rti.dds.dynamicdata.DynamicData.get_member_count (p. 1157)

8.94.6.18 member_exists()

```
boolean member_exists (
             String member_name,
             int member_id )
```

Indicates whether a member exists in this sample.

You only need to specify the name OR the ID (not both).

If the member doesn't exist in the type, this function returns false. In all other cases, it provides the same result as **com.rti.dds.dynamicdata.DynamicDataMemberInfo.member_exists** (p. 1245), which is retrieved with **com.rti.dds.dynamicdata.DynamicData.get_member_info** (p. 1161).

For union types, if a member can be selected with multiple discriminator values, looking up if a member exists using any of the values that select the member will return the same result.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with com.rti.dds.infrastructure.false. See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	<<***in***>> *(*p. *404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(*p. *404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

See also

com.rti.dds.dynamicdata.DynamicData.member_exists_in_type (p. 1161)

com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED (p. 1242)

8.94.6.19 member_exists_in_type()

```
boolean member_exists_in_type (
             String member_name,
             int member_id )
```

Indicates whether a member of a particular name/ID exists in this data sample's type.

You only need to specify the name OR the ID (not both).

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with com.rti.dds.↩ infrastructure.false. See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	*<<**in**>> (p. 404)* The name of the member or null to look up the member by its ID.
member_id	*<<**in**>> (p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

See also

com.rti.dds.dynamicdata.DynamicData.member_exists (p. 1160)

com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED (p. 1242)

8.94.6.20 get_member_info()

```
void get_member_info (
              DynamicDataMemberInfo info,
             String member_name,
             int member_id )
```

Fill in the given descriptor with information about the identified member of this **com.rti.dds.dynamicdata.DynamicData** (p. 1134) sample.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

This operation is valid for objects of **com.rti.dds.typecode.TCKind** (p. 2094) **com.rti.dds.typecode.TCKind.TK_ARRAY** (p. 2099), **com.rti.dds.typecode.TCKind.TK_SEQUENCE** (p. 2099), **com.rti.dds.typecode.TCKind.TK_STRUCT** (p. 2098), **com.rti.dds.typecode.TCKind.TK_UNION** (p. 2098), and **com.rti.dds.typecode.TCKind.TK_VALUE** (p. 2101).

MT Safety:

UNSAFE.

When this sample represents a struct, a value type, or a union:

- If the specified member is not defined in the type, this function fails with **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902). This includes cases when a union discriminator does not select a member in the union.
- If the specified member is defined in the type but doesn't exist in this data sample, this function returns an object with **com.rti.dds.dynamicdata.DynamicDataMemberInfo.member_exists** (p. 1245) set to false.
- If the specified member is defined in the type and exists in this data sample, **com.rti.dds.dynamicdata.DynamicDataMemberInfo.member_exists** (p. 1245) is true.

When this sample represents a sequence and `member_id` is the 1-based element index:

- If `member_id` is greater than the sequence's maximum length, this function fails with **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902).
- If `member_id` is greater than the sequence's current length but smaller than or equal to its maximum length, this function returns an object with **com.rti.dds.dynamicdata.DynamicDataMemberInfo.member_exists** (p. 1245) set to false.
- If `member_id` is smaller than or equal to the current length, **com.rti.dds.dynamicdata.DynamicDataMemberInfo.member_exists** (p. 1245) is true.

When this sample represents an array, this function either fails with with **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902) when the index is out of bounds or else returns an object with **com.rti.dds.dynamicdata.DynamicDataMemberInfo.member_exists** (p. 1245) set to true.

Parameters

info	*<<**out**>> (p. 404)* The descriptor object whose contents will be overwritten by this operations.
member_name	*<<**in**>> (p. 404)* The name of the member for which to get the info or null to look up the member by its ID. Only one of the name and the ID may be unspecified.
member_id	*<<**in**>> (p. 404)* The ID of the member for which to get the info, or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

The **com.rti.dds.dynamicdata.DynamicDataMemberInfo** (p. 1243) returned will contain information about the identi-

fied member, including its type, whether it exists in this sample, and other metadata.

The bounds for strings and collections are not provided in the returned **com.rti.dds.dynamicdata.DynamicData↩ MemberInfo** (p. 1243). To access that information you must query the **com.rti.dds.typecode.TypeCode** (p. 2183) of the member's type. See **com.rti.dds.typecode.TypeCode.length** (p. 2192), **com.rti.dds.typecode.TypeCode.↩ array_dimension_count** (p. 2198), and **com.rti.dds.typecode.TypeCode.array_dimension** (p. 2198).

The **com.rti.dds.typecode.TypeCode** (p. 2183) of a **DynamicData** (p. 1134) object can be accessed using **com.rti.↩ dds.dynamicdata.DynamicData.get_type** (p. 1156). You must iterate through the TypeCode to locate the members TypeCode. Once obtained, you can query the bounds using the TypeCode APIs mentioned above.

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

com.rti.dds.dynamicdata.DynamicData.get_member_info_by_index (p. 1163)

com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED (p. 1242)

8.94.6.21 get_member_info_by_index()

```
void get_member_info_by_index (
              DynamicDataMemberInfo info,
             int index )
```

Fill in the given descriptor with information about the identified member of this **com.rti.dds.dynamicdata.DynamicData** (p. 1134) sample.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

This operation is valid for objects of **com.rti.dds.typecode.TCKind** (p. 2094) **com.rti.dds.typecode.TCKind.TK_↩ ARRAY** (p. 2099), **com.rti.dds.typecode.TCKind.TK_SEQUENCE** (p. 2099), **com.rti.dds.typecode.TCKind.TK_↩ STRUCT** (p. 2098), **com.rti.dds.typecode.TCKind.TK_VALUE** (p. 2101), and **com.rti.dds.typecode.TCKind.TK_↩ UNION** (p. 2098).

Using this API to retrieve the discriminator value of a union by passing in index 0 has been deprecated. You should use the **com.rti.dds.dynamicdata.DynamicData.get_discriminator** (p. 1157) API instead. This API can still retrieve the discriminator value as long as the discriminator selects a member in the union. However, if the current discriminator value does not select a member in the union, this API will return **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902).

MT Safety:

UNSAFE.

Parameters

info	<<***out***>> *(*p. *404)* The descriptor object whose contents will be overwritten by this operations.
index	<<***in***>> *(*p. *404)* The zero-base of the member for which to get the info.

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

com.rti.dds.dynamicdata.DynamicData.get_member_info (p. 1161)

com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED (p. 1242)

8.94.6.22 get_member_type()

```
TypeCode get_member_type (
            String member_name,
            int member_id )
```

Get the type of the given member of this sample.

The member can be looked up either by name or by ID.

This operation is valid for objects of **com.rti.dds.typecode.TCKind** (p. 2094) **com.rti.dds.typecode.TCKind.TK_↩ ARRAY** (p. 2099), **com.rti.dds.typecode.TCKind.TK_SEQUENCE** (p. 2099), **com.rti.dds.typecode.TCKind.TK_↩ STRUCT** (p. 2098), and **com.rti.dds.typecode.TCKind.TK_VALUE** (p. 2101). For type kinds **com.rti.dds.typecode.↩ TCKind.TK_ARRAY** (p. 2099) and **com.rti.dds.typecode.TCKind.TK_SEQUENCE** (p. 2099), the index into the collection is taken to be one less than the ID, if specified. If this index is valid, this operation will return the content type of this collection.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	<<***in***>> *(*p. *404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(*p. *404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by
	name. See **Member Names and IDs** (p. 1140).

Exceptions

One	of the **Standard Return Codes** (p. 513)

8.94.6.23 is_member_key()

```
boolean is_member_key (
            String member_name,
            int member_id )
```

Indicates whether a given member forms part of the key of this sample's data type.

This operation is only valid for samples of types of kind **com.rti.dds.typecode.TCKind.TK_STRUCT** (p. 2098) or **com.rti.dds.typecode.TCKind.TK_VALUE** (p. 2101).

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	<<***in***>> *(p. 404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Exceptions

One	of the **Standard Return Codes** (p. 513)

8.94.6.24 get_int()

```
int get_int (
             String member_name,
             int member_id )
```

Get the value of the given field, which is of type com.rti.dds.infrastructure.int or another type implicitly convertible to it (byte, char, short, com.rti.dds.infrastructure.short, or **com.rti.dds.util.Enum** (p. 1330)).

The member may be specified by name or by ID.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	<<***in***>> *(p. 404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Exceptions

One	of the **Standard Return Codes** (p. 513). If the member is optional and not set, this operation will return **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902)

See also

com.rti.dds.dynamicdata.DynamicData.DynamicData.set_int

Referenced by **DynamicData.get_uint()**.

8.94.6.25 get_uint()

```
long get_uint (
             String member_name,
             int member_id )
```

Get the value of the given field, which is of type com.rti.dds.infrastructure.int or another type implicitly convertible to it (byte, char, short, com.rti.dds.infrastructure.short, or **com.rti.dds.util.Enum** (p. 1330)).

The member may be specified by name or by ID.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	*<<**in**>> (p. 404)* The name of the member or null to look up the member by its ID.
member_id	*<<**in**>> (p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Exceptions

One	of the **Standard Return Codes** (p. 513). If the member is optional and not set, this operation will return **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902)

See also

com.rti.dds.dynamicdata.DynamicData.DynamicData.set_int

References **DynamicData.get_int()**.

8.94.6.26 get_int_array()

```
int get_int_array (
             int[] array,
             String member_name,
             int member_id )
```

Get a copy of the given array member. The array may contain members of type com.rti.dds.infrastructure.int or **com.↩ rti.dds.util.Enum** (p. 1330).

This method will perform an automatic conversion from **com.rti.dds.infrastructure.IntSeq** (p. 1453).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

array	*<<**out**>> (p. 404)* An already-allocated array, into which the elements will be copied.
member_name	*<<**in**>> (p. 404)* The name of the member or null to look up the member by its ID.
member_id	*<<**in**>> (p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Returns

The size of the output array

See also

com.rti.dds.dynamicdata.DynamicData.DynamicData.set_int_array

com.rti.dds.dynamicdata.DynamicData.DynamicData.get_int_seq

Referenced by **DynamicData.get_uint_array()**.

8.94.6.27 get_uint_array()

```
int get_uint_array (
             long[] array,
             String member_name,
             int member_id )
```

Get a copy of the given array member. The array may contain members of type com.rti.dds.infrastructure.long or **com.↩ rti.dds.util.Enum** (p. 1330).

This method will perform an automatic conversion from com.rti.dds.infrastructure.UnsignedLongSeq.

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

array	*<<**out**>> (p. 404)* An already-allocated array, into which the elements will be copied. The array must be next bigger type to hold the unsigned values.
member_name	*<<**in**>> (p. 404)* The name of the member or null to look up the member by its ID.
member_id	*<<**in**>> (p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Returns

The size of the output array

See also

com.rti.dds.dynamicdata.DynamicData.set_ulong_array (p. 1231)

com.rti.dds.dynamicdata.DynamicData.DynamicData.get_uint_seq

References **DynamicData.get_int_array()**.

8.94.6.28 get_int_seq()

```
void get_int_seq (
               IntSeq seq,
              String member_name,
              int member_id )
```

Get a copy of the given sequence member.

The provided sequence will be automatically resized as necessary.

This method will perform an automatic conversion from an array of com.rti.dds.infrastructure.int.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

seq	<<***out***>> *(p. 404)* A sequence, into which the elements will be copied.
member_name	<<***in***>> *(p. 404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Exceptions

One	of the **Standard Return Codes** (p. 513). If the member is optional and not set, this operation will return **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902). This operation may also return **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903).

References **IntSeq.getMaximum()**, and **AbstractPrimitiveSequence.size()**.

Referenced by **DynamicData.get_uint_seq()**.

8.94.6.29 get_uint_seq()

```
void get_uint_seq (
              LongSeq seq,
             String member_name,
             int member_id )
```

Get a copy of the given sequence member.

The provided sequence will be automatically resized as necessary.

This method will perform an automatic conversion from an array of com.rti.dds.infrastructure.long.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

seq	<<***out***>> *(p. 404)* A sequence, into which the elements will be copied.
member_name	<<***in***>> *(p. 404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Exceptions

One	of the **Standard Return Codes** (p. 513). If the member is optional and not set, this operation will return **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902). This operation may also return **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903).

8.94.6.30 get_short()

```
short get_short (
            String member_name,
            int member_id )
```

Get the value of the given field, which is of type short or another type implicitly convertible to it (byte or char).

The member may be specified by name or by ID.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	<<***in***>> *(p. 404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Exceptions

One	of the **Standard Return Codes** (p. 513). If the member is optional and not set, this operation will return **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902)

See also

com.rti.dds.dynamicdata.DynamicData.set_short (p. 1206)

Referenced by **DynamicData.get_ushort()**.

8.94.6.31 get_ushort()

```
int get_ushort (
            String member_name,
            int member_id )
```

Get the value of the given field, which is of type com.rti.dds.infrastructure.short or another type implicitly convertible to it (byte or char).

The member may be specified by name or by ID.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	<<***in***>> *(*p. *404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(*p. *404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Returns

A Java int value with the unsigned value of the indicated member.

See also

com.rti.dds.dynamicdata.DynamicData.set_ushort (p. 1207)

References **DynamicData.get_short()**.

8.94.6.32 get_short_array()

```
int get_short_array (
            short[] array,
            String member_name,
            int member_id )
```

Get a copy of the given array member.

This method will perform an automatic conversion from **com.rti.dds.infrastructure.ShortSeq** (p. 1995).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

array	<<***out***>> *(*p. *404)* An already-allocated array, into which the elements will be copied.
member_name	<<***in***>> *(*p. *404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(*p. *404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Returns

The size of the output array

See also

com.rti.dds.dynamicdata.DynamicData.set_short_array (p. 1208)

com.rti.dds.dynamicdata.DynamicData.get_short_seq (p. 1174)

Referenced by **DynamicData.get_ushort_array()**.

8.94.6.33 get_ushort_array()

```
int get_ushort_array (
             int[] array,
             String member_name,
             int member_id )
```

Get a copy of the given array member.

This method will perform an automatic conversion from com.rti.dds.infrastructure.UnsignedShortSeq.

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

array	<<***out***>> *(*p. *404)* An already-allocated array, into which the elements will be copied. The array must be next bigger type to hold the unsigned values.
member_name	<<***in***>> *(*p. *404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(*p. *404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Returns

The size of the output array

See also

8.94.6.34 get_short_seq()

```
void get_short_seq (
              ShortSeq seq,
             String member_name,
             int member_id )
```

Get a copy of the given sequence member.

The provided sequence will be automatically resized as necessary.

This method will perform an automatic conversion from an array of short.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

seq	<<***out***>> *(*p. *404)* A sequence, into which the elements will be copied.
member_name	<<***in***>> *(*p. *404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(*p. *404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Exceptions

One	of the **Standard Return Codes** (p. 513). If the member is optional and not set, this operation will return **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902). This operation may also return **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903).

8.94.6.36 get_float()

```
float get_float (
             String member_name,
             int member_id )
```

Get the value of the given field, which is of type float.

The member may be specified by name or by ID.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	<<***in***>> *(p. 404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Exceptions

One	of the **Standard Return Codes** (p. 513). If the member is optional and not set, this operation will return **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902)

See also

com.rti.dds.dynamicdata.DynamicData.set_float (p. 1211)

8.94.6.37 get_float_array()

```
int get_float_array (
             float[] array,
             String member_name,
             int member_id )
```

Get a copy of the given array member.

This method will perform an automatic conversion from **com.rti.dds.infrastructure.FloatSeq** (p. 1341).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

array	<<***out***>> *(p. 404)* An already-allocated array, into which the elements will be copied.
member_name	<<***in***>> *(p. 404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Returns

The size of the output array

See also

com.rti.dds.dynamicdata.DynamicData.set_float_array (p. 1212)

com.rti.dds.dynamicdata.DynamicData.get_float_seq (p. 1177)

8.94.6.38 get_float_seq()

```
void get_float_seq (
              FloatSeq seq,
             String member_name,
             int member_id )
```

Get a copy of the given sequence member.

The provided sequence will be automatically resized as necessary.

This method will perform an automatic conversion from an array of float.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

seq	<<***out***>> *(p. 404)* A sequence, into which the elements will be copied.
member_name	<<***in***>> *(p. 404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Exceptions

One	of the **Standard Return Codes** (p. 513). If the member is optional and not set, this operation will return **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902). This operation may also return **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903).

See also

8.94.6.39 get_double()

```
double get_double (
             String member_name,
             int member_id )
```

Get the value of the given field, which is of type double or another type implicitly convertible to it (float).

The member may be specified by name or by ID.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	<<***in***>> *(p. 404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Exceptions

One	of the **Standard Return Codes** (p. 513). If the member is optional and not set, this operation will return **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902)

See also

com.rti.dds.dynamicdata.DynamicData.set_double (p. 1213)

8.94.6.40 get_double_array()

```
int get_double_array (
             double[] array,
             String member_name,
             int member_id )
```

Get a copy of the given array member.

This method will perform an automatic conversion from **com.rti.dds.infrastructure.DoubleSeq** (p. 1109).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

array	*<<**out**>> (p. 404)* An already-allocated array, into which the elements will be copied.
member_name	*<<**in**>> (p. 404)* The name of the member or null to look up the member by its ID.
member_id	*<<**in**>> (p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Returns

The size of the output array

See also

com.rti.dds.dynamicdata.DynamicData.set_double_array (p. 1214)

com.rti.dds.dynamicdata.DynamicData.get_double_seq (p. 1180)

8.94.6.41 get_double_seq()

```
void get_double_seq (
               DoubleSeq seq,
              String member_name,
              int member_id )
```

Get a copy of the given sequence member.

The provided sequence will be automatically resized as necessary.

This method will perform an automatic conversion from an array of double.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

seq	*<<**out**>> (p. 404)* A sequence, into which the elements will be copied.
member_name	*<<**in**>> (p. 404)* The name of the member or null to look up the member by its ID.
member_id	*<<**in**>> (p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Exceptions

One	of the **Standard Return Codes** (p. 513). If the member is optional and not set, this operation will return **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902). This operation may also return **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903).

8.94.6.42 get_boolean()

```
boolean get_boolean (
            String member_name,
            int member_id )
```

Get the value of the given field, which is of type boolean.

The member may be specified by name or by ID.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	*<<**in**>> (p. 404)* The name of the member or null to look up the member by its ID.
member_id	*<<**in**>> (p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Exceptions

One	of the **Standard Return Codes** (p. 513). If the member is optional and not set, this operation will return **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902)

See also

com.rti.dds.dynamicdata.DynamicData.set_boolean (p. 1216)

8.94.6.43 get_boolean_array()

```
int get_boolean_array (
             boolean[] array,
             String member_name,
             int member_id )
```

Get a copy of the given array member.

This method will perform an automatic conversion from **com.rti.dds.infrastructure.BooleanSeq** (p. 612).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

array	<<***out***>> *(p. 404)* An already-allocated array, into which the elements will be copied.
member_name	<<***in***>> *(p. 404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Returns

The size of the output array

See also

com.rti.dds.dynamicdata.DynamicData.set_boolean_array (p. 1217)

com.rti.dds.dynamicdata.DynamicData.get_boolean_seq (p. 1182)

8.94.6.44 get_boolean_seq()

```
void get_boolean_seq (
               BooleanSeq seq,
              String member_name,
              int member_id )
```

Get a copy of the given sequence member.

The provided sequence will be automatically resized as necessary.

This method will perform an automatic conversion from an array of boolean.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

seq	*<<**out**>> (p. 404)* A sequence, into which the elements will be copied.
member_name	*<<**in**>> (p. 404)* The name of the member or null to look up the member by its ID.
member_id	*<<**in**>> (p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Exceptions

One	of the **Standard Return Codes** (p. 513). If the member is optional and not set, this operation will return **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902). This operation may also return **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903).

8.94.6.45 get_char()

```
char get_char (
              String member_name,
              int member_id )
```

Get the value of the given field, which is of type char.

The member may be specified by name or by ID.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	<<***in***>> *(p. 404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Exceptions

One	of the **Standard Return Codes** (p. 513). If the member is optional and not set, this operation will return **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902)

See also

References **DynamicData.get_member_type()**, **TypeCode.kind()**, and **TCKind.TK_WCHAR**.

8.94.6.46 get_char_array()

```
int get_char_array (
             char[] array,
             String member_name,
             int member_id )
```

Get a copy of the given array member.

This method will perform an automatic conversion from **com.rti.dds.infrastructure.CharSeq** (p. 671).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

array	*<<**out**>> (p. 404)* An already-allocated array, into which the elements will be copied.
member_name	*<<**in**>> (p. 404)* The name of the member or null to look up the member by its ID.
member_id	*<<**in**>> (p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Returns

The size of the output array

See also

com.rti.dds.dynamicdata.DynamicData.set_char_array (p. 1219)

com.rti.dds.dynamicdata.DynamicData.get_char_seq (p. 1185)

8.94.6.47 get_char_seq()

```
void get_char_seq (
              CharSeq seq,
             String member_name,
             int member_id )
```

Get a copy of the given sequence member.

The provided sequence will be automatically resized as necessary.

This method will perform an automatic conversion from an array of char.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

seq	*<<**out**>> (p. 404)* A sequence, into which the elements will be copied.
member_name	*<<**in**>> (p. 404)* The name of the member or null to look up the member by its ID.
member_id	*<<**in**>> (p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Exceptions

One	of the **Standard Return Codes** (p. 513). If the member is optional and not set, this operation will return **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902). This operation may also return **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903).

8.94.6.48 get_byte()

```
byte get_byte (
             String member_name,
             int member_id )
```

Get the value of the given field, which is of type byte.

The member may be specified by name or by ID.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	<<***in***>> *(p. 404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Exceptions

One	of the **Standard Return Codes** (p. 513). If the member is optional and not set, this operation will return **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902)

See also

com.rti.dds.dynamicdata.DynamicData.DynamicData.set_byte

Referenced by **DynamicData.get_int8()**, and **DynamicData.get_uint8()**.

8.94.6.49 get_uint8()

```
short get_uint8 (
             String member_name,
             int member_id )
```

Get the value of the given field, which is of type com.rti.dds.infrastructure.byte.

The member may be specified by name or by ID.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	<<***in***>> *(p. 404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Returns

A short value with the unsigned value of the indicated member.

See also

com.rti.dds.dynamicdata.DynamicData.DynamicData.set_uint8

References **DynamicData.get_byte()**.

8.94.6.50 get_int8()

```
byte get_int8 (
             String member_name,
             int member_id )
```

Get the value of the given field, which is of type com.rti.dds.infrastructure.byte.

The member may be specified by name or by ID.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	*<<**in**>> (p. 404)* The name of the member or null to look up the member by its ID.
member_id	*<<**in**>> (p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Returns

A byte value with the value of the indicated member.

See also

com.rti.dds.dynamicdata.DynamicData.DynamicData.set_int8

References **DynamicData.get_byte()**.

8.94.6.51 get_byte_array()

```
int get_byte_array (
             byte[] array,
             String member_name,
             int member_id )
```

Get a copy of the given array member.

This method will perform an automatic conversion from **com.rti.dds.infrastructure.ByteSeq** (p. 649).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

array	<<***out***>> *(*p. *404)* An already-allocated array, into which the elements will be copied.
member_name	<<***in***>> *(*p. *404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(*p. *404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Returns

The size of the output array

See also

com.rti.dds.dynamicdata.DynamicData.DynamicData.set_byte_array

com.rti.dds.dynamicdata.DynamicData.DynamicData.get_byte_seq

Referenced by **DynamicData.get_int8_array()**, and **DynamicData.get_uint8_array()**.

8.94.6.52 get_int8_array()

```
int get_int8_array (
             byte[] array,
             String member_name,
             int member_id )
```

Get a copy of the given array member.

This method will perform an automatic conversion from **com.rti.dds.infrastructure.ByteSeq** (p. 649).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

array	*<<**out**>> (p. 404)* An already-allocated array, into which the elements will be copied.
member_name	*<<**in**>> (p. 404)* The name of the member or null to look up the member by its ID.
member_id	*<<**in**>> (p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Returns

The size of the output array

See also

com.rti.dds.dynamicdata.DynamicData.DynamicData.set_int8_array

com.rti.dds.dynamicdata.DynamicData.DynamicData.get_int8_seq

References **DynamicData.get_byte_array()**.

8.94.6.53 get_uint8_array()

```
int get_uint8_array (
             short[] array,
             String member_name,
             int member_id )
```

Get a copy of the given array member.

This method will perform an automatic conversion from **com.rti.dds.infrastructure.ByteSeq** (p. 649).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

array	*<<**out**>> (p. 404)* An already-allocated array, into which the elements will be copied. The array must be next bigger type to hold the unsigned values.
member_name	*<<**in**>> (p. 404)* The name of the member or null to look up the member by its ID.
member_id	*<<**in**>> (p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Returns

The size of the output array

See also

com.rti.dds.dynamicdata.DynamicData.DynamicData.set_uint8_array

com.rti.dds.dynamicdata.DynamicData.DynamicData.get_uint8_seq

References **DynamicData.get_byte_array()**.

8.94.6.54 get_byte_seq()

```
void get_byte_seq (
              ByteSeq seq,
             String member_name,
             int member_id )
```

Get a copy of the given sequence member.

The provided sequence will be automatically resized as necessary.

This method will perform an automatic conversion from an array of byte.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

seq	<<***out***>> *(p. 404)* A sequence, into which the elements will be copied.
member_name	<<***in***>> *(p. 404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Exceptions

One	of the **Standard Return Codes** (p. 513). If the member is optional and not set, this operation will return **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902). This operation may also return **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903).

              ShortSeq seq,
             String member_name,
             int member_id )
```

Get a copy of the given sequence member.

The provided sequence will be automatically resized as necessary.

This method will perform an automatic conversion from an array of com.rti.dds.infrastructure.byte.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

seq	<<***out***>> *(p. 404)* A sequence, into which the elements will be copied.
member_name	<<***in***>> *(p. 404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Exceptions

One	of the **Standard Return Codes** (p. 513). If the member is optional and not set, this operation will return **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902). This operation may also return **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903).

com.rti.dds.dynamicdata.DynamicData.DynamicData.get_uint8_array

References **DynamicData.get_byte_seq()**, **ByteSeq.getByte()**, **ByteSeq.getMaximum()**, **ShortSeq.get↩ Maximum()**, **ShortSeq.set()**, **AbstractSequence.setMaximum()**, **AbstractPrimitiveSequence.setSize()**, and **AbstractPrimitiveSequence.size()**.

8.94.6.57 get_long()

```
long get_long (
             String member_name,
             int member_id )
```

Get the value of the given field, which is of type long or another type implicitly convertible to it (byte, char, short, com.rti.dds.infrastructure.short, com.rti.dds.infrastructure.int, com.rti.dds.infrastructure.long, or **com.rti.dds.util.Enum** (p. 1330)).

The member may be specified by name or by ID.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	<<***in***>> *(p. 404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Exceptions

One	of the **Standard Return Codes** (p. 513). If the member is optional and not set, this operation will return **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902)

See also

com.rti.dds.dynamicdata.DynamicData.DynamicData.set_long

Referenced by **DynamicData.get_ulong()**.

8.94.6.58 get_ulong()

```
BigInteger get_ulong (
             String member_name,
             int member_id )
```

Get the value of the given field, which is of type com.rti.dds.infrastructure.long or another type implicitly convertible to it (byte, char, short, com.rti.dds.infrastructure.short, com.rti.dds.infrastructure.int, com.rti.dds.infrastructure.long, or **com.rti.dds.util.Enum** (p. 1330)).

The member may be specified by name or by ID.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	<<***in***>> *(p. 404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Returns

A Java BigInteger value with the unsigned value of the indicated member.

See also

com.rti.dds.dynamicdata.DynamicData.set_ulonglong

References **DynamicData.get_long()**.

8.94.6.59 get_long_array()

```
int get_long_array (
             long[] array,
             String member_name,
             int member_id )
```

Get a copy of the given array member.

This method will perform an automatic conversion from **com.rti.dds.infrastructure.LongSeq** (p. 1582).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

array	<<***out***>> *(*p. *404)* An already-allocated array, into which the elements will be copied.
member_name	<<***in***>> *(*p. *404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(*p. *404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Returns

The size of the output array

See also

com.rti.dds.dynamicdata.DynamicData.DynamicData.set_long_array

com.rti.dds.dynamicdata.DynamicData.DynamicData.get_long_seq

Referenced by **DynamicData.get_ulong_array()**.

8.94.6.60 get_ulong_array()

```
int get_ulong_array (
             BigInteger[] array,
             String member_name,
             int member_id )
```

Get a copy of the given array member.

This method will perform an automatic conversion from com.rti.dds.infrastructure.BigIntegerSeq.

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

array	<<***out***>> *(*p. *404)* An already-allocated array, into which the elements will be copied. The array must be next bigger type to hold the unsigned values.
member_name	<<***in***>> *(*p. *404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(*p. *404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Returns

The size of the output array

See also

com.rti.dds.dynamicdata.DynamicData.set_ulonglong_array

com.rti.dds.dynamicdata.DynamicData.get_ulonglong_seq

References **DynamicData.get_long_array()**.

8.94.6.61 get_long_seq()

```
void get_long_seq (
              LongSeq seq,
             String member_name,
             int member_id )
```

Get a copy of the given sequence member.

The provided sequence will be automatically resized as necessary.

This method will perform an automatic conversion from an array of long.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

seq	<<***out***>> *(*p. *404)* A sequence, into which the elements will be copied.
member_name	<<***in***>> *(*p. *404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(*p. *404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Exceptions

One	of the **Standard Return Codes** (p. 513). If the member is optional and not set, this operation will return **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902). This operation may also return **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903).

See also

com.rti.dds.dynamicdata.DynamicData.DynamicData.set_long_seq

com.rti.dds.dynamicdata.DynamicData.DynamicData.get_long_array

References **LongSeq.getMaximum()**, and **AbstractPrimitiveSequence.size()**.

Referenced by **DynamicData.get_ulong_seq()**.

8.94.6.62 get_ulong_seq()

```
void get_ulong_seq (
            List< BigInteger > seq,
            String member_name,
            int member_id )
```

Get a copy of the given sequence member.

The provided sequence will be automatically resized as necessary.

This method will perform an automatic conversion from an array of com.rti.dds.infrastructure.long.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

seq	<<***out***>> *(p. 404)* A sequence, into which the elements will be copied.
member_name	<<***in***>> *(p. 404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Exceptions

One	of the **Standard Return Codes** (p. 513). If the member is optional and not set, this operation will return **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902). This operation may also return **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903).

See also

com.rti.dds.dynamicdata.DynamicData.set_ulonglong_seq

com.rti.dds.dynamicdata.DynamicData.DynamicData.get_ulong_array

References **DynamicData.get_long_seq()**, **LongSeq.getLong()**, and **AbstractPrimitiveSequence.size()**.

8.94.6.63 get_string()

```
String get_string (
             String member_name,
             int member_id )
```

Get the value of the given field, which is of type com.rti.dds.infrastructure.String.

The member may be specified by name or by ID.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

This operation is also valid for members of kind **com.rti.dds.typecode.TCKind.TK_WSTRING** (p. 2100). In this case, each wide character is truncated into a String character. This may cause loss of information for wide strings that are encoded using more bytes per character than String does.

MT Safety:

UNSAFE.

Parameters

member_name	*<<**in**>> (p. 404)* The name of the member or null to look up the member by its ID.
member_id	*<<**in**>> (p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Exceptions

One	of the **Standard Return Codes** (p. 513). If the member is optional and not set, this operation will return **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902). This operation may also return **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903).

See also

com.rti.dds.dynamicdata.DynamicData.set_string (p. 1234)

References **DynamicData.get_member_type()**, **TypeCode.kind()**, and **TCKind.TK_WSTRING**.

8.94.6.64 get_complex_member()

```
void get_complex_member (
              DynamicData value_out,
             String member_name,
             int member_id )
```

Get a copy of the value of the given field, which is of some composed type.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

The member may be of type kind **com.rti.dds.typecode.TCKind.TK_ARRAY** (p. 2099), **com.rti.dds.typecode.↩ TCKind.TK_SEQUENCE** (p. 2099), **com.rti.dds.typecode.TCKind.TK_STRUCT** (p. 2098), **com.rti.dds.typecode.↩ TCKind.TK_VALUE** (p. 2101), or **com.rti.dds.typecode.TCKind.TK_UNION** (p. 2098). It may be specified by name or by ID.

This method is logically related to **com.rti.dds.dynamicdata.DynamicData.bind_complex_member** (p. 1154) in that both allow you to examine the state of nested objects. They are different in an important way: this method provides a *copy* of the data; changes to it will not be reflected in the source object.

MT Safety:

UNSAFE.

Parameters

value_out	*<<**out**>> (p. 404)* The **com.rti.dds.dynamicdata.DynamicData** (p. 1134) sample whose contents will be overwritten by this operation. This object must *not* be a bound member of another **com.rti.dds.dynamicdata.DynamicData** (p. 1134) sample.
member_name	*<<**in**>> (p. 404)* The name of the member or null to look up the member by its ID.
member_id	*<<**in**>> (p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).

Exceptions

One	of the **Standard Return Codes** (p. 513). If the member is optional and not set, this operation will return **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902). This operation may also return **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903).

com.rti.dds.dynamicdata.DynamicData.bind_complex_member (p. 1154)

8.94.6.65 set_int()

```
void set_int (
             String member_name,
             int member_id,
             int value )
```

Set the value of the given field, which is of type com.rti.dds.infrastructure.int.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	<<***in***>> *(*p. *404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(*p. *404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).
value	<<***in***>> *(*p. *404)* The value to which to set the member.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903)

See also

com.rti.dds.dynamicdata.DynamicData.DynamicData.get_int

Referenced by **DynamicData.set_uint()**.

8.94.6.66 set_uint()

```
void set_uint (
            String member_name,
            int member_id,
            long value )
```

Set the value of the given field, which is of type com.rti.dds.infrastructure.long.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	<<***in***>> *(p. 404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).
value	<<***in***>> *(p. 404)* The value to which to set the member.

Exceptions

IllegalArgumentException	if the value is bigger than the maximum unsigged value of the member. Or lower than 0.

See also

com.rti.dds.dynamicdata.DynamicData.DynamicData.get_uint

References **DynamicData.set_int()**.

8.94.6.67 set_int_array()

```
void set_int_array (
            String member_name,
            int member_id,
            int[] array )
```

Set the contents of the given array member. The array may contain members of type com.rti.dds.infrastructure.int or **com.rti.dds.util.Enum** (p. 1330).

This method will perform an automatic conversion to **com.rti.dds.infrastructure.IntSeq** (p. 1453).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	<<***in***>> *(p. 404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).
array	<<***in***>> *(p. 404)* The elements to copy.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903)

com.rti.dds.dynamicdata.DynamicData.DynamicData.get_int_array

com.rti.dds.dynamicdata.DynamicData.DynamicData.set_int_seq

Referenced by **DynamicData.set_uint_array()**.

8.94.6.68 set_uint_array()

```
void set_uint_array (
            String member_name,
```

```
            int member_id,
            long[] array )
```

Set the contents of the given array member. The array may contain members of type com.rti.dds.infrastructure.long or **com.rti.dds.util.Enum** (p. 1330).

This method will perform an automatic conversion to com.rti.dds.infrastructure.UnsignedLongSeq.

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	<<***in***>> *(p. 404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).
array	<<***in***>> *(p. 404)* The elements to copy.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903)

See also

8.94.6.71 set_short()

```
void set_short (
             String member_name,
             int member_id,
             short value )
```

Set the value of the given field, which is of type short.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	<<***in***>> *(p. 404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).
value	<<***in***>> *(p. 404)* The value to which to set the member.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903)

See also

```
void set_ushort (
            String member_name,
            int member_id,
            int value )
```

Set the value of the given field, which is of type com.rti.dds.infrastructure.short.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	*<<**in**>> (p. 404)* The name of the member or null to look up the member by its ID.
member_id	*<<**in**>> (p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).
value	*<<**in**>> (p. 404)* The value to which to set the member.

Exceptions

IllegalArgumentException	if the value is bigger than the maximum unsigged value of the member. Or lower than 0.

See also

com.rti.dds.dynamicdata.DynamicData.DynamicData.get_ushort

References **DynamicData.set_short()**.

8.94.6.73 set_short_array()

```
void set_short_array (
            String member_name,
            int member_id,
            short[] array )
```

Set the contents of the given array member.

This method will perform an automatic conversion to **com.rti.dds.infrastructure.ShortSeq** (p. 1995).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	<<***in***>> *(p. 404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).
array	<<***in***>> *(p. 404)* The elements to copy.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903)

See also

com.rti.dds.dynamicdata.DynamicData.get_short_array (p. 1172)

com.rti.dds.dynamicdata.DynamicData.set_short_seq (p. 1209)

Referenced by **DynamicData.set_ushort_array()**.

8.94.6.74 set_ushort_array()

```
void set_ushort_array (
            String member_name,
            int member_id,
            int[] array )
```

Set the contents of the given array member.

This method will perform an automatic conversion to com.rti.dds.infrastructure.UnsignedShortSeq.

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	<<***in***>> *(*p. *404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(*p. *404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).
array	<<***in***>> *(*p. *404)* The elements to copy.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903)

See also

com.rti.dds.dynamicdata.DynamicData.DynamicData.get_ushort_array

com.rti.dds.dynamicdata.DynamicData.set_ushort_seq (p. 1210)

8.94.6.75 set_short_seq()

```
void set_short_seq (
            String member_name,
```

```
int member_id,
 ShortSeq value )
```

Set the contents of the given sequence member.

This method will perform an automatic conversion to an array of short.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	<<***in***>> *(p. 404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).
value	<<***in***>> *(p. 404)* A sequence, from which the elements will be copied.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903)

See also

com.rti.dds.dynamicdata.DynamicData.get_short_seq (p. 1174)

8.94.6.77 set_float()

```
void set_float (
             String member_name,
             int member_id,
             float value )
```

Set the value of the given field, which is of type float.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	*<<**in**>> (p. 404)* The name of the member or null to look up the member by its ID.
member_id	*<<**in**>> (p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).
value	*<<**in**>> (p. 404)* The value to which to set the member.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903)

See also

com.rti.dds.dynamicdata.DynamicData.get_float (p. 1176)

8.94.6.80 set_double()

```
void set_double (
            String member_name,
            int member_id,
            double value )
```

Set the value of the given field, which is of type double.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	<<***in***>> *(p. 404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).
value	<<***in***>> *(p. 404)* The value to which to set the member.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903)

See also

com.rti.dds.dynamicdata.DynamicData.get_double (p. 1178)

8.94.6.81 set_double_array()

```
void set_double_array (
            String member_name,
            int member_id,
            double[] array )
```

Set the contents of the given array member.

This method will perform an automatic conversion to **com.rti.dds.infrastructure.DoubleSeq** (p. 1109).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	<<***in***>> *(p. 404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).
array	<<***in***>> *(p. 404)* The elements to copy.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903)

See also

com.rti.dds.dynamicdata.DynamicData.get_double_array (p. 1179)

8.94.6.83 set_boolean()

```
void set_boolean (
            String member_name,
            int member_id,
            boolean value )
```

Set the value of the given field, which is of type boolean.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	<<***in***>> *(p. 404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).
value	<<***in***>> *(p. 404)* The value to which to set the member.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903)

See also

com.rti.dds.dynamicdata.DynamicData.get_boolean (p. 1181)

8.94.6.84 set_boolean_array()

```
void set_boolean_array (
            String member_name,
            int member_id,
            boolean[] array )
```

Set the contents of the given array member.

This method will perform an automatic conversion to **com.rti.dds.infrastructure.BooleanSeq** (p. 612).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	<<***in***>> *(p. 404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).
array	<<***in***>> *(p. 404)* The elements to copy.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903)

See also

com.rti.dds.dynamicdata.DynamicData.get_boolean_array (p. 1182)

com.rti.dds.dynamicdata.DynamicData.set_boolean_seq (p. 1217)

8.94.6.85 set_boolean_seq()

```
void set_boolean_seq (
            String member_name,
            int member_id,
             BooleanSeq value )
```

Set the contents of the given sequence member.

This method will perform an automatic conversion to an array of boolean.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	<<***in***>> *(*p. *404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(*p. *404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).
value	<<***in***>> *(*p. *404)* A sequence, from which the elements will be copied.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903)

See also

8.94.6.86 set_char()

```
void set_char (
            String member_name,
            int member_id,
            char value )
```

Set the value of the given field, which is of type char.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	*<<**in**>> (p. 404)* The name of the member or null to look up the member by its ID.
member_id	*<<**in**>> (p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).
value	*<<**in**>> (p. 404)* The value to which to set the member.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903)

See also

com.rti.dds.dynamicdata.DynamicData.get_char (p. 1183)

8.94.6.87 set_char_array()

```
void set_char_array (
            String member_name,
            int member_id,
            char[] array )
```

Set the contents of the given array member.

This method will perform an automatic conversion to **com.rti.dds.infrastructure.CharSeq** (p. 671).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	<<***in***>> *(p. 404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).
array	<<***in***>> *(p. 404)* The elements to copy.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903)

See also

8.94.6.89 set_byte()

```
void set_byte (
             String member_name,
             int member_id,
             byte value )
```

Set the value of the given field, which is of type byte.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	<<***in***>> *(p. 404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).
value	<<***in***>> *(p. 404)* The value to which to set the member.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903)

See also

com.rti.dds.dynamicdata.DynamicData.DynamicData.get_byte

Referenced by **DynamicData.set_int8()**, and **DynamicData.set_uint8()**.

8.94.6.90 set_uint8()

```
void set_uint8 (
            String member_name,
            int member_id,
            short value )
```

Set the value of the given field, which is of type com.rti.dds.infrastructure.byte.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	<<***in***>> *(p. 404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).
value	<<***in***>> *(p. 404)* The value to which to set the member.

Exceptions

IllegalArgumentException	if the value is bigger than the maximum unsigged value of the member. Or lower than 0.

See also

com.rti.dds.dynamicdata.DynamicData.DynamicData.get_uint8

References **DynamicData.set_byte()**.

8.94.6.91 set_int8()

```
void set_int8 (
             String member_name,
             int member_id,
             byte value )
```

Set the value of the given field, which is of type com.rti.dds.infrastructure.byte.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	<<***in***>> *(p. 404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).
value	<<***in***>> *(p. 404)* The value to which to set the member.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903)

See also

com.rti.dds.dynamicdata.DynamicData.DynamicData.get_int8

References **DynamicData.set_byte()**.

8.94.6.92 set_byte_array()

```
void set_byte_array (
             String member_name,
             int member_id,
             byte[] array )
```

Set the contents of the given array member.

This method will perform an automatic conversion to **com.rti.dds.infrastructure.ByteSeq** (p. 649).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	<<***in***>> *(*p. *404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(*p. *404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).
array	<<***in***>> *(*p. *404)* The elements to copy.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903)

See also

com.rti.dds.dynamicdata.DynamicData.DynamicData.get_byte_array

com.rti.dds.dynamicdata.DynamicData.DynamicData.set_byte_seq

Referenced by **DynamicData.set_int8_array()**, and **DynamicData.set_uint8_array()**.

8.94.6.93 set_int8_array()

```
void set_int8_array (
             String member_name,
             int member_id,
             byte[] array )
```

Set the contents of the given array member.

This method will perform an automatic conversion to **com.rti.dds.infrastructure.ByteSeq** (p. 649).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	<<***in***>> *(p. 404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).
array	<<***in***>> *(p. 404)* The elements to copy.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903)

```
void set_ulong_seq (
            String member_name,
            int member_id,
            List< BigInteger > value )
```

Set the contents of the given sequence member.

This method will perform an automatic conversion to an array of com.rti.dds.infrastructure.long.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

MT Safety:

UNSAFE.

Parameters

member_name	<<***in***>> *(p. 404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).
value	<<***in***>> *(p. 404)* A sequence, from which the elements will be copied.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903)

See also

com.rti.dds.dynamicdata.DynamicData.get_ulonglong_seq

com.rti.dds.dynamicdata.DynamicData.set_ulonglong_array

References **LongSeq.set()**, **DynamicData.set_long_seq()**, **AbstractPrimitiveSequence.setSize()**, and **Abstract↩ PrimitiveSequence.size()**.

8.94.6.104 set_string()

```
void set_string (
            String member_name,
            int member_id,
            String value )
```

Set the value of the given field of type com.rti.dds.infrastructure.String.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

This operation is also valid for members of kind **com.rti.dds.typecode.TCKind.TK_WSTRING** (p. 2100). In this case, each String character is encoded in a wide char.

MT Safety:

UNSAFE.

Parameters

member_name	<<***in***>> *(*p. *404)* The name of the member or null to look up the member by its ID.
member_id	<<***in***>> *(*p. *404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).
value	<<***in***>> *(*p. *404)* The value to which to set the member.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903)

See also

com.rti.dds.dynamicdata.DynamicData.get_string (p. 1199)

References **DynamicData.get_member_type()**, **TypeCode.kind()**, and **TCKind.TK_WSTRING**.

8.94.6.105 set_complex_member()

```
void set_complex_member (
             String member_name,
             int member_id,
              DynamicData value )
```

Copy the state of the given **com.rti.dds.dynamicdata.DynamicData** (p. 1134) object into a member of this object.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

The member may be of type kind **com.rti.dds.typecode.TCKind.TK_ARRAY** (p. 2099), **com.rti.dds.typecode.TCKind.TK_SEQUENCE** (p. 2099), **com.rti.dds.typecode.TCKind.TK_STRUCT** (p. 2098), **com.rti.dds.typecode.TCKind.TK_VALUE** (p. 2101), or **com.rti.dds.typecode.TCKind.TK_UNION** (p. 2098). It may be specified by name or by ID.

Example: Copying Data

This method can be used with **com.rti.dds.dynamicdata.DynamicData.bind_complex_member** (p. 1154) to copy from one **com.rti.dds.dynamicdata.DynamicData** (p. 1134) object to another efficiently. Suppose the following data structure:

```
struct Bar {

    short theShort;

};

struct Foo {

    Bar theBar;

};
```

Suppose we have two instances of `Foo`, `foo_dst` and `foo_src`, and we want to replace the contents of `foo_dst.theBar` with the contents of `foo_src.theBar`. The following example shows how to do this (error handling has been omitted for the sake of brevity).

```
DynamicData foo_dst = ...;

DynamicData foo_src = ...;

DynamicData bar = new DynamicData(null, myProperties);

// Point to the source of the copy:
foo_src.bind_complex_member(
    bar,
    "theBar",
    DynamicData.MEMBER_ID_UNSPECIFIED);

try {
    // Just one copy:

    foo_dst.set_complex_member(
        "theBar",
        DynamicData.MEMBER_ID_UNSPECIFIED,
        bar);

} finally {
    // Tear down:
    foo_src.unbind_complex_member(bar);

}

bar.delete();
```

MT Safety:

UNSAFE.

Parameters

member_name	*<<**in**>> (p. 404)* The name of the member or null to look up the member by its ID.
member_id	*<<**in**>> (p. 404)* The ID of the member or **com.rti.dds.dynamicdata.DynamicData.MEMBER_ID_UNSPECIFIED** (p. 1242) to look up by name. See **Member Names and IDs** (p. 1140).
value	*<<**in**>> (p. 404)* The source **com.rti.dds.dynamicdata.DynamicData** (p. 1134) object whose contents will be copied.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903)

See also

com.rti.dds.dynamicdata.DynamicData.get_complex_member (p. 1200)

com.rti.dds.dynamicdata.DynamicData.bind_complex_member (p. 1154)

8.94.6.106 to_cdr_buffer() [1/4]

```
int to_cdr_buffer (
            byte[] buffer,
            short representation )
```

Serializes a **DynamicData** (p. 1134) object into a buffer of octets.

This method serializes a **DynamicData** (p. 1134) object into a buffer of octets using the input data representation. See **com.rti.dds.dynamicdata.DynamicData.to_cdr_buffer** (p. 1236) for details.

Parameters

buffer	*<<**out**>> (p. 404).* Serialization buffer.
representation	*<<**in**>> (p. 404).* Representation used to serialize the data

Referenced by **DynamicData.to_cdr_buffer()**, and **DynamicDataTypeSupport.to_cdr_buffer()**.

8.94.6.107 to_cdr_buffer() [2/4]

```
int to_cdr_buffer (
            byte[] buffer )
```

Serializes a **DynamicData** (p. 1134) object into a CDR buffer of octets.

This method serializes a **DynamicData** (p. 1134) object into a buffer of octets, using CDR as the data representation. Calling this method is equivalent to calling **com.rti.dds.dynamicdata.DynamicData.to_cdr_buffer** (p. 1236) with **com.rti.dds.infrastructure.DataRepresentationQosPolicy.AUTO_DATA_REPRESENTATION** (p. 464) as the representation.

The input buffer must be large enough to store the serialized representation of the **DynamicData** (p. 1134) object. Otherwise, the method will return an error code.

To determine the minimum size of the input buffer, you must call this method with the buffer set to null.

Parameters

buffer	*<<**out**>> (p. 404).* Serialization buffer.

Exceptions

One	of the **Standard Return Codes** (p. 513)

References **DataRepresentationQosPolicy.AUTO_DATA_REPRESENTATION**, and **DynamicData.to_cdr_buffer()**.

8.94.6.108 from_cdr_buffer() [1/2]

```
void from_cdr_buffer (
            byte[] buffer )
```

Deserializes a **DynamicData** (p. 1134) object from a buffer of octets.

This method deserializes a **DynamicData** (p. 1134) object from a CDR buffer of octets.

The content of the buffer generated by the method **com.rti.dds.dynamicdata.DynamicData.to_cdr_buffer** (p. 1236) can be provided to this method to get the **DynamicData** (p. 1134) object back.

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

Parameters

buffer	*<<**in**>> (p. 404).* Deserialization buffer.

Exceptions

One	of the **Standard Return Codes** (p. 513)

Referenced by **BytesTypeSupport.data_to_string()**, **KeyedBytesTypeSupport.data_to_string()**, **KeyedString↩ TypeSupport.data_to_string()**, **StringTypeSupport.data_to_string()**, **DynamicData.from_cdr_buffer()**, and **DynamicDataTypeSupport.from_cdr_buffer()**.

8.94.6.109 to_cdr_buffer() [3/4]

```
void to_cdr_buffer (
            ByteSeq sequence,
            short representation )
```

Serializes a **DynamicData** (p. 1134) object into a sequence of octets.

This method serializes a **DynamicData** (p. 1134) object into a sequence of octets using the input data representation.

The behavior of this method is the same as that of the **com.rti.dds.dynamicdata.DynamicData.to_cdr_buffer** (p. 1236) method, except that it receives a **com.rti.dds.infrastructure.ByteSeq** (p. 649) as a serialization output.

This method may resize `sequence` as needed to fit the serialized **DynamicData** (p. 1134) object.

See also

com.rti.dds.dynamicdata.DynamicData.to_cdr_buffer (p. 1236)

Parameters

sequence	<<***out***>> *(p. 404).* Serialization byte sequence.
representation	<<***in***>> *(p. 404).* Representation used to serialize the data.

Exceptions

One	of the **Standard Return Codes** (p. 513)

References **ByteSeq.getMaximum()**, **AbstractSequence.setMaximum()**, **AbstractPrimitiveSequence.setSize()**, and **DynamicData.to_cdr_buffer()**.

8.94.6.110 to_cdr_buffer() [4/4]

```
void to_cdr_buffer (
            ByteSeq sequence )
```

Serializes a **DynamicData** (p. 1134) object into a CDR sequence of octets.

This method serializes a **DynamicData** (p. 1134) object into a sequence of octets, using CDR as the data representation.

The behavior of this method is the same as that of the **com.rti.dds.dynamicdata.DynamicData.to_cdr_buffer** (p. 1236) method, except that it receives a **com.rti.dds.infrastructure.ByteSeq** (p. 649) as a serialization output.

This method may resize `sequence` as needed to fit the serialized **DynamicData** (p. 1134) object.

See also

com.rti.dds.dynamicdata.DynamicData.to_cdr_buffer (p. 1236)

Parameters

sequence	<<***out***>> *(*p. *404)*. Serialization byte sequence.

Exceptions

One	of the **Standard Return Codes** (p. 513)

References **DataRepresentationQosPolicy.AUTO_DATA_REPRESENTATION**, and **DynamicData.to_cdr_buffer()**.

8.94.6.111 from_cdr_buffer() [2/2]

```
void from_cdr_buffer (
                ByteSeq sequence )
```

Deserializes a **DynamicData** (p. 1134) object from a sequence octets.

This method deserializes the a **DynamicData** (p. 1134) object from a CDR sequence of octets.

The behavior of this method is the same as that of the **com.rti.dds.dynamicdata.DynamicData.from_cdr_buffer** (p. 1237) method, except that it receives a **com.rti.dds.infrastructure.ByteSeq** (p. 649) as deserialization input.

See also

com.rti.dds.dynamicdata.DynamicData.from_cdr_buffer (p. 1237)

Parameters

sequence	<<***in***>> *(*p. *404)*. Deserialization octet sequence. Cannot be null.

Exceptions

One	of the **Standard Return Codes** (p. 513)

References **DynamicData.from_cdr_buffer()**.

8.94.6.112 to_string() [1/2]

```
String to_string (
            PrintFormatProperty property )
```

Get a string representation of a **DynamicData** (p. 1134) object.

This method takes a dynamic data sample and creates a string representation of the data.

If the size of the output string is longer than the size of an unsigned 32-bit integer, this operation will fail with **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903).

This API is not supported when the **DynamicData** (p. 1134) object is in CDR format and will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903). See com.rti.dds.dynamicdata.DynamicData.is_cdr for more information.

Parameters

property	<<***in***>> *(*p. *404)*. Properties describing what the format of the output string should be. Cannot be null.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903) , java.lang.IllegalStateException

References **PrintFormatProperty.enum_as_int**, **PrintFormatProperty.include_root_elements**, **PrintFormatProperty.kind**, **Enum.ordinal()**, and **PrintFormatProperty.pretty_print**.

Referenced by **BytesTypeSupport.data_to_string()**, **KeyedBytesTypeSupport.data_to_string()**, **KeyedStringTypeSupport.data_to_string()**, and **StringTypeSupport.data_to_string()**.

8.94.6.113 to_string() [2/2]

```
String to_string ( )
```

Get a string representation of a **DynamicData** (p. 1134) object using the default values for **com.rti.dds.topic.PrintFormatProperty** (p. 1686).

See also

com.rti.dds.dynamicdata.DynamicData.to_string (p. 1240)

References **DynamicData.to_string()**.

Referenced by **DynamicData.to_string()**.

8.94.6.114 from_string() [1/2]

```
void from_string (
             String str,
              PrintFormatKind format_kind )
```

Populates a **DynamicData** (p. 1134) object from a JSON string representation.

This method takes a JSON string representing a data sample of this type, and uses it to populate this **DynamicData** (p. 1134).

Parameters

str	*<<**in**>> (p. 404).* The JSON string representation
format_kind	*<<**in**>> (p. 404).* Must be set to **com.rti.dds.topic.PrintFormatKind.JSON_PRINT_FORMAT** (p. 1686), the only currently supported format.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903)

References **Enum.ordinal()**.

Referenced by **DynamicData.from_string()**.

8.94.6.115 from_string() [2/2]

```
void from_string (
             String str )
```

Populates a **DynamicData** (p. 1134) object from a JSON string representation.

This method is an overload that does not take a PrintFormatKind.

Parameters

str	*<<**in**>> (p. 404).* The JSON string representation

See also

com.rti.dds.dynamicdata.DynamicData.from_string (p. 1240)

References **DynamicData.from_string()**, and **PrintFormatKind.JSON_PRINT_FORMAT**.

8.94.7 Member Data Documentation

8.94.7.1 MEMBER_ID_UNSPECIFIED

```
final int MEMBER_ID_UNSPECIFIED  [static]
```

A sentinel value that indicates that no member ID is needed in order to perform some operation.

Most commonly, this constant will be used in "get" operations to indicate that a lookup should be performed based on a name, not on an ID.

8.95 DynamicDataInfo Class Reference

A descriptor for a **com.rti.dds.dynamicdata.DynamicData** (p. 1134) object.

Inherits Struct.

Public Member Functions

- **DynamicDataInfo** ()

  *A descriptor for a **com.rti.dds.dynamicdata.DynamicData** (p. 1134) object.*
- **DynamicDataInfo** (int **member_count**, int **stored_size**, boolean is_optimized_storage)

  *A descriptor for a **com.rti.dds.dynamicdata.DynamicData** (p. 1134) object.*

Public Attributes

- int **member_count**

  *The number of data members in this **com.rti.dds.dynamicdata.DynamicData** (p. 1134) sample.*
- int **stored_size**

  *The number of bytes currently used to store the data of this **com.rti.dds.dynamicdata.DynamicData** (p. 1134) sample.*

8.95.1 Detailed Description

A descriptor for a **com.rti.dds.dynamicdata.DynamicData** (p. 1134) object.

See also

com.rti.dds.dynamicdata.DynamicData.get_info (p. 1152)

8.95.2 Member Data Documentation

8.95.2.1 member_count

```
int member_count
```

The number of data members in this **com.rti.dds.dynamicdata.DynamicData** (p. 1134) sample.

Referenced by **DynamicDataInfo.DynamicDataInfo()**.

8.95.2.2 stored_size

```
int stored_size
```

The number of bytes currently used to store the data of this **com.rti.dds.dynamicdata.DynamicData** (p. 1134) sample.

Referenced by **DynamicDataInfo.DynamicDataInfo()**.

8.96 DynamicDataMemberInfo Class Reference

A descriptor for a single member (i.e. field) of dynamically defined data type.

Inherits Struct.

Public Member Functions

- **DynamicDataMemberInfo** ()

  A descriptor for a single member (i.e. field) of dynamically defined data type.
- **DynamicDataMemberInfo** (int **member_id**, String **member_name**, boolean **member_exists**, **TCKind member_kind**, int representation_count, int **element_count**, **TCKind element_kind**)

  A descriptor for a single member (i.e. field) of dynamically defined data type.

Public Attributes

- int **member_id**

  An integer that uniquely identifies the data member within this ***com.rti.dds.dynamicdata.DynamicData*** *(*p. *1134) sample's type.*
- String **member_name**

  The string name of the data member.
- boolean **member_exists**

  Indicates whether the member exists in this sample.
- **TCKind member_kind**

  The kind of type of this data member (e.g., integer, structure, etc.).
- int **element_count**

  The number of elements within this data member.
- **TCKind element_kind**

  The kind of type of the elements within this data member.

8.96.1 Detailed Description

A descriptor for a single member (i.e. field) of dynamically defined data type.

See also

com.rti.dds.dynamicdata.DynamicData.get_member_info (p. 1161)

8.96.2 Member Data Documentation

8.96.2.1 member_id

```
int member_id
```

An integer that uniquely identifies the data member within this **com.rti.dds.dynamicdata.DynamicData** (p. 1134) sample's type.

The member ID is assigned automatically by the middleware based on the member's declaration order within the type. It is a 1-based index of the member's position in the type.

See also

com.rti.dds.typecode.TCKind (p. 2094)

Referenced by **DynamicDataMemberInfo.DynamicDataMemberInfo()**.

8.96.2.2 member_name

```
String member_name
```

The string name of the data member.

This name will be unique among members of the same type. However, a single named member may have multiple type representations.

Referenced by **DynamicDataMemberInfo.DynamicDataMemberInfo()**.

8.96.2.3 member_exists

```
boolean member_exists
```

Indicates whether the member exists in this sample.

A member that is defined in a type may not exist in a sample of that type in the following situations

- The member is optional and is unset
- Being part of a union, the discriminator doesn't select this member
- When getting the information about a sequence element, with index `i`, and `i` is greater than the current sequence length but smaller than its maximum length.

See also

com.rti.dds.dynamicdata.DynamicData.member_exists_in_type (p. 1161)

Referenced by **DynamicDataMemberInfo.DynamicDataMemberInfo()**.

8.96.2.4 member_kind

```
TCKind member_kind
```

The kind of type of this data member (e.g., integer, structure, etc.).

This is a convenience field; it is equivalent to looking up the member in the **com.rti.dds.typecode.TypeCode** (p. 2183) and getting the **com.rti.dds.typecode.TCKind** (p. 2094) from there.

Referenced by **DynamicDataMemberInfo.DynamicDataMemberInfo()**.

8.96.2.5 element_count

```
int element_count
```

The number of elements within this data member.

This information is only valid for members of array or sequence types. Members of other types will always report zero (0) here.

Referenced by **DynamicDataMemberInfo.DynamicDataMemberInfo()**.

8.96.2.6 element_kind

```
TCKind element_kind
```

The kind of type of the elements within this data member.

This information is only valid for members of array or sequence types. Members of other types will always report **com.rti.dds.typecode.TCKind.TK_NULL** (p. 2096) here.

Referenced by **DynamicDataMemberInfo.DynamicDataMemberInfo()**.

8.97 DynamicDataProperty_t Class Reference

A collection of attributes used to configure **com.rti.dds.dynamicdata.DynamicData** (p. 1134) objects.

Public Member Functions

- **DynamicDataProperty_t** ()

  The constructor.
- **DynamicDataProperty_t** (int **buffer_initial_size**, int **buffer_max_size**, int buffer_max_size_increment, Charset **string_character_encoding**)

  Constructor accepting an alternative string encoding.
- **DynamicDataProperty_t** (int **buffer_initial_size**, int **buffer_max_size**, int buffer_max_size_increment)

  The constructor.

Public Attributes

- int **buffer_initial_size** = 0

  *The initial amount of memory used by the underlying **com.rti.dds.dynamicdata.DynamicData** (p. 1134) buffer, in bytes.*
- int **buffer_max_size** = **ResourceLimitsQosPolicy.LENGTH_UNLIMITED**

  *The maximum amount of memory that the underlying **com.rti.dds.dynamicdata.DynamicData** (p. 1134) buffer may use, in bytes.*
- Charset **string_character_encoding** = StandardCharsets.UTF_8

  *String encoding that this **com.rti.dds.dynamicdata.DynamicData** (p. 1134) object will use internally.*

8.97.1 Detailed Description

A collection of attributes used to configure **com.rti.dds.dynamicdata.DynamicData** (p. 1134) objects.

8.97.2 Constructor & Destructor Documentation

8.97.2.1 DynamicDataProperty_t() [1/3]

```
DynamicDataProperty_t ( )
```

The constructor.

8.97.2.2 DynamicDataProperty_t() [2/3]

```
DynamicDataProperty_t (
            int buffer_initial_size,
            int buffer_max_size,
            int buffer_max_size_increment,
            Charset string_character_encoding )
```

Constructor accepting an alternative string encoding.

References **DynamicDataProperty_t.buffer_initial_size**, **DynamicDataProperty_t.buffer_max_size**, and **DynamicDataProperty_t.string_character_encoding**.

8.97.2.3 DynamicDataProperty_t() [3/3]

```
DynamicDataProperty_t (
            int buffer_initial_size,
            int buffer_max_size,
            int buffer_max_size_increment )
```

The constructor.

References **DynamicDataProperty_t.buffer_initial_size**, and **DynamicDataProperty_t.buffer_max_size**.

8.97.3 Member Data Documentation

8.97.3.1 buffer_initial_size

```
int buffer_initial_size = 0
```

The initial amount of memory used by the underlying **com.rti.dds.dynamicdata.DynamicData** (p. 1134) buffer, in bytes.

This property is used to configure the **DynamicData** (p. 1134) objects that are created stand-alone as well as the **DynamicData** (p. 1134) samples that are obtained from the sample pool that is created by each **DynamicData** (p. 1134) DataReader.

If set to 0 (default): The initial buffer size will be set to the minimum amount of space required to hold the overhead required by the **DynamicData** (p. 1134) internal representation (about 100 bytes) in addition to the minimum deserialized size of a sample. The minimum deserialized size of a sample assumes that all strings are allocated to their default values, sequences are left to length 0, and all optional members are unset.

If set to any value other than 0: The underlying buffer will be allocated to the provided size plus the overhead required by the **DynamicData** (p. 1134) internal representation (about 100 bytes). If the provided size plus the overhead is less than the size used when buffer_initial_size is left to 0, then the default value is used.

See also

com.rti.dds.dynamicdata.DynamicDataProperty_t.buffer_max_size (p. 1248)

Referenced by **DynamicDataProperty_t.DynamicDataProperty_t()**, **DynamicDataTypeProperty_t.DynamicData↩ TypeProperty_t()**, and **DynamicDataTypeSupport.DynamicDataTypeSupport()**.

8.97.3.2 buffer_max_size

```
int buffer_max_size = ResourceLimitsQosPolicy.LENGTH_UNLIMITED
```

The maximum amount of memory that the underlying **com.rti.dds.dynamicdata.DynamicData** (p. 1134) buffer may use, in bytes.

This property is used to configure the **DynamicData** (p. 1134) objects that are created stand-alone as well as the **DynamicData** (p. 1134) samples that are obtained from the sample pool that is created by each **DynamicData** (p. 1134) DataReader.

A **DynamicData** (p. 1134) object will grow to this size from the initial size as needed. The buffer_max_size includes all overhead that is required for the internal **DynamicData** (p. 1134) representation and therefore represents a hard upper limit on the size of the underlying **DynamicData** (p. 1134) buffer.

If set to -1 (default): The buffer will grow unbounded to the size required to fit all members.

If set to any value other than -1: The buffer will not grow beyond this size. If setting a member's values requires the buffer to grow beyond this maximum, the member will fail to be set. If the buffer is required to grow beyond this maximum during deserialization, the sample will fail to be deserialized. The buffer_max_size cannot be smaller than the buffer_initial_size.

See also

com.rti.dds.dynamicdata.DynamicDataProperty_t.buffer_initial_size (p. 1247)

Referenced by **DynamicDataProperty_t.DynamicDataProperty_t()**, **DynamicDataTypeProperty_t.DynamicData↩ TypeProperty_t()**, and **DynamicDataTypeSupport.DynamicDataTypeSupport()**.

8.97.3.3 string_character_encoding

```
Charset string_character_encoding = StandardCharsets.UTF_8
```

String encoding that this **com.rti.dds.dynamicdata.DynamicData** (p. 1134) object will use internally.

This **com.rti.dds.dynamicdata.DynamicData** (p. 1134) object will store IDL strings with the encoding configured by this field.

In addition, IDL strings will be serialized with this encoding when sent on the wire.

Currently, only encodings ISO-8859-1 and UTF-8 are supported.

In Java 1.7 and above, the Charset objects corresponding to these encodings can be obtained from java.nio.charset.↩ StandardCharsets.

In previous Java versions, you can invoke Charset.availableCharsets().get(name) where name can be ISO-8859-1 and UTF-8.

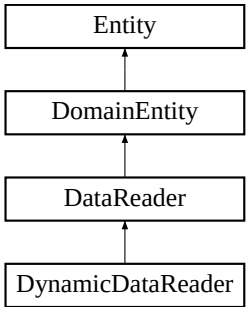
[default] UTF_8

Referenced by **DynamicDataProperty_t.DynamicDataProperty_t()**.

8.98 DynamicDataReader Class Reference

Reads (subscribes to) objects of type **com.rti.dds.dynamicdata.DynamicData** (p. 1134).

Inheritance diagram for DynamicDataReader:



Public Member Functions

- void **read** (**DynamicDataSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, int sample_states, int view_states, int instance_states)

  *Access a collection of data samples from the **com.rti.dds.subscription.DataReader** (p. 707).*
- void **take** (**DynamicDataSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, int sample_states, int view_states, int instance_states)

  *Access a collection of data-samples from the **com.rti.dds.subscription.DataReader** (p. 707).*
- void **read_w_condition** (**DynamicDataSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, **ReadCondition** condition)

  *Accesses via **com.rti.ndds.example.FooDataReader.read** (p. 1361) the samples that match the criteria specified in the **com.rti.dds.subscription.ReadCondition** (p. 1816).*
- void **take_w_condition** (**DynamicDataSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, **ReadCondition** condition)

  *Analogous to **com.rti.ndds.example.FooDataReader.read_w_condition** (p. 1368) except it accesses samples via the **com.rti.ndds.example.FooDataReader.take** (p. 1363) operation.*
- void **read_next_sample** (**DynamicData** received_data, **SampleInfo** sample_info)

  *Copies the next not-previously-accessed data value from the **com.rti.dds.subscription.DataReader** (p. 707).*
- void **take_next_sample** (**DynamicData** received_data, **SampleInfo** sample_info)

  *Copies the next not-previously-accessed data value from the **com.rti.dds.subscription.DataReader** (p. 707).*
- void **read_instance** (**DynamicDataSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, **InstanceHandle_t** a_handle, int sample_states, int view_states, int instance_states)

  *Access a collection of data samples from the **com.rti.dds.subscription.DataReader** (p. 707).*
- void **take_instance** (**DynamicDataSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, **InstanceHandle_t** a_handle, int sample_states, int view_states, int instance_states)

  *Access a collection of data samples from the **com.rti.dds.subscription.DataReader** (p. 707).*
- void **read_instance_w_condition** (**DynamicDataSeq** received_data, **SampleInfoSeq** info_seq, int max_↩ samples, **InstanceHandle_t** a_handle, **ReadCondition** condition)

  *<<**extension**>> (p. 403) Accesses via **com.rti.ndds.example.FooDataReader.read_instance** (p. 1373) the samples that match the criteria specified in the **com.rti.dds.subscription.ReadCondition** (p. 1816).*
- void **take_instance_w_condition** (**DynamicDataSeq** received_data, **SampleInfoSeq** info_seq, int max_↩ samples, **InstanceHandle_t** a_handle, **ReadCondition** condition)

  *<<**extension**>> (p. 403) Accesses via **com.rti.ndds.example.FooDataReader.take_instance** (p. 1374) the samples that match the criteria specified in the **com.rti.dds.subscription.ReadCondition** (p. 1816).*
- void **read_next_instance** (**DynamicDataSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, **InstanceHandle_t** previous_handle, int sample_states, int view_states, int instance_states)

  *Access a collection of data samples from the **com.rti.dds.subscription.DataReader** (p. 707).*
- void **take_next_instance** (**DynamicDataSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, **InstanceHandle_t** previous_handle, int sample_states, int view_states, int instance_states)

  *Access a collection of data samples from the **com.rti.dds.subscription.DataReader** (p. 707).*
- void **read_next_instance_w_condition** (**DynamicDataSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, **InstanceHandle_t** previous_handle, **ReadCondition** condition)

  *Accesses via **com.rti.ndds.example.FooDataReader.read_next_instance** (p. 1376) the samples that match the criteria specified in the **com.rti.dds.subscription.ReadCondition** (p. 1816).*
- void **take_next_instance_w_condition** (**DynamicDataSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, **InstanceHandle_t** previous_handle, **ReadCondition** condition)

  *Accesses via **com.rti.ndds.example.FooDataReader.take_next_instance** (p. 1378) the samples that match the criteria specified in the **com.rti.dds.subscription.ReadCondition** (p. 1816).*
- void **return_loan** (**DynamicDataSeq** received_data, **SampleInfoSeq** info_seq)

*Indicates to the **com.rti.dds.subscription.DataReader** (p. 707) that the application is done accessing the collection of `received_data` and `info_seq` obtained by some earlier invocation of read or take on the **com.rti.dds.subscription.DataReader** (p. 707).*

- void **get_key_value** (**DynamicData** key_holder, **InstanceHandle_t** handle)

  Retrieve the instance `key` that corresponds to an instance `handle`.

- **InstanceHandle_t lookup_instance** (**DynamicData** key_holder)

  Retrieves the instance `handle` that corresponds to an instance `key_holder`.

Additional Inherited Members

8.98.1 Detailed Description

Reads (subscribes to) objects of type **com.rti.dds.dynamicdata.DynamicData** (p. 1134).

Instantiates **`com.rti.dds.subscription.DataReader`** (p. 707) < **com.rti.dds.dynamicdata.DynamicData** (p. 1134) >.

8.98.2 Member Function Documentation

8.98.2.1 read()

```
void read (
              DynamicDataSeq received_data,
              SampleInfoSeq info_seq,
             int max_samples,
             int sample_states,
             int view_states,
             int instance_states )
```

Access a collection of data samples from the **com.rti.dds.subscription.DataReader** (p. 707).

This operation offers the same functionality and API as **com.rti.ndds.example.FooDataReader.take** (p. 1363) except that the samples returned remain in the **com.rti.dds.subscription.DataReader** (p. 707) such that they can be retrieved again by means of a read or take operation.

Please refer to the documentation of **com.rti.ndds.example.FooDataReader.take()** (p. 1363) for details on the number of samples returned within the received_data and info_seq as well as the order in which the samples appear in these sequences.

The act of reading a sample changes its `sample_state` to com.rti.dds.subscription.SampleStateKind.SampleState↩ Kind.READ_SAMPLE_STATE. If the sample belongs to the most recent generation of the instance, it will also set the `view_state` of the instance to be com.rti.dds.subscription.ViewStateKind.ViewStateKind.NOT_NEW_VIEW_STATE. It will not affect the `instance_state` of the instance.

Once the application completes its use of the samples, it must 'return the loan' to the **com.rti.dds.subscription.Data↩ Reader** (p. 707) by calling the **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386) operation.

Important: When you loan data from the middleware, you *must not* keep any pointers to any part of the data samples or the **com.rti.dds.subscription.SampleInfo** (p. 1944) objects after the call to **com.rti.ndds.example.FooDataReader.↩ return_loan** (p. 1386). Returning the loan places the objects back into a pool, allowing the middleware to overwrite them with new data.

Note: While the loan must be returned at some point, you do *not* have to do so before the next **com.rti.ndds.↩ example.FooDataReader.take** (p. 1363) call. However, failure to return the loan will eventually deplete the **com.rti.↩ dds.subscription.DataReader** (p. 707) of the buffers it needs to receive new samples and eventually samples will start to be lost. The total number of buffers available to the **com.rti.dds.subscription.DataReader** (p. 707) is specified by the **com.rti.dds.infrastructure.ResourceLimitsQosPolicy** (p. 1894) and the **com.rti.dds.infrastructure.DataReader↩ ResourceLimitsQosPolicy** (p. 789).

Important: If the samples "returned" by this method are loaned from RTI Connext (see **com.rti.ndds.example.Foo↩ DataReader.take** (p. 1363) for more information on memory loaning), it is important that their contents not be changed. Because the memory in which the data is stored belongs to the middleware, any modifications made to the data will be seen the next time the same samples are read or taken; the samples will no longer reflect the state that was received from the network.

Parameters

received_data	<<***inout***>> *(*p. *404)* User data type-specific com.rti.dds.infrastructure.com.rti.dds.util.Sequence object where the received data samples will be returned. Must be a valid non-NULL FooSeq. The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
info_seq	<<***inout***>> *(*p. *404)* A **com.rti.dds.subscription.SampleInfoSeq** (p. 1957) object where the received sample info will be returned. Must be a valid non-NULL **com.rti.dds.subscription.SampleInfoSeq** (p. 1957). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
max_samples	<<***in***>> *(*p. *404)* The maximum number of samples to be returned. If the special value **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511) is provided, as many samples will be returned as are available, up to the limits described in the documentation for **com.rti.ndds.example.FooDataReader.take()** (p. 1363).
sample_states	<<***in***>> *(*p. *404)* Data samples matching one of these `sample_states` are returned. See the valid values for this parameter here: **com.rti.dds.subscription.SampleStateKind** (p. 1972).
view_states	<<***in***>> *(*p. *404)* Data samples matching one of these `view_state` are returned. See the valid values for this parameter here: **com.rti.dds.subscription.ViewStateKind** (p. 2283).
instance_states	<<***in***>> *(*p. *404)* Data samples matching ones of these `instance_state` are returned. See the valid values for this parameter here: **com.rti.dds.subscription.InstanceStateKind** (p. 1451).

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903), **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

com.rti.ndds.example.FooDataReader.take_w_condition (p. 1369)

com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED (p. 511)

References **DataReader.read_untyped()**.

8.98.2.2 take()

```
void take (
              DynamicDataSeq received_data,
              SampleInfoSeq info_seq,
             int max_samples,
             int sample_states,
             int view_states,
             int instance_states )
```

Access a collection of data-samples from the **com.rti.dds.subscription.DataReader** (p. 707).

The operation will return the list of samples received by the **com.rti.dds.subscription.DataReader** (p. 707) since the last **com.rti.ndds.example.FooDataReader.take** (p. 1363) operation that matches the specified com.rti.dds.↩ subscription.SampleStateMask, com.rti.dds.subscription.ViewStateMask and com.rti.dds.subscription.InstanceState↩ Mask.

This operation may fail with **com.rti.dds.infrastructure.RETCODE_ERROR** (p. 1900) if the **com.rti.dds.↩ infrastructure.DataReaderResourceLimitsQosPolicy.max_outstanding_reads** (p. 796) limit has been exceeded.

The actual number of samples returned depends on the information that has been received by the middleware as well as the **com.rti.dds.infrastructure.HistoryQosPolicy** (p. 1435), **com.rti.dds.infrastructure.ResourceLimitsQosPolicy** (p. 1894), **com.rti.dds.infrastructure.DataReaderResourceLimitsQosPolicy** (p. 789) and the characteristics of the data-type that is associated with the **com.rti.dds.subscription.DataReader** (p. 707):

- In the case where the **com.rti.dds.infrastructure.HistoryQosPolicy.kind** (p. 1437) is com.rti.dds.↩ infrastructure.HistoryQosPolicyKind.HistoryQosPolicyKind.KEEP_LAST_HISTORY_QOS, the call will return at most **com.rti.dds.infrastructure.HistoryQosPolicy.depth** (p. 1438) samples for each ALIVE instance and (**com.rti.dds.infrastructure.HistoryQosPolicy.depth** (p. 1438) +1) samples for each NOT_ALIVE instance. The extra sample is an invalid sample (**com.rti.dds.subscription.SampleInfo.valid_data** (p. 1952) is FALSE) that is used to indicate the instance state transition from ALIVE to NOT_ALIVE.

- The maximum number of samples returned is limited by **com.rti.dds.infrastructure.ResourceLimitsQos↩ Policy.max_samples** (p. 1896), and by **com.rti.dds.infrastructure.DataReaderResourceLimitsQosPolicy.↩ max_samples_per_read** (p. 796).

- For multiple instances, the number of samples returned is additionally limited by the product (**com.rti.dds.↩ infrastructure.ResourceLimitsQosPolicy.max_samples_per_instance** (p. 1897)
  - **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_instances** (p. 1896))

- If **com.rti.dds.infrastructure.DataReaderResourceLimitsQosPolicy.max_infos** (p. 793) is limited, the number of samples returned may also be limited if insufficient **com.rti.dds.subscription.SampleInfo** (p. 1944) resources are available.

If the read or take succeeds and the number of samples returned has been limited (by means of a maximum limit, as listed above, or insufficient **com.rti.dds.subscription.SampleInfo** (p. 1944) resources), the call will complete successfully and provide those samples the reader is able to return. The user may need to make additional calls, or return outstanding loaned buffers in the case of insufficient resources, in order to access remaining samples.

Note that in the case where the **com.rti.dds.topic.Topic** (p. 2116) associated with the **com.rti.dds.subscription.↩ DataReader** (p. 707) is bound to a data-type that has no key definition, then there will be at most one instance in the **com.rti.dds.subscription.DataReader** (p. 707). So the per-sample limits will apply.

The act of *taking* a sample removes it from RTI Connext so it cannot be read or taken again. If the sample belongs to the most recent generation of the instance, it will also set the `view_state` of the sample's instance to com.rti.dds.↩ subscription.ViewStateKind.ViewStateKind.NOT_NEW_VIEW_STATE. It will not affect the `instance_state` of the sample's instance.

After **com.rti.ndds.example.FooDataReader.take** (p. 1363) completes, `received_data` and `info_seq` will be of the same length and contain the received data.

If the sequences are empty (maximum size equals 0) when the **com.rti.ndds.example.FooDataReader.take** (p. 1363) is called, the samples returned in the `received_data` and the corresponding `info_seq` are 'loaned' to the application from buffers provided by the **com.rti.dds.subscription.DataReader** (p. 707). The application can use them as desired and has guaranteed exclusive access to them.

Once the application completes its use of the samples it must 'return the loan' to the **com.rti.dds.subscription.Data↩ Reader** (p. 707) by calling the **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386) operation.

Important: When you loan data from the middleware, you *must not* keep any pointers to any part of the data samples or the **com.rti.dds.subscription.SampleInfo** (p. 1944) objects after the call to **com.rti.ndds.example.FooDataReader.↩ return_loan** (p. 1386). Returning the loan places the objects back into a pool, allowing the middleware to overwrite them with new data.

Note: While you must call **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386) at some point, you do *not* have to do so before the next **com.rti.ndds.example.FooDataReader.take** (p. 1363) call. However, failure to return the loan will eventually deplete the **com.rti.dds.subscription.DataReader** (p. 707) of the buffers it needs to receive new samples and eventually samples will start to be lost. The total number of buffers available to the **com.rti.dds.↩ subscription.DataReader** (p. 707) is specified by the **com.rti.dds.infrastructure.ResourceLimitsQosPolicy** (p. 1894) and the **com.rti.dds.infrastructure.DataReaderResourceLimitsQosPolicy** (p. 789).

If the sequences are not empty (maximum size not equal to 0 and length not equal to 0) when **com.rti.ndds.example.↩ FooDataReader.take** (p. 1363) is called, samples are copied to received_data and info_seq. The application will not need to call **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386).

The order of the samples returned to the caller depends on the **com.rti.dds.infrastructure.PresentationQosPolicy** (p. 1678).

- If **com.rti.dds.infrastructure.PresentationQosPolicy.access_scope** (p. 1682) is com.rti.dds.infrastructure.↩ PresentationQosPolicyAccessScopeKind.PresentationQosPolicyAccessScopeKind.INSTANCE_PRESENTATION↩ _QOS, the returned collection is a list where samples belonging to the same data instance are consecutive.

- If **com.rti.dds.infrastructure.PresentationQosPolicy.access_scope** (p. 1682) is com.rti.dds.infrastructure.↩ PresentationQosPolicyAccessScopeKind.PresentationQosPolicyAccessScopeKind.TOPIC_PRESENTATION↩ _QOS and **com.rti.dds.infrastructure.PresentationQosPolicy.ordered_access** (p. 1682) is set to com.rti.↩ dds.infrastructure.false, then the returned collection is a list where samples belonging to the same data instance are consecutive.

- If **com.rti.dds.infrastructure.PresentationQosPolicy.access_scope** (p. 1682) is com.rti.dds.infrastructure.↩ PresentationQosPolicyAccessScopeKind.PresentationQosPolicyAccessScopeKind.TOPIC_PRESENTATION↩ _QOS and **com.rti.dds.infrastructure.PresentationQosPolicy.ordered_access** (p. 1682) is set to com.rti.↩ dds.infrastructure.true, then the returned collection is a list where the relative order of samples as they were written by a DataWriter is preserved also across different instances. In other words, changes made by a single DataWriter are made available to subscribers in the same order in which they occur. Samples belonging to the same instance may or may not be consecutive. This is because, to preserve order within a single DataWriter, it may be necessary to mix samples from different instances.

- If **com.rti.dds.infrastructure.PresentationQosPolicy.access_scope** (p. 1682) is com.rti.dds.infrastructure.↩ PresentationQosPolicyAccessScopeKind.PresentationQosPolicyAccessScopeKind.GROUP_PRESENTATION↩ _QOS and **com.rti.dds.infrastructure.PresentationQosPolicy.ordered_access** (p. 1682) is set to com.rti.↩ dds.infrastructure.false, then the returned collection is a list where samples belonging to the same data instance are consecutive.

- If **com.rti.dds.infrastructure.PresentationQosPolicy.access_scope** (p. 1682) is com.rti.dds.infrastructure.↩ PresentationQosPolicyAccessScopeKind.PresentationQosPolicyAccessScopeKind.GROUP_PRESENTATION↩ _QOS and **com.rti.dds.infrastructure.PresentationQosPolicy.ordered_access** (p. 1682) is set to com.↩ rti.dds.infrastructure.true, then changes made to instances by a set of DataWriters attached to a common Publisher are made available in the order in which they were written. For this to happen, the application must take the samples using the Subscriber's **com.rti.dds.subscription.Subscriber.begin_access** (p. 2058) and **com.rti.dds.subscription.Subscriber.end_access** (p. 2059) operations.

See the "Ordered Access" section in the "PRESENTATION QosPolicy" section of the Core Libraries User's Manual for more information.

In all of the above cases, the relative order between the samples of one instance is consistent with the **DESTINATION↩ _ORDER** (p. 468) policy:

- If **com.rti.dds.infrastructure.DestinationOrderQosPolicy.kind** (p. 905) is com.rti.dds.infrastructure.↩ DestinationOrderQosPolicyKind.DestinationOrderQosPolicyKind.BY_RECEPTION_TIMESTAMP_DESTINATIONORDER↩ _QOS, samples belonging to the same instances will appear in the relative order in which there were received (FIFO, earlier samples ahead of the later samples).

- If **com.rti.dds.infrastructure.DestinationOrderQosPolicy.kind** (p. 905) is com.rti.dds.infrastructure.↩ DestinationOrderQosPolicyKind.DestinationOrderQosPolicyKind.BY_SOURCE_TIMESTAMP_DESTINATIONORDER↩ _QOS, samples belonging to the same instances will appear in the relative order implied by the `source_↩ timestamp` (FIFO, smaller values of `source_timestamp` ahead of the larger values).

If the **com.rti.dds.subscription.DataReader** (p. 707) has no samples that meet the constraints, the method will fail with **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902).

In addition to the collection of samples, the read and take operations also use a collection of **com.rti.dds.↩ subscription.SampleInfo** (p. 1944) structures.

The initial (input) properties of the `received_data` and `info_seq` collections will determine the precise behavior of the read or take operation. For the purposes of this description, the collections are modeled as having these properties:

- the current-length (`len`, see com.rti.dds.infrastructure.com.rti.dds.util.Sequence.Sequence.size())
- the maximum length (`max_len`, see com.rti.dds.infrastructure.com.rti.dds.util.Sequence.Sequence.get↩ Maximum)

The initial values of the `len` and `max_len` properties for the `received_data` and `info_seq` collections govern the behavior of the read and take operations as specified by the following rules:

1. The values of `len` and `max_len` properties for the two collections must be identical. Otherwise read/take will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).
2. On successful output, the values of `len` and `max_len` will be the same for both collections.
3. If the initial `max_len==0`, then the `received_data` and `info_seq` collections will be filled with elements that are loaned by the **com.rti.dds.subscription.DataReader** (p. 707). On output, `len` will be set to the number of values returned, and `max_len` will be set to a value verifying `max_len >= len`. The use of this variant allows for Zero Copy access to the data and the application will need to return the loan to the **com.rti.dds.↩ publication.DataWriter** (p. 818) using **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386).
4. If initial `max_len>0` then the read or take operation will copy the `received_data` values and **com.rti.dds.↩ subscription.SampleInfo** (p. 1944) values into the elements already inside the collections. On output, `len` will be set to the number of values copied and `max_len` will remain unchanged. The use of this variant forces a copy but the application can control where the copy is placed and the application will not need to return the loan. The number of samples copied depends on the relative values of `max_len` and `max_samples`:
   - If `max_samples` == LENGTH_UNLIMITED, then at most `max_len` values will be copied. The use of this variant lets the application limit the number of samples returned to what the sequence can accommodate.
   - If `max_samples <= max_len`, then at most `max_samples` values will be copied. The use of this variant lets the application limit the number of samples returned to fewer that what the sequence can accommodate.
   - If `max_samples > max_len`, then the read or take operation will fail with **com.rti.dds.infrastructure.↩ RETCODE_PRECONDITION_NOT_MET** (p. 1903). This avoids the potential confusion where the application expects to be able to access up to `max_samples`, but that number can never be returned, even if they are available in the **com.rti.dds.subscription.DataReader** (p. 707), because the output sequence cannot accommodate them.

As described above, upon completion, the `received_data` and `info_seq` collections may contain elements loaned from the **com.rti.dds.subscription.DataReader** (p. 707). If this is the case, the application will need to use **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386) to return the loan once it is no longer using the `received_data` in the collection. When **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386) completes, the collection will have `max_len=0`. The application can determine whether it is necessary to return the loan or not based on how the state of the collections when the read/take operation was called However, in many cases it may be simpler to always call **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386), as this operation is harmless (i.e., it leaves all elements unchanged) if the collection does not have a loan.

On output, the collection of **com.rti.ndds.example.Foo** (p. 1358) values and the collection of **com.rti.dds.↩ subscription.SampleInfo** (p. 1944) structures are of the same length and are in a one-to-one correspondence. Each **com.rti.dds.subscription.SampleInfo** (p. 1944) provides information, such as the source_timestamp, the sample_state, view_state, and instance_state, etc., about the corresponding sample. Some elements in the returned collection may not have valid data. If the instance_state in the **com.rti.dds.subscription.SampleInfo** (p. 1944) is **com.rti.dds.subscription.InstanceStateKind.NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 1452) or **com.↩ rti.dds.subscription.InstanceStateKind.NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 1452), then the last sample for that instance in the collection (that is, the one whose **com.rti.dds.subscription.SampleInfo** (p. 1944) has sample_rank==0) does not contain valid data.

Samples that contain no data do not count towards the limits imposed by the **com.rti.dds.infrastructure.Resource↩ LimitsQosPolicy** (p. 1894). The act of reading/taking a sample sets its sample_state to com.rti.dds.subscription.↩ SampleStateKind.SampleStateKind.READ_SAMPLE_STATE.

If the sample belongs to the most recent generation of the instance, it will also set the view_state of the instance to com.rti.dds.subscription.ViewStateKind.ViewStateKind.NOT_NEW_VIEW_STATE. It will not affect the instance_state of the instance.

This operation must be provided on the specialized class that is generated for the particular application data-type that is being read (**com.rti.ndds.example.Foo** (p. 1358)).

If the **com.rti.dds.subscription.DataReader** (p. 707) has no samples that meet the constraints, the operations fails with **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902). For an example on how `take` can be used, please refer to the **Access received data via a reader** (p. 379) "receive example".

Parameters

received_data	<<***inout***>> *(p. 404)* User data type-specific com.rti.dds.infrastructure.com.rti.dds.util.Sequence object where the received data samples will be returned. Must be a valid non-NULL FooSeq. The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
info_seq	<<***inout***>> *(p. 404)* A **com.rti.dds.subscription.SampleInfoSeq** (p. 1957) object where the received sample info will be returned. Must be a valid non-NULL **com.rti.dds.subscription.SampleInfoSeq** (p. 1957). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
max_samples	<<***in***>> *(p. 404)* The maximum number of samples to be returned. If the special value **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511) is provided, as many samples will be returned as are available, up to the limits described above.
sample_states	<<***in***>> *(p. 404)* Data samples matching one of these `sample_states` are returned. See the valid values for this parameter here: **com.rti.dds.subscription.SampleStateKind** (p. 1972).
view_states	<<***in***>> *(p. 404)* Data samples matching one of these `view_state` are returned. See the valid values for this parameter here: **com.rti.dds.subscription.ViewStateKind** (p. 2283).
instance_states	<<***in***>> *(p. 404)* Data samples matching one of these `instance_state` are returned. See the valid values for this parameter here: **com.rti.dds.subscription.InstanceStateKind** (p. 1451).

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903), **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

See also

com.rti.ndds.example.FooDataReader.read (p. 1361)

com.rti.ndds.example.FooDataReader.read_w_condition (p. 1368), **com.rti.ndds.example.FooData↩ Reader.take_w_condition** (p. 1369)

com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED (p. 511)

References **DataReader.take_untyped()**.

8.98.2.3 read_w_condition()

```
void read_w_condition (
               DynamicDataSeq received_data,
               SampleInfoSeq info_seq,
              int max_samples,
               ReadCondition condition )
```

Accesses via **com.rti.ndds.example.FooDataReader.read** (p. 1361) the samples that match the criteria specified in the **com.rti.dds.subscription.ReadCondition** (p. 1816).

This operation is especially useful in combination with **com.rti.dds.subscription.QueryCondition** (p. 1812) to filter data samples based on the content.

The specified **com.rti.dds.subscription.ReadCondition** (p. 1816) must be attached to the **com.rti.dds.↩ subscription.DataReader** (p. 707); otherwise the operation will fail with **com.rti.dds.infrastructure.RETCODE_↩ PRECONDITION_NOT_MET** (p. 1903).

In case the **com.rti.dds.subscription.ReadCondition** (p. 1816) is a plain **com.rti.dds.subscription.ReadCondition** (p. 1816) and not the specialized **com.rti.dds.subscription.QueryCondition** (p. 1812), the operation is equivalent to calling **com.rti.ndds.example.FooDataReader.read** (p. 1361) and passing as `sample_states`, `view_states` and `instance_states` the value of the corresponding attributes in the `read_condition`. Using this operation, the application can avoid repeating the same parameters specified when creating the **com.rti.dds.subscription.↩ ReadCondition** (p. 1816).

The samples are accessed with the same semantics as **com.rti.ndds.example.FooDataReader.read** (p. 1361).

If the **com.rti.dds.subscription.DataReader** (p. 707) has no samples that meet the constraints, the operation will fail with **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902).

Parameters

received_data	*<<**inout**>> (p. 404)* user data type-specific com.rti.dds.infrastructure.com.rti.dds.util.Sequence object where the received data samples will be returned. Must be a valid non-NULL FooSeq. The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
info_seq	*<<**inout**>> (p. 404)* a **com.rti.dds.subscription.SampleInfoSeq** (p. 1957) object where the received sample info will be returned. Must be a valid non-NULL **com.rti.dds.subscription.SampleInfoSeq** (p. 1957). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
max_samples	*<<**in**>> (p. 404)* The maximum number of samples to be returned. If the special value **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511) is provided, as many samples will be returned as are available, up to the limits described in the documentation for **com.rti.ndds.example.FooDataReader.take()** (p. 1363).
condition	*<<**in**>> (p. 404)* the **com.rti.dds.subscription.ReadCondition** (p. 1816) to select samples of interest. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903), **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

See also

com.rti.ndds.example.FooDataReader.read (p. 1361)

com.rti.ndds.example.FooDataReader.take (p. 1363), **com.rti.ndds.example.FooDataReader.take_w_↩ condition** (p. 1369)

com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED (p. 511)

References **DataReader.read_w_condition_untyped()**.

8.98.2.4 take_w_condition()

```
void take_w_condition (
              DynamicDataSeq received_data,
              SampleInfoSeq info_seq,
             int max_samples,
              ReadCondition condition )
```

Analogous to **com.rti.ndds.example.FooDataReader.read_w_condition** (p. 1368) except it accesses samples via the **com.rti.ndds.example.FooDataReader.take** (p. 1363) operation.

This operation is analogous to **com.rti.ndds.example.FooDataReader.read_w_condition** (p. 1368) except that it accesses samples via the **com.rti.ndds.example.FooDataReader.take** (p. 1363) operation.

The specified **com.rti.dds.subscription.ReadCondition** (p. 1816) must be attached to the **com.rti.dds.↩ subscription.DataReader** (p. 707); otherwise the operation will fail with **com.rti.dds.infrastructure.RETCODE_↩ PRECONDITION_NOT_MET** (p. 1903).

The samples are accessed with the same semantics as **com.rti.ndds.example.FooDataReader.take** (p. 1363).

This operation is especially useful in combination with **com.rti.dds.subscription.QueryCondition** (p. 1812) to filter data samples based on the content.

If the **com.rti.dds.subscription.DataReader** (p. 707) has no samples that meet the constraints, the method will fail with **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902).

Parameters

received_data	*<<**inout**>> (p. 404)* user data type-specific com.rti.dds.infrastructure.com.rti.dds.util.Sequence object where the received data samples will be returned. Must be a valid non-NULL FooSeq. The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.

Parameters

info_seq	*<<**inout**>> (p. 404)* a **com.rti.dds.subscription.SampleInfoSeq** (p. 1957) object where the received sample info will be returned. Must be a valid non-NULL **com.rti.dds.subscription.SampleInfoSeq** (p. 1957). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
max_samples	*<<**in**>> (p. 404)* The maximum number of samples to be returned. If the special value **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511) is provided, as many samples will be returned as are available, up to the limits described in the documentation for **com.rti.ndds.example.FooDataReader.take()** (p. 1363).
condition	*<<**in**>> (p. 404)* the **com.rti.dds.subscription.ReadCondition** (p. 1816) to select samples of interest. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903), **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

See also

com.rti.ndds.example.FooDataReader.read_w_condition (p. 1368), **com.rti.ndds.example.FooData↩ Reader.read** (p. 1361)

com.rti.ndds.example.FooDataReader.take (p. 1363)

com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED (p. 511)

References **DataReader.take_w_condition_untyped()**.

8.98.2.5 read_next_sample()

```
void read_next_sample (
            DynamicData received_data,
            SampleInfo sample_info )
```

Copies the next not-previously-accessed data value from the **com.rti.dds.subscription.DataReader** (p. 707).

This operation copies the next not-previously-accessed data value from the **com.rti.dds.subscription.DataReader** (p. 707). This operation also copies the corresponding **com.rti.dds.subscription.SampleInfo** (p. 1944). The implied order among the samples stored in the **com.rti.dds.subscription.DataReader** (p. 707) is the same as for the **com.↩ rti.ndds.example.FooDataReader.read** (p. 1361) operation.

The **com.rti.ndds.example.FooDataReader.read_next_sample** (p. 1370) operation is semantically equivalent to the **com.rti.ndds.example.FooDataReader.read** (p. 1361) operation, where the input data sequences has max_len=1, the sample_states=NOT_READ, the view_states=ANY_VIEW_STATE, and the instance_states=ANY_INSTANCE_STATE.

The **com.rti.ndds.example.FooDataReader.read_next_sample** (p. 1370) operation provides a simplified API to 'read' samples, avoiding the need for the application to manage sequences and specify states.

If there is no unread data in the **com.rti.dds.subscription.DataReader** (p. 707), the operation will fail with **com.rti.↩ dds.infrastructure.RETCODE_NO_DATA** (p. 1902) and nothing is copied.

Note

Calling **com.rti.ndds.example.FooDataReader.read_next_sample** (p. 1370) from the **com.rti.dds.↩ subscription.DataReaderListener.on_data_available()** (p. 760) callback reads only one sample of potentially many samples in the reader queue, because **com.rti.dds.subscription.DataReaderListener.on_data_↩ available()** (p. 760) is triggered only once when new samples arrive in the queue. Therefore, it is recommended that you call **com.rti.ndds.example.FooDataReader.read_next_sample** (p. 1370) in a loop within the on↩ _data_available callback until **com.rti.ndds.example.FooDataReader.read_next_sample** (p. 1370) returns **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902) . This ensures that all samples in the reader queue are serviced by application logic. (You may also choose to use **com.rti.ndds.example.FooDataReader.read** (p. 1361) rather than **com.rti.ndds.example.FooDataReader.read_next_sample** (p. 1370) in order to read more than one sample at a time.)

Parameters

received_data	*<<**inout**>> (p. 404)* user data type-specific **com.rti.ndds.example.Foo** (p. 1358) object where the next received data sample will be returned. The received_data must have been fully allocated. Otherwise, this operation may fail. Must be a valid non-NULL Foo. The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
sample_info	*<<**inout**>> (p. 404)* a **com.rti.dds.subscription.SampleInfo** (p. 1944) object where the next received sample info will be returned. Must be a valid non-NULL **com.rti.dds.subscription.SampleInfo** (p. 1944). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

See also

com.rti.ndds.example.FooDataReader.read (p. 1361)

References **DataReader.read_next_sample_untyped()**.

8.98.2.6 take_next_sample()

```
void take_next_sample (
              DynamicData received_data,
              SampleInfo sample_info )
```

Copies the next not-previously-accessed data value from the **com.rti.dds.subscription.DataReader** (p. 707).

This operation copies the next not-previously-accessed data value from the **com.rti.dds.subscription.DataReader** (p. 707) and 'removes' it from the **com.rti.dds.subscription.DataReader** (p. 707) so that it is no longer accessible.

This operation also copies the corresponding **com.rti.dds.subscription.SampleInfo** (p. 1944). This operation is analogous to the **com.rti.ndds.example.FooDataReader.read_next_sample** (p. 1370) except for the fact that the sample is removed from the **com.rti.dds.subscription.DataReader** (p. 707).

The **com.rti.ndds.example.FooDataReader.take_next_sample** (p. 1371) operation is semantically equivalent to the **com.rti.ndds.example.FooDataReader.take** (p. 1363) operation, where the input data sequences has max_len=1, the sample_states=NOT_READ, the view_states=ANY_VIEW_STATE, and the instance_states=ANY_INSTANCE_STATE.

The **com.rti.ndds.example.FooDataReader.take_next_sample** (p. 1371) operation provides a simplified API to 'take' samples, avoiding the need for the application to manage sequences and specify states.

If there is no unread data in the **com.rti.dds.subscription.DataReader** (p. 707), the operation will fail with **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902) and nothing is copied.

Note

Calling **com.rti.ndds.example.FooDataReader.take_next_sample** (p. 1371) from the **com.rti.dds.subscription.DataReaderListener.on_data_available()** (p. 760) callback retrieves only one sample of potentially many samples in the reader queue, because **com.rti.dds.subscription.DataReaderListener.on_data_available()** (p. 760) is triggered only once when new samples arrive in the queue. Therefore, it is recommended that you call **com.rti.ndds.example.FooDataReader.take_next_sample** (p. 1371) in a loop within the on_data_available callback until **com.rti.ndds.example.FooDataReader.take_next_sample** (p. 1371) returns **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902) . This ensures that all samples in the reader queue are serviced by application logic. (You may also choose to use the **com.rti.ndds.example.FooDataReader.take** (p. 1363) rather than **com.rti.ndds.example.FooDataReader.take_next_sample** (p. 1371) in order to take more than one sample at a time.)

Parameters

received_data	*<<**inout**>> (p. 404)* user data type-specific **com.rti.ndds.example.Foo** (p. 1358) object where the next received data sample will be returned. The received_data must have been fully allocated. Otherwise, this operation may fail. Must be a valid non-NULL Foo. The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
sample_info	*<<**inout**>> (p. 404)* a **com.rti.dds.subscription.SampleInfo** (p. 1944) object where the next received sample info will be returned. Exceptions

One	of the **Standard Return Codes** (p. 513),

com.rti.dds.infrastructure.RETCODE_NO_DATA (p. 1902) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

See also

com.rti.ndds.example.FooDataReader.take (p. 1363)

References **DataReader.take_next_sample_untyped()**.

8.98.2.7 read_instance()

```
void read_instance (
              DynamicDataSeq received_data,
              SampleInfoSeq info_seq,
             int max_samples,
              InstanceHandle_t a_handle,
             int sample_states,
             int view_states,
             int instance_states )
```

Access a collection of data samples from the **com.rti.dds.subscription.DataReader** (p. 707).

This operation accesses a collection of data values from the **com.rti.dds.subscription.DataReader** (p. 707). The behavior is identical to **com.rti.ndds.example.FooDataReader.read** (p. 1361), except that all samples returned belong to the single specified instance whose handle is `a_handle`.

Upon successful completion, the data collection will contain samples all belonging to the same instance. The corresponding **com.rti.dds.subscription.SampleInfo** (p. 1944) verifies **com.rti.dds.subscription.SampleInfo.instance_handle** (p. 1949) == `a_handle`.

The **com.rti.ndds.example.FooDataReader.read_instance** (p. 1373) operation is semantically equivalent to the **com.rti.ndds.example.FooDataReader.read** (p. 1361) operation, except in building the collection, the **com.rti.dds.subscription.DataReader** (p. 707) will check that the sample belongs to the specified instance and otherwise it will not place the sample in the returned collection.

The behavior of the **com.rti.ndds.example.FooDataReader.read_instance** (p. 1373) operation follows the same rules as the **com.rti.ndds.example.FooDataReader.read** (p. 1361) operation regarding the pre-conditions and post-conditions for the `received_data` and `sample_info`. Similar to the **com.rti.ndds.example.FooDataReader.read** (p. 1361), the **com.rti.ndds.example.FooDataReader.read_instance** (p. 1373) operation may 'loan' elements to the output collections, which must then be returned by means of **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386).

Similar to the **com.rti.ndds.example.FooDataReader.read** (p. 1361), this operation must be provided on the specialized class that is generated for the particular application data-type that is being taken.

If the **com.rti.dds.subscription.DataReader** (p. 707) has no samples that meet the constraints, the method will fail with **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902).

This operation may fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if the **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443) `a_handle` does not correspond to an existing data-object known to the **com.rti.dds.subscription.DataReader** (p. 707).

Parameters

received_data	<<***inout***>> *(p. 404)* user data type-specific com.rti.dds.infrastructure.com.rti.dds.util.Sequence object where the received data samples will be returned. Must be a valid non-NULL FooSeq. The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
info_seq	<<***inout***>> *(p. 404)* a **com.rti.dds.subscription.SampleInfoSeq** (p. 1957) object where the received sample info will be returned. Must be a valid non-NULL **com.rti.dds.subscription.SampleInfoSeq** (p. 1957). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.

Parameters

max_samples	<<***in***>> *(p. 404)* The maximum number of samples to be returned. If the special value **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511) is provided, as many samples will be returned as are available, up to the limits described in the documentation for **com.rti.ndds.example.FooDataReader.take()** (p. 1363).
a_handle	<<***in***>> *(p. 404)* The specified instance to return samples for. Must be a valid non-NULL **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if the `handle` does not correspond to an existing data-object known to the **com.rti.dds.subscription.DataReader** (p. 707).
sample_states	<<***in***>> *(p. 404)* data samples matching ones of these `sample_states` are returned. See the valid values for this parameter here: **com.rti.dds.subscription.SampleStateKind** (p. 1972).
view_states	<<***in***>> *(p. 404)* data samples matching ones of these `view_state` are returned. See the valid values for this parameter here: **com.rti.dds.subscription.ViewStateKind** (p. 2283).
instance_states	<<***in***>> *(p. 404)* data samples matching ones of these `instance_state` are returned. See the valid values for this parameter here: **com.rti.dds.subscription.InstanceStateKind** (p. 1451).

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903), **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

See also

com.rti.ndds.example.FooDataReader.read (p. 1361)

com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED (p. 511)

References **DataReader.read_instance_untyped()**.

8.98.2.8 take_instance()

```
void take_instance (
             DynamicDataSeq received_data,
             SampleInfoSeq info_seq,
            int max_samples,
             InstanceHandle_t a_handle,
            int sample_states,
            int view_states,
            int instance_states )
```

Access a collection of data samples from the **com.rti.dds.subscription.DataReader** (p. 707).

This operation accesses a collection of data values from the **com.rti.dds.subscription.DataReader** (p. 707). The behavior is identical to **com.rti.ndds.example.FooDataReader.take** (p. 1363), except for that all samples returned belong to the single specified instance whose handle is `a_handle`.

The semantics are the same for the **com.rti.ndds.example.FooDataReader.take** (p. 1363) operation, except in building the collection, the **com.rti.dds.subscription.DataReader** (p. 707) will check that the sample belongs to the specified instance, and otherwise it will not place the sample in the returned collection.

The behavior of the **com.rti.ndds.example.FooDataReader.take_instance** (p. 1374) operation follows the same rules as the **com.rti.ndds.example.FooDataReader.read** (p. 1361) operation regarding the pre-conditions and post-conditions for the `received_data` and `sample_info`. Similar to the **com.rti.ndds.example.FooDataReader.read** (p. 1361), the **com.rti.ndds.example.FooDataReader.take_instance** (p. 1374) operation may 'loan' elements to the output collections, which must then be returned by means of **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386).

Similar to the **com.rti.ndds.example.FooDataReader.read** (p. 1361), this operation must be provided on the specialized class that is generated for the particular application data-type that is being taken.

If the **com.rti.dds.subscription.DataReader** (p. 707) has no samples that meet the constraints, the method fails with **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902).

This operation may fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if the **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443) `a_handle` does not correspond to an existing data-object known to the **com.rti.dds.subscription.DataReader** (p. 707).

Parameters

received_data	<<***inout***>> *(p. 404)* user data type-specific com.rti.dds.infrastructure.com.rti.dds.util.Sequence object where the received data samples will be returned. Must be a valid non-NULL FooSeq. The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
info_seq	<<***inout***>> *(p. 404)* a **com.rti.dds.subscription.SampleInfoSeq** (p. 1957) object where the received sample info will be returned. Must be a valid non-NULL **com.rti.dds.subscription.SampleInfoSeq** (p. 1957). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
max_samples	<<***in***>> *(p. 404)* The maximum number of samples to be returned. If the special value **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511) is provided, as many samples will be returned as are available, up to the limits described in the documentation for **com.rti.ndds.example.FooDataReader.take()** (p. 1363).
a_handle	<<***in***>> *(p. 404)* The specified instance to return samples for. Must be a valid non-NULL **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL. The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if the `handle` does not correspond to an existing data-object known to the **com.rti.dds.subscription.DataReader** (p. 707).
sample_states	<<***in***>> *(p. 404)* data samples matching ones of these `sample_states` are returned. See the valid values for this parameter here: **com.rti.dds.subscription.SampleStateKind** (p. 1972).
view_states	<<***in***>> *(p. 404)* data samples matching ones of these `view_state` are returned. See the valid values for this parameter here: **com.rti.dds.subscription.ViewStateKind** (p. 2283).
instance_states	<<***in***>> *(p. 404)* data samples matching ones of these `instance_state` are returned. See the valid values for this parameter here: **com.rti.dds.subscription.InstanceStateKind** (p. 1451).

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903), **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

See also

com.rti.ndds.example.FooDataReader.take (p. 1363)

com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED (p. 511)

References **DataReader.take_instance_untyped()**.

8.98.2.9 read_instance_w_condition()

```
void read_instance_w_condition (
              DynamicDataSeq received_data,
              SampleInfoSeq info_seq,
             int max_samples,
              InstanceHandle_t a_handle,
              ReadCondition condition )
```

<<***extension***>> *(*p. *403)* Accesses via **com.rti.ndds.example.FooDataReader.read_instance** (p. 1373) the samples that match the criteria specified in the **com.rti.dds.subscription.ReadCondition** (p. 1816).

This operation accesses a collection of data values from the **com.rti.dds.subscription.DataReader** (p. 707). The behavior is identical to **com.rti.ndds.example.FooDataReader.read_instance** (p. 1373), except that all returned samples satisfy the specified condition. In other words, on success, all returned samples belong to belong the single specified instance whose handle is `a_handle`, and for which the specified **com.rti.dds.subscription.ReadCondition** (p. 1816) evaluates to TRUE.

The behavior of the **com.rti.ndds.example.FooDataReader.read_instance_w_condition** (p. 1380) operation follows the same rules as the **com.rti.ndds.example.FooDataReader.read** (p. 1361) operation regarding the pre-conditions and post-conditions for the `received_data` and `sample_info`. Similar to the **com.rti.ndds.example.FooData↩ Reader.read** (p. 1361), the **com.rti.ndds.example.FooDataReader.read_instance_w_condition** (p. 1380) operation may 'loan' elements to the output collections, which must then be returned by means of **com.rti.ndds.example.Foo↩ DataReader.return_loan** (p. 1386).

Similar to **com.rti.ndds.example.FooDataReader.read** (p. 1361), this operation must be provided on the specialized class that is generated for the particular application data-type that is being taken.

If the **com.rti.dds.subscription.DataReader** (p. 707) has no samples that meet the constraints, the method will fail with **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902).

Parameters

received_data	*<<**inout**>> (p. 404)* user data type-specific com.rti.dds.infrastructure.com.rti.dds.util.Sequence object where the received data samples will be returned. Must be a valid non-NULL FooSeq. The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
info_seq	*<<**inout**>> (p. 404)* a **com.rti.dds.subscription.SampleInfoSeq** (p. 1957) object where the received sample info will be returned. Must be a valid non-NULL **com.rti.dds.subscription.SampleInfoSeq** (p. 1957). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
max_samples	*<<**in**>> (p. 404)* The maximum number of samples to be returned. If the special value **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511) is provided, as many samples will be returned as are available, up to the limits described in the documentation for **com.rti.ndds.example.FooDataReader.take()** (p. 1363).
a_handle	*<<**in**>> (p. 404)* The 'next smallest' instance with a value greater than this value that has available samples will be returned. Must be a valid non-NULL **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
condition	*<<**in**>> (p. 404)* the **com.rti.dds.subscription.ReadCondition** (p. 1816) to select samples of interest. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903) **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

com.rti.ndds.example.FooDataReader.read_next_instance (p. 1376)

com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED (p. 511)

References **DataReader.read_instance_w_condition_untyped()**.

8.98.2.10 take_instance_w_condition()

```
void take_instance_w_condition (
              DynamicDataSeq received_data,
              SampleInfoSeq info_seq,
             int max_samples,
              InstanceHandle_t a_handle,
              ReadCondition condition )
```

*<<**extension**>> (p. 403)* Accesses via **com.rti.ndds.example.FooDataReader.take_instance** (p. 1374) the samples that match the criteria specified in the **com.rti.dds.subscription.ReadCondition** (p. 1816).

This operation accesses a collection of data values from the **com.rti.dds.subscription.DataReader** (p. 707) and 'removes' them from the **com.rti.dds.subscription.DataReader** (p. 707). The behavior is identical to **com.rti.ndds.example.FooDataReader.take_instance** (p. 1374), except that all returned samples satisfy the specified condition. In other words, on success, all returned samples belong to belong the single specified instance whose handle is `a_handle`, and for which the specified **com.rti.dds.subscription.ReadCondition** (p. 1816) evaluates to TRUE.

The operation has the same behavior as **com.rti.ndds.example.FooDataReader.read_instance_w_condition** (p. 1380), except that the samples are 'taken' from the **com.rti.dds.subscription.DataReader** (p. 707) such that they are no longer accessible via subsequent 'read' or 'take' operations.

The behavior of the **com.rti.ndds.example.FooDataReader.take_instance_w_condition** (p. 1381) operation follows the same rules as the **com.rti.ndds.example.FooDataReader.read** (p. 1361) operation regarding the pre-conditions and post-conditions for the `received_data` and `sample_info`. Similar to the **com.rti.ndds.example.FooDataReader.read** (p. 1361), the **com.rti.ndds.example.FooDataReader.take_instance_w_condition** (p. 1381) operation may 'loan' elements to the output collections, which must then be returned by means of **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386).

Similar to the **com.rti.ndds.example.FooDataReader.read** (p. 1361), this operation must be provided on the specialized class that is generated for the particular application data-type that is being taken.

If the **com.rti.dds.subscription.DataReader** (p. 707) has no samples that meet the constraints, the method will fail with **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902).

Parameters

received_data	<<***inout***>> *(p. 404)* user data type-specific com.rti.dds.infrastructure.com.rti.dds.util.Sequence object where the received data samples will be returned. Must be a valid non-NULL FooSeq. The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
info_seq	<<***inout***>> *(p. 404)* a **com.rti.dds.subscription.SampleInfoSeq** (p. 1957) object where the received sample info will be returned. Must be a valid non-NULL **com.rti.dds.subscription.SampleInfoSeq** (p. 1957). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
max_samples	<<***in***>> *(p. 404)* The maximum number of samples to be returned. If the special value **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511) is provided, as many samples will be returned as are available, up to the limits described in the documentation for **com.rti.ndds.example.FooDataReader.take()** (p. 1363).
a_handle	<<***in***>> *(p. 404)* The 'next smallest' instance with a value greater than this value that has available samples will be returned. Must be a valid non-NULL **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
condition	<<***in***>> *(p. 404)* the **com.rti.dds.subscription.ReadCondition** (p. 1816) to select samples of interest. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903), or **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902), **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

See also

com.rti.ndds.example.FooDataReader.take_next_instance (p. 1378)

com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED (p. 511)

References **DataReader.take_instance_w_condition_untyped()**.

8.98.2.11 read_next_instance()

```
void read_next_instance (
              DynamicDataSeq received_data,
              SampleInfoSeq info_seq,
             int max_samples,
              InstanceHandle_t previous_handle,
             int sample_states,
             int view_states,
             int instance_states )
```

Access a collection of data samples from the **com.rti.dds.subscription.DataReader** (p. 707).

This operation accesses a collection of data values from the **com.rti.dds.subscription.DataReader** (p. 707) where all the samples belong to a single instance. The behavior is similar to **com.rti.ndds.example.FooDataReader.read_instance** (p. 1373), except that the actual instance is not directly specified. Rather, the samples will all belong to the 'next' instance with `instance_handle` 'greater' than the specified 'previous_handle' that has available samples.

This operation implies the existence of a total order 'greater-than' relationship between the instance handles. The specifics of this relationship are not all important and are implementation specific. The important thing is that, according to the middleware, all instances are ordered relative to each other. This ordering is between the instance handles; It should not depend on the state of the instance (e.g. whether it has data or not) and must be defined even for instance handles that do not correspond to instances currently managed by the **com.rti.dds.subscription.DataReader** (p. 707). For the purposes of the ordering, it should be 'as if' each instance handle was represented as unique integer.

The behavior of **com.rti.ndds.example.FooDataReader.read_next_instance** (p. 1376) is 'as if' the **com.rti.dds.subscription.DataReader** (p. 707) invoked **com.rti.ndds.example.FooDataReader.read_instance** (p. 1373), passing the smallest instance_handle among all the ones that: (a) are greater than `previous_handle`, and (b) have available samples (i.e. samples that meet the constraints imposed by the specified states).

The special value **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447) is guaranteed to be 'less than' any valid `instance_handle`. So the use of the parameter value `previous_handle` == **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447) will return the samples for the instance which has the smallest `instance_handle` among all the instances that contain available samples.

Note

The operation **com.rti.ndds.example.FooDataReader.read_next_instance** (p. 1376) is intended to be used in an application-driven iteration, where the application starts by passing `previous_handle` == **com.rti.↩ dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447), examines the samples returned, and then uses the `instance_handle` returned in the **com.rti.dds.subscription.SampleInfo** (p. 1944) as the value of the `previous_handle` argument to the next call to **com.rti.ndds.example.FooDataReader.read_next_instance** (p. 1376). The iteration continues until **com.rti.ndds.example.FooDataReader.read_next_instance** (p. 1376) fails with **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902). This application-driven iteration is required to ensure that all samples on the reader queue are read.

Note that it is possible to call the **com.rti.ndds.example.FooDataReader.read_next_instance** (p. 1376) operation with a `previous_handle` that does not correspond to an instance currently managed by the **com.rti.dds.↩ subscription.DataReader** (p. 707). This is because as stated earlier the 'greater-than' relationship is defined even for handles not managed by the **com.rti.dds.subscription.DataReader** (p. 707). One practical situation where this may occur is when an application is iterating though all the instances, takes all the samples of a **com.rti.dds.subscription.↩ InstanceStateKind.NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 1452) instance, returns the loan (at which point the instance information may be removed, and thus the handle becomes invalid), and tries to read the next instance. The behavior of the **com.rti.ndds.example.FooDataReader.read_next_instance** (p. 1376) operation follows the same rules as the **com.rti.ndds.example.FooDataReader.read** (p. 1361) operation regarding the pre-conditions and post-conditions for the `received_data` and `sample_info`. Similar to the **com.rti.ndds.example.FooDataReader.↩ read** (p. 1361), the **com.rti.ndds.example.FooDataReader.read_instance** (p. 1373) operation may 'loan' elements to the output collections, which must then be returned by means of **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386).

Similar to the **com.rti.ndds.example.FooDataReader.read** (p. 1361), this operation must be provided on the specialized class that is generated for the particular application data-type that is being taken.

If the **com.rti.dds.subscription.DataReader** (p. 707) has no samples that meet the constraints, the method will fail with **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902).

Parameters

received_data	<<***inout***>> *(p. 404)* user data type-specific com.rti.dds.infrastructure.com.rti.dds.util.Sequence object where the received data samples will be returned. Must be a valid non-NULL FooSeq. The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
info_seq	<<***inout***>> *(p. 404)* a **com.rti.dds.subscription.SampleInfoSeq** (p. 1957) object where the received sample info will be returned. Must be a valid non-NULL **com.rti.dds.subscription.SampleInfoSeq** (p. 1957). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
max_samples	<<***in***>> *(p. 404)* The maximum number of samples to be returned. If the special value **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511) is provided, as many samples will be returned as are available, up to the limits described in the documentation for **com.rti.ndds.example.FooDataReader.take()** (p. 1363).
previous_handle	<<***in***>> *(p. 404)* The 'next smallest' instance with a value greater than this value that has available samples will be returned. Must be a valid non-NULL **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
sample_states	<<***in***>> *(p. 404)* data samples matching ones of these `sample_states` are returned. See the valid values for this parameter here: **com.rti.dds.subscription.SampleStateKind** (p. 1972).
view_states	<<***in***>> *(p. 404)* data samples matching ones of these `view_state` are returned. See the valid values for this parameter here: **com.rti.dds.subscription.ViewStateKind** (p. 2283).
instance_states	<<***in***>> *(p. 404)* data samples matching ones of these `instance_state` are returned. See the valid values for this parameter here: **com.rti.dds.subscription.InstanceStateKind** (p. 1451).

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903) **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

8.98.2.12 take_next_instance()

```
void take_next_instance (
              DynamicDataSeq received_data,
              SampleInfoSeq info_seq,
             int max_samples,
              InstanceHandle_t previous_handle,
             int sample_states,
             int view_states,
             int instance_states )
```

Access a collection of data samples from the **com.rti.dds.subscription.DataReader** (p. 707).

This operation accesses a collection of data values from the **com.rti.dds.subscription.DataReader** (p. 707) and 'removes' them from the **com.rti.dds.subscription.DataReader** (p. 707).

This operation has the same behavior as **com.rti.ndds.example.FooDataReader.read_next_instance** (p. 1376), except that the samples are 'taken' from the **com.rti.dds.subscription.DataReader** (p. 707) such that they are no longer accessible via subsequent 'read' or 'take' operations.

Note

Like **com.rti.ndds.example.FooDataReader.read_next_instance** (p. 1376), this operation is intended to be used in an application-driven iteration until all samples on the reader queue are taken. The iteration continues until **com.rti.ndds.example.FooDataReader.take_next_instance** (p. 1378) fails with the value **com.rti.dds.↩ infrastructure.RETCODE_NO_DATA** (p. 1902) .

Similar to the operation **com.rti.ndds.example.FooDataReader.read_next_instance** (p. 1376), it is possible to call **com.rti.ndds.example.FooDataReader.take_next_instance** (p. 1378) with a `previous_handle` that does not correspond to an instance currently managed by the **com.rti.dds.subscription.DataReader** (p. 707).

The behavior of the **com.rti.ndds.example.FooDataReader.take_next_instance** (p. 1378) operation follows the same rules as the **com.rti.ndds.example.FooDataReader.read** (p. 1361) operation regarding the pre-conditions and post-conditions for the `received_data` and `sample_info`. Similar to the **com.rti.ndds.example.FooDataReader.↩ read** (p. 1361), the **com.rti.ndds.example.FooDataReader.take_next_instance** (p. 1378) operation may 'loan' elements to the output collections, which must then be returned by means of **com.rti.ndds.example.FooDataReader.↩ return_loan** (p. 1386).

Similar to the **com.rti.ndds.example.FooDataReader.read** (p. 1361), this operation must be provided on the specialized class that is generated for the particular application data-type that is being taken.

If the **com.rti.dds.subscription.DataReader** (p. 707) has no samples that meet the constraints, the method will fail with **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902).

Parameters

received_data	*<<**inout**>> (p. 404)* user data type-specific com.rti.dds.infrastructure.com.rti.dds.util.Sequence object where the received data samples will be returned. Must be a valid non-NULL FooSeq. The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
info_seq	*<<**inout**>> (p. 404)* a **com.rti.dds.subscription.SampleInfoSeq** (p. 1957) object where the received sample info will be returned. Must be a valid non-NULL **com.rti.dds.subscription.SampleInfoSeq** (p. 1957). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
max_samples	*<<**in**>> (p. 404)* The maximum number of samples to be returned. If the special value **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511) is provided, as many samples will be returned as are available, up to the limits described in the documentation for **com.rti.ndds.example.FooDataReader.take()** (p. 1363).
previous_handle	*<<**in**>> (p. 404)* The 'next smallest' instance with a value greater than this value that has available samples will be returned. Must be a valid non-NULL **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
sample_states	*<<**in**>> (p. 404)* data samples matching ones of these `sample_states` are returned. See the valid values for this parameter here: **com.rti.dds.subscription.SampleStateKind** (p. 1972).
view_states	*<<**in**>> (p. 404)* data samples matching ones of these `view_state` are returned. See the valid values for this parameter here: **com.rti.dds.subscription.ViewStateKind** (p. 2283).
instance_states	*<<**in**>> (p. 404)* data samples matching ones of these `instance_state` are returned. See the valid values for this parameter here: **com.rti.dds.subscription.InstanceStateKind** (p. 1451).

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903), **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

8.98.2.13 read_next_instance_w_condition()

```
void read_next_instance_w_condition (
              DynamicDataSeq received_data,
              SampleInfoSeq info_seq,
             int max_samples,
```

```
InstanceHandle_t previous_handle,
ReadCondition condition )
```

Accesses via **com.rti.ndds.example.FooDataReader.read_next_instance** (p. 1376) the samples that match the criteria specified in the **com.rti.dds.subscription.ReadCondition** (p. 1816).

This operation accesses a collection of data values from the **com.rti.dds.subscription.DataReader** (p. 707). The behavior is identical to **com.rti.ndds.example.FooDataReader.read_next_instance** (p. 1376), except that all returned samples satisfy the specified condition. In other words, on success, all returned samples belong to the same instance, and the instance is the instance with 'smallest' `instance_handle` among the ones that verify: (a) `instance_handle` >= `previous_handle`, and (b) have samples for which the specified **com.rti.dds.subscription.ReadCondition** (p. 1816) evaluates to TRUE.

Similar to the operation **com.rti.ndds.example.FooDataReader.read_next_instance** (p. 1376), it is possible to call **com.rti.ndds.example.FooDataReader.read_next_instance_w_condition** (p. 1383) with a `previous_handle` that does not correspond to an instance currently managed by the **com.rti.dds.subscription.DataReader** (p. 707).

The behavior of the **com.rti.ndds.example.FooDataReader.read_next_instance_w_condition** (p. 1383) operation follows the same rules as the **com.rti.ndds.example.FooDataReader.read** (p. 1361) operation regarding the pre-conditions and post-conditions for the `received_data` and `sample_info`. Similar to the **com.rti.ndds.example.FooDataReader.read** (p. 1361), the **com.rti.ndds.example.FooDataReader.read_next_instance_w_condition** (p. 1383) operation may 'loan' elements to the output collections, which must then be returned by means of **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386).

Similar to the **com.rti.ndds.example.FooDataReader.read** (p. 1361), this operation must be provided on the specialized class that is generated for the particular application data-type that is being taken.

If the **com.rti.dds.subscription.DataReader** (p. 707) has no samples that meet the constraints, the method will fail with **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902).

Parameters

received_data	<<***inout***>> *(p. 404)* user data type-specific com.rti.dds.infrastructure.com.rti.dds.util.Sequence object where the received data samples will be returned. Must be a valid non-NULL FooSeq. The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
info_seq	<<***inout***>> *(p. 404)* a **com.rti.dds.subscription.SampleInfoSeq** (p. 1957) object where the received sample info will be returned. Must be a valid non-NULL **com.rti.dds.subscription.SampleInfoSeq** (p. 1957). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
max_samples	<<***in***>> *(p. 404)* The maximum number of samples to be returned. If the special value **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511) is provided, as many samples will be returned as are available, up to the limits described in the documentation for **com.rti.ndds.example.FooDataReader.take()** (p. 1363).
previous_handle	<<***in***>> *(p. 404)* The 'next smallest' instance with a value greater than this value that has available samples will be returned. Must be a valid non-NULL **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
condition	<<***in***>> *(p. 404)* the **com.rti.dds.subscription.ReadCondition** (p. 1816) to select samples of interest. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903) **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

8.98.2.14 take_next_instance_w_condition()

```
void take_next_instance_w_condition (
              DynamicDataSeq received_data,
              SampleInfoSeq info_seq,
             int max_samples,
              InstanceHandle_t previous_handle,
              ReadCondition condition )
```

Accesses via **com.rti.ndds.example.FooDataReader.take_next_instance** (p. 1378) the samples that match the criteria specified in the **com.rti.dds.subscription.ReadCondition** (p. 1816).

This operation accesses a collection of data values from the **com.rti.dds.subscription.DataReader** (p. 707) and 'removes' them from the **com.rti.dds.subscription.DataReader** (p. 707).

The operation has the same behavior as **com.rti.ndds.example.FooDataReader.read_next_instance_w_condition** (p. 1383), except that the samples are 'taken' from the **com.rti.dds.subscription.DataReader** (p. 707) such that they are no longer accessible via subsequent 'read' or 'take' operations.

Similar to the operation **com.rti.ndds.example.FooDataReader.read_next_instance** (p. 1376), it is possible to call **com.rti.ndds.example.FooDataReader.take_next_instance_w_condition** (p. 1384) with a `previous_handle` that does not correspond to an instance currently managed by the **com.rti.dds.subscription.DataReader** (p. 707).

The behavior of the **com.rti.ndds.example.FooDataReader.take_next_instance_w_condition** (p. 1384) operation follows the same rules as the **com.rti.ndds.example.FooDataReader.read** (p. 1361) operation regarding the pre-conditions and post-conditions for the `received_data` and `sample_info`. Similar to **com.rti.ndds.example.FooDataReader.read** (p. 1361), the **com.rti.ndds.example.FooDataReader.take_next_instance_w_condition** (p. 1384) operation may 'loan' elements to the output collections, which must then be returned by means of **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386).

Similar to the **com.rti.ndds.example.FooDataReader.read** (p. 1361), this operation must be provided on the specialized class that is generated for the particular application data-type that is being taken.

If the **com.rti.dds.subscription.DataReader** (p. 707) has no samples that meet the constraints, the method will fail with **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902).

Parameters

received_data	<<***inout***>> *(p. 404)* user data type-specific com.rti.dds.infrastructure.com.rti.dds.util.Sequence object where the received data samples will be returned. Must be a valid non-NULL FooSeq. The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
info_seq	<<***inout***>> *(p. 404)* a **com.rti.dds.subscription.SampleInfoSeq** (p. 1957) object where the received sample info will be returned. Must be a valid non-NULL **com.rti.dds.subscription.SampleInfoSeq** (p. 1957). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
max_samples	<<***in***>> *(p. 404)* The maximum number of samples to be returned. If the special value **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511) is provided, as many samples will be returned as are available, up to the limits described in the documentation for **com.rti.ndds.example.FooDataReader.take()** (p. 1363).
previous_handle	<<***in***>> *(p. 404)* The 'next smallest' instance with a value greater than this value that has available samples will be returned. Must be a valid non-NULL **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
condition	<<***in***>> *(p. 404)* the **com.rti.dds.subscription.ReadCondition** (p. 1816) to select samples of interest. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903), or **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902), **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

See also

com.rti.ndds.example.FooDataReader.take_next_instance (p. 1378)

com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED (p. 511)

References **DataReader.take_next_instance_w_condition_untyped()**.

8.98.2.15 return_loan()

```
void return_loan (
            DynamicDataSeq received_data,
            SampleInfoSeq info_seq )
```

Indicates to the **com.rti.dds.subscription.DataReader** (p. 707) that the application is done accessing the collection of `received_data` and `info_seq` obtained by some earlier invocation of read or take on the **com.rti.dds.↩ subscription.DataReader** (p. 707).

The `received_data` and `info_seq` must belong to a single related "pair"; that is, they should correspond to a pair returned from a single call to read or take. The `received_data` and `info_seq` must also have been obtained from

the same **com.rti.dds.subscription.DataReader** (p. 707) to which they are returned. If either of these conditions is not met, the operation will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).

The operation **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386) allows implementations of the read and take operations to "loan" buffers from the **com.rti.dds.subscription.DataReader** (p. 707) to the application and in this manner provide "zerocopy" access to the data. During the loan, the **com.rti.dds.subscription.DataReader** (p. 707) will guarantee that the data and sample-information are not modified.

It is not necessary for an application to return the loans immediately after the read or take calls. However, as these buffers correspond to internal resources inside the **com.rti.dds.subscription.DataReader** (p. 707), the application should not retain them indefinitely.

The use of **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386) is only necessary if the read or take calls "loaned" buffers to the application. This only occurs if the `received_data` and `info_Seq` collections had `max_len=0` at the time read or take was called.

If the collections had a loan, upon completion of **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386), the collections will have `max_len=0`.

Similar to read, this operation must be provided on the specialized class that is generated for the particular application data-type that is being taken.

Parameters

received_data	*<<**in**>> (p. 404)* user data type-specific com.rti.dds.infrastructure.com.rti.dds.util.Sequence object where the received data samples was obtained from earlier invocation of read or take on the **com.rti.dds.subscription.DataReader** (p. 707). Must be a valid non-NULL FooSeq. The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.

Parameters

info_seq	*<<**in**>> (p. 404)* a **com.rti.dds.subscription.SampleInfoSeq** (p. 1957) object where the received sample info was obtained from earlier invocation of read or take on the **com.rti.dds.subscription.DataReader** (p. 707). Must be a valid non-NULL **com.rti.dds.subscription.SampleInfoSeq** (p. 1957). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

References **DataReader.return_loan_untyped()**.

8.98.2.16 get_key_value()

```
void get_key_value (
              DynamicData key_holder,
              InstanceHandle_t handle )
```

Retrieve the instance `key` that corresponds to an instance `handle`.

Useful for keyed data types.

The operation will only fill the fields that form the `key` inside the `key_holder` instance. If the type has no keys, this method has no effect and exits with no error.

For keyed data types, this operation may fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if the `handle` does not correspond to an existing data-object known to the **com.rti.dds.subscription.DataReader** (p. 707).

Parameters

key_holder	<<***inout***>> *(p. 404)* a user data type specific key holder, whose `key` fields are filled by this operation. If **com.rti.ndds.example.Foo** (p. 1358) has no key, this method has no effect. This method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if `key_holder` is NULL.
handle	<<***in***>> *(p. 404)* the `instance` whose key is to be retrieved. If **com.rti.ndds.example.Foo** (p. 1358) *has* a key, `handle` must represent an existing instance of type **com.rti.ndds.example.Foo** (p. 1358) known to the **com.rti.dds.subscription.DataReader** (p. 707). Otherwise, this method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899).

If **com.rti.ndds.example.Foo** (p. 1358) *has* a key and `handle` is **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447), this method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899).

If **com.rti.ndds.example.Foo** (p. 1358) has a key and `handle` represents an instance of another type or an instance of type **com.rti.ndds.example.Foo** (p. 1358) that has been unregistered, this method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899). If **com.rti.ndds.example.Foo** (p. 1358) has no key, this method has no effect.

This method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if `handle` is NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

See also

com.rti.ndds.example.FooDataWriter.get_key_value (p. 1406)

References **DataReader.get_key_value_untyped()**.

8.98.2.17 lookup_instance()

```
InstanceHandle_t lookup_instance (
            DynamicData key_holder )
```

Retrieves the instance `handle` that corresponds to an instance `key_holder`.

Useful for keyed data types.

This operation takes as a parameter an instance and returns a handle that can be used in subsequent operations that accept an instance handle as an argument. The instance parameter is only used for the purpose of examining the fields that define the key. If the instance is unknown to the DataReader, or if for any other reason the Service is unable to provide an instance handle, the Service will return the special value **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447).

Parameters

key_holder	<<***in***>> *(p. 404)* a user data type specific key holder.

Returns

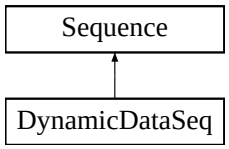
the instance handle associated with this instance. If **com.rti.ndds.example.Foo** (p. 1358) has no key, this method has no effect and returns **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447)

References **DataReader.lookup_instance_untyped()**.

8.99 DynamicDataSeq Class Reference

An ordered collection of **com.rti.dds.dynamicdata.DynamicData** (p. 1134) elements.

Inheritance diagram for DynamicDataSeq:



Public Member Functions

- **DynamicDataSeq** ()

  *Construct a new empty **com.rti.dds.dynamicdata.DynamicDataSeq** (p. 1279).*
- **DynamicDataSeq** (int initialMaximum)

  *Construct a new empty **com.rti.dds.dynamicdata.DynamicDataSeq** (p. 1279).*

8.100.3 Member Data Documentation

8.100.3.1 data

```
final DynamicDataProperty_t data
```

Initial value:

```
=
        new DynamicDataProperty_t()
```

These properties will be provided to every new **com.rti.dds.dynamicdata.DynamicData** (p. 1134) sample created from the **com.rti.dds.dynamicdata.DynamicDataTypeSupport** (p. 1286).

These properties are also used to create the samples that are kept in the DataReader's queue.

Referenced by **DynamicDataTypeProperty_t.DynamicDataTypeProperty_t()**, and **DynamicDataTypeSupport.DynamicDataTypeSupport()**.

8.100.3.2 serialization

```
final DynamicDataTypeSerializationProperty_t serialization
```

Initial value:

```
=
        new DynamicDataTypeSerializationProperty_t()
```

Properties that govern how the data of this type will be serialized on the network.

Referenced by **DynamicDataTypeProperty_t.DynamicDataTypeProperty_t()**, and **DynamicDataTypeSupport.↩ DynamicDataTypeSupport()**.

8.101 DynamicDataTypeSerializationProperty_t Class Reference

Properties that govern how data of a certain type will be serialized on the network.

Public Member Functions

- **DynamicDataTypeSerializationProperty_t** ()

  The constructor.
- **DynamicDataTypeSerializationProperty_t** (boolean **use_42e_compatible_alignment**, int **max_size_↩ serialized**, int **min_size_serialized**, boolean **trim_to_size**)

  The constructor.

Public Attributes

- boolean **use_42e_compatible_alignment** = false

  *[**No longer supported**] Use RTI Connext 4.2e-compatible alignment for large primitive types.*
- int **max_size_serialized** = 0xffffffff

  *[**No longer supported**] If you were previously using this property, use **com.rti.dds.dynamicdata.DynamicData↩ Property_t.buffer_max_size** (p. 1248) instead. The maximum number of bytes that objects of a given type could consume when serialized on the network.*
- int **min_size_serialized** = 0xffffffff

  *[**No longer supported**] If you were previously using this property, use **com.rti.dds.dynamicdata.DynamicData↩ Property_t.buffer_initial_size** (p. 1247) instead. The minimum number of bytes that objects of a given type could consume when serialized on the network.*
- boolean **trim_to_size** = false

  *Controls the growth of the buffer in a **DynamicData** (p. 1134) object.*

8.101.1 Detailed Description

Properties that govern how data of a certain type will be serialized on the network.

8.101.2 Constructor & Destructor Documentation

8.101.2.1 DynamicDataTypeSerializationProperty_t() [1/2]

```
DynamicDataTypeSerializationProperty_t ( )
```

The constructor.

8.101.2.2 DynamicDataTypeSerializationProperty_t() [2/2]

```
DynamicDataTypeSerializationProperty_t (
            boolean use_42e_compatible_alignment,
            int max_size_serialized,
            int min_size_serialized,
            boolean trim_to_size )
```

The constructor.

References **DynamicDataTypeSerializationProperty_t.max_size_serialized**, **DynamicDataTypeSerialization↩ Property_t.min_size_serialized**, **DynamicDataTypeSerializationProperty_t.trim_to_size**, and **DynamicData↩ TypeSerializationProperty_t.use_42e_compatible_alignment**.

8.101.3 Member Data Documentation

8.101.3.1 use_42e_compatible_alignment

```
boolean use_42e_compatible_alignment = false
```

[**No longer supported**] Use RTI Connext 4.2e-compatible alignment for large primitive types.

In RTI Connext 4.2e, the default alignment for large primitive types – long, com.rti.dds.infrastructure.long, double, and com.rti.dds.infrastructure.LongDouble – was not RTPS-compliant. This compatibility mode allows applications targeting post-4.2e versions of RTI Connext to interoperate with 4.2e-based applications, regardless of the data types they use.

If this flag is not set, all data will be serialized in an RTPS-compliant manner, which for the types listed above, will not be interoperable with RTI Connext 4.2e.

Referenced by **DynamicDataTypeProperty_t.DynamicDataTypeProperty_t()**, **DynamicDataTypeSerialization↩ Property_t.DynamicDataTypeSerializationProperty_t()**, and **DynamicDataTypeSupport.DynamicDataType↩ Support()**.

8.101.3.2 max_size_serialized

```
int max_size_serialized = 0xffffffff
```

[**No longer supported**] If you were previously using this property, use **com.rti.dds.dynamicdata.DynamicData↩ Property_t.buffer_max_size** (p. 1248) instead. The maximum number of bytes that objects of a given type could consume when serialized on the network.

This value is used to set the sizes of certain internal middleware buffers.

The effective value of the maximum serialized size will be the value of this field or the size automatically inferred from the type's **com.rti.dds.typecode.TypeCode** (p. 2183), whichever is smaller.

Referenced by **DynamicDataTypeProperty_t.DynamicDataTypeProperty_t()**, **DynamicDataTypeSerialization↩ Property_t.DynamicDataTypeSerializationProperty_t()**, and **DynamicDataTypeSupport.DynamicDataType↩ Support()**.

8.101.3.3 min_size_serialized

```
int min_size_serialized = 0xffffffff
```

[**No longer supported**] If you were previously using this property, use **com.rti.dds.dynamicdata.DynamicData↩ Property_t.buffer_initial_size** (p. 1247) instead. The minimum number of bytes that objects of a given type could consume when serialized on the network.

This value is used to set the sizes of certain internal middleware buffers.

Default: 0xFFFFFFFF, a sentinel that indicates that this value must be equal to the value specified in max_size_↩ serialized.

Referenced by **DynamicDataTypeProperty_t.DynamicDataTypeProperty_t()**, **DynamicDataTypeSerialization↩ Property_t.DynamicDataTypeSerializationProperty_t()**, and **DynamicDataTypeSupport.DynamicDataType↩ Support()**.

8.101.3.4 trim_to_size

```
boolean trim_to_size = false
```

Controls the growth of the buffer in a **DynamicData** (p. 1134) object.

This property only applies to **DynamicData** (p. 1134) samples that are obtained from the sample pool that is created by each **DynamicData** (p. 1134) DataReader.

If set to 0 (default): The buffer will not be reallocated unless the deserialized size of the incoming sample is greater than the current buffer size.

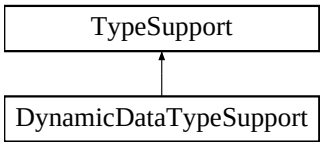
If set to 1: The buffer of a **DynamicData** (p. 1134) object obtained from the DDS sample pool will be freed and re-allocated for each sample to just fit the size of the deserialized data of the incoming sample. The newly allocated size will not be smaller than **com.rti.dds.dynamicdata.DynamicDataProperty_t.buffer_initial_size** (p. 1247).

Referenced by **DynamicDataTypeProperty_t.DynamicDataTypeProperty_t()**, **DynamicDataTypeSerialization↩ Property_t.DynamicDataTypeSerializationProperty_t()**, and **DynamicDataTypeSupport.DynamicDataType↩ Support()**.

8.102 DynamicDataTypeSupport Class Reference

A factory for registering a dynamically defined type and creating **com.rti.dds.dynamicdata.DynamicData** (p. 1134) objects.

Inheritance diagram for DynamicDataTypeSupport:



Public Member Functions

- final void **register_type** (**DomainParticipant** participant, String type_name)

  *Associate the **com.rti.dds.typecode.TypeCode** (p. 2183) with the given **com.rti.dds.domain.DomainParticipant** (p. 948) under the given logical name.*
- final void **unregister_type** (**DomainParticipant** participant, String type_name)

  *Remove the definition of this type from the **com.rti.dds.domain.DomainParticipant** (p. 948).*
- final String **get_type_name** ()

  Get the default name of this type.
- final **TypeCode** **get_data_type** ()

  *Get the **com.rti.dds.typecode.TypeCode** (p. 2183) wrapped by this **com.rti.dds.dynamicdata.DynamicDataType↩ Support** (p. 1286).*
- Object **create_data** ()

  *Create a new **com.rti.dds.dynamicdata.DynamicData** (p. 1134) sample initialized with the **com.rti.dds.typecode.↩ TypeCode** (p. 2183) and properties of this **com.rti.dds.dynamicdata.DynamicDataTypeSupport** (p. 1286).*
- void **destroy_data** (Object data)

  *Finalize and deallocate the **com.rti.dds.dynamicdata.DynamicData** (p. 1134) sample.*
- void **print_data** (**DynamicData** data)

  Print a string representation of the given sample to the given file.
- void **copy_data** (**DynamicData** dst, **DynamicData** src)

  Deeply copy the given data samples.
- void **to_cdr_buffer** (**ByteSeq** sequence, **DynamicData** data, short representation)

  *Serializes the specified **DynamicData** (p. 1134) object into a sequence of octets.*
- void **to_cdr_buffer** (**ByteSeq** sequence, **DynamicData** data)

  *Serializes the specified **DynamicData** (p. 1134) object into a CDR sequence of octets.*
- void **from_cdr_buffer** (**DynamicData** data, **ByteSeq** sequence)

  *Deserializes the specified **DynamicData** (p. 1134) object from a sequence octets.*
- void **delete** ()

  *Delete a **com.rti.dds.dynamicdata.DynamicDataTypeSupport** (p. 1286) object.*
- **DynamicDataTypeSupport** (**TypeCode** type, **DynamicDataTypeProperty_t** props)

  *Construct a new **com.rti.dds.dynamicdata.DynamicDataTypeSupport** (p. 1286) object.*

Static Public Attributes

- static final **DynamicDataTypeProperty_t TYPE_PROPERTY_DEFAULT**

  *Sentinel constant indicating default values for **com.rti.dds.dynamicdata.DynamicDataTypeProperty_t** (p. 1281).*

Static Protected Attributes

- static final RuntimeException **DYNAMICDATA_TYPE_NOT_SUPPORTED** = new **RETCODE_ERROR**("not a top-level type")

8.102.1 Detailed Description

A factory for registering a dynamically defined type and creating **com.rti.dds.dynamicdata.DynamicData** (p. 1134) objects.

A **com.rti.dds.dynamicdata.DynamicDataTypeSupport** (p. 1286) has three roles:

1. It associates a **com.rti.dds.typecode.TypeCode** (p. 2183) with policies for managing objects of that type. See the constructor, com.rti.dds.dynamicdata.DynamicDataTypeSupport.DynamicDataTypeSupport.DynamicDataType↩ Support.
2. It registers its type under logical names with a **com.rti.dds.domain.DomainParticipant** (p. 948). See **com.rti.↩ dds.dynamicdata.DynamicDataTypeSupport.register_type** (p. 1288).
3. It creates **com.rti.dds.dynamicdata.DynamicData** (p. 1134) samples pre-initialized with the type and properties of the type support itself. See **com.rti.dds.dynamicdata.DynamicDataTypeSupport.create_data** (p. 1289).

8.102.2 Constructor & Destructor Documentation

8.102.2.1 DynamicDataTypeSupport()

```
DynamicDataTypeSupport (
            TypeCode type,
            DynamicDataTypeProperty_t props )
```

Construct a new **com.rti.dds.dynamicdata.DynamicDataTypeSupport** (p. 1286) object.

This step is usually followed by type registration.

The new object created by this constructor retains a reference to the **com.rti.dds.typecode.TypeCode** (p. 2183) that is passed in. It is *not* safe to delete the **com.rti.dds.typecode.TypeCode** (p. 2183) until the **com.rti.dds.dynamicdata.↩ DynamicDataTypeSupport** (p. 1286) itself is deleted. You have two options:

- Keep a reference to the **com.rti.dds.typecode.TypeCode** (p. 2183) object yourself, and delete it with **com.↩ rti.dds.typecode.TypeCodeFactory.delete_tc** (p. 2245) after you've deleted the **com.rti.dds.dynamicdata.↩ DynamicDataTypeSupport** (p. 1286).
- Do not keep a reference to the **com.rti.dds.typecode.TypeCode** (p. 2183). The garbage collector will delete it when it's eligible for collection.

If the object cannot be created, this method throws **com.rti.dds.infrastructure.RETCODE_ERROR** (p. 1900).

Parameters

type	The **com.rti.dds.typecode.TypeCode** (p. 2183) that describes the members of this type.
props	Policies that describe how to manage the memory and other properties of the data samples created by this factory. In most cases, the default values will be appropriate; see **com.rti.dds.dynamicdata.DynamicDataTypeSupport.TYPE_PROPERTY_DEFAULT** (p. 70).

See also

com.rti.dds.dynamicdata.DynamicDataTypeSupport.register_type (p. 1288)

Exceptions

One	of the **Standard Return Codes** (p. 513)

References **DynamicDataProperty_t.buffer_initial_size**, **DynamicDataProperty_t.buffer_max_size**, **DynamicDataTypeProperty_t.data**, **DynamicDataTypeSerializationProperty_t.max_size_serialized**, **DynamicDataTypeSerializationProperty_t.min_size_serialized**, **DynamicDataTypeProperty_t.serialization**, **DynamicDataTypeSerializationProperty_t.trim_to_size**, and **DynamicDataTypeSerializationProperty_t.use_42e_compatible_alignment**.

8.102.3 Member Function Documentation

8.102.3.1 register_type()

```
final void register_type (
             DomainParticipant participant,
            String type_name )
```

Associate the **com.rti.dds.typecode.TypeCode** (p. 2183) with the given **com.rti.dds.domain.DomainParticipant** (p. 948) under the given logical name.

Once a type has been registered, it can be referenced by name when creating a topic. Statically and dynamically defined types behave the same way in this respect.

If the type cannot be registered, this function will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903) or **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903).

See also

com.rti.ndds.example.FooTypeSupport.register_type (p. 1411)

com.rti.dds.domain.DomainParticipant.create_topic (p. 984)

com.rti.dds.dynamicdata.DynamicDataTypeSupport.unregister_type (p. 1288)

8.102.3.2 unregister_type()

```
final void unregister_type (
              DomainParticipant participant,
             String type_name )
```

Remove the definition of this type from the **com.rti.dds.domain.DomainParticipant** (p. 948).

This operation is optional; all types are automatically unregistered when a **com.rti.dds.domain.DomainParticipant** (p. 948) is deleted. Most application will not need to manually unregister types.

A type cannot be unregistered while it is still in use; that is, while any **com.rti.dds.topic.Topic** (p. 2116) is still referring to it.

If the type cannot be unregistered, this function will fail with **com.rti.dds.infrastructure.RETCODE_ERROR** (p. 1900) or **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899).

com.rti.ndds.example.FooTypeSupport.unregister_type

com.rti.dds.dynamicdata.DynamicDataTypeSupport.register_type (p. 1288)

8.102.3.3 get_type_name()

```
final String get_type_name ( )
```

Get the default name of this type.

The **com.rti.dds.typecode.TypeCode** (p. 2183) that is wrapped by this **com.rti.dds.dynamicdata.DynamicData↩ TypeSupport** (p. 1286) includes a name; this operation returns that name.

This operation is useful when registering a type, because in most cases it is not necessary for the physical and logical names of the type to be different.

```
myTypeSupport.register_type(myParticipant, myTypeSupport.get_type_name());
```

com.rti.ndds.example.FooTypeSupport.get_type_name (p. 1411)

8.102.3.4 get_data_type()

```
final  TypeCode get_data_type ( )
```

Get the **com.rti.dds.typecode.TypeCode** (p. 2183) wrapped by this **com.rti.dds.dynamicdata.DynamicDataType↩ Support** (p. 1286).

8.102.3.5 create_data()

```
Object create_data ( )
```

Create a new **com.rti.dds.dynamicdata.DynamicData** (p. 1134) sample initialized with the **com.rti.dds.typecode.↩ TypeCode** (p. 2183) and properties of this **com.rti.dds.dynamicdata.DynamicDataTypeSupport** (p. 1286).

If this method fails, it will throw a Runtime Exception.

8.102.3.7 print_data()

```
void print_data (
              DynamicData data )
```

Print a string representation of the given sample to the given file.

This method is equivalent to **com.rti.dds.dynamicdata.DynamicData.print** (p. 1151).

See also

com.rti.dds.dynamicdata.DynamicData.print (p. 1151)

8.102.3.8 copy_data()

```
void copy_data (
              DynamicData dst,
              DynamicData src )
```

Deeply copy the given data samples.

8.102.3.9 to_cdr_buffer() [1/2]

```
void to_cdr_buffer (
              ByteSeq sequence,
              DynamicData data,
             short representation )
```

Serializes the specified **DynamicData** (p. 1134) object into a sequence of octets.

This method serializes the specified **DynamicData** (p. 1134) object into a sequence of octets using the input data representation.

The behavior of this method is the same as that of the **com.rti.dds.dynamicdata.DynamicData.to_cdr_buffer** (p. 1236) method, except that it receives the **DynamicData** (p. 1134) object to be serialized and a **com.rti.dds.infrastructure.ByteSeq** (p. 649) as a serialization output.

This method may resize `sequence` as needed to fit the serialized **DynamicData** (p. 1134) object.

See also

com.rti.dds.dynamicdata.DynamicData.to_cdr_buffer (p. 1236)

Parameters

sequence	<<***out***>> *(p. 404).* Serialization byte sequence.
data	<<***in***>> *(p. 404).* The **DynamicData** (p. 1134) object to be serialized. Cannot be null.
representation	<<***in***>> *(p. 404).* Representation used to serialize the data.

Exceptions

One	of the **Standard Return Codes** (p. 513)

References **DynamicData.to_cdr_buffer()**.

Referenced by **DynamicDataTypeSupport.to_cdr_buffer()**.

8.102.3.10 to_cdr_buffer() [2/2]

```
void to_cdr_buffer (
            ByteSeq sequence,
            DynamicData data )
```

Serializes the specified **DynamicData** (p. 1134) object into a CDR sequence of octets.

This method serializes the specified **DynamicData** (p. 1134) object into a sequence of octets, using CDR as the data representation.

The behavior of this method is the same as that of the **com.rti.dds.dynamicdata.DynamicData.to_cdr_buffer** (p. 1236) method, except that it receives the **DynamicData** (p. 1134) object to be serialized and a **com.rti.dds.infrastructure.ByteSeq** (p. 649) as output.

This method may resize `sequence` as needed to fit the serialized dynamicData object.

See also

com.rti.dds.dynamicdata.DynamicData.to_cdr_buffer (p. 1236)

Parameters

sequence	<<***out***>> *(*p. *404)*. Serialization byte sequence.
data	<<***in***>> *(*p. *404)*. The **DynamicData** (p. 1134) object to be serialized. Cannot be null.

Exceptions

One	of the **Standard Return Codes** (p. 513)

References **DataRepresentationQosPolicy.AUTO_DATA_REPRESENTATION**, and **DynamicDataTypeSupport.to_cdr_buffer()**.

8.102.3.11 from_cdr_buffer()

```
void from_cdr_buffer (
            DynamicData data,
            ByteSeq sequence )
```

Deserializes the specified **DynamicData** (p. 1134) object from a sequence octets.

This method deserializes the specified **DynamicData** (p. 1134) object from a CDR sequence of octets.

The behavior of this method is the same as that of the **com.rti.dds.dynamicdata.DynamicData.from_cdr_buffer** (p. 1237) method, except that it receives the **DynamicData** (p. 1134) object that contains the result of the deserialization, and a **com.rti.dds.infrastructure.ByteSeq** (p. 649) as deserialization input.

See also

com.rti.dds.dynamicdata.DynamicData.from_cdr_buffer (p. 1237)

Parameters

data	*<<**in**>> (p. 404).* The **DynamicData** (p. 1134) object to hold the result of the deserialization.
sequence	*<<**in**>> (p. 404).* Deserialization octet sequence. Cannot be null.

Exceptions

One	of the **Standard Return Codes** (p. 513)

References **DynamicData.from_cdr_buffer()**.

8.102.3.12 delete()

```
void delete ( )
```

Delete a **com.rti.dds.dynamicdata.DynamicDataTypeSupport** (p. 1286) object.

A **com.rti.dds.dynamicdata.DynamicDataTypeSupport** (p. 1286) cannot be deleted while it is still in use. For each **com.rti.dds.domain.DomainParticipant** (p. 948) with which the **com.rti.dds.dynamicdata.DynamicData↩ TypeSupport** (p. 1286) is registered, either the type must be unregistered or the participant must be deleted.

This method is deprecated in the Java API and does nothing.

Resources will be automatically released by the GC once all references to the object are released.

This will happen once all DomainParticipants where the **DynamicDataTypeSupport** (p. 1286) were registered have been deleted, or the **DynamicDataTypeSupport** (p. 1286) has been explicitly unregistered.

com.rti.dds.dynamicdata.DynamicDataTypeSupport.DynamicDataTypeSupport.DynamicDataTypeSupport

8.102.4 Member Data Documentation

8.102.4.1 DYNAMICDATA_TYPE_NOT_SUPPORTED

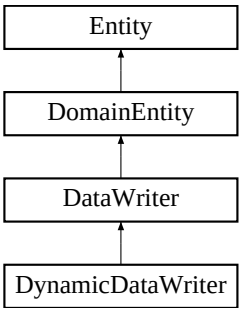
```
final RuntimeException DYNAMICDATA_TYPE_NOT_SUPPORTED = new  RETCODE_ERROR("not a top-level type")
[static], [protected]
```

Cached exception to be thrown in the event that we can't create native type support.

8.103 DynamicDataWriter Class Reference

Writes (publishes) objects of type **com.rti.dds.dynamicdata.DynamicData** (p. 1134).

Inheritance diagram for DynamicDataWriter:



Public Member Functions

- **InstanceHandle_t register_instance** (**DynamicData** instance_data)

  Informs RTI Connext that the application will be modifying a particular instance.
- **InstanceHandle_t register_instance_untyped** (Object instance_data)

  Register a new instance with this writer.
- **InstanceHandle_t register_instance_w_timestamp** (**DynamicData** instance_data, **Time_t** source_↩ timestamp)

  Performs the same functions as register_instance except that the application provides the value for the `source_↩ timestamp`*.*
- void **unregister_instance** (**DynamicData** instance_data, **InstanceHandle_t** handle)

  Reverses the action of ***com.rti.ndds.example.FooDataWriter.register_instance*** *(p. 1390).*
- void **unregister_instance_untyped** (Object instance_data, **InstanceHandle_t** handle)

  Unregister a new instance from this writer.
- void **unregister_instance_w_timestamp** (**DynamicData** instance_data, **InstanceHandle_t** handle, **Time_t** source_timestamp)

  Performs the same function as ***com.rti.ndds.example.FooDataWriter.unregister_instance*** *(p. 1392) except that it also provides the value for the* `source_timestamp`*.*
- void **write** (**DynamicData** instance_data, **InstanceHandle_t** handle)

  Modifies the value of a data instance.
- void **write_untyped** (Object instance_data, **InstanceHandle_t** handle)

  Publish a data sample.
- void **write_w_timestamp** (**DynamicData** instance_data, **InstanceHandle_t** handle, **Time_t** source_↩ timestamp)

  Performs the same function as ***com.rti.ndds.example.FooDataWriter.write*** *(p. 1397) except that it also provides the value for the* `source_timestamp`*.*
- void **dispose** (**DynamicData** instance_data, **InstanceHandle_t** instance_handle)

  Requests the middleware to delete the instance.
- void **dispose_w_timestamp** (**DynamicData** instance_data, **InstanceHandle_t** instance_handle, **Time_↩ t** source_timestamp)

Performs the same functions as dispose except that the application provides the value for the `source_timestamp` *that is made available to* ***com.rti.dds.subscription.DataReader*** *(*p. *707) objects by means of the* `source_timestamp` *attribute inside the* ***com.rti.dds.subscription.SampleInfo*** *(*p. *1944).*

- void **dispose_w_timestamp_untyped** (Object instance_data, **InstanceHandle_t** instance_handle, **Time_t** source_timestamp)

  Dispose a data sample using the given time instead of the current time.
- void **get_key_value** (**DynamicData** key_holder, **InstanceHandle_t** handle)

  Retrieve the instance `key` *that corresponds to an instance* `handle`*.*
- **InstanceHandle_t lookup_instance** (**DynamicData** key_holder)

  Retrieve the instance `handle` *that corresponds to an instance* `key_holder`*.*

8.103.1 Detailed Description

Writes (publishes) objects of type **com.rti.dds.dynamicdata.DynamicData** (p. 1134).

Instantiates **`com.rti.dds.publication.DataWriter`** (p. 818) < **com.rti.dds.dynamicdata.Dynamic↩ Data** (p. 1134) > .

See also

com.rti.dds.publication.DataWriter (p. 818)

com.rti.ndds.example.FooDataWriter (p. 1389)

com.rti.dds.dynamicdata.DynamicData (p. 1134)

8.103.2 Member Function Documentation

8.103.2.1 register_instance()

```
InstanceHandle_t register_instance (
            DynamicData instance_data )
```

Informs RTI Connext that the application will be modifying a particular instance.

This operation is only useful for keyed data types. Using it for non-keyed types causes no effect and returns **com.↩ rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447). The operation takes as a parameter an instance (of which only the key value is examined) and returns a `handle` that can be used in successive **write()** (p. 1301) or **dispose()** (p. 1307) operations.

The operation gives RTI Connext an opportunity to pre-configure itself to improve performance.

The use of this operation by an application is optional even for keyed types. If an instance has not been pre-registered, the application can use the special value **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447) as the **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443) parameter to the write or dispose operation and RTI Connext will auto-register the instance.

For best performance, the operation should be invoked prior to calling any operation that modifies the instance, such as **com.rti.ndds.example.FooDataWriter.write** (p. 1397), **com.rti.ndds.example.FooDataWriter.write_w_timestamp** (p. 1401), **com.rti.ndds.example.FooDataWriter.dispose** (p. 1403) and **com.rti.ndds.example.FooDataWriter.dispose_w_timestamp** (p. 1405) and the handle used in conjunction with the data for those calls.

When this operation is used, RTI Connext will automatically supply the value of the `source_timestamp` that is used.

This operation may fail and return **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447) if **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_instances** (p. 1896) limit has been exceeded.

The operation is **idempotent**. If it is called for an already registered instance, it just returns the already allocated handle. This may be used to lookup and retrieve the handle allocated to a given instance.

This operation can only be called after **com.rti.dds.publication.DataWriter** (p. 818) has been enabled. Otherwise, **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447) will be returned.

Parameters

instance_data	<<***in***>> *(p. 404)* The instance that should be registered. Of this instance, only the fields that represent the key are examined by the function. Cannot be NULL.

Returns

For keyed data type, a handle that can be used in the calls that take a **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443), such as write, dispose, unregister_instance, or return **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447) on failure. If the instance_data is of a data type that has no keys, this function always returns **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447).

See also

com.rti.ndds.example.FooDataWriter.unregister_instance (p. 1392), **com.rti.ndds.example.FooDataWriter.get_key_value** (p. 1406), **Relationship between registration, liveliness and ownership** (p. 1642)

References **InstanceHandle_t.HANDLE_NIL**.

Referenced by **DynamicDataWriter.register_instance_untyped()**.

8.103.2.2 register_instance_untyped()

```
InstanceHandle_t register_instance_untyped (
            Object instance_data )
```

Register a new instance with this writer.

This method allows type-independent code to work with a variety of concrete **com.rti.ndds.example.FooDataWriter** (p. 1389) classes in a consistent way.

Statically type-safe code should use the appropriate **com.rti.ndds.example.FooDataWriter.register_instance** (p. 1390) method instead of this one. See that method for detailed documentation.

See also

com.rti.dds.publication.DataWriter.unregister_instance_untyped (p. 838)

com.rti.ndds.example.FooDataWriter.register_instance (p. 1390)

Implements **DataWriter** (p. 837).

References **DynamicDataWriter.register_instance()**.

8.103.2.3 register_instance_w_timestamp()

```
InstanceHandle_t register_instance_w_timestamp (
            DynamicData instance_data,
            Time_t source_timestamp )
```

Performs the same functions as register_instance except that the application provides the value for the source_↩ timestamp.

The provided source_timestamp potentially affects the relative order in which readers observe events from multiple writers. Refer to **DESTINATION_ORDER** (p. 468) QoS policy for details.

This operation may fail and return **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447) if **com.rti.↩ dds.infrastructure.ResourceLimitsQosPolicy.max_instances** (p. 1896) limit has been exceeded.

This operation can only be called after **com.rti.dds.publication.DataWriter** (p. 818) has been enabled. Otherwise, **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447) will be returned.

Parameters

instance_data	<<***in***>> *(p. 404)* The instance that should be registered. Of this instance, only the fields that represent the key are examined by the function. Cannot be NULL.
source_timestamp	<<***in***>> *(p. 404)* The timestamp value must be greater than or equal to the timestamp value used in the last writer operation (used in a *register*, *unregister*, *dispose*, or *write*, with either the automatically supplied timestamp or the application provided timestamp). This timestamp may potentially affect the order in which readers observe events from multiple writers. Cannot be NULL.

Returns

For keyed data type, return a handle that can be used in the calls that take a **com.rti.dds.infrastructure.↩ InstanceHandle_t** (p. 1443), such as write, dispose, unregister_instance, or return **com.rti.dds.infrastructure.↩ InstanceHandle_t.HANDLE_NIL** (p. 1447) on failure. If the instance_data is of a data type that has no keys, this function always return **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447).

See also

com.rti.ndds.example.FooDataWriter.unregister_instance (p. 1392), **com.rti.ndds.example.FooData↩ Writer.get_key_value** (p. 1406)

References **InstanceHandle_t.HANDLE_NIL**, **Time_t.is_invalid()**, **Time_t.nanosec**, and **Time_t.sec**.

8.103.2.4 unregister_instance()

```
void unregister_instance (
               DynamicData instance_data,
               InstanceHandle_t handle )
```

Reverses the action of **com.rti.ndds.example.FooDataWriter.register_instance** (p. 1390).

This operation is useful only for keyed data types. Using it for non-keyed types causes no effect and reports no error. The operation takes as a parameter an instance (of which only the key value is examined) and a handle.

This operation should only be called on an instance that is currently registered. This includes instances that have been auto-registered by calling operations such as write or dispose as described in **com.rti.ndds.example.FooDataWriter.↩ register_instance** (p. 1390). Otherwise, this operation may fail with **com.rti.dds.infrastructure.RETCODE_BAD_↩ PARAMETER** (p. 1899).

This only need be called just once per instance, regardless of how many times register_instance was called for that instance.

When this operation is used, RTI Connext will automatically supply the value of the `source_timestamp` that is used.

This operation informs RTI Connext that the **com.rti.dds.publication.DataWriter** (p. 818) is no longer going to provide any information about the instance. This operation also indicates that RTI Connext can locally remove all information regarding that instance. The application should not attempt to use the `handle` previously allocated to that instance after calling this function.

The special value **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447) can be used for the parameter `handle`. This indicates that the identity of the instance should be automatically deduced from the `instance_↩ data` (by means of the `key`).

If `handle` is any value other than **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447), then it must correspond to an instance that has been registered. If there is no correspondence, the operation will fail with **com.rti.↩ dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899).

RTI Connext will not detect the error when the handle is any value other than **com.rti.dds.infrastructure.Instance↩ Handle_t.HANDLE_NIL** (p. 1447), corresponds to an instance that has been registered, but does not correspond to the instance deduced from the `instance_data` (by means of the `key`). RTI Connext will treat as if the **unregister_↩ instance()** (p. 1298) operation is for the instance as indicated by the `handle`.

If, after a **com.rti.ndds.example.FooDataWriter.unregister_instance** (p. 1392), the application wants to modify (**com.rti.ndds.example.FooDataWriter.write** (p. 1397) or **com.rti.ndds.example.FooDataWriter.dispose** (p. 1403)) an instance, it has to register it again, or else use the special `handle` value **com.rti.dds.infrastructure.Instance↩ Handle_t.HANDLE_NIL** (p. 1447).

This operation does not indicate that the instance is deleted (that is the purpose of **com.rti.ndds.example.Foo↩ DataWriter.dispose** (p. 1403)). The operation **com.rti.ndds.example.FooDataWriter.unregister_instance** (p. 1392) just indicates that the **com.rti.dds.publication.DataWriter** (p. 818) no longer has anything to say about the instance. **com.rti.dds.subscription.DataReader** (p. 707) entities that are reading the instance may receive a sample with **com.↩ rti.dds.subscription.InstanceStateKind.NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 1452) for the instance, unless there are other **com.rti.dds.publication.DataWriter** (p. 818) objects writing that same instance.

com.rti.dds.infrastructure.WriterDataLifecycleQosPolicy.autodispose_unregistered_instances (p. 2321) controls whether instances are automatically disposed when they are unregistered.

This operation can affect the ownership of the data instance (see **OWNERSHIP** (p. 494)). If the **com.rti.dds.↩ publication.DataWriter** (p. 818) was the exclusive owner of the instance, then calling **unregister_instance()** (p. 1298) will relinquish that ownership.

If **com.rti.dds.infrastructure.ReliabilityQosPolicy.kind** (p. 1831) is set to **com.rti.dds.infrastructure.Reliability↩ QosPolicyKind.RELIABLE_RELIABILITY_QOS** (p. 1836) and the unregistration would overflow the resource limits of this writer or of a reader, this operation may block for up to **com.rti.dds.infrastructure.ReliabilityQosPolicy.max_↩ blocking_time** (p. 1831); if this writer is still unable to unregister after that period, this method will fail with **com.rti.↩ dds.infrastructure.RETCODE_TIMEOUT** (p. 1904).

Parameters

instance_data	<<***in***>> *(*p. *404)* The instance that should be unregistered. If **com.rti.ndds.example.Foo** (p. 1358) *has* a key and `instance_handle` is **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447), only the fields that represent the key are examined by the function. Otherwise, `instance_data` is not used. If `instance_data` is used, it must represent an instance that has been registerd. Otherwise, this method may fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) . If **com.rti.ndds.example.Foo** (p. 1358) *has* a key, `instance_data` can be NULL only if `handle` is not **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447). Otherwise, this method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899).
handle	<<***in***>> *(*p. *404)* represents the `instance` to be unregistered. If **com.rti.ndds.example.Foo** (p. 1358) *has* a key and `handle` is **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447), `handle` is not used and `instance` is deduced from `instance_data`. If **com.rti.ndds.example.Foo** (p. 1358) has no key, `handle` is not used. If `handle` is used, it must represent an instance that has been registered. Otherwise, this method may fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899). This method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if `handle` is NULL. If **com.rti.ndds.example.Foo** (p. 1358) *has* a key, `handle` cannot be **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447) if `instance_data` is NULL. Otherwise, this method will report the error **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899).

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902)

See also

Relationship between registration, liveliness and ownership (p. 1642)

Referenced by **DynamicDataWriter.unregister_instance_untyped()**.

8.103.2.5 unregister_instance_untyped()

```
void unregister_instance_untyped (
             Object instance_data,
              InstanceHandle_t handle )
```

Unregister a new instance from this writer.

This method allows type-independent code to work with a variety of concrete **com.rti.ndds.example.FooDataWriter** (p. 1389) classes in a consistent way.

Statically type-safe code should use the appropriate **com.rti.ndds.example.FooDataWriter.unregister_instance** (p. 1392) method instead of this one. See that method for detailed documentation.

See also

com.rti.dds.publication.DataWriter.register_instance_untyped (p. 837)

com.rti.ndds.example.FooDataWriter.unregister_instance (p. 1392)

Implements **DataWriter** (p. 838).

References **DynamicDataWriter.unregister_instance()**.

8.103.2.6 unregister_instance_w_timestamp()

```
void unregister_instance_w_timestamp (
              DynamicData instance_data,
              InstanceHandle_t handle,
              Time_t source_timestamp )
```

Performs the same function as **com.rti.ndds.example.FooDataWriter.unregister_instance** (p. 1392) except that it also provides the value for the `source_timestamp`.

The provided `source_timestamp` potentially affects the relative order in which readers observe events from multiple writers. Refer to **DESTINATION_ORDER** (p. 468) QoS policy for details.

The constraints on the values of the `handle` parameter and the corresponding error behavior are the same specified for the **com.rti.ndds.example.FooDataWriter.unregister_instance** (p. 1392) operation.

This operation may block and may time out (**com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904)) under the same circumtances described for the unregister_instance operation.

Parameters

instance_data	<<***in***>> *(p. 404)* The instance that should be unregistered. If **com.rti.ndds.example.Foo** (p. 1358) *has* a key and `instance_handle` is **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447), only the fields that represent the key are examined by the function. Otherwise, `instance_data` is not used. If `instance_data` is used, it must represent an instance that has been registerd. Otherwise, this method may fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899). If **com.rti.ndds.example.Foo** (p. 1358) *has* a key, `instance_data` can be NULL only if `handle` is not **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447). Otherwise, this method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899).
handle	<<***in***>> *(p. 404)* represents the `instance` to be unregistered. If **com.rti.ndds.example.Foo** (p. 1358) *has* a key and `handle` is **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447), `handle` is not used and `instance` is deduced from `instance_data`. If **com.rti.ndds.example.Foo** (p. 1358) has no key, `handle` is not used. If `handle` is used, it must represent an instance that has been registered. Otherwise, this method may fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899). This method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if `handle` is NULL. If **com.rti.ndds.example.Foo** (p. 1358) *has* a key, `handle` cannot be **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447) if `instance_data` is NULL. Otherwise, this method will report the error **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899).
source_timestamp	<<***in***>> *(p. 404)* The timestamp value must be greater than or equal to the timestamp value used in the last writer operation (used in a *register*, *unregister*, *dispose*, or *write*, with either the automatically supplied timestamp or the application provided timestamp). This timestamp may potentially affect the order in which readers observe events from multiple writers. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

See also

com.rti.ndds.example.FooDataWriter.register_instance (p. 1390)

com.rti.ndds.example.FooDataWriter.unregister_instance (p. 1392)

com.rti.ndds.example.FooDataWriter.get_key_value (p. 1406)

References **Time_t.nanosec**, and **Time_t.sec**.

8.103.2.7 write()

```
void write (
              DynamicData instance_data,
              InstanceHandle_t handle )
```

Modifies the value of a data instance.

When this operation is used, RTI Connext will automatically supply the value of the `source_timestamp` that is made available to **com.rti.dds.subscription.DataReader** (p. 707) objects by means of the `source_timestamp` attribute inside the **com.rti.dds.subscription.SampleInfo** (p. 1944). (Refer to **com.rti.dds.subscription.SampleInfo** (p. 1944) and **DESTINATION_ORDER** (p. 468) QoS policy for details).

As a side effect, this operation asserts liveliness on the **com.rti.dds.publication.DataWriter** (p. 818) itself, the **com.rti.dds.publication.Publisher** (p. 1767) and the **com.rti.dds.domain.DomainParticipant** (p. 948).

Note that the special value **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447) can be used for the parameter `handle`. This indicates the identity of the instance should be automatically deduced from the `instance_data` (by means of the `key`).

If `handle` is any value other than **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447), then it must correspond to an instance that has been registered. If there is no correspondence, the operation will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899).

RTI Connext will not detect the error when the handle is any value other than **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447), corresponds to an instance that has been registered, but does not correspond to the instance deduced from the `instance_data` (by means of the `key`). RTI Connext will treat as if the **write()** (p. 1301) operation is for the instance as indicated by the `handle`.

This operation may block if the **RELIABILITY** (p. 510) `kind` is set to **com.rti.dds.infrastructure.ReliabilityQosPolicyKind.RELIABLE_RELIABILITY_QOS** (p. 1836) and the modification would cause data to be lost or else cause one of the limits specified in the **RESOURCE_LIMITS** (p. 511) to be exceeded.

This operation will not block when using **com.rti.dds.infrastructure.ReliabilityQosPolicyKind.BEST_EFFORT_RELIABILITY_QOS** (p. 1836). If you are using BEST_EFFORT Reliability in combination with com.rti.dds.infrastructure.PublishModeQosPolicyKind.PublishModeQosPolicyKind.ASYNCHRONOUS_PUBLISH_MODE_QOS, then instead of being blocked, samples that are queued to be sent by the asynchronous publishing thread will be overwritten when the number of DDS samples that are currently queued has reached the `depth` QoS value in the **com.rti.dds.infrastructure.HistoryQosPolicy** (p. 1435).

If **com.rti.dds.infrastructure.ReliabilityQosPolicy.max_blocking_time** (p. 1831) elapses before the **com.rti.dds.publication.DataWriter** (p. 818) can store the modification without exceeding the limits, the operation will fail and return **com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904) for KEEP_ALL configurations.

Here is how the write operation behaves when com.rti.dds.infrastructure.HistoryQosPolicyKind.HistoryQosPolicyKind.KEEP_LAST_HISTORY_QOS and **com.rti.dds.infrastructure.ReliabilityQosPolicyKind.RELIABLE_RELIABILITY_QOS** (p. 1836) are used:

- The send window size is determined by the **com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t.max_send_window_size** (p. 1924) and **com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t.min_send_window_size** (p. 1924) fields in the **com.rti.dds.infrastructure.DataWriterProtocolQosPolicy** (p. 860). If a send window is specified (max_send_window_size is not UNLIMITED) and the window is full, the write operation will block until one of the samples in the send window is protocol-acknowledged (ACKed) (1) or until the **com.rti.dds.infrastructure.ReliabilityQosPolicy.max_blocking_time** (p. 1831) expires.
- Then, the **com.rti.dds.publication.DataWriter** (p. 818) will try to add the new sample to the writer history.
- If the instance associated with the sample is present in the writer history and there are `depth` (in the **HISTORY** (p. 487)) samples in the instance, the DataWriter will replace the oldest sample of that instance independently of that sample's acknowledged status, and the write operation will return com.rti.dds.infrastructure.RETCODE_OK. Otherwise, no sample will be replaced and the write operation will continue.

- If the instance associated with the sample is not present in the writer history and **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_instances** (p. 1896) is exceeded, the DataWriter will try to replace an existing instance (and its samples) according to the value of **com.rti.dds.infrastructure.DataWriterResourceLimitsQosPolicy.instance_replacement** (p. 896) (see **com.rti.dds.infrastructure.DataWriterResourceLimitsInstanceReplacementKind** (p. 889)).
  - If no instance can be replaced, the write operation returns **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903).
- If **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_samples** (p. 1896) is exceeded, the DataWriter will try to drop a sample from a different instance as follows:
  - The DataWriter will try first to remove a fully ACKed (2) sample from a different instance 'I' as long as that sample is not the last remaining sample for the instance 'I'. To find this sample, the DataWriter starts iterating from the oldest sample in the writer history to the newest sample.
  - If no such sample is found, the DataWriter will replace the oldest sample in the writer history.
- The sample is added to the writer history, and the write operation returns com.rti.dds.infrastructure.RETCODE_OK.

Here is how the write operation behaves when com.rti.dds.infrastructure.HistoryQosPolicyKind.HistoryQosPolicyKind.KEEP_ALL_HISTORY_QOS and **com.rti.dds.infrastructure.ReliabilityQosPolicyKind.RELIABLE_RELIABILITY_QOS** (p. 1836) are used:

- The send window size is determined by the **com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t.max_send_window_size** (p. 1924) and **com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t.min_send_window_size** (p. 1924) fields in the **DATA_WRITER_PROTOCOL** (p. 465). If a send window is specified (max_send_window_size is not UNLIMITED) and the window is full, the write operation will block until one of the samples in the send window is protocol-acknowledged (ACKed) (1) or until the **com.rti.dds.infrastructure.ReliabilityQosPolicy.max_blocking_time** (p. 1831) expires.
  - If the max_blocking_time expires, the write operation returns **com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904).
- When a sample is protocol-ACKed (1) before max_blocking_time expires, the DataWriter will try to add the sample to the writer history as follows:
  - If the instance associated with the sample is not present in the writer history and max_instances is exceeded, the DataWriter will try to replace an existing instance (and its samples) according to the value of **com.rti.dds.infrastructure.DataWriterResourceLimitsQosPolicy.instance_replacement** (p. 896) (see **com.rti.dds.infrastructure.DataWriterResourceLimitsInstanceReplacementKind** (p. 889)).
    - If no instance can be replaced, the write operation returns **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903).
  - If **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_samples** (p. 1896) is exceeded, the DataWriter will go through the samples in the order in which they were added, and it will replace the first sample that is fully ACKed (2).
    - If no fully ACKed sample is found, the DataWriter will block (3) until a sample is fully ACKed and can be replaced or **com.rti.dds.infrastructure.ReliabilityQosPolicy.max_blocking_time** (p. 1831) expires. If the max_blocking_time expires, the write operation will return **com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904).
  - If **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_samples_per_instance** (p. 1897) is exceeded, the DataWriter will go through the samples of the instance in the order in which they were added, and it will replace the first sample that is fully ACKed.

    * If no fully ACKed sample is found, the DataWriter will block (3) until a sample is fully ACKed and can be replaced or the max_blocking_time expires. If the max_blocking_time expires, the write operation will return **com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904).
  - The sample is added to the writer history, and the write operation returns com.rti.dds.infrastructure.↩ RETCODE_OK.

If there are no instance resources left, this operation may fail with **com.rti.dds.infrastructure.RETCODE_OUT_↩ OF_RESOURCES** (p. 1903). Calling **com.rti.ndds.example.FooDataWriter.unregister_instance** (p. 1392) may help freeing up some resources.

This operation will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903) if the timestamp is less than the timestamp used in the last writer operation (*register*, *unregister*, *dispose*, or *write*, with either the automatically supplied timestamp or the application-provided timestamp).

See **com.rti.dds.infrastructure.ReliabilityQosPolicyAcknowledgmentModeKind** (p. 1834) for more information on the following notes:

(1) A sample in the writer history is considered "protocol ACKed" when the sample has been individually ACKed at the RTPS protocol level by each one of the DataReaders that matched the DataWriter at the moment the sample was added to the writer queue.

- Late joiners do not change the protocol ACK state of a sample. If a sample is marked as protocol ACKed because it has been acknowledged by all the matching DataReaders and a DataReader joins later on, the historical sample is still considered protocol ACKed even if it has not been received by the late joiner.
- If a sample 'S1' is protocol ACKed and a TopicQuery is received, triggering the publication of 'S1', the sample is still considered protocol ACKed. If a sample 'S1' is not ACKed and a TopicQuery is received triggering the publication of 'S1', the DataWriter will require that both the matching DataReaders on the live RTPS channel and the DataReader on the TopicQuery channel individually protocol ACK the sample in order to consider the sample protocol ACKed.

(2) A sample in the writer history is considered "fully ACKed" when all of the following conditions are met:

- The sample is protocol-ACKed.
- The sample has been "application-level ACKed" by all the DataReaders matching the DataWriter that have their **com.rti.dds.infrastructure.ReliabilityQosPolicy.acknowledgment_kind** (p. 1832) set to **com.rti.dds.infrastructure.ReliabilityQosPolicyAcknowledgmentModeKind.APPLICATION_EXPLICIT_↩ ACKNOWLEDGMENT_MODE** (p. 1835) or **com.rti.dds.infrastructure.ReliabilityQosPolicyAcknowledgment↩ ModeKind.APPLICATION_AUTO_ACKNOWLEDGMENT_MODE** (p. 1834). Once the sample is application-level ACKed, it cannot change its status to not ACked after new DataReaders are matched. (Application-level ACK occurs when the application acknowledges receipt of a sample.)
- If required subscriptions are enabled (see **com.rti.dds.infrastructure.AvailabilityQosPolicy** (p. 597)), the sample must also be ACKed by all the required subscriptions configured on the DataWriter.

(3) It is possible within a single call to the write operation for a DataWriter to block both when the send window is full and then again when **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_samples** (p. 1896) or **com.rti.↩ dds.infrastructure.ResourceLimitsQosPolicy.max_samples_per_instance** (p. 1897) is exceeded. This can happen because blocking on the send window only considers protocol-ACKed samples, while blocking based on resource limits considers fully-ACKed samples. In any case, the total max blocking time of a single call to the write operation will not exceed **com.rti.dds.infrastructure.ReliabilityQosPolicy.max_blocking_time** (p. 1831).

Parameters

instance_data	<<***in***>> *(*p. *404)* The data to write.

This method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if `instance_data` is NULL.

Parameters

handle	<<***in***>> *(*p. *404)* Either the handle returned by a previous call to **com.rti.ndds.example.FooDataWriter.register_instance** (p. 1390), or else the special value **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447). If **com.rti.ndds.example.Foo** (p. 1358) *has* a key and `handle` is not **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447), `handle` must represent a registered instance of type **com.rti.ndds.example.Foo** (p. 1358). Otherwise, this method may fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899).

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903), **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903), or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

MT Safety:

It is UNSAFE to modify `instance_data` before the operation has finished. The operation is otherwise SAFE.

See also

com.rti.dds.subscription.DataReader (p. 707)

com.rti.ndds.example.FooDataWriter.write_w_timestamp (p. 1401)

DESTINATION_ORDER (p. 468)

Referenced by **DynamicDataWriter.write_untyped()**.

8.103.2.8 write_untyped()

```
void write_untyped (
             Object instance_data,
              InstanceHandle_t handle )
```

Publish a data sample.

This method allows type-independent code to work with a variety of concrete **com.rti.ndds.example.FooDataWriter** (p. 1389) classes in a consistent way.

Statically type-safe code should use the appropriate **com.rti.ndds.example.FooDataWriter.write** (p. 1397) method instead of this one. See that method for detailed documentation.

See also

com.rti.dds.publication.DataWriter.write_w_timestamp_untyped (p. 840)

com.rti.ndds.example.FooDataWriter.write (p. 1397)

Implements **DataWriter** (p. 839).

References **DynamicDataWriter.write()**.

8.103.2.9 write_w_timestamp()

```
void write_w_timestamp (
                DynamicData instance_data,
                InstanceHandle_t handle,
                Time_t source_timestamp )
```

Performs the same function as **com.rti.ndds.example.FooDataWriter.write** (p. 1397) except that it also provides the value for the `source_timestamp`.

Explicitly provides the timestamp that will be available to the **com.rti.dds.subscription.DataReader** (p. 707) objects by means of the `source_timestamp` attribute inside the **com.rti.dds.subscription.SampleInfo** (p. 1944). (Refer to **com.rti.dds.subscription.SampleInfo** (p. 1944) and **DESTINATION_ORDER** (p. 468) QoS policy for details)

The constraints on the values of the `handle` parameter and the corresponding error behavior are the same specified for the **com.rti.ndds.example.FooDataWriter.write** (p. 1397) operation.

This operation may block and time out (**com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904)) under the same circumtances described for **com.rti.ndds.example.FooDataWriter.write** (p. 1397).

If there are no instance resources left, this operation may fail with **com.rti.dds.infrastructure.RETCODE_OUT_OF_↩ RESOURCES** (p. 1903). Calling **com.rti.ndds.example.FooDataWriter.unregister_instance** (p. 1392) may help free up some resources.

This operation may fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) under the same circumstances described for the write operation.

Parameters

instance_data	<<***in***>> *(p. 404)* The data to write. This method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if `instance_data` is NULL.
handle	<<***in***>> *(p. 404)* Either the handle returned by a previous call to **com.rti.ndds.example.FooDataWriter.register_instance** (p. 1390), or else the special value **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447). If **com.rti.ndds.example.Foo** (p. 1358) *has* a key and `handle` is not **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447), `handle` must represent a registered instance of type **com.rti.ndds.example.Foo** (p. 1358). Otherwise, this method may fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899). This method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if `handle` is NULL.

Parameters

source_timestamp	<<***in***>> *(*p. *404)* When using com.rti.dds.infrastructure.DestinationOrderQosPolicyKind.↩ DestinationOrderQosPolicyKind.BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS the timestamp value must be greater than or equal to the timestamp value used in the last writer operation (*register*, *unregister*, *dispose*, or *write*, with either the automatically supplied timestamp or the application-provided timestamp) However, if it is less than the timestamp of the previous operation but the difference is less than the **com.rti.dds.infrastructure.DestinationOrderQosPolicy.source_timestamp_tolerance** (p. 905), the timestamp of the previous operation will be used as the source timestamp of this sample. Otherwise, if the difference is greater than **com.rti.dds.infrastructure.DestinationOrderQosPolicy.source_timestamp_tolerance** (p. 905), the function will return **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899).

Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904), **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903), or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

See also

com.rti.ndds.example.FooDataWriter.write (p. 1397)

com.rti.dds.subscription.DataReader (p. 707)

DESTINATION_ORDER (p. 468)

References **Time_t.nanosec**, and **Time_t.sec**.

8.103.2.10 dispose()

```
void dispose (
               DynamicData instance_data,
               InstanceHandle_t instance_handle )
```

Requests the middleware to delete the instance.

This operation is useful only for keyed data types. Using it for non-keyed types has no effect and reports no error.

When an instance is disposed, the **com.rti.dds.publication.DataWriter** (p. 818) communicates this state change to **com.rti.dds.subscription.DataReader** (p. 707) objects by propagating a dispose sample. When the instance changes to a disposed state, you can see the state change on the DataReader by looking at **com.rti.dds.subscription.↩ SampleInfo.instance_state** (p. 1949). Disposed instances have the value **com.rti.dds.subscription.InstanceState↩ Kind.NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 1452).

The resources allocated to dispose instances on the DataWriter are not removed by default. The removal of the resources allocated to a dispose instance on the DataWriter queue can be controlled by using the QoS **com.rti.dds.infrastructure.WriterDataLifecycleQosPolicy.autopurge_disposed_instances_delay** (p. 2322).

Likewise, on the DataReader, the removal of the resources associated with an instance in the dispose state can be controlled by using the QoS **com.rti.dds.infrastructure.ReaderDataLifecycleQosPolicy.autopurge_disposed_instances_delay** (p. 1824).

This operation does not modify the value of the instance. The `instance_data` parameter is passed just for the purposes of identifying the instance.

When this operation is used, RTI Connext will automatically supply the value of the `source_timestamp` that is made available to **com.rti.dds.subscription.DataReader** (p. 707) objects by means of the source_timestamp attribute inside the **com.rti.dds.subscription.SampleInfo** (p. 1944).

The constraints on the values of the handle parameter and the corresponding error behavior are the same specified for the **com.rti.ndds.example.FooDataWriter.unregister_instance** (p. 1392) operation.

The special value **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447) can be used for the parameter `instance_handle`. This indicates the identity of the instance should be automatically deduced from the `instance_data` (by means of the `key`).

If `instance_handle` is any value other than **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447), then it must correspond to an instance that has been registered. If there is no correspondence, the operation will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899).

RTI Connext will not detect the error when the `instance_handle` is any value other than **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447), and the `instance_handle` corresponds to an instance that has been registered but does not correspond to the instance deduced from the `instance_data` (by means of the `key`). In this case, the instance that will be disposed is the instance corresponding to the `instance_handle`, not to the `instance_data`.

This operation may block and time out (**com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904)) under the same circumstances described for **com.rti.ndds.example.FooDataWriter.write** (p. 1397).

If there are no instance resources left, this operation may fail with **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903). Calling **com.rti.ndds.example.FooDataWriter.unregister_instance** (p. 1392) may help free up some resources.

Parameters

instance_data	<<***in***>> *(p. 404)* The data to dispose. If **com.rti.ndds.example.Foo** (p. 1358) *has* a key and `instance_handle` is **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447), only the fields that represent the key are examined by the function. Otherwise, `instance_data` is not used. If **com.rti.ndds.example.Foo** (p. 1358) *has* a key, `instance_data` can be NULL only if `instance_handle` is not **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447). Otherwise, this method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899).

Parameters

instance_handle	<<***in***>> *(*p. *404)* Either the handle returned by a previous call to **com.rti.ndds.example.FooDataWriter.register_instance** (p. 1390), or else the special value **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447). If **com.rti.ndds.example.Foo** (p. 1358) *has* a key and `instance_handle` is **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447), `instance_handle` is not used and it is deduced from `instance_data`. If **com.rti.ndds.example.Foo** (p. 1358) has no key, `instance_handle` is not used. If `instance_handle` is used, it must represent an instance of type **com.rti.ndds.example.Foo** (p. 1358) that has been written or registered with this writer. Otherwise, this method fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899). This method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if `instance_handle` is NULL. If **com.rti.ndds.example.Foo** (p. 1358) *has* a key, `instance_handle` cannot be **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447) if `instance_data` is NULL. Otherwise, this method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899).

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904), **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

See also

com.rti.ndds.example.FooDataWriter.dispose_w_timestamp (p. 1405)

Relationship between registration, liveliness and ownership (p. 1642)

8.103.2.11 dispose_w_timestamp()

```
void dispose_w_timestamp (
                DynamicData instance_data,
                InstanceHandle_t instance_handle,
                Time_t source_timestamp )
```

Performs the same functions as dispose except that the application provides the value for the `source_timestamp` that is made available to **com.rti.dds.subscription.DataReader** (p. 707) objects by means of the `source_timestamp` attribute inside the **com.rti.dds.subscription.SampleInfo** (p. 1944).

The constraints on the values of the `handle` parameter and the corresponding error behavior are the same specified for the **com.rti.ndds.example.FooDataWriter.dispose** (p. 1403) operation.

This operation may block and time out (**com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904)) under the same circumtances described for **com.rti.ndds.example.FooDataWriter.write** (p. 1397).

If there are no instance resources left, this operation may fail with **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903). Calling **com.rti.ndds.example.FooDataWriter.unregister_instance** (p. 1392) may help freeing up some resources.

Parameters

instance_data	<<***in***>> *(*p. *404)* The data to dispose. If **com.rti.ndds.example.Foo** (p. 1358) *has* a key and `instance_handle` is **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447), only the fields that represent the key are examined by the function. Otherwise, `instance_data` is not used. If **com.rti.ndds.example.Foo** (p. 1358) *has* a key, `instance_data` can be NULL only if `instance_handle` is not **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447). Otherwise, this method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899).
instance_handle	<<***in***>> *(*p. *404)* Either the handle returned by a previous call to **com.rti.ndds.example.FooDataWriter.register_instance** (p. 1390), or else the special value **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447). If **com.rti.ndds.example.Foo** (p. 1358) *has* a key and `handle` is not **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447), `handle` must represent a registered instance of type **com.rti.ndds.example.Foo** (p. 1358). Otherwise, this method may fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899). This method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if `handle` is NULL.
source_timestamp	<<***in***>> *(*p. *404)* The timestamp value must be greater than or equal to the timestamp value used in the last writer operation (used in a *register*, *unregister*, *dispose*, or *write*, with either the automatically supplied timestamp or the application provided timestamp). This timestamp may potentially affect the order in which readers observe events from multiple writers. This timestamp will be available to the **com.rti.dds.subscription.DataReader** (p. 707) objects by means of the `source_timestamp` attribute inside the **com.rti.dds.subscription.SampleInfo** (p. 1944). Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904), **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

See also

com.rti.ndds.example.FooDataWriter.dispose (p. 1403)

References **Time_t.nanosec**, and **Time_t.sec**.

Referenced by **DynamicDataWriter.dispose_w_timestamp_untyped()**.

8.103.2.12 dispose_w_timestamp_untyped()

```
void dispose_w_timestamp_untyped (
             Object instance_data,
              InstanceHandle_t handle,
              Time_t source_timestamp )
```

Dispose a data sample using the given time instead of the current time.

This method allows type-independent code to work with a variety of concrete **com.rti.ndds.example.FooDataWriter** (p. 1389) classes in a consistent way.

Statically type-safe code should use the appropriate **com.rti.ndds.example.FooDataWriter.dispose_w_timestamp** (p. 1405) method instead of this one. See that method for detailed documentation.

See also

com.rti.dds.publication.DataWriter.dispose_untyped (p. 840)

com.rti.ndds.example.FooDataWriter.dispose_w_timestamp (p. 1405)

Implements **DataWriter** (p. 841).

References **DynamicDataWriter.dispose_w_timestamp()**.

8.103.2.13 get_key_value()

```
void get_key_value (
               DynamicData key_holder,
               InstanceHandle_t handle )
```

Retrieve the instance `key` that corresponds to an instance `handle`.

Useful for keyed data types.

The operation will only fill the fields that form the `key` inside the `key_holder` instance. If the type has no keys, this method has no effect and exits with no error.

For keyed data types, this operation may fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if the `handle` does not correspond to an existing data-object known to the **com.rti.dds.publication.DataWriter** (p. 818).

Parameters

key_holder	*<<**inout**>> (p. 404)* a user data type specific key holder, whose `key` fields are filled by this operation. If **com.rti.ndds.example.Foo** (p. 1358) has no key, this method has no effect.

This method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if `key_holder` is NULL.

Parameters

handle	<<***in***>> *(p. 404)* the `instance` whose key is to be retrieved. If **com.rti.ndds.example.Foo** (p. 1358) *has* a key, `handle` must represent a registered instance of type **com.rti.ndds.example.Foo** (p. 1358). Otherwise, this method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899). If **com.rti.ndds.example.Foo** (p. 1358) *has* a key and `handle` is **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447), this method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899). This method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if `handle` is NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

See also

com.rti.ndds.example.FooDataReader.get_key_value (p. 1387)

8.103.2.14 lookup_instance()

```
InstanceHandle_t lookup_instance (
            DynamicData key_holder )
```

Retrieve the instance `handle` that corresponds to an instance `key_holder`.

Useful for keyed data types.

This operation takes as a parameter an instance and returns a handle that can be used in subsequent operations that accept an instance handle as an argument. The instance parameter is only used for the purpose of examining the fields that define the key. This operation does not register the instance in question. If the instance has not been previously registered, or if for any other reason RTI Connext is unable to provide an instance handle, RTI Connext will return the special value HANDLE_NIL.

Parameters

key_holder	<<***in***>> *(p. 404)* a user data type specific key holder.

Returns

the instance handle associated with this instance. If **com.rti.ndds.example.Foo** (p. 1358) has no key, this method has no effect and returns **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447)

References **InstanceHandle_t.HANDLE_NIL**.

8.104 EndpointGroup_t Class Reference

Specifies a group of endpoints that can be collectively identified by a name and satisfied by a quorum.

Inherits Struct.

Public Member Functions

- **EndpointGroup_t** ()
  Constructor.
- **EndpointGroup_t** (**EndpointGroup_t** src)
  Copy constructor.
- **EndpointGroup_t** (String **role_name**, int **quorum_count**)
  *Construct an **EndpointGroup_t** (p. 1313) with the given parameters.*

Public Attributes

- String **role_name** = null
  Defines the role name of the endpoint group.
- int **quorum_count** = 0
  Defines the minimum number of members that satisfies the endpoint group.

8.104.1 Detailed Description

Specifies a group of endpoints that can be collectively identified by a name and satisfied by a quorum.

8.104.2 Constructor & Destructor Documentation

8.104.2.1 EndpointGroup_t() [1/3]

```
EndpointGroup_t ( )
```

Constructor.

8.104.2.2 EndpointGroup_t() [2/3]

```
EndpointGroup_t (
            EndpointGroup_t src )
```

Copy constructor.

References **EndpointGroup_t.quorum_count**, and **EndpointGroup_t.role_name**.

8.104.2.3 EndpointGroup_t() [3/3]

```
EndpointGroup_t (
            String role_name,
            int quorum_count )
```

Construct an **EndpointGroup_t** (p. 1313) with the given parameters.

References **EndpointGroup_t.quorum_count**, and **EndpointGroup_t.role_name**.

8.104.3 Member Data Documentation

8.104.3.1 role_name

```
String role_name = null
```

Defines the role name of the endpoint group.

If used in the **com.rti.dds.infrastructure.AvailabilityQosPolicy** (p. 597) on a **com.rti.dds.publication.DataWriter** (p. 818), it specifies the name that identifies a Durable Subcription.

The role name can be at most 255 characters in length.

Referenced by **EndpointGroup_t.EndpointGroup_t()**.

8.104.3.2 quorum_count

```
int quorum_count = 0
```

Defines the minimum number of members that satisfies the endpoint group.

If used in the **com.rti.dds.infrastructure.AvailabilityQosPolicy** (p. 597) on a **com.rti.dds.publication.DataWriter** (p. 818), it specifies the number of DataReaders that must acknowledge a sample before the sample is considered to be acknowledged by the Durable Subscription.

Referenced by **EndpointGroup_t.EndpointGroup_t()**.

8.105 EndpointGroupSeq Class Reference

A sequence of **com.rti.dds.infrastructure.EndpointGroup_t** (p. 1313).

Inherits ArraySequence.

8.105.1 Detailed Description

A sequence of **com.rti.dds.infrastructure.EndpointGroup_t** (p. 1313).

In the context of Collaborative DataWriters, it can be used by a **com.rti.dds.subscription.DataReader** (p. 707) to define a group of remote DataWriters that the **com.rti.dds.subscription.DataReader** (p. 707) will wait to discover before skipping missing samples.

In the context of Durable Subscriptions, it can be used to create a set of Durable Subscriptions identified by a name and a quorum count.

Instantiates:

<<***generic***>> *(*p. *403)* com.rti.dds.infrastructure.com.rti.dds.util.Sequence

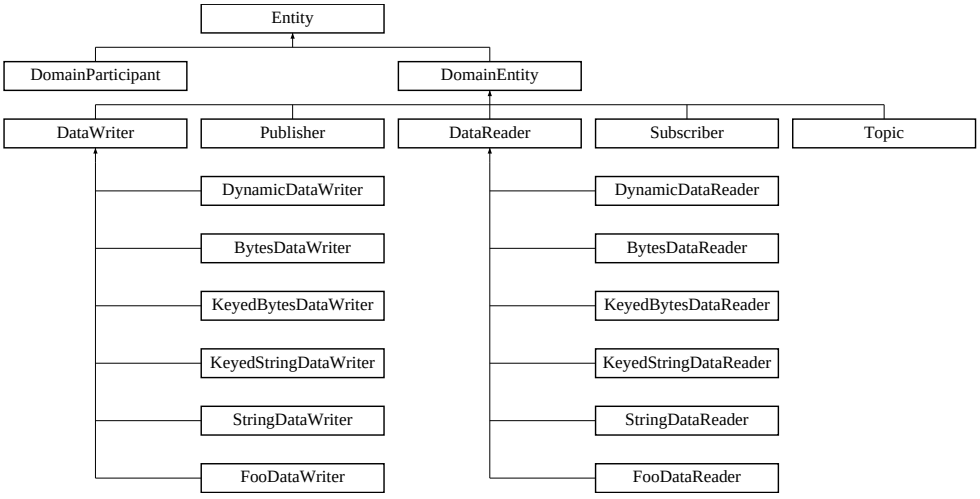
8.109 Entity Interface Reference

<<***interface***>> *(*p. *403)* Abstract base class for all the DDS objects that support QoS policies, a listener, and a status condition.

Inheritance diagram for Entity:



Public Member Functions

- void **enable** ()

  Enables the ***com.rti.dds.infrastructure.Entity*** *(*p. *1320).*

- **StatusCondition get_statuscondition** ()

  Allows access to the ***com.rti.dds.infrastructure.StatusCondition*** *(*p. *2008) associated with the* ***com.rti.dds.infrastructure.Entity*** *(*p. *1320).*

- int **get_status_changes** ()

  Retrieves the list of communication statuses in the ***com.rti.dds.infrastructure.Entity*** *(*p. *1320) that are triggered.*

- **InstanceHandle_t get_instance_handle** ()

  Allows access to the ***com.rti.dds.infrastructure.InstanceHandle_t*** *(*p. *1443) associated with the* ***com.rti.dds.infrastructure.Entity*** *(*p. *1320).*

8.109.1 Detailed Description

<<***interface***>> *(p. 403)* Abstract base class for all the DDS objects that support QoS policies, a listener, and a status condition.

All operations except for set_qos(), get_qos(), set_listener(), get_listener() and **enable()** (p. 1323), may return the value **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

QoS:

All QoS Policies (p. 501)

Status:

Status Kinds (p. 514)

Listener:

com.rti.dds.infrastructure.Listener (p. 1528)

8.109.2 Abstract operations

Each derived entity provides the following operations specific to its role in RTI Connext.

8.109.2.1 set_qos (abstract)

This operation sets the QoS policies of the **com.rti.dds.infrastructure.Entity** (p. 1320). Each of the derived entity classes provides this operation: **com.rti.dds.infrastructure.Entity** (p. 1320) classes (**com.rti.dds.domain.Domain↩ Participant** (p. 948), **com.rti.dds.topic.Topic** (p. 2116), **com.rti.dds.publication.Publisher** (p. 1767), **com.rti.dds.↩ publication.DataWriter** (p. 818), **com.rti.dds.subscription.Subscriber** (p. 2039), and **com.rti.dds.subscription.↩ DataReader** (p. 707)) so that the policies that are meaningful to each **com.rti.dds.infrastructure.Entity** (p. 1320) can be set. For example, see **com.rti.dds.domain.DomainParticipant.set_qos** (p. 992).

Precondition

Certain policies are immutable (see **All QoS Policies** (p. 501)): they can only be set at **com.rti.dds.↩ infrastructure.Entity** (p. 1320) creation time or before the entity is enabled. If `set_qos()` is invoked after the **com.rti.dds.infrastructure.Entity** (p. 1320) is enabled and it attempts to change the value of an immutable policy, the operation will fail and return **com.rti.dds.infrastructure.RETCODE_IMMUTABLE_POLICY** (p. 1901).

Certain values of QoS policies can be incompatible with the settings of the other policies. The `set_qos()` operation will also fail if it specifies a set of values that, once combined with the existing values, would result in an inconsistent set of policies. In this case, the operation will fail and return **com.rti.dds.infrastructure.RETCODE↩ _INCONSISTENT_POLICY** (p. 1901).

If the application supplies a non-default value for a QoS policy that is not supported by the implementation of the service, the set_qos operation will fail and return **com.rti.dds.infrastructure.RETCODE_UNSUPPORTED** (p. 1904).

Postcondition

The existing set of policies is only changed if the `set_qos()` operation succeeds. This is indicated by a return code of com.rti.dds.infrastructure.RETCODE_OK. In all other cases, none of the policies are modified.

Each derived **com.rti.dds.infrastructure.Entity** (p. 1320) class (**com.rti.dds.domain.DomainParticipant** (p. 948), **com.rti.dds.topic.Topic** (p. 2116), **com.rti.dds.publication.Publisher** (p. 1767), **com.rti.dds.publication.DataWriter** (p. 818), **com.rti.dds.subscription.Subscriber** (p. 2039), **com.rti.dds.subscription.DataReader** (p. 707)) has a corresponding special value of the QoS (**com.rti.dds.domain.DomainParticipantFactory.PARTICIPANT_QOS_DEFAULT** (p. 44), **com.rti.dds.domain.DomainParticipant.PUBLISHER_QOS_DEFAULT** (p. 48), **com.rti.dds.domain.DomainParticipant.SUBSCRIBER_QOS_DEFAULT** (p. 49), **com.rti.dds.domain.DomainParticipant.TOPIC_QOS_DEFAULT** (p. 47), **com.rti.dds.publication.Publisher.DATAWRITER_QOS_DEFAULT** (p. 72), **com.rti.dds.subscription.Subscriber.DATAREADER_QOS_DEFAULT** (p. 82)). This special value may be used as a parameter to the `set_qos` operation to indicate that the QoS of the **com.rti.dds.infrastructure.Entity** (p. 1320) should be changed to match the current default QoS set in the **com.rti.dds.infrastructure.Entity** (p. 1320)'s factory. The operation set_qos cannot modify the immutable QoS, so a successful return of the operation indicates that the mutable QoS for the **Entity** (p. 1320) has been modified to match the current default for the **com.rti.dds.infrastructure.Entity** (p. 1320)'s factory.

The set of policies specified in the `qos` parameter are applied on top of the existing QoS, replacing the values of any policies previously set.

Possible exceptions thrown in addition to **Standard Return Codes** (p. 513) : **com.rti.dds.infrastructure.RETCODE_IMMUTABLE_POLICY** (p. 1901), **com.rti.dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901), **com.rti.dds.infrastructure.RETCODE_NOT_ALLOWED_BY_SECURITY** (p. 1902).

8.109.2.2 get_qos (abstract)

This operation allows access to the existing set of QoS policies for the **com.rti.dds.infrastructure.Entity** (p. 1320). This operation must be provided by each of the derived **com.rti.dds.infrastructure.Entity** (p. 1320) classes (**com.rti.dds.domain.DomainParticipant** (p. 948), **com.rti.dds.topic.Topic** (p. 2116), **com.rti.dds.publication.Publisher** (p. 1767), **com.rti.dds.publication.DataWriter** (p. 818), **com.rti.dds.subscription.Subscriber** (p. 2039), and **com.rti.dds.subscription.DataReader** (p. 707)), so that the policies that are meaningful to each **com.rti.dds.infrastructure.Entity** (p. 1320) can be retrieved. For example, see **com.rti.dds.domain.DomainParticipant.get_qos** (p. 993)

Possible error codes are **Standard Return Codes** (p. 513).

8.109.2.3 set_listener (abstract)

This operation installs a **com.rti.dds.infrastructure.Listener** (p. 1528) on the **com.rti.dds.infrastructure.Entity** (p. 1320). The listener will only be invoked on the changes of communication status indicated by the specified `mask`.

This operation must be provided by each of the derived **com.rti.dds.infrastructure.Entity** (p. 1320) classes (**com.rti.dds.domain.DomainParticipant** (p. 948), **com.rti.dds.topic.Topic** (p. 2116), **com.rti.dds.publication.Publisher** (p. 1767), **com.rti.dds.publication.DataWriter** (p. 818), **com.rti.dds.subscription.Subscriber** (p. 2039), and **com.rti.dds.subscription.DataReader** (p. 707)), so that the listener is of the concrete type suitable to the particular **com.rti.dds.infrastructure.Entity** (p. 1320).

There are two components involved when setting up listeners: the listener itself and the mask. Both of these can be NULL.

Listeners for some Entities derive from the Connext DDS Listeners for related Entities. This means that the derived **Listener** (p. 1528) has all of the methods of its parent class. You can install Listeners at all levels of the object hierarchy. At the top is the DomainParticipantListener; only one can be installed in a DomainParticipant. Then every Subscriber and Publisher can have their own **Listener** (p. 1528). Finally, each Topic, DataReader and DataWriter can have their own listeners. All are optional.

Suppose, however, that an **Entity** (p. 1320) does not install a **Listener** (p. 1528), or installs a **Listener** (p. 1528) that does not have particular communication status selected in the bitmask. In this case, if/when that particular status changes for that **Entity** (p. 1320), the corresponding **Listener** (p. 1528) for that **Entity** (p. 1320)'s parent is called. Status changes are "propagated" from child **Entity** (p. 1320) to parent **Entity** (p. 1320) until a **Listener** (p. 1528) is found that is registered for that status. Connext DDS will give up and drop the status-change event only if no Listeners have been installed in the object hierarchy to be called back for the specific status.

The following table describes the effect of different combinations of Listeners and Status Bit Masks considering the hierarchical processing.

Table 8.704 Effect of Different Combinations of Listeners and Status Bit Masks

	No Bits Set in Mask	Some/All Bits Set in Mask
Listener (p. 1528) is Specified	Connext DDS finds the next most relevant listener for the changed status	For the statuses that are enabled in the mask, the most relevant listener will be called. The 'statusChangedFlag' for the relevant status is reset
Listener (p. 1528) is NULL	Connext DDS behaves as if the listener is not installed and finds the next most relevant listener for that status	Connext DDS behaves as if the listener is installed, but the callback is doing nothing. This is called a "nil" listener

Postcondition

Only one listener can be attached to each **com.rti.dds.infrastructure.Entity** (p. 1320). If a listener was already set, the operation `set_listener()` will replace it with the new one. Consequently, if the value null is passed for the listener parameter to the set_listener operation, any existing listener will be removed.

8.109.2.4 get_listener (abstract)

This operation allows access to the existing **com.rti.dds.infrastructure.Listener** (p. 1528) attached to the **com.rti.dds.infrastructure.Entity** (p. 1320).

This operation must be provided by each of the derived **com.rti.dds.infrastructure.Entity** (p. 1320) classes (**com.rti.dds.domain.DomainParticipant** (p. 948), **com.rti.dds.topic.Topic** (p. 2116), **com.rti.dds.publication.Publisher** (p. 1767), **com.rti.dds.publication.DataWriter** (p. 818), **com.rti.dds.subscription.Subscriber** (p. 2039), and **com.rti.dds.subscription.DataReader** (p. 707)) so that the listener is of the concrete type suitable to the particular **com.rti.dds.infrastructure.Entity** (p. 1320).

If no listener is installed on the **com.rti.dds.infrastructure.Entity** (p. 1320), this operation will return null.

8.109.3 Member Function Documentation

8.109.3.1 enable()

```
void enable ( )
```

Enables the **com.rti.dds.infrastructure.Entity** (p. 1320).

This operation enables the **Entity** (p. 1320). **Entity** (p. 1320) objects can be created either enabled or disabled. This is controlled by the value of the **ENTITY_FACTORY** (p. 484) QoS policy on the corresponding factory for the **com.rti.dds.infrastructure.Entity** (p. 1320).

By default, **ENTITY_FACTORY** (p. 484) is set so that it is not necessary to explicitly call **com.rti.dds.infrastructure.Entity.enable** (p. 1323) on newly created entities.

The **com.rti.dds.infrastructure.Entity.enable** (p. 1323) operation is idempotent. Calling enable on an already enabled **Entity** (p. 1320) returns OK and has no effect.

If a **com.rti.dds.infrastructure.Entity** (p. 1320) has not yet been enabled, the following kinds of operations may be invoked on it:

- set or get the QoS policies (including default QoS policies) and listener
- **com.rti.dds.infrastructure.Entity.get_statuscondition** (p. 1325)
- 'factory' operations
- **com.rti.dds.infrastructure.Entity.get_status_changes** (p. 1325) and other get status operations (although the status of a disabled entity never changes)
- 'lookup' operations

Other operations may explicitly state that they may be called on disabled entities; those that do not will return the error **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

It is legal to delete an **com.rti.dds.infrastructure.Entity** (p. 1320) that has not been enabled by calling the proper operation on its factory .

Entities created from a factory **Entity** (p. 1320) that is disabled are created disabled, regardless of the setting of the **com.rti.dds.infrastructure.EntityFactoryQosPolicy** (p. 1326).

Calling enable on an **Entity** (p. 1320) whose factory **Entity** (p. 1320) is not enabled will fail and return **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).

If **com.rti.dds.infrastructure.EntityFactoryQosPolicy.autoenable_created_entities** (p. 1327) is TRUE, the enable operation on a factory will automatically enable all entities created from that factory (for example, enabling a **com.rti.dds.publication.Publisher** (p. 1767) will enable all its contained **com.rti.dds.publication.DataWriter** (p. 818) objects)

Listeners associated with an entity are not called until the entity is enabled.

Conditions associated with a disabled entity are "inactive," that is, they have a `trigger_value` == FALSE.

Exceptions

One	of the **Standard Return Codes** (p. 513), **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).

8.109.3.2 get_statuscondition()

```
StatusCondition get_statuscondition ( )
```

Allows access to the **com.rti.dds.infrastructure.StatusCondition** (p. 2008) associated with the **com.rti.dds.↩ infrastructure.Entity** (p. 1320).

The returned condition can then be added to a **com.rti.dds.infrastructure.WaitSet** (p. 2287) so that the application can wait for specific status changes that affect the **com.rti.dds.infrastructure.Entity** (p. 1320).

Returns

the status condition associated with this entity.

8.109.3.3 get_status_changes()

```
int get_status_changes ( )
```

Retrieves the list of communication statuses in the **com.rti.dds.infrastructure.Entity** (p. 1320) that are triggered.

That is, the list of statuses whose value has changed since the last time the application read the status using the get_∗_status() method.

When the entity is first created or if the entity is not enabled, all communication statuses are in the "untriggered" state so the list returned by the get_status_changes operation will be empty.

The list of statuses returned by the get_status_changes operation refers to the status that are triggered on the **Entity** (p. 1320) itself and does not include statuses that apply to contained entities.

Returns

list of communication statuses in the **com.rti.dds.infrastructure.Entity** (p. 1320) that are triggered.

See also

Status Kinds (p. 514)

8.109.3.4 get_instance_handle()

```
InstanceHandle_t get_instance_handle ( )
```

Allows access to the **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443) associated with the **com.rti.dds.infrastructure.Entity** (p. 1320).

This operation returns the **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443) that represents the **com.rti.dds.infrastructure.Entity** (p. 1320).

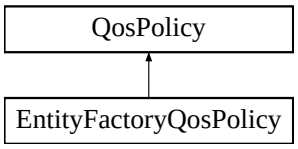
Returns

the instance handle associated with this entity.

8.110 EntityFactoryQosPolicy Class Reference

<<***spec***>> *(p. 132)* A QoS policy for all **com.rti.dds.infrastructure.Entity** (p. 1320) types that can act as factories for one or more other **com.rti.dds.infrastructure.Entity** (p. 1320) types.

Inheritance diagram for EntityFactoryQosPolicy:



Public Attributes

- boolean **autoenable_created_entities**

  <<***basic***>> *(p. 123)* <<***spec***>> *(p. 132) Specifies whether the entity acting as a factory automatically enables the instances it creates.*

8.110.1 Detailed Description

<<***spec***>> *(p. 132)* A QoS policy for all **com.rti.dds.infrastructure.Entity** (p. 1320) types that can act as factories for one or more other **com.rti.dds.infrastructure.Entity** (p. 1320) types.

Entity:

com.rti.dds.domain.DomainParticipantFactory (p. 1039), **com.rti.dds.domain.DomainParticipant** (p. 948), **com.rti.dds.publication.Publisher** (p. 1767), **com.rti.dds.subscription.Subscriber** (p. 2039)

Properties:

RxO (p. 506) = NO
Changeable (p. 507) = **YES** (p. 507)

8.110.2 Usage

This policy controls the behavior of the **com.rti.dds.infrastructure.Entity** (p. 1320) as a factory for other entities. It controls whether or not child entities are created in the enabled state.

RTI Connext uses a factory design pattern for creating DDS Entities. That is, a parent entity must be used to create child entities. DomainParticipants create Topics, Publishers and Subscribers. Publishers create DataWriters. Subscribers create DataReaders.

By default, a child object is enabled upon creation (initialized and may be actively used). With this QoS policy, a child object can be created in a disabled state. A disabled entity is only partially initialized and cannot be used until the entity is enabled. Note: an entity can only be *enabled*; it cannot be *disabled* after it has been enabled.

This QoS policy is useful to synchronize the initialization of DDS Entities. For example, when a **com.rti.dds.↩ subscription.DataReader** (p. 707) is created in an enabled state, its existence is immediately propagated for discovery and the **com.rti.dds.subscription.DataReader** (p. 707) object's listener called as soon as data is received. The initialization process for an application may extend beyond the creation of the **com.rti.dds.subscription.DataReader** (p. 707), and thus, it may not be desireable for the **com.rti.dds.subscription.DataReader** (p. 707) to start to receive or process any data until the initialization process is complete. So by creating readers in a disabled state, your application can make sure that no data is received until the rest of the application initialization is complete, and at that time, enable the them.

Note: if an entity is disabled, then all of the child entities it creates will be disabled, too, regardless of the setting of this QoS policy. However, enabling a disabled entity will enable all of its children if this QoS policy is set to automatically enable children entities.

This policy is mutable. A change in the policy affects only the entities created after the change, not any previously created entities.

8.110.3 Member Data Documentation

8.110.3.1 autoenable_created_entities

```
boolean autoenable_created_entities
```

<<***basic***>> *(*p. *123)* <<***spec***>> *(*p. *132)* Specifies whether the entity acting as a factory automatically enables the instances it creates.

The setting of `autoenable_created_entities` to com.rti.dds.infrastructure.true indicates that the factory `create_<entity>` operation(s) will automatically invoke the **com.rti.dds.infrastructure.Entity.enable** (p. 1323) operation each time a new **com.rti.dds.infrastructure.Entity** (p. 1320) is created. Therefore, the **com.rti.dds.↩ infrastructure.Entity** (p. 1320) returned by `create_<entity>` will already be enabled. A setting of com.rti.↩ dds.infrastructure.false indicates that the **com.rti.dds.infrastructure.Entity** (p. 1320) will not be automatically enabled. Your application will need to call **com.rti.dds.infrastructure.Entity.enable** (p. 1323) itself.

The default setting of `autoenable_created_entities` = com.rti.dds.infrastructure.true means that, by default, it is not necessary to explicitly call **com.rti.dds.infrastructure.Entity.enable** (p. 1323) on newly created entities.

[default] com.rti.dds.infrastructure.true

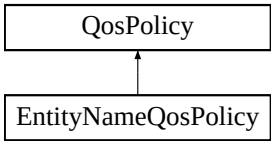
Categories

Mutable (p. 338), **Application Startup** (p. 193)

8.111 EntityNameQosPolicy Class Reference

*<<**extension**>> (p. 138)* Assigns a name and a role name to a **com.rti.dds.domain.DomainParticipant** (p. 948), **com.rti.dds.publication.Publisher** (p. 1767), **com.rti.dds.subscription.Subscriber** (p. 2039), **com.rti.dds.publication.DataWriter** (p. 818) or **com.rti.dds.subscription.DataReader** (p. 707). Except for **com.rti.dds.publication.Publisher** (p. 1767) and **com.rti.dds.subscription.Subscriber** (p. 2039), these names will be visible during the discovery process and in RTI tools to help you visualize and debug your system.

Inheritance diagram for EntityNameQosPolicy:



Public Attributes

- String **name**

  *<<**basic**>> (p. 123) <<**extension**>> (p. 138) The name of the entity.*
- String **role_name**

  *<<**extension**>> (p. 138) The entity role name.*

8.111.1 Detailed Description

*<<**extension**>> (p. 138)* Assigns a name and a role name to a **com.rti.dds.domain.DomainParticipant** (p. 948), **com.rti.dds.publication.Publisher** (p. 1767), **com.rti.dds.subscription.Subscriber** (p. 2039), **com.rti.dds.publication.DataWriter** (p. 818) or **com.rti.dds.subscription.DataReader** (p. 707). Except for **com.rti.dds.publication.Publisher** (p. 1767) and **com.rti.dds.subscription.Subscriber** (p. 2039), these names will be visible during the discovery process and in RTI tools to help you visualize and debug your system.

Entity:

com.rti.dds.domain.DomainParticipant (p. 948), **com.rti.dds.subscription.Subscriber** (p. 2039), **com.rti.dds.publication.Publisher** (p. 1767), **com.rti.dds.subscription.DataReader** (p. 707), **com.rti.dds.publication.DataWriter** (p. 818)

Properties:

RxO (p. 506) = NO;
Changeable (p. 507) = **UNTIL ENABLE** (p. 507)

8.111.2 Usage

The name and role name can be at most 255 characters in length.

8.111.3 Member Data Documentation

8.111.3.1 name

```
String name
```

<<***basic***>> *(*p. *123)* <<***extension***>> *(*p. *138)* The name of the entity.

[default] null

[range] Null terminated string with length not exceeding 255. It can be null.

Categories

Immutable (p. 292), **Debuggability** (p. 205), **Discovery Metadata** (p. 348)

8.111.3.2 role_name

```
String role_name
```

<<***extension***>> *(*p. *138)* The entity role name.

With Durable Subscriptions this name is used to specify to which Durable Subscription the **com.rti.dds.subscription.↩ DataReader** (p. 707) belongs.

With Collaborative DataWriters this name is used to specify to which endpoint group the **com.rti.dds.publication.↩ DataWriter** (p. 818) belongs.

[range] Null terminated string with length not exceeding 255. It can be null.

[default] null

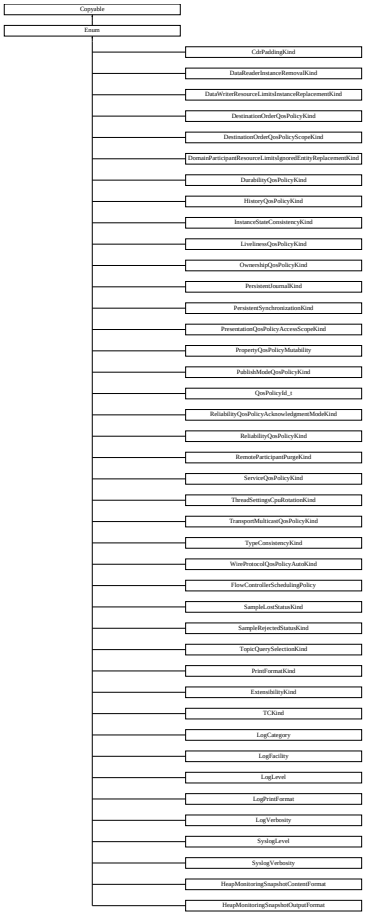
Categories

Immutable (p. 292), **Debuggability** (p. 205), **Discovery Metadata** (p. 348), **Durability** (p. 221)

8.112 Enum Class Reference

A superclass for all type-safe enumerated types.

Inheritance diagram for Enum:



Public Member Functions

- final int **ordinal** ()

  The integral value of this enumerated constant.
- Object **copy_from** (Object src)
- final String **name** ()

  The name of this enum constant, as declared in the enum declaration.
- final String **toString** ()

  The string value of this enum constant.

Protected Member Functions

- **Enum** (String **name**, int **ordinal**)

  The constructor.
- final Object **clone** () throws CloneNotSupportedException

8.112.1 Detailed Description

A superclass for all type-safe enumerated types.

This class is not part of the DDS specification *per se*. It has been introduced to facilitate the implementation of the numerous enumerated types in the specification and is based on the Java enumeration JSR. See `http://www.jcp.org/aboutJava/communityprocess/jsr/tiger/enum.html`.

8.112.2 Constructor & Destructor Documentation

8.112.2.1 Enum()

```
Enum (
            String name,
            int ordinal )  [protected]
```

The constructor.

Parameters

ordinal	The value of the ordinal field of the new enumerated constant.
name	The value of the name field of the new enumerated constant.

See also

com.rti.dds.util.Enum.ordinal (p. 1331)

com.rti.dds.util.Enum.name (p. 1332)

References **Enum.name()**, and **Enum.ordinal()**.

8.112.3 Member Function Documentation

8.112.3.1 ordinal()

```
final int ordinal ( )
```

The integral value of this enumerated constant.

For example, in an IDL definition like this:

```
enum Foo {
```

```
    BAR = 2
};
```

...the value of `Foo.BAR.ordinal()` will be 2. If the assignment ("<code>= 2</code>") is omitted, the ordinal value will be 0.

Referenced by **TypeCodeFactory.create_enum_tc()**, **Enum.Enum()**, **DynamicData.from_string()**, **Logger.get_print_format_by_log_level()**, **Logger.get_verbosity_by_category()**, **Logger.set_print_format()**, **Logger.set_print_format_by_log_level()**, **Logger.set_verbosity()**, **Logger.set_verbosity_by_category()**, and **DynamicData.to_string()**.

8.112.3.2 copy_from()

```
Object copy_from (
             Object src )
```

This is the implementation of the `Copyable` interface. While this implementation is not strictly a copy it can have the same effect. In order to use it properly, assign the result of the operation to the member that is the target of the copy. So, for example: myEnumField = myEnumField.copy_from(anotherInstanceOfEnum); Since **Enum** (p. 1330)s are immutable there cannot be a true copy made but this method will return a reference to the same enumerate as `anotherInstanceOfEnum`.

Returns

returns `src`

See also

com.rti.dds.infrastructure.Copyable::copy_from (p. 701)(java.lang.Object)

Implements **Copyable** (p. 701).

8.112.3.3 name()

```
final String name ( )
```

The name of this enum constant, as declared in the enum declaration.

Most programmers should use the **com.rti.dds.util.Enum.toString** (p. 1332) method rather than accessing this field.

Referenced by **Enum.Enum()**.

8.112.3.4 toString()

```
final String toString ( )
```

The string value of this enum constant.

See also

com.rti.dds.util.Enum.name (p. 1332)

Returns

the name of this enum constant

8.112.3.5 clone()

```
final Object clone ( ) throws CloneNotSupportedException  [protected]
```

This method resolves the serialized data to an instance of this class. It is required functionality for all concrete subclasses but we've decided to keep it commented out for now as it will force customers to regenerate their Java code (if their IDL contains enumerations). We (RTI) should uncomment this method to check that all subclasses have implemented this method so we can avoid CORE-3759 and CORE-5292 from happening again.

Returns

One of the existing instance of the enumeration (to replace the instance created by the Java deserialization process).

Exceptions

ObjectStreamException	

8.113 EnumMember Class Reference

A description of a member of an enumeration.

Inherits Serializable.

Public Member Functions

- **EnumMember** (String **name**, int **ordinal**)

Public Attributes

- String **name**

  The name of the enumeration member.
- int **ordinal**

  The value associated the the enumeration member.

8.113.1 Detailed Description

A description of a member of an enumeration.

See also

com.rti.dds.typecode.TypeCodeFactory.create_enum_tc (p. 2239)

8.113.2 Constructor & Destructor Documentation

8.113.2.1 EnumMember()

```
EnumMember (
            String name,
            int ordinal )
```

Constructs an **EnumMember** (p. 1333) object initialized with the given values.

References **EnumMember.name**, and **EnumMember.ordinal**.

8.113.3 Member Data Documentation

8.113.3.1 name

```
String name
```

The name of the enumeration member.

Cannot be null.

Referenced by **EnumMember.EnumMember()**, and **TypeCode.member_name()**.

8.113.3.2 ordinal

```
int ordinal
```

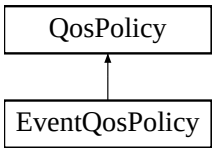
The value associated the the enumeration member.

Referenced by **EnumMember.EnumMember()**, and **TypeCode.member_ordinal()**.

8.114 EventQosPolicy Class Reference

<<***extension***>> *(*p. *138)* Settings for event.

Inheritance diagram for EventQosPolicy:



Public Attributes

- final **ThreadSettings_t thread**
  <<***extension***>> *(*p. *138) Event thread QoS.*
- int **initial_count**
  <<***extension***>> *(*p. *138) The initial number of events.*
- int **max_count**
  <<***extension***>> *(*p. *138) The maximum number of events.*

8.114.1 Detailed Description

<<***extension***>> *(*p. *138)* Settings for event.

In a **com.rti.dds.domain.DomainParticipant** (p. 948), a thread is dedicated to handle all timed events, including checking for timeouts and deadlines and executing internal and user-defined timeout or exception handling routines/callbacks.

This QoS policy allows you to configure thread properties such as priority level and stack size. You can also configure the maximum number of events that can be posted to the event thread. By default, a **com.rti.dds.domain.Domain↩ Participant** (p. 948) will dynamically allocate memory as needed for events posted to the event thread. However, by setting a maximum value or setting the initial and maximum value to be the same, you can either bound the amount of memory allocated for the event thread or prevent a **com.rti.dds.domain.DomainParticipant** (p. 948) from dynamically allocating memory for the event thread after initialization.

This QoS policy is an extension to the DDS standard.

Entity:

com.rti.dds.domain.DomainParticipant (p. 948)

Properties:

RxO (p. 506) = N/A
Changeable (p. 507) = **NO** (p. 507)

8.114.2 Member Data Documentation

8.114.2.1 thread

```
final ThreadSettings_t thread
```

<<***extension***>> *(*p. *138)* Event thread QoS.

There is only one event thread.

Priority:
[default] The actual value depends on your architecture:
For Windows: -2
For Linux: OS default priority
For a complete list of platform specific values, please refer to `Platform Notes`.

Stack Size:
[default] The actual value depends on your architecture:
For Windows: OS default stack size
For Linux: OS default stack size
For a complete list of platform specific values, please refer to `Platform Notes`.

Mask:
[default] mask = **com.rti.dds.infrastructure.ThreadSettingsKind.THREAD_SETTINGS_FLOATING_POINT** (p. 2106) | **com.rti.dds.infrastructure.ThreadSettingsKind.THREAD_SETTINGS_STDIO** (p. 2106)

Categories

Immutable (p. 292), **Concurrency** (p. 195)

8.114.2.2 initial_count

```
int initial_count
```

<<***extension***>> *(*p. *138)* The initial number of events.

[default] 256

[range] [1, 1 million], <= max_count

Categories

Immutable (p. 292), **Middleware Memory Management** (p. 244)

8.114.2.3 max_count

```
int max_count
```

<<***extension***>> *(*p. *138)* The maximum number of events.

The maximum number of events. If the limit is reached, no new event can be added.

[default] com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED (p. 511)

[range] [1, 1 million] or **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511), >= initial_count

Categories

Immutable (p. 292), **Middleware Memory Management** (p. 244)

8.115 ExpressionProperty Class Reference

Provides additional information about the filter expression passed to **com.rti.dds.topic.WriterContentFilter.writer_compile** (p. 2317) .

Inherits Struct.

Public Attributes

- boolean **key_only_filter** = false

  Indicates if the filter expression is based only on key fields. In this case, RTI Connext itself can cache the filtering results.
- boolean **writer_side_filter_optimization** = false

  Indicates if the filter implementation can cache the filtering result for the provided expression.

8.115.1 Detailed Description

Provides additional information about the filter expression passed to **com.rti.dds.topic.WriterContentFilter.writer_compile** (p. 2317) .

It is used by the filter implementation to indicate to the middleware whether or not the **com.rti.dds.topic.WriterContentFilter** (p. 2316) will cache the result of filter evaluation.

8.115.2 Member Data Documentation

8.115.2.1 key_only_filter

```
boolean key_only_filter = false
```

Indicates if the filter expression is based only on key fields. In this case, RTI Connext itself can cache the filtering results.

When this field is set to com.rti.dds.infrastructure.true, it indicates to RTI Connext that the filter expression is based only on key fields.

8.115.2.2 writer_side_filter_optimization

```
boolean writer_side_filter_optimization = false
```

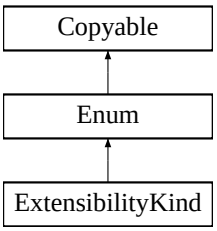
Indicates if the filter implementation can cache the filtering result for the provided expression.

When this field is set to com.rti.dds.infrastructure.true, RTI Connext will do no caching or explicit filter evaluation for the associated **com.rti.dds.subscription.DataReader** (p. 707). Instead, it will rely on the filter implementation to provide appropriate results.

8.116 ExtensibilityKind Class Reference

Type to indicate the extensibility of a type.

Inheritance diagram for ExtensibilityKind:



Static Public Attributes

- static final **ExtensibilityKind FINAL_EXTENSIBILITY**

  Specifies that a type has FINAL extensibility.
- static final **ExtensibilityKind EXTENSIBLE_EXTENSIBILITY**

  Specifies that a type has EXTENSIBLE extensibility.
- static final **ExtensibilityKind MUTABLE_EXTENSIBILITY**

  Specifies that a type has MUTABLE extensibility.

Additional Inherited Members

8.116.1 Detailed Description

Type to indicate the extensibility of a type.

8.117 FilterSampleInfo Class Reference

Provides meta information associated with the sample.

Inherits Struct.

Public Attributes

- **SampleIdentity_t related_sample_identity**
  The identity of another sample related to this one.
- **GUID_t related_source_guid**
  Identifies the application logical data source that is related to the sample being written.
- **GUID_t related_reader_guid**
  Identifies a DataReader that is logically related to the sample.
- **SampleIdentity_t sample_identity**
  The identity of the sample.
- **GUID_t source_guid**
  Identifies the application logical data source associated with the sample being written.

8.117.1 Detailed Description

Provides meta information associated with the sample.

This can be used by a content filter to perform filtering on meta data.

8.117.2 Member Data Documentation

8.117.2.1 related_sample_identity

```
SampleIdentity_t related_sample_identity
```

The identity of another sample related to this one.

The value of this field identifies another sample that is logically related to the one that is written. For example, the **com.rti.dds.publication.DataWriter** (p. 818) created by a Replier uses this field to associate the identity of the request sample with a response sample.

The related_sample_identity can be set using the field **com.rti.dds.infrastructure.WriteParams_t.related_sample_identity** (p. 2311) when writing a sample using the method **com.rti.ndds.example.FooDataWriter.write_w_params** (p. 1402).

Default value com.rti.dds.infrastructure.SampleIdentity_t.SampleIdentity_t.UNKNOWN_SAMPLE_IDENTITY denotes a sample not associated with any other sample.

A **com.rti.dds.subscription.DataReader** (p. 707) can inspect the related sample identity of a received sample by accessing the fields **com.rti.dds.subscription.SampleInfo.related_original_publication_virtual_guid** (p. 1954) and **com.rti.dds.subscription.SampleInfo.related_original_publication_virtual_sequence_number** (p. 1954).

8.117.2.2 related_source_guid

```
GUID_t related_source_guid
```

Identifies the application logical data source that is related to the sample being written.

The related_source_guid can be set by using the field **com.rti.dds.infrastructure.WriteParams_t.related_source_guid** (p. 2314) when writing a sample using the method **com.rti.ndds.example.FooDataWriter.write_w_params** (p. 1402).

Default value **com.rti.dds.infrastructure.GUID_t.GUID_UNKNOWN** (p. 1426) denotes a sample as lacking a related data source.

A **com.rti.dds.subscription.DataReader** (p. 707) can inspect the related_source_guid of a received sample by accessing the field **com.rti.dds.subscription.SampleInfo.related_source_guid** (p. 1955).

8.117.2.3 related_reader_guid

```
GUID_t related_reader_guid
```

Identifies a DataReader that is logically related to the sample.

The related_reader_guid can be set by using the field **com.rti.dds.infrastructure.WriteParams_t.related_reader_guid** (p. 2315) when writing a sample using the method **com.rti.ndds.example.FooDataWriter.write_w_params** (p. 1402).

Default value **com.rti.dds.infrastructure.GUID_t.GUID_UNKNOWN** (p. 1426) denotes a sample without an associated DataReader.

A **com.rti.dds.subscription.DataReader** (p. 707) can inspect the related_reader_guid of a received sample by accessing the field **com.rti.dds.subscription.SampleInfo.related_source_guid** (p. 1955).

8.117.2.4 sample_identity

```
SampleIdentity_t sample_identity
```

The identity of the sample.

The value of this field uniquely identifies a sample within its source DataWriter.

The identity of a sample can be set by using the field **com.rti.dds.infrastructure.WriteParams_t.identity** (p. 2311) when writing a sample using the method **com.rti.ndds.example.FooDataWriter.write_w_params** (p. 1402).

Default value com.rti.dds.infrastructure.SampleIdentity_t.SampleIdentity_t.UNKNOWN_SAMPLE_IDENTITY can be used to let the DataWriter assign a default identity to a sample. In this case, sample_identity.writer_guid will be set to the GUID of the DataWriter, while sample_identity.sequence_number will be set to the next sequence number to be written by the DataWriter.

A **com.rti.dds.subscription.DataReader** (p. 707) can inspect the identity of a received sample by accessing the fields **com.rti.dds.subscription.SampleInfo.original_publication_virtual_guid** (p. 1953) and **com.rti.dds.subscription.SampleInfo.original_publication_virtual_sequence_number** (p. 1953).

8.117.2.5 source_guid

```
GUID_t source_guid
```

Identifies the application logical data source associated with the sample being written.

The source_guid can be set by using the field **com.rti.dds.infrastructure.WriteParams_t.source_guid** (p. 2314) when writing a sample using the method **com.rti.ndds.example.FooDataWriter.write_w_params** (p. 1402).

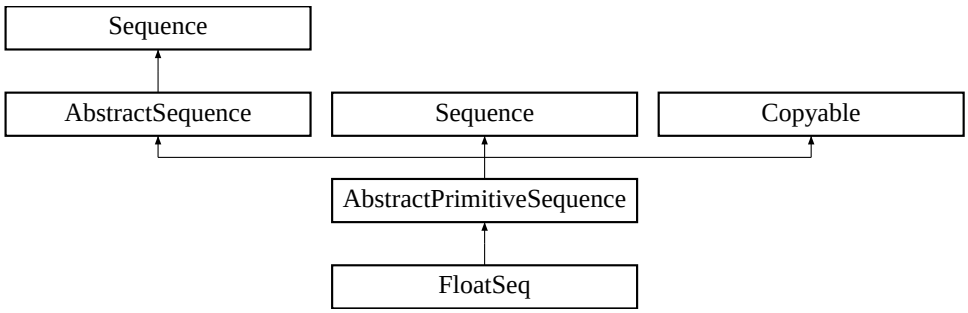
Default value **com.rti.dds.infrastructure.GUID_t.GUID_UNKNOWN** (p. 1426) denotes a sample without a logical data source associated with it.

A **com.rti.dds.subscription.DataReader** (p. 707) can inspect the logical data source of a sample by accessing the field **com.rti.dds.subscription.SampleInfo.source_guid** (p. 1955).

8.118 FloatSeq Class Reference

Instantiates `com.rti.dds.infrastructure.com.rti.dds.util.Sequence` < float >

Inheritance diagram for FloatSeq:



Public Member Functions

- **FloatSeq** ()

  Constructs an empty sequence of floats with an initial maximum of zero.
- **FloatSeq** (int initialMaximum)

  Constructs an empty sequence of floats with the given initial maximum.
- **FloatSeq** (float[ ] floats)

  Constructs a new sequence containing the given floats.
- boolean **addAllFloat** (float[ ] elements, int offset, int length)

  Append `length` elements from the given array to this sequence, starting at index `offset` in that array.
- boolean **addAllFloat** (float[ ] elements)
- void **addFloat** (float element)

  Append the element to the end of the sequence.
- void **addFloat** (int index, float element)

  Shift all elements in the sequence starting from the given index and add the element to the given index.
- float **getFloat** (int index)

  Returns the float at the given index.
- float **setFloat** (int index, float element)

  Set the new float at the given index and return the old float.
- void **setFloat** (int dstIndex, float[ ] elements, int srcIndex, int length)

  Copy a portion of the given array into this sequence.
- float[ ] **toArrayFloat** (float[ ] array)

  Return an array containing copy of the contents of this sequence.
- int **getMaximum** ()

  Get the current maximum number of elements that can be stored in this sequence.
- Object **get** (int index)

  *A wrapper for **getFloat(int)** (p. 1344) that returns a java.lang.Float.*
- Object **set** (int index, Object element)

  *A wrapper for **setFloat()** (p. 1345).*
- void **add** (int index, Object element)

  A wrapper for addFloat(int, int).

8.118.1 Detailed Description

Instantiates `com.rti.dds.infrastructure.com.rti.dds.util.Sequence` < float >

Instantiates:

<<***generic***>> *(p. 403)* com.rti.dds.infrastructure.com.rti.dds.util.Sequence

com.rti.dds.infrastructure.com.rti.dds.util.Sequence

8.118.2 Constructor & Destructor Documentation

8.118.2.1 FloatSeq() [1/3]

```
FloatSeq ( )
```

Constructs an empty sequence of floats with an initial maximum of zero.

8.118.2.2 FloatSeq() [2/3]

```
FloatSeq (
            int initialMaximum )
```

Constructs an empty sequence of floats with the given initial maximum.

8.118.2.3 FloatSeq() [3/3]

```
FloatSeq (
            float[] floats )
```

Constructs a new sequence containing the given floats.

Parameters

floats	the initial contents of this sequence

Exceptions

NullPointerException	if the input array is null

References **FloatSeq.addAllFloat()**.

8.118.3 Member Function Documentation

8.118.3.1 addAllFloat() [1/2]

```
boolean addAllFloat (
            float[] elements,
            int offset,
            int length )
```

Append `length` elements from the given array to this sequence, starting at index `offset` in that array.

Exceptions

NullPointerException	if the given array is null.

Referenced by **FloatSeq.addAllFloat()**, and **FloatSeq.FloatSeq()**.

8.118.3.2 addAllFloat() [2/2]

```
boolean addAllFloat (
            float[] elements )
```

Exceptions

NullPointerException	if the given array is null

References **FloatSeq.addAllFloat()**.

8.118.3.3 addFloat() [1/2]

```
void addFloat (
            float element )
```

Append the element to the end of the sequence.

Referenced by **FloatSeq.add()**.

8.118.3.4 addFloat() [2/2]

```
void addFloat (
            int index,
            float element )
```

Shift all elements in the sequence starting from the given index and add the element to the given index.

8.118.3.5 getFloat()

```
float getFloat (
            int index )
```

Returns the float at the given index.

Exceptions

IndexOutOfBoundsException	if the index is out of bounds.

Referenced by **FloatSeq.get()**.

8.118.3.6 setFloat() [1/2]

```
float setFloat (
            int index,
            float element )
```

Set the new float at the given index and return the old float.

Exceptions

IndexOutOfBoundsException	if the index is out of bounds.

Referenced by **FloatSeq.set()**.

8.118.3.7 setFloat() [2/2]

```
void setFloat (
            int dstIndex,
            float[] elements,
            int srcIndex,
            int length )
```

Copy a portion of the given array into this sequence.

Parameters

dstIndex	the index at which to start copying into this sequence.
elements	an array of primitive elements.
srcIndex	the index at which to start copying from the given array.
length	the number of elements to copy.

Exceptions

IndexOutOfBoundsException	if copying would cause access of data outside array bounds.

8.118.3.8 toArrayFloat()

```
float[] toArrayFloat (
             float[] array )
```

Return an array containing copy of the contents of this sequence.

Parameters

array	The array into which this sequence should be copied. It may be null. If it is, or if array length is too small, the array will be ignored, and a new array of the necessary length will be created and copied into instead.

Returns

A non-null array containing a copy of the contents of this sequence.

8.118.3.9 getMaximum()

```
int getMaximum ( )
```

Get the current maximum number of elements that can be stored in this sequence.

The `maximum` of the sequence represents the maximum number of elements that the underlying buffer can hold. It does not represent the current number of elements.

The `maximum` is a non-negative number. It is initialized when the sequence is first created.

The `maximum` can be changed implicitly by adding an element to the sequence with **`add()`** (p. 1347), or explicitly by calling com.rti.dds.infrastructure.com.rti.dds.util.Sequence.Sequence.setMaximum.

Returns

the current maximum of the sequence.

See also

com.rti.dds.infrastructure.com.rti.dds.util.Sequence.Sequence.size()

Implements **Sequence** (p. 1974).

Referenced by **DynamicData.get_float_seq()**, and **DynamicData.set_float_seq()**.

8.118.3.10 get()

```
Object get (
            int index )
```

A wrapper for **getFloat(int)** (p. 1344) that returns a java.lang.Float.

See also

java.util.List::get(int)

Reimplemented from **AbstractPrimitiveSequence** (p. 576).

References **FloatSeq.getFloat()**.

8.118.3.11 set()

```
Object set (
            int index,
            Object element )
```

A wrapper for **setFloat()** (p. 1345).

Exceptions

ClassCastException	if the element is not of type Float.

See also

java.util.List::set(int, java.lang.Object)

Reimplemented from **AbstractPrimitiveSequence** (p. 576).

References **FloatSeq.setFloat()**.

8.118.3.12 add()

```
void add (
            int index,
            Object element )
```

A wrapper for addFloat(int, int).

Exceptions

ClassCastException	if the element is not of type Float.

See also

java.util.List::add(int, java.lang.Object)

Reimplemented from **AbstractPrimitiveSequence** (p. 577).

References **FloatSeq.addFloat()**.

8.119 FlowController Interface Reference

<<***interface***>> *(*p. *403)* A flow controller is the object responsible for shaping the network traffic by determining when attached asynchronous **com.rti.dds.publication.DataWriter** (p. 818) instances are allowed to write data.

Public Member Functions

- String **get_name** ()

  *Returns the name of the **com.rti.dds.publication.FlowController** (*p. *1348).*

- **DomainParticipant get_participant** ()

  *Returns the **com.rti.dds.domain.DomainParticipant** (*p. *948) to which the **com.rti.dds.publication.FlowController** (*p. *1348) belongs.*

- void **set_property** (**FlowControllerProperty_t** prop)

  *Sets the **com.rti.dds.publication.FlowController** (*p. *1348) property.*

- void **get_property** (**FlowControllerProperty_t** prop)

  *Gets the **com.rti.dds.publication.FlowController** (*p. *1348) property.*

- void **trigger_flow** ()

  *Provides an external trigger to the **com.rti.dds.publication.FlowController** (*p. *1348).*

Static Public Attributes

- static final String **DEFAULT_FLOW_CONTROLLER_NAME**

  ***[default]** Special value of **com.rti.dds.infrastructure.PublishModeQosPolicy.flow_controller_name** (*p. *1798) that refers to the built-in default flow controller.*

- static final String **FIXED_RATE_FLOW_CONTROLLER_NAME**

  *Special value of **com.rti.dds.infrastructure.PublishModeQosPolicy.flow_controller_name** (*p. *1798) that refers to the built-in fixed-rate flow controller.*

- static final String **ON_DEMAND_FLOW_CONTROLLER_NAME**

  *Special value of **com.rti.dds.infrastructure.PublishModeQosPolicy.flow_controller_name** (*p. *1798) that refers to the built-in on-demand flow controller.*

8.119.1 Detailed Description

<<***interface***>> *(p. 403)* A flow controller is the object responsible for shaping the network traffic by determining when attached asynchronous **com.rti.dds.publication.DataWriter** (p. 818) instances are allowed to write data.

QoS:

com.rti.dds.publication.FlowControllerProperty_t (p. 1351)

8.119.2 Member Function Documentation

8.119.2.1 get_name()

```
String get_name ( )
```

Returns the name of the **com.rti.dds.publication.FlowController** (p. 1348).

Returns

The name of the **com.rti.dds.publication.FlowController** (p. 1348).

8.119.2.2 get_participant()

```
DomainParticipant get_participant ( )
```

Returns the **com.rti.dds.domain.DomainParticipant** (p. 948) to which the **com.rti.dds.publication.FlowController** (p. 1348) belongs.

Returns

The **com.rti.dds.domain.DomainParticipant** (p. 948) to which the **com.rti.dds.publication.FlowController** (p. 1348) belongs.

8.119.2.3 set_property()

```
void set_property (
            FlowControllerProperty_t prop )
```

Sets the **com.rti.dds.publication.FlowController** (p. 1348) property.

This operation modifies the property of the **com.rti.dds.publication.FlowController** (p. 1348).

Once a **com.rti.dds.publication.FlowController** (p. 1348) has been instantiated, only the **com.rti.dds.publication.FlowControllerProperty_t.token_bucket** (p. 1352) can be changed. The **com.rti.dds.publication.FlowControllerProperty_t.scheduling_policy** (p. 1352) is immutable.

A new **com.rti.dds.publication.FlowControllerTokenBucketProperty_t.period** (p. 1357) only takes effect at the next scheduled token distribution time (as determined by its previous value).

Parameters

prop	*<<**in**>> (*p. *404)* The new **com.rti.dds.publication.FlowControllerProperty_t** (p. 1351). Property must be consistent. Immutable fields cannot be changed after **com.rti.dds.publication.FlowController** (p. 1348) has been created. The special value **com.rti.dds.domain.DomainParticipant.FLOW_CONTROLLER_PROPERTY_DEFAULT** (p. 51) can be used to indicate that the property of the **com.rti.dds.publication.FlowController** (p. 1348) should be changed to match the current default **com.rti.dds.publication.FlowControllerProperty_t** (p. 1351) set in the **com.rti.dds.domain.DomainParticipant** (p. 948). Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_IMMUTABLE_POLICY** (p. 1901), or **com.rti.dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901).

See also

com.rti.dds.publication.FlowControllerProperty_t (p. 1351) for rules on consistency among property values.

8.119.2.4 get_property()

```
void get_property (
              FlowControllerProperty_t prop )
```

Gets the **com.rti.dds.publication.FlowController** (p. 1348) property.

Parameters

prop	*<<**in**>> (*p. *404)* **com.rti.dds.publication.FlowController** (p. 1348) to be filled in. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513)

8.119.2.5 trigger_flow()

```
void trigger_flow ( )
```

Provides an external trigger to the **com.rti.dds.publication.FlowController** (p. 1348).

Typically, a **com.rti.dds.publication.FlowController** (p. 1348) uses an internal trigger to periodically replenish its tokens. The period by which this trigger is called is determined by the **com.rti.dds.publication.FlowControllerTokenBucketProperty_t.period** (p. 1357) property setting.

This function provides an additional, external trigger to the **com.rti.dds.publication.FlowController** (p. 1348). This trigger adds **com.rti.dds.publication.FlowControllerTokenBucketProperty_t.tokens_added_per_period** (p. 1356) tokens each time it is called (subject to the other property settings of the **com.rti.dds.publication.FlowController** (p. 1348)).

An *on-demand* **com.rti.dds.publication.FlowController** (p. 1348) can be created with a **com.rti.dds.infrastructure.Duration_t.DURATION_INFINITE** (p. 1133) as **com.rti.dds.publication.FlowControllerTokenBucketProperty_t.period** (p. 1357), in which case the only trigger source is external (i.e. the **FlowController** (p. 1348) is solely triggered by the user on demand).

com.rti.dds.publication.FlowController.trigger_flow (p. 1350) can be called on both strict *on-demand* **FlowController** (p. 1348) and hybrid **FlowController** (p. 1348) (internally and externally triggered).

Exceptions

One	of the **Standard Return Codes** (p. 513)

8.120 FlowControllerProperty_t Class Reference

Determines the flow control characteristics of the **com.rti.dds.publication.FlowController** (p. 1348).

Inherits Struct.

Public Attributes

- **FlowControllerSchedulingPolicy scheduling_policy**

  Scheduling policy.
- **FlowControllerTokenBucketProperty_t token_bucket**

  Settings for the token bucket.

8.120.1 Detailed Description

Determines the flow control characteristics of the **com.rti.dds.publication.FlowController** (p. 1348).

The flow control characteristics shape the network traffic by determining how often and in what order associated asynchronous **com.rti.dds.publication.DataWriter** (p. 818) instances are serviced and how much data they are allowed to send.

Note that these settings apply directly to the **com.rti.dds.publication.FlowController** (p. 1348), and do not depend on the number of **com.rti.dds.publication.DataWriter** (p. 818) instances the **com.rti.dds.publication.FlowController** (p. 1348) is servicing. For instance, the specified flow rate does *not* double simply because two **com.rti.dds.publication.DataWriter** (p. 818) instances are waiting to write.

Entity:

com.rti.dds.publication.FlowController (p. 1348)

Properties:

RxO (p. 506) = N/A

Changeable (p. 507) = **NO** (p. 507) for **com.rti.dds.publication.FlowControllerProperty_t.scheduling_policy** (p. 1352), **YES** (p. 507) for **com.rti.dds.publication.FlowControllerProperty_t.token_bucket** (p. 1352). However, the special value of **com.rti.dds.infrastructure.Duration_t.DURATION_INFINITE** (p. 1133) as **com.rti.dds.publication.↩ FlowControllerTokenBucketProperty_t.period** (p. 1357) is strictly used to create an *on-demand* **com.rti.dds.↩ publication.FlowController** (p. 1348). The token period cannot toggle from an infinite to finite value (or vice versa). It can, however, change from one finite value to another.

8.120.2 Member Data Documentation

8.120.2.1 scheduling_policy

FlowControllerSchedulingPolicy scheduling_policy

Scheduling policy.

Determines the scheduling policy for servicing the **com.rti.dds.publication.DataWriter** (p. 818) instances associated with the **com.rti.dds.publication.FlowController** (p. 1348).

[default] com.rti.dds.publication.FlowControllerSchedulingPolicy.FlowControllerSchedulingPolicy.EDF_FLOW_↩ CONTROLLER_SCHED_POLICY

8.120.2.2 token_bucket

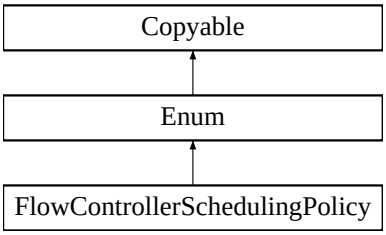
FlowControllerTokenBucketProperty_t token_bucket

Settings for the token bucket.

8.121 FlowControllerSchedulingPolicy Class Reference

Kinds of flow controller scheduling policy.

Inheritance diagram for FlowControllerSchedulingPolicy:



Static Public Attributes

- static final **FlowControllerSchedulingPolicy RR_FLOW_CONTROLLER_SCHED_POLICY**
  Indicates to flow control in a round-robin fashion.
- static final **FlowControllerSchedulingPolicy EDF_FLOW_CONTROLLER_SCHED_POLICY**
  Indicates to flow control in an earliest-deadline-first fashion.
- static final **FlowControllerSchedulingPolicy HPF_FLOW_CONTROLLER_SCHED_POLICY**
  Indicates to flow control in a highest-priority-first fashion.

Additional Inherited Members

8.121.1 Detailed Description

Kinds of flow controller scheduling policy.

Samples written by an asynchronous **com.rti.dds.publication.DataWriter** (p. 818) are not sent in the context of the **com.rti.ndds.example.FooDataWriter.write** (p. 1397) call. Instead, the middleware puts the samples in a queue for future processing. The **com.rti.dds.publication.FlowController** (p. 1348) associated with each asynchronous **Data↩ Writer** (p. 818) instance determines when the samples are actually sent.

Each **com.rti.dds.publication.FlowController** (p. 1348) maintains a separate FIFO queue for each unique destination (remote application). Samples written by asynchronous **com.rti.dds.publication.DataWriter** (p. 818) instances associated with the flow controller, are placed in the queues that correspond to the intended destinations of the sample.

When tokens become available, a flow controller must decide which queue(s) to grant tokens first. This is determined by the flow controller's scheduling policy. Once a queue has been granted tokens, it is serviced by the asynchronous publishing thread. The queued up samples will be coalesced and sent to the corresponding destination. The number of samples sent depends on the data size and the number of tokens granted.

QoS:

com.rti.dds.publication.FlowControllerProperty_t (p. 1351)

8.121.2 Member Data Documentation

8.121.2.1 RR_FLOW_CONTROLLER_SCHED_POLICY

```
final FlowControllerSchedulingPolicy RR_FLOW_CONTROLLER_SCHED_POLICY [static]
```

Indicates to flow control in a round-robin fashion.

Whenever tokens become available, the flow controller distributes the tokens uniformly across all of its (non-empty) destination queues. No destinations are prioritized. Instead, all destinations are treated equally and are serviced in a round-robin fashion.

8.121.2.2 EDF_FLOW_CONTROLLER_SCHED_POLICY

```
final FlowControllerSchedulingPolicy EDF_FLOW_CONTROLLER_SCHED_POLICY [static]
```

Indicates to flow control in an earliest-deadline-first fashion.

A sample's deadline is determined by the time it was written plus the latency budget of the **DataWriter** (p. 818) at the time of the write call (as specified in the **com.rti.dds.infrastructure.LatencyBudgetQosPolicy** (p. 1523)). The relative priority of a flow controller's destination queue is determined by the earliest deadline across all samples it contains.

When tokens become available, the **com.rti.dds.publication.FlowController** (p. 1348) distributes tokens to the destination queues in order of their deadline priority. In other words, the queue containing the sample with the earliest deadline is serviced first. The number of tokens granted equals the number of tokens required to send the first sample in the queue. Note that the priority of a queue may change as samples are sent (i.e. removed from the queue). If a sample must be sent to multiple destinations or two samples have an equal deadline value, the corresponding destination queues are serviced in a round-robin fashion.

Hence, under the default **com.rti.dds.infrastructure.LatencyBudgetQosPolicy.duration** (p. 1525) setting, an EDF↩ _FLOW_CONTROLLER_SCHED_POLICY **com.rti.dds.publication.FlowController** (p. 1348) preserves the order in which the user calls **com.rti.ndds.example.FooDataWriter.write** (p. 1397) across the DataWriters associated with the flow controller.

Since the **com.rti.dds.infrastructure.LatencyBudgetQosPolicy** (p. 1523) is mutable, a sample written second may contain an earlier deadline than the sample written first if the **com.rti.dds.infrastructure.LatencyBudgetQosPolicy.**↩ **duration** (p. 1525) value is sufficiently decreased in between writing the two samples. In that case, if the first sample is not yet written (still in queue waiting for its turn), it inherits the priority corresponding to the (earlier) deadline from the second sample.

In other words, the priority of a destination queue is always determined by the earliest deadline among all samples contained in the queue. This priority inheritance approach is required in order to both honor the updated **com.rti.dds.**↩ **infrastructure.LatencyBudgetQosPolicy.duration** (p. 1525) and adhere to the **com.rti.dds.publication.DataWriter** (p. 818) in-order data delivery guarantee.

[default] for **com.rti.dds.publication.DataWriter** (p. 818)

8.121.2.3 HPF_FLOW_CONTROLLER_SCHED_POLICY

```
final FlowControllerSchedulingPolicy HPF_FLOW_CONTROLLER_SCHED_POLICY [static]
```

Indicates to flow control in a highest-priority-first fashion.

Determines the next destination queue to service as determined by the publication priority of the **com.rti.dds.**↩ **publication.DataWriter** (p. 818), channel of multi-channel **DataWriter** (p. 818), or individual sample.

The relative priority of a flow controller's destination queue is determined by the highest publication priority of all samples it contains.

When tokens become available, the **com.rti.dds.publication.FlowController** (p. 1348) distributes tokens to the destination queues in order of their publication priority. In other words, the queue containing the sample with the highest publication priority is serviced first. The number of tokens granted equals the number of tokens required to send the first sample in the queue. Note that the priority of a queue may change as samples are sent (i.e. removed from the queue). If a sample must be sent to multiple destinations or two samples have an equal publication priority, the corresponding destination queues are serviced in a round-robin fashion.

This priority inheritance approach is required in order to both honor the designated publication priority and adhere to the **com.rti.dds.publication.DataWriter** (p. 818) in-order data delivery guarantee.

8.122 FlowControllerTokenBucketProperty_t Class Reference

com.rti.dds.publication.FlowController (p. 1348) uses the popular token bucket approach for open loop network flow control. The flow control characteristics are determined by the token bucket properties.

Inherits Struct.

Public Attributes

- int **max_tokens**

  Maximum number of tokens than can accumulate in the token bucket.
- int **tokens_added_per_period**

  The number of tokens added to the token bucket per specified period.
- int **tokens_leaked_per_period**

  The number of tokens removed from the token bucket per specified period.
- **Duration_t period**

  Period for adding tokens to and removing tokens from the bucket.
- int **bytes_per_token**

  Maximum number of bytes allowed to send for each token available.

8.122.1 Detailed Description

com.rti.dds.publication.FlowController (p. 1348) uses the popular token bucket approach for open loop network flow control. The flow control characteristics are determined by the token bucket properties.

Asynchronously published samples are queued up and transmitted based on the token bucket flow control scheme. The token bucket contains tokens, each of which represents a number of bytes. Samples can be sent only when there are sufficient tokens in the bucket. As samples are sent, tokens are consumed. The number of tokens consumed is proportional to the size of the data being sent. Tokens are replenished on a periodic basis.

The rate at which tokens become available and other token bucket properties determine the network traffic flow.

Note that if the same sample must be sent to multiple destinations, separate tokens are required for each destination. Only when multiple samples are destined to the same destination will they be co-alesced and sent using the same token(s). In other words, each token can only contribute to a single network packet.

Entity:

com.rti.dds.publication.FlowController (p. 1348)

Properties:

RxO (p. 506) = N/A

Changeable (p. 507) = **YES** (p. 507). However, the special value of **com.rti.dds.infrastructure.Duration_t.↩ DURATION_INFINITE** (p. 1133) as **com.rti.dds.publication.FlowControllerTokenBucketProperty_t.period** (p. 1357) is strictly used to create an *on-demand* **com.rti.dds.publication.FlowController** (p. 1348). The token period cannot toggle from an infinite to finite value (or vice versa). It can, however, change from one finite value to another.

8.122.2 Member Data Documentation

8.122.2.1 max_tokens

```
int max_tokens
```

Maximum number of tokens than can accumulate in the token bucket.

The number of tokens in the bucket will never exceed this value. Any excess tokens are discarded. This property value, combined with **com.rti.dds.publication.FlowControllerTokenBucketProperty_t.bytes_per_token** (p. 1357), determines the maximum allowable data burst.

Use **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511) to allow accumulation of an unlimited amount of tokens (and therefore potentially an unlimited burst size).

[default] com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED (p. 511)

[range] [1,**com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511)]

8.122.2.2 tokens_added_per_period

```
int tokens_added_per_period
```

The number of tokens added to the token bucket per specified period.

com.rti.dds.publication.FlowController (p. 1348) transmits data only when tokens are available. Tokens are periodically replenished. This field determines the number of tokens added to the token bucket with each periodic replenishment.

Available tokens are distributed to associated **com.rti.dds.publication.DataWriter** (p. 818) instances based on the **com.rti.dds.publication.FlowControllerProperty_t.scheduling_policy** (p. 1352).

Use **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511) to add the maximum number of tokens allowed by **com.rti.dds.publication.FlowControllerTokenBucketProperty_t.max_tokens** (p. 1356).

[default] com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED (p. 511)

[range] [1,**com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511)]

8.122.2.3 tokens_leaked_per_period

```
int tokens_leaked_per_period
```

The number of tokens removed from the token bucket per specified period.

com.rti.dds.publication.FlowController (p. 1348) transmits data only when tokens are available. When tokens are replenished and there are sufficient tokens to send all samples in the queue, this property determines whether any or all of the leftover tokens remain in the bucket.

Use **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511) to remove all excess tokens from the token bucket once all samples have been sent. In other words, no token accumulation is allowed. When new samples are written after tokens were purged, the earliest point in time at which they can be sent is at the next periodic replenishment.

[default] 0

[range] [0,**com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511)]

8.122.2.4 period

```
Duration_t period
```

Period for adding tokens to and removing tokens from the bucket.

com.rti.dds.publication.FlowController (p. 1348) transmits data only when tokens are available. This field determines the period by which tokens are added or removed from the token bucket.

The special value **com.rti.dds.infrastructure.Duration_t.DURATION_INFINITE** (p. 1133) can be used to create an *on-demand* **com.rti.dds.publication.FlowController** (p. 1348), for which tokens are no longer replenished periodically. Instead, tokens must be added explicitly by calling **com.rti.dds.publication.FlowController.trigger_flow** (p. 1350). This external trigger adds **com.rti.dds.publication.FlowControllerTokenBucketProperty_t.tokens_added_per_period** (p. 1356) tokens each time it is called (subject to the other property settings).

[default] 1 second

[range] [1 nanosec, 1 year] or **com.rti.dds.infrastructure.Duration_t.DURATION_INFINITE** (p. 1133)

8.122.2.5 bytes_per_token

```
int bytes_per_token
```

Maximum number of bytes allowed to send for each token available.

com.rti.dds.publication.FlowController (p. 1348) transmits data only when tokens are available. This field determines the number of bytes that can actually be transmitted based on the number of tokens.

Tokens are always consumed in whole by each **com.rti.dds.publication.DataWriter** (p. 818). That is, in cases where **com.rti.dds.publication.FlowControllerTokenBucketProperty_t.bytes_per_token** (p. 1357) is greater than the sample size, multiple samples may be sent to the same destination using a single token (regardless of **com.rti.dds.publication.FlowControllerProperty_t.scheduling_policy** (p. 1352)).

Where fragmentation is required, the fragment size will be **com.rti.dds.publication.FlowControllerTokenBucketProperty_t.bytes_per_token** (p. 1357) or the minimum largest message size across all transports installed with the **com.rti.dds.publication.DataWriter** (p. 818), whichever is less.

Use **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511) to indicate that an unlimited number of bytes can be transmitted per token. In other words, a single token allows the recipient **com.rti.dds.publication.DataWriter** (p. 818) to transmit all its queued samples to a single destination. A separate token is required to send to each additional destination.

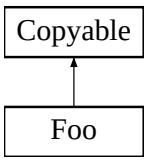
[default] com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED (p. 511)

[range] [1024,**com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511)]

8.123 Foo Class Reference

A representative user-defined data type.

Inheritance diagram for Foo:



Public Member Functions

- Object **copy_from** (Object src)

8.123.1 Detailed Description

A representative user-defined data type.

Foo (p. 1358) represents a user-defined data-type that is intended to be distributed using DDS.

The type **Foo** (p. 1358) is usually defined using IDL syntax and placed in a ".idl" file that is then processed using rtiddsgen. The rtiddsgen utility generates the helper classes com.rti.dds.infrastructure.com.rti.dds.util.Sequence as well as the necessary code for DDS to manipulate the type (serialize it so that it can be sent over the network) as well as the implied **com.rti.ndds.example.FooDataReader** (p. 1359) and **com.rti.ndds.example.FooDataWriter** (p. 1389) types that allow the application to send and receive data of this type.

8.123.2 Member Function Documentation

8.123.2.1 copy_from()

```
Object copy_from (
            Object src )
```

This is the implementation of the `Copyable` interface. This method will perform a deep copy of `src`. This method could be placed into **`FooTypeSupport`** (p. `1410`).

rather than here by using the **-noCopyable** option to rtiddsgen.

Parameters

src	The Object which contains the data to be copied.

Returns

Returns **this**

Exceptions

NullPointerException	If `src` is null.
ClassCastException	If `src` is not the same type as `this`.

See also

com.rti.dds.infrastructure.Copyable::copy_from (p. 701)(java.lang.Object)

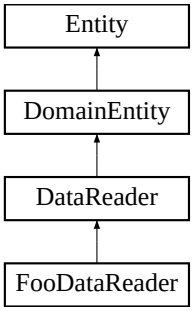
Implements **Copyable** (p. 701).

Referenced by **FooTypeSupport.copy_data()**.

8.124 FooDataReader Class Reference

*<<**interface**>> (p. 403) <<**generic**>> (p. 403)* User data type-specific data reader.

Inheritance diagram for FooDataReader:



Public Member Functions

- void **read** (**FooSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, int sample_states, int view_↩ states, int instance_states)

  *Access a collection of data samples from the **com.rti.dds.subscription.DataReader** (p. 707).*
- void **take** (**FooSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, int sample_states, int view_↩ states, int instance_states)

*Access a collection of data-samples from the **com.rti.dds.subscription.DataReader** (p. 707).*

- void **read_w_condition** (**FooSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, **ReadCondition** condition)

  *Accesses via **com.rti.ndds.example.FooDataReader.read** (p. 1361) the samples that match the criteria specified in the **com.rti.dds.subscription.ReadCondition** (p. 1816).*

- void **take_w_condition** (**FooSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, **ReadCondition** condition)

  *Analogous to **com.rti.ndds.example.FooDataReader.read_w_condition** (p. 1368) except it accesses samples via the **com.rti.ndds.example.FooDataReader.take** (p. 1363) operation.*

- void **read_next_sample** (**Foo** received_data, **SampleInfo** sample_info)

  *Copies the next not-previously-accessed data value from the **com.rti.dds.subscription.DataReader** (p. 707).*

- void **take_next_sample** (**Foo** received_data, **SampleInfo** sample_info)

  *Copies the next not-previously-accessed data value from the **com.rti.dds.subscription.DataReader** (p. 707).*

- void **read_instance** (**FooSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, **InstanceHandle_t** a_handle, int sample_states, int view_states, int instance_states)

  *Access a collection of data samples from the **com.rti.dds.subscription.DataReader** (p. 707).*

- void **take_instance** (**FooSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, **InstanceHandle_t** a_handle, int sample_states, int view_states, int instance_states)

  *Access a collection of data samples from the **com.rti.dds.subscription.DataReader** (p. 707).*

- void **read_next_instance** (**FooSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, **InstanceHandle_t** previous_handle, int sample_states, int view_states, int instance_states)

  *Access a collection of data samples from the **com.rti.dds.subscription.DataReader** (p. 707).*

- void **take_next_instance** (**FooSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, **InstanceHandle_t** previous_handle, int sample_states, int view_states, int instance_states)

  *Access a collection of data samples from the **com.rti.dds.subscription.DataReader** (p. 707).*

- void **read_instance_w_condition** (**FooSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, **InstanceHandle_t** a_handle, **ReadCondition** condition)

  *<<**extension**>> (p. 403) Accesses via **com.rti.ndds.example.FooDataReader.read_instance** (p. 1373) the samples that match the criteria specified in the **com.rti.dds.subscription.ReadCondition** (p. 1816).*

- void **take_instance_w_condition** (**FooSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, **InstanceHandle_t** a_handle, **ReadCondition** condition)

  *<<**extension**>> (p. 403) Accesses via **com.rti.ndds.example.FooDataReader.take_instance** (p. 1374) the samples that match the criteria specified in the **com.rti.dds.subscription.ReadCondition** (p. 1816).*

- void **read_next_instance_w_condition** (**FooSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, **InstanceHandle_t** previous_handle, **ReadCondition** condition)

  *Accesses via **com.rti.ndds.example.FooDataReader.read_next_instance** (p. 1376) the samples that match the criteria specified in the **com.rti.dds.subscription.ReadCondition** (p. 1816).*

- void **take_next_instance_w_condition** (**FooSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, **InstanceHandle_t** previous_handle, **ReadCondition** condition)

  *Accesses via **com.rti.ndds.example.FooDataReader.take_next_instance** (p. 1378) the samples that match the criteria specified in the **com.rti.dds.subscription.ReadCondition** (p. 1816).*

- void **return_loan** (**FooSeq** received_data, **SampleInfoSeq** info_seq)

  *Indicates to the **com.rti.dds.subscription.DataReader** (p. 707) that the application is done accessing the collection of `received_data` and `info_seq` obtained by some earlier invocation of read or take on the **com.rti.dds.subscription.DataReader** (p. 707).*

- void **get_key_value** (**Foo** key_holder, **InstanceHandle_t** handle)

  Retrieve the instance `key` that corresponds to an instance `handle`.

- **InstanceHandle_t lookup_instance** (**Foo** key_holder)

  Retrieves the instance `handle` that corresponds to an instance `key_holder`.

Additional Inherited Members

8.124.1 Detailed Description

*<<**interface**>> (p. 403) <<**generic**>> (p. 403)* User data type-specific data reader.

Defines the user data type specific reader interface generated for each application class.

The concrete user data type reader automatically generated by the implementation is an incarnation of this class.

See also

com.rti.dds.subscription.DataReader (p. 707)

com.rti.ndds.example.FooDataWriter (p. 1389)

the `Code Generator User's Manual`

8.124.2 Member Function Documentation

8.124.2.1 read()

```
void read (
              FooSeq received_data,
              SampleInfoSeq info_seq,
             int max_samples,
             int sample_states,
             int view_states,
             int instance_states )
```

Access a collection of data samples from the **com.rti.dds.subscription.DataReader** (p. 707).

This operation offers the same functionality and API as **com.rti.ndds.example.FooDataReader.take** (p. 1363) except that the samples returned remain in the **com.rti.dds.subscription.DataReader** (p. 707) such that they can be retrieved again by means of a read or take operation.

Please refer to the documentation of **com.rti.ndds.example.FooDataReader.take()** (p. 1363) for details on the number of samples returned within the received_data and info_seq as well as the order in which the samples appear in these sequences.

The act of reading a sample changes its `sample_state` to com.rti.dds.subscription.SampleStateKind.SampleState↩Kind.READ_SAMPLE_STATE. If the sample belongs to the most recent generation of the instance, it will also set the `view_state` of the instance to be com.rti.dds.subscription.ViewStateKind.ViewStateKind.NOT_NEW_VIEW_STATE. It will not affect the `instance_state` of the instance.

Once the application completes its use of the samples, it must 'return the loan' to the **com.rti.dds.subscription.Data↩Reader** (p. 707) by calling the **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386) operation.

Important: When you loan data from the middleware, you *must not* keep any pointers to any part of the data samples or the **com.rti.dds.subscription.SampleInfo** (p. 1944) objects after the call to **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386). Returning the loan places the objects back into a pool, allowing the middleware to overwrite them with new data.

Note: While the loan must be returned at some point, you do *not* have to do so before the next **com.rti.ndds.example.FooDataReader.take** (p. 1363) call. However, failure to return the loan will eventually deplete the **com.rti.dds.subscription.DataReader** (p. 707) of the buffers it needs to receive new samples and eventually samples will start to be lost. The total number of buffers available to the **com.rti.dds.subscription.DataReader** (p. 707) is specified by the **com.rti.dds.infrastructure.ResourceLimitsQosPolicy** (p. 1894) and the **com.rti.dds.infrastructure.DataReaderResourceLimitsQosPolicy** (p. 789).

Important: If the samples "returned" by this method are loaned from RTI Connext (see **com.rti.ndds.example.FooDataReader.take** (p. 1363) for more information on memory loaning), it is important that their contents not be changed. Because the memory in which the data is stored belongs to the middleware, any modifications made to the data will be seen the next time the same samples are read or taken; the samples will no longer reflect the state that was received from the network.

Parameters

received_data	<<***inout***>> *(*p. *404)* User data type-specific com.rti.dds.infrastructure.com.rti.dds.util.Sequence object where the received data samples will be returned. Must be a valid non-NULL **FooSeq** (p. 1408). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
info_seq	<<***inout***>> *(*p. *404)* A **com.rti.dds.subscription.SampleInfoSeq** (p. 1957) object where the received sample info will be returned. Must be a valid non-NULL **com.rti.dds.subscription.SampleInfoSeq** (p. 1957). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
max_samples	<<***in***>> *(*p. *404)* The maximum number of samples to be returned. If the special value **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511) is provided, as many samples will be returned as are available, up to the limits described in the documentation for **com.rti.ndds.example.FooDataReader.take()** (p. 1363).
sample_states	<<***in***>> *(*p. *404)* Data samples matching one of these `sample_states` are returned. See the valid values for this parameter here: **com.rti.dds.subscription.SampleStateKind** (p. 1972).
view_states	<<***in***>> *(*p. *404)* Data samples matching one of these `view_state` are returned. See the valid values for this parameter here: **com.rti.dds.subscription.ViewStateKind** (p. 2283).
instance_states	<<***in***>> *(*p. *404)* Data samples matching ones of these `instance_state` are returned. See the valid values for this parameter here: **com.rti.dds.subscription.InstanceStateKind** (p. 1451).

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903), **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

com.rti.ndds.example.FooDataReader.take_w_condition (p. 1369)

com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED (p. 511)

References **DataReader.read_untyped()**.

8.124.2.2 take()

```
void take (
              FooSeq received_data,
              SampleInfoSeq info_seq,
             int max_samples,
             int sample_states,
             int view_states,
             int instance_states )
```

Access a collection of data-samples from the **com.rti.dds.subscription.DataReader** (p. 707).

The operation will return the list of samples received by the **com.rti.dds.subscription.DataReader** (p. 707) since the last **com.rti.ndds.example.FooDataReader.take** (p. 1363) operation that matches the specified com.rti.dds.↩ subscription.SampleStateMask, com.rti.dds.subscription.ViewStateMask and com.rti.dds.subscription.InstanceState↩ Mask.

This operation may fail with **com.rti.dds.infrastructure.RETCODE_ERROR** (p. 1900) if the **com.rti.dds.↩ infrastructure.DataReaderResourceLimitsQosPolicy.max_outstanding_reads** (p. 796) limit has been exceeded.

The actual number of samples returned depends on the information that has been received by the middleware as well as the **com.rti.dds.infrastructure.HistoryQosPolicy** (p. 1435), **com.rti.dds.infrastructure.ResourceLimitsQosPolicy** (p. 1894), **com.rti.dds.infrastructure.DataReaderResourceLimitsQosPolicy** (p. 789) and the characteristics of the data-type that is associated with the **com.rti.dds.subscription.DataReader** (p. 707):

- In the case where the **com.rti.dds.infrastructure.HistoryQosPolicy.kind** (p. 1437) is com.rti.dds.↩ infrastructure.HistoryQosPolicyKind.HistoryQosPolicyKind.KEEP_LAST_HISTORY_QOS, the call will return at most **com.rti.dds.infrastructure.HistoryQosPolicy.depth** (p. 1438) samples for each ALIVE instance and (**com.rti.dds.infrastructure.HistoryQosPolicy.depth** (p. 1438) +1) samples for each NOT_ALIVE instance. The extra sample is an invalid sample (**com.rti.dds.subscription.SampleInfo.valid_data** (p. 1952) is FALSE) that is used to indicate the instance state transition from ALIVE to NOT_ALIVE.

- The maximum number of samples returned is limited by **com.rti.dds.infrastructure.ResourceLimitsQos↩ Policy.max_samples** (p. 1896), and by **com.rti.dds.infrastructure.DataReaderResourceLimitsQosPolicy.↩ max_samples_per_read** (p. 796).

- For multiple instances, the number of samples returned is additionally limited by the product (**com.rti.dds.↩ infrastructure.ResourceLimitsQosPolicy.max_samples_per_instance** (p. 1897)
  - **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_instances** (p. 1896))

- If **com.rti.dds.infrastructure.DataReaderResourceLimitsQosPolicy.max_infos** (p. 793) is limited, the number of samples returned may also be limited if insufficient **com.rti.dds.subscription.SampleInfo** (p. 1944) resources are available.

If the read or take succeeds and the number of samples returned has been limited (by means of a maximum limit, as listed above, or insufficient **com.rti.dds.subscription.SampleInfo** (p. 1944) resources), the call will complete successfully and provide those samples the reader is able to return. The user may need to make additional calls, or return outstanding loaned buffers in the case of insufficient resources, in order to access remaining samples.

Note that in the case where the **com.rti.dds.topic.Topic** (p. 2116) associated with the **com.rti.dds.subscription.DataReader** (p. 707) is bound to a data-type that has no key definition, then there will be at most one instance in the **com.rti.dds.subscription.DataReader** (p. 707). So the per-sample limits will apply.

The act of *taking* a sample removes it from RTI Connext so it cannot be read or taken again. If the sample belongs to the most recent generation of the instance, it will also set the `view_state` of the sample's instance to com.rti.dds.subscription.ViewStateKind.ViewStateKind.NOT_NEW_VIEW_STATE. It will not affect the `instance_state` of the sample's instance.

After **com.rti.ndds.example.FooDataReader.take** (p. 1363) completes, `received_data` and `info_seq` will be of the same length and contain the received data.

If the sequences are empty (maximum size equals 0) when the **com.rti.ndds.example.FooDataReader.take** (p. 1363) is called, the samples returned in the `received_data` and the corresponding `info_seq` are 'loaned' to the application from buffers provided by the **com.rti.dds.subscription.DataReader** (p. 707). The application can use them as desired and has guaranteed exclusive access to them.

Once the application completes its use of the samples it must 'return the loan' to the **com.rti.dds.subscription.DataReader** (p. 707) by calling the **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386) operation.

Important: When you loan data from the middleware, you *must not* keep any pointers to any part of the data samples or the **com.rti.dds.subscription.SampleInfo** (p. 1944) objects after the call to **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386). Returning the loan places the objects back into a pool, allowing the middleware to overwrite them with new data.

Note: While you must call **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386) at some point, you do *not* have to do so before the next **com.rti.ndds.example.FooDataReader.take** (p. 1363) call. However, failure to return the loan will eventually deplete the **com.rti.dds.subscription.DataReader** (p. 707) of the buffers it needs to receive new samples and eventually samples will start to be lost. The total number of buffers available to the **com.rti.dds.subscription.DataReader** (p. 707) is specified by the **com.rti.dds.infrastructure.ResourceLimitsQosPolicy** (p. 1894) and the **com.rti.dds.infrastructure.DataReaderResourceLimitsQosPolicy** (p. 789).

If the sequences are not empty (maximum size not equal to 0 and length not equal to 0) when **com.rti.ndds.example.FooDataReader.take** (p. 1363) is called, samples are copied to received_data and info_seq. The application will not need to call **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386).

The order of the samples returned to the caller depends on the **com.rti.dds.infrastructure.PresentationQosPolicy** (p. 1678).

- If **com.rti.dds.infrastructure.PresentationQosPolicy.access_scope** (p. 1682) is com.rti.dds.infrastructure.PresentationQosPolicyAccessScopeKind.PresentationQosPolicyAccessScopeKind.INSTANCE_PRESENTATION_QOS, the returned collection is a list where samples belonging to the same data instance are consecutive.

- If **com.rti.dds.infrastructure.PresentationQosPolicy.access_scope** (p. 1682) is com.rti.dds.infrastructure.↩ PresentationQosPolicyAccessScopeKind.PresentationQosPolicyAccessScopeKind.TOPIC_PRESENTATION↩ _QOS and **com.rti.dds.infrastructure.PresentationQosPolicy.ordered_access** (p. 1682) is set to com.rti.↩ dds.infrastructure.false, then the returned collection is a list where samples belonging to the same data instance are consecutive.

- If **com.rti.dds.infrastructure.PresentationQosPolicy.access_scope** (p. 1682) is com.rti.dds.infrastructure.↩ PresentationQosPolicyAccessScopeKind.PresentationQosPolicyAccessScopeKind.TOPIC_PRESENTATION↩ _QOS and **com.rti.dds.infrastructure.PresentationQosPolicy.ordered_access** (p. 1682) is set to com.rti.↩ dds.infrastructure.true, then the returned collection is a list where the relative order of samples as they were written by a DataWriter is preserved also across different instances. In other words, changes made by a single DataWriter are made available to subscribers in the same order in which they occur. Samples belonging to the same instance may or may not be consecutive. This is because, to preserve order within a single DataWriter, it may be necessary to mix samples from different instances.

- If **com.rti.dds.infrastructure.PresentationQosPolicy.access_scope** (p. 1682) is com.rti.dds.infrastructure.↩ PresentationQosPolicyAccessScopeKind.PresentationQosPolicyAccessScopeKind.GROUP_PRESENTATION↩ _QOS and **com.rti.dds.infrastructure.PresentationQosPolicy.ordered_access** (p. 1682) is set to com.rti.↩ dds.infrastructure.false, then the returned collection is a list where samples belonging to the same data instance are consecutive.

- If **com.rti.dds.infrastructure.PresentationQosPolicy.access_scope** (p. 1682) is com.rti.dds.infrastructure.↩ PresentationQosPolicyAccessScopeKind.PresentationQosPolicyAccessScopeKind.GROUP_PRESENTATION↩ _QOS and **com.rti.dds.infrastructure.PresentationQosPolicy.ordered_access** (p. 1682) is set to com.↩ rti.dds.infrastructure.true, then changes made to instances by a set of DataWriters attached to a common Publisher are made available in the order in which they were written. For this to happen, the application must take the samples using the Subscriber's **com.rti.dds.subscription.Subscriber.begin_access** (p. 2058) and **com.rti.dds.subscription.Subscriber.end_access** (p. 2059) operations.

See the "Ordered Access" section in the "PRESENTATION QosPolicy" section of the Core Libraries User's Manual for more information.

In all of the above cases, the relative order between the samples of one instance is consistent with the **DESTINATION↩ _ORDER** (p. 468) policy:

- If **com.rti.dds.infrastructure.DestinationOrderQosPolicy.kind** (p. 905) is com.rti.dds.infrastructure.↩ DestinationOrderQosPolicyKind.DestinationOrderQosPolicyKind.BY_RECEPTION_TIMESTAMP_DESTINATIONORDER↩ _QOS, samples belonging to the same instances will appear in the relative order in which there were received (FIFO, earlier samples ahead of the later samples).

- If **com.rti.dds.infrastructure.DestinationOrderQosPolicy.kind** (p. 905) is com.rti.dds.infrastructure.↩ DestinationOrderQosPolicyKind.DestinationOrderQosPolicyKind.BY_SOURCE_TIMESTAMP_DESTINATIONORDER↩ _QOS, samples belonging to the same instances will appear in the relative order implied by the `source_↩ timestamp` (FIFO, smaller values of `source_timestamp` ahead of the larger values).

If the **com.rti.dds.subscription.DataReader** (p. 707) has no samples that meet the constraints, the method will fail with **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902).

In addition to the collection of samples, the read and take operations also use a collection of **com.rti.dds.↩ subscription.SampleInfo** (p. 1944) structures.

The initial (input) properties of the `received_data` and `info_seq` collections will determine the precise behavior of the read or take operation. For the purposes of this description, the collections are modeled as having these properties:

- the current-length (len, see com.rti.dds.infrastructure.com.rti.dds.util.Sequence.Sequence.size())
- the maximum length (max_len, see com.rti.dds.infrastructure.com.rti.dds.util.Sequence.Sequence.get↩ Maximum)

The initial values of the len and max_len properties for the received_data and info_seq collections govern the behavior of the read and take operations as specified by the following rules:

1. The values of len and max_len properties for the two collections must be identical. Otherwise read/take will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).
2. On successful output, the values of len and max_len will be the same for both collections.
3. If the initial max_len==0, then the received_data and info_seq collections will be filled with elements that are loaned by the **com.rti.dds.subscription.DataReader** (p. 707). On output, len will be set to the number of values returned, and max_len will be set to a value verifying max_len >= len. The use of this variant allows for Zero Copy access to the data and the application will need to return the loan to the **com.rti.dds.↩ publication.DataWriter** (p. 818) using **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386).
4. If initial max_len>0 then the read or take operation will copy the received_data values and **com.rti.dds.↩ subscription.SampleInfo** (p. 1944) values into the elements already inside the collections. On output, len will be set to the number of values copied and max_len will remain unchanged. The use of this variant forces a copy but the application can control where the copy is placed and the application will not need to return the loan. The number of samples copied depends on the relative values of max_len and max_samples:
   - If max_samples == LENGTH_UNLIMITED, then at most max_len values will be copied. The use of this variant lets the application limit the number of samples returned to what the sequence can accommodate.
   - If max_samples <= max_len, then at most max_samples values will be copied. The use of this variant lets the application limit the number of samples returned to fewer that what the sequence can accommodate.
   - If max_samples > max_len, then the read or take operation will fail with **com.rti.dds.infrastructure.↩ RETCODE_PRECONDITION_NOT_MET** (p. 1903). This avoids the potential confusion where the application expects to be able to access up to max_samples, but that number can never be returned, even if they are available in the **com.rti.dds.subscription.DataReader** (p. 707), because the output sequence cannot accommodate them.

As described above, upon completion, the received_data and info_seq collections may contain elements loaned from the **com.rti.dds.subscription.DataReader** (p. 707). If this is the case, the application will need to use **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386) to return the loan once it is no longer using the received_data in the collection. When **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386) completes, the collection will have max_len=0. The application can determine whether it is necessary to return the loan or not based on how the state of the collections when the read/take operation was called However, in many cases it may be simpler to always call **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386), as this operation is harmless (i.e., it leaves all elements unchanged) if the collection does not have a loan.

On output, the collection of **com.rti.ndds.example.Foo** (p. 1358) values and the collection of **com.rti.dds.↩ subscription.SampleInfo** (p. 1944) structures are of the same length and are in a one-to-one correspondence. Each **com.rti.dds.subscription.SampleInfo** (p. 1944) provides information, such as the source_timestamp, the sample_state, view_state, and instance_state, etc., about the corresponding sample. Some elements in the returned collection may not have valid data. If the instance_state in the **com.rti.dds.subscription.SampleInfo** (p. 1944) is **com.rti.dds.subscription.InstanceStateKind.NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 1452) or **com.↩ rti.dds.subscription.InstanceStateKind.NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 1452), then the last

sample for that instance in the collection (that is, the one whose **com.rti.dds.subscription.SampleInfo** (p. 1944) has sample_rank==0) does not contain valid data.

Samples that contain no data do not count towards the limits imposed by the **com.rti.dds.infrastructure.Resource↩ LimitsQosPolicy** (p. 1894). The act of reading/taking a sample sets its sample_state to com.rti.dds.subscription.↩ SampleStateKind.SampleStateKind.READ_SAMPLE_STATE.

If the sample belongs to the most recent generation of the instance, it will also set the view_state of the instance to com.rti.dds.subscription.ViewStateKind.ViewStateKind.NOT_NEW_VIEW_STATE. It will not affect the instance_state of the instance.

This operation must be provided on the specialized class that is generated for the particular application data-type that is being read (**com.rti.ndds.example.Foo** (p. 1358)).

If the **com.rti.dds.subscription.DataReader** (p. 707) has no samples that meet the constraints, the operations fails with **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902). For an example on how `take` can be used, please refer to the **Access received data via a reader** (p. 379) "receive example".

Parameters

received_data	<<***inout***>> *(p. 404)* User data type-specific com.rti.dds.infrastructure.com.rti.dds.util.Sequence object where the received data samples will be returned. Must be a valid non-NULL **FooSeq** (p. 1408). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
info_seq	<<***inout***>> *(p. 404)* A **com.rti.dds.subscription.SampleInfoSeq** (p. 1957) object where the received sample info will be returned. Must be a valid non-NULL **com.rti.dds.subscription.SampleInfoSeq** (p. 1957). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
max_samples	<<***in***>> *(p. 404)* The maximum number of samples to be returned. If the special value **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511) is provided, as many samples will be returned as are available, up to the limits described above.
sample_states	<<***in***>> *(p. 404)* Data samples matching one of these `sample_states` are returned. See the valid values for this parameter here: **com.rti.dds.subscription.SampleStateKind** (p. 1972).
view_states	<<***in***>> *(p. 404)* Data samples matching one of these `view_state` are returned. See the valid values for this parameter here: **com.rti.dds.subscription.ViewStateKind** (p. 2283).
instance_states	<<***in***>> *(p. 404)* Data samples matching one of these `instance_state` are returned. See the valid values for this parameter here: **com.rti.dds.subscription.InstanceStateKind** (p. 1451).

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903), **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

com.rti.ndds.example.FooDataReader.read (p. 1361)

com.rti.ndds.example.FooDataReader.read_w_condition (p. 1368), **com.rti.ndds.example.FooData↩ Reader.take_w_condition** (p. 1369)

com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED (p. 511)

References **DataReader.take_untyped()**.

8.124.2.3 read_w_condition()

```
void read_w_condition (
              FooSeq received_data,
              SampleInfoSeq info_seq,
             int max_samples,
              ReadCondition condition )
```

Accesses via **com.rti.ndds.example.FooDataReader.read** (p. 1361) the samples that match the criteria specified in the **com.rti.dds.subscription.ReadCondition** (p. 1816).

This operation is especially useful in combination with **com.rti.dds.subscription.QueryCondition** (p. 1812) to filter data samples based on the content.

The specified **com.rti.dds.subscription.ReadCondition** (p. 1816) must be attached to the **com.rti.dds.↩ subscription.DataReader** (p. 707); otherwise the operation will fail with **com.rti.dds.infrastructure.RETCODE_↩ PRECONDITION_NOT_MET** (p. 1903).

In case the **com.rti.dds.subscription.ReadCondition** (p. 1816) is a plain **com.rti.dds.subscription.ReadCondition** (p. 1816) and not the specialized **com.rti.dds.subscription.QueryCondition** (p. 1812), the operation is equivalent to calling **com.rti.ndds.example.FooDataReader.read** (p. 1361) and passing as `sample_states`, `view_states` and `instance_states` the value of the corresponding attributes in the `read_condition`. Using this operation, the application can avoid repeating the same parameters specified when creating the **com.rti.dds.subscription.↩ ReadCondition** (p. 1816).

The samples are accessed with the same semantics as **com.rti.ndds.example.FooDataReader.read** (p. 1361).

If the **com.rti.dds.subscription.DataReader** (p. 707) has no samples that meet the constraints, the operation will fail with **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902).

Parameters

received_data	*<<**inout**>> (p. 404)* user data type-specific com.rti.dds.infrastructure.com.rti.dds.util.Sequence object where the received data samples will be returned. Must be a valid non-NULL **FooSeq** (p. 1408). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
info_seq	*<<**inout**>> (p. 404)* a **com.rti.dds.subscription.SampleInfoSeq** (p. 1957) object where the received sample info will be returned. Must be a valid non-NULL **com.rti.dds.subscription.SampleInfoSeq** (p. 1957). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
max_samples	*<<**in**>> (p. 404)* The maximum number of samples to be returned. If the special value **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511) is provided, as many samples will be returned as are available, up to the limits described in the documentation for **com.rti.ndds.example.FooDataReader.take()** (p. 1363).
condition	*<<**in**>> (p. 404)* the **com.rti.dds.subscription.ReadCondition** (p. 1816) to select samples of interest. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903), **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

com.rti.ndds.example.FooDataReader.read (p. 1361)

com.rti.ndds.example.FooDataReader.take (p. 1363), **com.rti.ndds.example.FooDataReader.take_w_↩ condition** (p. 1369)

com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED (p. 511)

References **DataReader.read_w_condition_untyped()**.

8.124.2.4 take_w_condition()

```
void take_w_condition (
              FooSeq received_data,
              SampleInfoSeq info_seq,
             int max_samples,
              ReadCondition condition )
```

Analogous to **com.rti.ndds.example.FooDataReader.read_w_condition** (p. 1368) except it accesses samples via the **com.rti.ndds.example.FooDataReader.take** (p. 1363) operation.

This operation is analogous to **com.rti.ndds.example.FooDataReader.read_w_condition** (p. 1368) except that it accesses samples via the **com.rti.ndds.example.FooDataReader.take** (p. 1363) operation.

The specified **com.rti.dds.subscription.ReadCondition** (p. 1816) must be attached to the **com.rti.dds.↩ subscription.DataReader** (p. 707); otherwise the operation will fail with **com.rti.dds.infrastructure.RETCODE_↩ PRECONDITION_NOT_MET** (p. 1903).

The samples are accessed with the same semantics as **com.rti.ndds.example.FooDataReader.take** (p. 1363).

This operation is especially useful in combination with **com.rti.dds.subscription.QueryCondition** (p. 1812) to filter data samples based on the content.

If the **com.rti.dds.subscription.DataReader** (p. 707) has no samples that meet the constraints, the method will fail with **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902).

Parameters

received_data	*<<**inout**>> (p. 404)* user data type-specific com.rti.dds.infrastructure.com.rti.dds.util.Sequence object where the received data samples will be returned. Must be a valid non-NULL **FooSeq** (p. 1408). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
info_seq	*<<**inout**>> (p. 404)* a **com.rti.dds.subscription.SampleInfoSeq** (p. 1957) object where the received sample info will be returned. Must be a valid non-NULL **com.rti.dds.subscription.SampleInfoSeq** (p. 1957). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
max_samples	*<<**in**>> (p. 404)* The maximum number of samples to be returned. If the special value **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511) is provided, as many samples will be returned as are available, up to the limits described in the documentation for **com.rti.ndds.example.FooDataReader.take()** (p. 1363).
condition	*<<**in**>> (p. 404)* the **com.rti.dds.subscription.ReadCondition** (p. 1816) to select samples of interest. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903), **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

See also

com.rti.ndds.example.FooDataReader.read_w_condition (p. 1368), **com.rti.ndds.example.FooDataReader.read** (p. 1361)

com.rti.ndds.example.FooDataReader.take (p. 1363)

com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED (p. 511)

References **DataReader.take_w_condition_untyped()**.

8.124.2.5 read_next_sample()

```
void read_next_sample (
               Foo received_data,
               SampleInfo sample_info )
```

Copies the next not-previously-accessed data value from the **com.rti.dds.subscription.DataReader** (p. 707).

This operation copies the next not-previously-accessed data value from the **com.rti.dds.subscription.DataReader** (p. 707). This operation also copies the corresponding **com.rti.dds.subscription.SampleInfo** (p. 1944). The implied order among the samples stored in the **com.rti.dds.subscription.DataReader** (p. 707) is the same as for the **com.rti.ndds.example.FooDataReader.read** (p. 1361) operation.

The **com.rti.ndds.example.FooDataReader.read_next_sample** (p. 1370) operation is semantically equivalent to the **com.rti.ndds.example.FooDataReader.read** (p. 1361) operation, where the input data sequences has max_len=1, the sample_states=NOT_READ, the view_states=ANY_VIEW_STATE, and the instance_states=ANY_INSTANCE_STATE.

The **com.rti.ndds.example.FooDataReader.read_next_sample** (p. 1370) operation provides a simplified API to 'read' samples, avoiding the need for the application to manage sequences and specify states.

If there is no unread data in the **com.rti.dds.subscription.DataReader** (p. 707), the operation will fail with **com.rti.↩ dds.infrastructure.RETCODE_NO_DATA** (p. 1902) and nothing is copied.

Note

Calling **com.rti.ndds.example.FooDataReader.read_next_sample** (p. 1370) from the **com.rti.dds.↩ subscription.DataReaderListener.on_data_available()** (p. 760) callback reads only one sample of potentially many samples in the reader queue, because **com.rti.dds.subscription.DataReaderListener.on_data_↩ available()** (p. 760) is triggered only once when new samples arrive in the queue. Therefore, it is recommended that you call **com.rti.ndds.example.FooDataReader.read_next_sample** (p. 1370) in a loop within the on↩ _data_available callback until **com.rti.ndds.example.FooDataReader.read_next_sample** (p. 1370) returns **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902) . This ensures that all samples in the reader queue are serviced by application logic. (You may also choose to use **com.rti.ndds.example.FooDataReader.read** (p. 1361) rather than **com.rti.ndds.example.FooDataReader.read_next_sample** (p. 1370) in order to read more than one sample at a time.)

Parameters

received_data	<<***inout***>> *(p. 404)* user data type-specific **com.rti.ndds.example.Foo** (p. 1358) object where the next received data sample will be returned. The received_data must have been fully allocated. Otherwise, this operation may fail. Must be a valid non-NULL **Foo** (p. 1358). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
sample_info	<<***inout***>> *(p. 404)* a **com.rti.dds.subscription.SampleInfo** (p. 1944) object where the next received sample info will be returned. Must be a valid non-NULL **com.rti.dds.subscription.SampleInfo** (p. 1944). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

See also

com.rti.ndds.example.FooDataReader.read (p. 1361)

References **DataReader.read_next_sample_untyped()**.

8.124.2.6 take_next_sample()

```
void take_next_sample (
            Foo received_data,
            SampleInfo sample_info )
```

Copies the next not-previously-accessed data value from the **com.rti.dds.subscription.DataReader** (p. 707).

This operation copies the next not-previously-accessed data value from the **com.rti.dds.subscription.DataReader** (p. 707) and 'removes' it from the **com.rti.dds.subscription.DataReader** (p. 707) so that it is no longer accessible. This operation also copies the corresponding **com.rti.dds.subscription.SampleInfo** (p. 1944). This operation is analogous to the **com.rti.ndds.example.FooDataReader.read_next_sample** (p. 1370) except for the fact that the sample is removed from the **com.rti.dds.subscription.DataReader** (p. 707).

The **com.rti.ndds.example.FooDataReader.take_next_sample** (p. 1371) operation is semantically equivalent to the **com.rti.ndds.example.FooDataReader.take** (p. 1363) operation, where the input data sequences has max_len=1, the sample_states=NOT_READ, the view_states=ANY_VIEW_STATE, and the instance_states=ANY_INSTANCE_STATE.

The **com.rti.ndds.example.FooDataReader.take_next_sample** (p. 1371) operation provides a simplified API to 'take' samples, avoiding the need for the application to manage sequences and specify states.

If there is no unread data in the **com.rti.dds.subscription.DataReader** (p. 707), the operation will fail with **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902) and nothing is copied.

Note

Calling **com.rti.ndds.example.FooDataReader.take_next_sample** (p. 1371) from the **com.rti.dds.subscription.DataReaderListener.on_data_available()** (p. 760) callback retrieves only one sample of potentially many samples in the reader queue, because **com.rti.dds.subscription.DataReaderListener.on_data_available()** (p. 760) is triggered only once when new samples arrive in the queue. Therefore, it is recommended that you call **com.rti.ndds.example.FooDataReader.take_next_sample** (p. 1371) in a loop within the on_data_available callback until **com.rti.ndds.example.FooDataReader.take_next_sample** (p. 1371) returns **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902) . This ensures that all samples in the reader queue are serviced by application logic. (You may also choose to use the **com.rti.ndds.example.FooDataReader.take** (p. 1363) rather than **com.rti.ndds.example.FooDataReader.take_next_sample** (p. 1371) in order to take more than one sample at a time.)

Parameters

received_data	*<<**inout**>> (p. 404)* user data type-specific **com.rti.ndds.example.Foo** (p. 1358) object where the next received data sample will be returned. The received_data must have been fully allocated. Otherwise, this operation may fail. Must be a valid non-NULL **Foo** (p. 1358). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
sample_info	*<<**inout**>> (p. 404)* a **com.rti.dds.subscription.SampleInfo** (p. 1944) object where the next received sample info will be returned. Must be a valid non-NULL **com.rti.dds.subscription.SampleInfo** (p. 1944). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513),

com.rti.dds.infrastructure.RETCODE_NO_DATA (p. 1902) or **com.rti.dds.infrastructure.RETCODE_NOT_↩ ENABLED** (p. 1902).

com.rti.ndds.example.FooDataReader.take (p. 1363)

References **DataReader.take_next_sample_untyped()**.

8.124.2.7 read_instance()

```
void read_instance (
              FooSeq received_data,
              SampleInfoSeq info_seq,
             int max_samples,
              InstanceHandle_t a_handle,
             int sample_states,
             int view_states,
             int instance_states )
```

Access a collection of data samples from the **com.rti.dds.subscription.DataReader** (p. 707).

This operation accesses a collection of data values from the **com.rti.dds.subscription.DataReader** (p. 707). The behavior is identical to **com.rti.ndds.example.FooDataReader.read** (p. 1361), except that all samples returned belong to the single specified instance whose handle is `a_handle`.

Upon successful completion, the data collection will contain samples all belonging to the same instance. The corresponding **com.rti.dds.subscription.SampleInfo** (p. 1944) verifies **com.rti.dds.subscription.SampleInfo.instance↩ _handle** (p. 1949) == `a_handle`.

The **com.rti.ndds.example.FooDataReader.read_instance** (p. 1373) operation is semantically equivalent to the **com.rti.ndds.example.FooDataReader.read** (p. 1361) operation, except in building the collection, the **com.rti.dds.↩ subscription.DataReader** (p. 707) will check that the sample belongs to the specified instance and otherwise it will not place the sample in the returned collection.

The behavior of the **com.rti.ndds.example.FooDataReader.read_instance** (p. 1373) operation follows the same rules as the **com.rti.ndds.example.FooDataReader.read** (p. 1361) operation regarding the pre-conditions and post-conditions for the `received_data` and `sample_info`. Similar to the **com.rti.ndds.example.FooDataReader.↩ read** (p. 1361), the **com.rti.ndds.example.FooDataReader.read_instance** (p. 1373) operation may 'loan' elements to the output collections, which must then be returned by means of **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386).

Similar to the **com.rti.ndds.example.FooDataReader.read** (p. 1361), this operation must be provided on the specialized class that is generated for the particular application data-type that is being taken.

If the **com.rti.dds.subscription.DataReader** (p. 707) has no samples that meet the constraints, the method will fail with **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902).

This operation may fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if the **com.rti.dds.↩ infrastructure.InstanceHandle_t** (p. 1443) `a_handle` does not correspond to an existing data-object known to the **com.rti.dds.subscription.DataReader** (p. 707).

Parameters

received_data	<<***inout***>> *(*p. *404)* user data type-specific com.rti.dds.infrastructure.com.rti.dds.util.Sequence object where the received data samples will be returned. Must be a valid non-NULL **FooSeq** (p. 1408). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
info_seq	<<***inout***>> *(*p. *404)* a **com.rti.dds.subscription.SampleInfoSeq** (p. 1957) object where the received sample info will be returned. Must be a valid non-NULL **com.rti.dds.subscription.SampleInfoSeq** (p. 1957). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
max_samples	<<***in***>> *(*p. *404)* The maximum number of samples to be returned. If the special value **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511) is provided, as many samples will be returned as are available, up to the limits described in the documentation for **com.rti.ndds.example.FooDataReader.take()** (p. 1363).
a_handle	<<***in***>> *(*p. *404)* The specified instance to return samples for. Must be a valid non-NULL **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if the `handle` does not correspond to an existing data-object known to the **com.rti.dds.subscription.DataReader** (p. 707).
sample_states	<<***in***>> *(*p. *404)* data samples matching ones of these `sample_states` are returned. See the valid values for this parameter here: **com.rti.dds.subscription.SampleStateKind** (p. 1972).
view_states	<<***in***>> *(*p. *404)* data samples matching ones of these `view_state` are returned. See the valid values for this parameter here: **com.rti.dds.subscription.ViewStateKind** (p. 2283).
instance_states	<<***in***>> *(*p. *404)* data samples matching ones of these `instance_state` are returned. See the valid values for this parameter here: **com.rti.dds.subscription.InstanceStateKind** (p. 1451).

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903), **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

8.124.2.8 take_instance()

```
void take_instance (
            FooSeq received_data,
```

```
 SampleInfoSeq info_seq,
int max_samples,
 InstanceHandle_t a_handle,
int sample_states,
int view_states,
int instance_states )
```

Access a collection of data samples from the **com.rti.dds.subscription.DataReader** (p. 707).

This operation accesses a collection of data values from the **com.rti.dds.subscription.DataReader** (p. 707). The behavior is identical to **com.rti.ndds.example.FooDataReader.take** (p. 1363), except for that all samples returned belong to the single specified instance whose handle is `a_handle`.

The semantics are the same for the **com.rti.ndds.example.FooDataReader.take** (p. 1363) operation, except in building the collection, the **com.rti.dds.subscription.DataReader** (p. 707) will check that the sample belongs to the specified instance, and otherwise it will not place the sample in the returned collection.

The behavior of the **com.rti.ndds.example.FooDataReader.take_instance** (p. 1374) operation follows the same rules as the **com.rti.ndds.example.FooDataReader.read** (p. 1361) operation regarding the pre-conditions and post-conditions for the `received_data` and `sample_info`. Similar to the **com.rti.ndds.example.FooDataReader.read** (p. 1361), the **com.rti.ndds.example.FooDataReader.take_instance** (p. 1374) operation may 'loan' elements to the output collections, which must then be returned by means of **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386).

Similar to the **com.rti.ndds.example.FooDataReader.read** (p. 1361), this operation must be provided on the specialized class that is generated for the particular application data-type that is being taken.

If the **com.rti.dds.subscription.DataReader** (p. 707) has no samples that meet the constraints, the method fails with **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902).

This operation may fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if the **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443) `a_handle` does not correspond to an existing data-object known to the **com.rti.dds.subscription.DataReader** (p. 707).

Parameters

received_data	<<***inout***>> *(*p. *404)* user data type-specific com.rti.dds.infrastructure.com.rti.dds.util.Sequence object where the received data samples will be returned. Must be a valid non-NULL **FooSeq** (p. 1408). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
info_seq	<<***inout***>> *(*p. *404)* a **com.rti.dds.subscription.SampleInfoSeq** (p. 1957) object where the received sample info will be returned. Must be a valid non-NULL **com.rti.dds.subscription.SampleInfoSeq** (p. 1957). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
max_samples	<<***in***>> *(*p. *404)* The maximum number of samples to be returned. If the special value **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511) is provided, as many samples will be returned as are available, up to the limits described in the documentation for **com.rti.ndds.example.FooDataReader.take()** (p. 1363).
a_handle	<<***in***>> *(*p. *404)* The specified instance to return samples for. Must be a valid non-NULL **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL. The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if the `handle` does not correspond to an existing data-object known to the **com.rti.dds.subscription.DataReader** (p. 707).

Parameters

sample_states	*<<**in**>> (p. 404)* data samples matching ones of these `sample_states` are returned. See the valid values for this parameter here: **com.rti.dds.subscription.SampleStateKind** (p. 1972).
view_states	*<<**in**>> (p. 404)* data samples matching ones of these `view_state` are returned. See the valid values for this parameter here: **com.rti.dds.subscription.ViewStateKind** (p. 2283).
instance_states	*<<**in**>> (p. 404)* data samples matching ones of these `instance_state` are returned. See the valid values for this parameter here: **com.rti.dds.subscription.InstanceStateKind** (p. 1451).

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903), **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

com.rti.ndds.example.FooDataReader.take (p. 1363)

com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED (p. 511)

References **DataReader.take_instance_untyped()**.

8.124.2.9 read_next_instance()

```
void read_next_instance (
              FooSeq received_data,
              SampleInfoSeq info_seq,
             int max_samples,
              InstanceHandle_t previous_handle,
             int sample_states,
             int view_states,
             int instance_states )
```

Access a collection of data samples from the **com.rti.dds.subscription.DataReader** (p. 707).

This operation accesses a collection of data values from the **com.rti.dds.subscription.DataReader** (p. 707) where all the samples belong to a single instance. The behavior is similar to **com.rti.ndds.example.FooDataReader.read_↩ instance** (p. 1373), except that the actual instance is not directly specified. Rather, the samples will all belong to the 'next' instance with `instance_handle` 'greater' than the specified 'previous_handle' that has available samples.

This operation implies the existence of a total order 'greater-than' relationship between the instance handles. The specifics of this relationship are not all important and are implementation specific. The important thing is that, according to the middleware, all instances are ordered relative to each other. This ordering is between the instance handles; It should not depend on the state of the instance (e.g. whether it has data or not) and must be defined even for instance

handles that do not correspond to instances currently managed by the **com.rti.dds.subscription.DataReader** (p. 707). For the purposes of the ordering, it should be 'as if' each instance handle was represented as unique integer.

The behavior of **com.rti.ndds.example.FooDataReader.read_next_instance** (p. 1376) is 'as if' the **com.rti.dds.↩ subscription.DataReader** (p. 707) invoked **com.rti.ndds.example.FooDataReader.read_instance** (p. 1373), passing the smallest instance_handle among all the ones that: (a) are greater than `previous_handle`, and (b) have available samples (i.e. samples that meet the constraints imposed by the specified states).

The special value **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447) is guaranteed to be 'less than' any valid `instance_handle`. So the use of the parameter value `previous_handle` == **com.rti.dds.↩ infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447) will return the samples for the instance which has the smallest `instance_handle` among all the instances that contain available samples.

Note

The operation **com.rti.ndds.example.FooDataReader.read_next_instance** (p. 1376) is intended to be used in an application-driven iteration, where the application starts by passing `previous_handle` == **com.rti.↩ dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447), examines the samples returned, and then uses the `instance_handle` returned in the **com.rti.dds.subscription.SampleInfo** (p. 1944) as the value of the `previous_handle` argument to the next call to **com.rti.ndds.example.FooDataReader.read_next_instance** (p. 1376). The iteration continues until **com.rti.ndds.example.FooDataReader.read_next_instance** (p. 1376) fails with **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902). This application-driven iteration is required to ensure that all samples on the reader queue are read.

Note that it is possible to call the **com.rti.ndds.example.FooDataReader.read_next_instance** (p. 1376) operation with a `previous_handle` that does not correspond to an instance currently managed by the **com.rti.dds.↩ subscription.DataReader** (p. 707). This is because as stated earlier the 'greater-than' relationship is defined even for handles not managed by the **com.rti.dds.subscription.DataReader** (p. 707). One practical situation where this may occur is when an application is iterating though all the instances, takes all the samples of a **com.rti.dds.subscription.↩ InstanceStateKind.NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 1452) instance, returns the loan (at which point the instance information may be removed, and thus the handle becomes invalid), and tries to read the next instance. The behavior of the **com.rti.ndds.example.FooDataReader.read_next_instance** (p. 1376) operation follows the same rules as the **com.rti.ndds.example.FooDataReader.read** (p. 1361) operation regarding the pre-conditions and post-conditions for the `received_data` and `sample_info`. Similar to the **com.rti.ndds.example.FooDataReader.↩ read** (p. 1361), the **com.rti.ndds.example.FooDataReader.read_instance** (p. 1373) operation may 'loan' elements to the output collections, which must then be returned by means of **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386).

Similar to the **com.rti.ndds.example.FooDataReader.read** (p. 1361), this operation must be provided on the specialized class that is generated for the particular application data-type that is being taken.

If the **com.rti.dds.subscription.DataReader** (p. 707) has no samples that meet the constraints, the method will fail with **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902).

Parameters

received_data	<<***inout***>> *(p. 404)* user data type-specific com.rti.dds.infrastructure.com.rti.dds.util.Sequence object where the received data samples will be returned. Must be a valid non-NULL **FooSeq** (p. 1408). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
info_seq	<<***inout***>> *(p. 404)* a **com.rti.dds.subscription.SampleInfoSeq** (p. 1957) object where the received sample info will be returned. Must be a valid non-NULL **com.rti.dds.subscription.SampleInfoSeq** (p. 1957). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.

Parameters

max_samples	<<***in***>> *(*p. *404)* The maximum number of samples to be returned. If the special value **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511) is provided, as many samples will be returned as are available, up to the limits described in the documentation for **com.rti.ndds.example.FooDataReader.take()** (p. 1363).
previous_handle	<<***in***>> *(*p. *404)* The 'next smallest' instance with a value greater than this value that has available samples will be returned. Must be a valid non-NULL **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
sample_states	<<***in***>> *(*p. *404)* data samples matching ones of these `sample_states` are returned. See the valid values for this parameter here: **com.rti.dds.subscription.SampleStateKind** (p. 1972).
view_states	<<***in***>> *(*p. *404)* data samples matching ones of these `view_state` are returned. See the valid values for this parameter here: **com.rti.dds.subscription.ViewStateKind** (p. 2283).
instance_states	<<***in***>> *(*p. *404)* data samples matching ones of these `instance_state` are returned. See the valid values for this parameter here: **com.rti.dds.subscription.InstanceStateKind** (p. 1451).

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903) **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

See also

com.rti.ndds.example.FooDataReader.read (p. 1361)

com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED (p. 511)

References **DataReader.read_next_instance_untyped()**.

8.124.2.10 take_next_instance()

```
void take_next_instance (
              FooSeq received_data,
              SampleInfoSeq info_seq,
             int max_samples,
              InstanceHandle_t previous_handle,
             int sample_states,
             int view_states,
             int instance_states )
```

Access a collection of data samples from the **com.rti.dds.subscription.DataReader** (p. 707).

This operation accesses a collection of data values from the **com.rti.dds.subscription.DataReader** (p. 707) and 'removes' them from the **com.rti.dds.subscription.DataReader** (p. 707).

This operation has the same behavior as **com.rti.ndds.example.FooDataReader.read_next_instance** (p. 1376), except that the samples are 'taken' from the **com.rti.dds.subscription.DataReader** (p. 707) such that they are no longer accessible via subsequent 'read' or 'take' operations.

Note

Like **com.rti.ndds.example.FooDataReader.read_next_instance** (p. 1376), this operation is intended to be used in an application-driven iteration until all samples on the reader queue are taken. The iteration continues until **com.rti.ndds.example.FooDataReader.take_next_instance** (p. 1378) fails with the value **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902) .

Similar to the operation **com.rti.ndds.example.FooDataReader.read_next_instance** (p. 1376), it is possible to call **com.rti.ndds.example.FooDataReader.take_next_instance** (p. 1378) with a `previous_handle` that does not correspond to an instance currently managed by the **com.rti.dds.subscription.DataReader** (p. 707).

The behavior of the **com.rti.ndds.example.FooDataReader.take_next_instance** (p. 1378) operation follows the same rules as the **com.rti.ndds.example.FooDataReader.read** (p. 1361) operation regarding the pre-conditions and post-conditions for the `received_data` and `sample_info`. Similar to the **com.rti.ndds.example.FooDataReader.read** (p. 1361), the **com.rti.ndds.example.FooDataReader.take_next_instance** (p. 1378) operation may 'loan' elements to the output collections, which must then be returned by means of **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386).

Similar to the **com.rti.ndds.example.FooDataReader.read** (p. 1361), this operation must be provided on the specialized class that is generated for the particular application data-type that is being taken.

If the **com.rti.dds.subscription.DataReader** (p. 707) has no samples that meet the constraints, the method will fail with **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902).

Parameters

received_data	<<***inout***>> *(p. 404)* user data type-specific com.rti.dds.infrastructure.com.rti.dds.util.Sequence object where the received data samples will be returned. Must be a valid non-NULL **FooSeq** (p. 1408). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
info_seq	<<***inout***>> *(p. 404)* a **com.rti.dds.subscription.SampleInfoSeq** (p. 1957) object where the received sample info will be returned. Must be a valid non-NULL **com.rti.dds.subscription.SampleInfoSeq** (p. 1957). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
max_samples	<<***in***>> *(p. 404)* The maximum number of samples to be returned. If the special value **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511) is provided, as many samples will be returned as are available, up to the limits described in the documentation for **com.rti.ndds.example.FooDataReader.take()** (p. 1363).
previous_handle	<<***in***>> *(p. 404)* The 'next smallest' instance with a value greater than this value that has available samples will be returned. Must be a valid non-NULL **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
sample_states	<<***in***>> *(p. 404)* data samples matching ones of these `sample_states` are returned. See the valid values for this parameter here: **com.rti.dds.subscription.SampleStateKind** (p. 1972).
view_states	<<***in***>> *(p. 404)* data samples matching ones of these `view_state` are returned. See the valid values for this parameter here: **com.rti.dds.subscription.ViewStateKind** (p. 2283).
instance_states	<<***in***>> *(p. 404)* data samples matching ones of these `instance_state` are returned. See the valid values for this parameter here: **com.rti.dds.subscription.InstanceStateKind** (p. 1451).

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903), **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

See also

com.rti.ndds.example.FooDataReader.take (p. 1363)

com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED (p. 511)

References **DataReader.take_next_instance_untyped()**.

8.124.2.11 read_instance_w_condition()

```
void read_instance_w_condition (
              FooSeq received_data,
              SampleInfoSeq info_seq,
             int max_samples,
              InstanceHandle_t a_handle,
              ReadCondition condition )
```

<<***extension***>> *(p. 403)* Accesses via **com.rti.ndds.example.FooDataReader.read_instance** (p. 1373) the samples that match the criteria specified in the **com.rti.dds.subscription.ReadCondition** (p. 1816).

This operation accesses a collection of data values from the **com.rti.dds.subscription.DataReader** (p. 707). The behavior is identical to **com.rti.ndds.example.FooDataReader.read_instance** (p. 1373), except that all returned samples satisfy the specified condition. In other words, on success, all returned samples belong to belong the single specified instance whose handle is `a_handle`, and for which the specified **com.rti.dds.subscription.ReadCondition** (p. 1816) evaluates to TRUE.

The behavior of the **com.rti.ndds.example.FooDataReader.read_instance_w_condition** (p. 1380) operation follows the same rules as the **com.rti.ndds.example.FooDataReader.read** (p. 1361) operation regarding the pre-conditions and post-conditions for the `received_data` and `sample_info`. Similar to the **com.rti.ndds.example.FooData↩ Reader.read** (p. 1361), the **com.rti.ndds.example.FooDataReader.read_instance_w_condition** (p. 1380) operation may 'loan' elements to the output collections, which must then be returned by means of **com.rti.ndds.example.Foo↩ DataReader.return_loan** (p. 1386).

Similar to **com.rti.ndds.example.FooDataReader.read** (p. 1361), this operation must be provided on the specialized class that is generated for the particular application data-type that is being taken.

If the **com.rti.dds.subscription.DataReader** (p. 707) has no samples that meet the constraints, the method will fail with **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902).

Parameters

received_data	*<<**inout**>> (p. 404)* user data type-specific com.rti.dds.infrastructure.com.rti.dds.util.Sequence object where the received data samples will be returned. Must be a valid non-NULL **FooSeq** (p. 1408). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
info_seq	*<<**inout**>> (p. 404)* a **com.rti.dds.subscription.SampleInfoSeq** (p. 1957) object where the received sample info will be returned. Must be a valid non-NULL **com.rti.dds.subscription.SampleInfoSeq** (p. 1957). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
max_samples	*<<**in**>> (p. 404)* The maximum number of samples to be returned. If the special value **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511) is provided, as many samples will be returned as are available, up to the limits described in the documentation for **com.rti.ndds.example.FooDataReader.take()** (p. 1363).
a_handle	*<<**in**>> (p. 404)* The 'next smallest' instance with a value greater than this value that has available samples will be returned. Must be a valid non-NULL **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
condition	*<<**in**>> (p. 404)* the **com.rti.dds.subscription.ReadCondition** (p. 1816) to select samples of interest. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903) **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

References **DataReader.read_instance_w_condition_untyped()**.

8.124.2.12 take_instance_w_condition()

```
void take_instance_w_condition (
              FooSeq received_data,
              SampleInfoSeq info_seq,
             int max_samples,
              InstanceHandle_t a_handle,
              ReadCondition condition )
```

*<<**extension**>> (p. 403)* Accesses via **com.rti.ndds.example.FooDataReader.take_instance** (p. 1374) the samples that match the criteria specified in the **com.rti.dds.subscription.ReadCondition** (p. 1816).

This operation accesses a collection of data values from the **com.rti.dds.subscription.DataReader** (p. 707) and 'removes' them from the **com.rti.dds.subscription.DataReader** (p. 707). The behavior is identical to **com.rti.ndds.example.FooDataReader.take_instance** (p. 1374), except that all returned samples satisfy the specified condition. In other words, on success, all returned samples belong to belong the single specified instance whose handle is `a_handle`, and for which the specified **com.rti.dds.subscription.ReadCondition** (p. 1816) evaluates to TRUE.

The operation has the same behavior as **com.rti.ndds.example.FooDataReader.read_instance_w_condition** (p. 1380), except that the samples are 'taken' from the **com.rti.dds.subscription.DataReader** (p. 707) such that they are no longer accessible via subsequent 'read' or 'take' operations.

The behavior of the **com.rti.ndds.example.FooDataReader.take_instance_w_condition** (p. 1381) operation follows the same rules as the **com.rti.ndds.example.FooDataReader.read** (p. 1361) operation regarding the pre-conditions and post-conditions for the `received_data` and `sample_info`. Similar to the **com.rti.ndds.example.FooDataReader.read** (p. 1361), the **com.rti.ndds.example.FooDataReader.take_instance_w_condition** (p. 1381) operation may 'loan' elements to the output collections, which must then be returned by means of **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386).

Similar to the **com.rti.ndds.example.FooDataReader.read** (p. 1361), this operation must be provided on the specialized class that is generated for the particular application data-type that is being taken.

If the **com.rti.dds.subscription.DataReader** (p. 707) has no samples that meet the constraints, the method will fail with **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902).

Parameters

received_data	*<<**inout**>> (p. 404)* user data type-specific com.rti.dds.infrastructure.com.rti.dds.util.Sequence object where the received data samples will be returned. Must be a valid non-NULL **FooSeq** (p. 1408). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
info_seq	*<<**inout**>> (p. 404)* a **com.rti.dds.subscription.SampleInfoSeq** (p. 1957) object where the received sample info will be returned. Must be a valid non-NULL **com.rti.dds.subscription.SampleInfoSeq** (p. 1957). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
max_samples	*<<**in**>> (p. 404)* The maximum number of samples to be returned. If the special value **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511) is provided, as many samples will be returned as are available, up to the limits described in the documentation for **com.rti.ndds.example.FooDataReader.take()** (p. 1363).
a_handle	*<<**in**>> (p. 404)* The 'next smallest' instance with a value greater than this value that has available samples will be returned. Must be a valid non-NULL **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
condition	*<<**in**>> (p. 404)* the **com.rti.dds.subscription.ReadCondition** (p. 1816) to select samples of interest. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903), or **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902), **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

See also

com.rti.ndds.example.FooDataReader.take_next_instance (p. 1378)

com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED (p. 511)

References **DataReader.take_instance_w_condition_untyped()**.

8.124.2.13 read_next_instance_w_condition()

```
void read_next_instance_w_condition (
              FooSeq received_data,
              SampleInfoSeq info_seq,
             int max_samples,
              InstanceHandle_t previous_handle,
              ReadCondition condition )
```

Accesses via **com.rti.ndds.example.FooDataReader.read_next_instance** (p. 1376) the samples that match the criteria specified in the **com.rti.dds.subscription.ReadCondition** (p. 1816).

This operation accesses a collection of data values from the **com.rti.dds.subscription.DataReader** (p. 707). The behavior is identical to **com.rti.ndds.example.FooDataReader.read_next_instance** (p. 1376), except that all returned samples satisfy the specified condition. In other words, on success, all returned samples belong to the same instance, and the instance is the instance with 'smallest' `instance_handle` among the ones that verify: (a) `instance_handle` >= `previous_handle`, and (b) have samples for which the specified **com.rti.dds.subscription.ReadCondition** (p. 1816) evaluates to TRUE.

Similar to the operation **com.rti.ndds.example.FooDataReader.read_next_instance** (p. 1376), it is possible to call **com.rti.ndds.example.FooDataReader.read_next_instance_w_condition** (p. 1383) with a `previous_handle` that does not correspond to an instance currently managed by the **com.rti.dds.subscription.DataReader** (p. 707).

The behavior of the **com.rti.ndds.example.FooDataReader.read_next_instance_w_condition** (p. 1383) operation follows the same rules as the **com.rti.ndds.example.FooDataReader.read** (p. 1361) operation regarding the pre-conditions and post-conditions for the `received_data` and `sample_info`. Similar to the **com.rti.ndds.example.FooDataReader.read** (p. 1361), the **com.rti.ndds.example.FooDataReader.read_next_instance_w_condition** (p. 1383) operation may 'loan' elements to the output collections, which must then be returned by means of **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386).

Similar to the **com.rti.ndds.example.FooDataReader.read** (p. 1361), this operation must be provided on the specialized class that is generated for the particular application data-type that is being taken.

If the **com.rti.dds.subscription.DataReader** (p. 707) has no samples that meet the constraints, the method will fail with **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902).

Parameters

received_data	<<***inout***>> *(p. 404)* user data type-specific com.rti.dds.infrastructure.com.rti.dds.util.Sequence object where the received data samples will be returned. Must be a valid non-NULL **FooSeq** (p. 1408). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.

Parameters

info_seq	*<<**inout**>> (p. 404)* a **com.rti.dds.subscription.SampleInfoSeq** (p. 1957) object where the received sample info will be returned. Must be a valid non-NULL **com.rti.dds.subscription.SampleInfoSeq** (p. 1957). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
max_samples	*<<**in**>> (p. 404)* The maximum number of samples to be returned. If the special value **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511) is provided, as many samples will be returned as are available, up to the limits described in the documentation for **com.rti.ndds.example.FooDataReader.take()** (p. 1363).
previous_handle	*<<**in**>> (p. 404)* The 'next smallest' instance with a value greater than this value that has available samples will be returned. Must be a valid non-NULL **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
condition	*<<**in**>> (p. 404)* the **com.rti.dds.subscription.ReadCondition** (p. 1816) to select samples of interest. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903) **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

See also

com.rti.ndds.example.FooDataReader.read_next_instance (p. 1376)

com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED (p. 511)

References **DataReader.read_next_instance_w_condition_untyped()**.

8.124.2.14 take_next_instance_w_condition()

```
void take_next_instance_w_condition (
              FooSeq received_data,
              SampleInfoSeq info_seq,
             int max_samples,
              InstanceHandle_t previous_handle,
              ReadCondition condition )
```

Accesses via **com.rti.ndds.example.FooDataReader.take_next_instance** (p. 1378) the samples that match the criteria specified in the **com.rti.dds.subscription.ReadCondition** (p. 1816).

This operation accesses a collection of data values from the **com.rti.dds.subscription.DataReader** (p. 707) and 'removes' them from the **com.rti.dds.subscription.DataReader** (p. 707).

The operation has the same behavior as **com.rti.ndds.example.FooDataReader.read_next_instance_w_condition** (p. 1383), except that the samples are 'taken' from the **com.rti.dds.subscription.DataReader** (p. 707) such that they are no longer accessible via subsequent 'read' or 'take' operations.

Similar to the operation **com.rti.ndds.example.FooDataReader.read_next_instance** (p. 1376), it is possible to call **com.rti.ndds.example.FooDataReader.take_next_instance_w_condition** (p. 1384) with a `previous_handle` that does not correspond to an instance currently managed by the **com.rti.dds.subscription.DataReader** (p. 707).

The behavior of the **com.rti.ndds.example.FooDataReader.take_next_instance_w_condition** (p. 1384) operation follows the same rules as the **com.rti.ndds.example.FooDataReader.read** (p. 1361) operation regarding the pre-conditions and post-conditions for the `received_data` and `sample_info`. Similar to **com.rti.ndds.↩ example.FooDataReader.read** (p. 1361), the **com.rti.ndds.example.FooDataReader.take_next_instance_w_↩ condition** (p. 1384) operation may 'loan' elements to the output collections, which must then be returned by means of **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386).

Similar to the **com.rti.ndds.example.FooDataReader.read** (p. 1361), this operation must be provided on the specialized class that is generated for the particular application data-type that is being taken.

If the **com.rti.dds.subscription.DataReader** (p. 707) has no samples that meet the constraints, the method will fail with **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902).

Parameters

received_data	*<<**inout**>> (p. 404)* user data type-specific com.rti.dds.infrastructure.com.rti.dds.util.Sequence object where the received data samples will be returned. Must be a valid non-NULL **FooSeq** (p. 1408). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
info_seq	*<<**inout**>> (p. 404)* a **com.rti.dds.subscription.SampleInfoSeq** (p. 1957) object where the received sample info will be returned. Must be a valid non-NULL **com.rti.dds.subscription.SampleInfoSeq** (p. 1957). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
max_samples	*<<**in**>> (p. 404)* The maximum number of samples to be returned. If the special value **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511) is provided, as many samples will be returned as are available, up to the limits described in the documentation for **com.rti.ndds.example.FooDataReader.take()** (p. 1363).
previous_handle	*<<**in**>> (p. 404)* The 'next smallest' instance with a value greater than this value that has available samples will be returned. Must be a valid non-NULL **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.
condition	*<<**in**>> (p. 404)* the **com.rti.dds.subscription.ReadCondition** (p. 1816) to select samples of interest. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903), or **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902), **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

See also

com.rti.ndds.example.FooDataReader.take_next_instance (p. 1378)

com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED (p. 511)

References **DataReader.take_next_instance_w_condition_untyped()**.

8.124.2.15 return_loan()

```
void return_loan (
            FooSeq received_data,
            SampleInfoSeq info_seq )
```

Indicates to the **com.rti.dds.subscription.DataReader** (p. 707) that the application is done accessing the collection of `received_data` and `info_seq` obtained by some earlier invocation of read or take on the **com.rti.dds.subscription.DataReader** (p. 707).

The `received_data` and `info_seq` must belong to a single related "pair"; that is, they should correspond to a pair returned from a single call to read or take. The `received_data` and `info_seq` must also have been obtained from the same **com.rti.dds.subscription.DataReader** (p. 707) to which they are returned. If either of these conditions is not met, the operation will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).

The operation **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386) allows implementations of the read and take operations to "loan" buffers from the **com.rti.dds.subscription.DataReader** (p. 707) to the application and in this manner provide "zerocopy" access to the data. During the loan, the **com.rti.dds.subscription.DataReader** (p. 707) will guarantee that the data and sample-information are not modified.

It is not necessary for an application to return the loans immediately after the read or take calls. However, as these buffers correspond to internal resources inside the **com.rti.dds.subscription.DataReader** (p. 707), the application should not retain them indefinitely.

The use of **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386) is only necessary if the read or take calls "loaned" buffers to the application. This only occurs if the `received_data` and `info_Seq` collections had `max_len=0` at the time read or take was called.

If the collections had a loan, upon completion of **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386), the collections will have `max_len=0`.

Similar to read, this operation must be provided on the specialized class that is generated for the particular application data-type that is being taken.

Parameters

received_data	*<<**in**>> (p. 404)* user data type-specific com.rti.dds.infrastructure.com.rti.dds.util.Sequence object where the received data samples was obtained from earlier invocation of read or take on the **com.rti.dds.subscription.DataReader** (p. 707). Must be a valid non-NULL **FooSeq** (p. 1408). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.

Parameters

info_seq	<<***in***>> *(*p. *404)* a **com.rti.dds.subscription.SampleInfoSeq** (p. 1957) object where the received sample info was obtained from earlier invocation of read or take on the **com.rti.dds.subscription.DataReader** (p. 707). Must be a valid non-NULL **com.rti.dds.subscription.SampleInfoSeq** (p. 1957). The method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if it is NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

References **DataReader.return_loan_untyped()**.

8.124.2.16 get_key_value()

```
void get_key_value (
               Foo key_holder,
               InstanceHandle_t handle )
```

Retrieve the instance `key` that corresponds to an instance `handle`.

Useful for keyed data types.

The operation will only fill the fields that form the `key` inside the `key_holder` instance. If the type has no keys, this method has no effect and exits with no error.

For keyed data types, this operation may fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if the `handle` does not correspond to an existing data-object known to the **com.rti.dds.subscription.DataReader** (p. 707).

Parameters

key_holder	<<***inout***>> *(*p. *404)* a user data type specific key holder, whose `key` fields are filled by this operation. If **com.rti.ndds.example.Foo** (p. 1358) has no key, this method has no effect. This method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if `key_holder` is NULL.
handle	<<***in***>> *(*p. *404)* the `instance` whose key is to be retrieved. If **com.rti.ndds.example.Foo** (p. 1358) *has* a key, `handle` must represent an existing instance of type **com.rti.ndds.example.Foo** (p. 1358) known to the **com.rti.dds.subscription.DataReader** (p. 707). Otherwise, this method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899).

If **com.rti.ndds.example.Foo** (p. 1358) *has* a key and `handle` is **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447), this method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899).

If **com.rti.ndds.example.Foo** (p. 1358) has a key and `handle` represents an instance of another type or an instance of type **com.rti.ndds.example.Foo** (p. 1358) that has been unregistered, this method will fail with **com.rti.↩ dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899). If **com.rti.ndds.example.Foo** (p. 1358) has no key, this method has no effect.

This method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if `handle` is NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

See also

com.rti.ndds.example.FooDataWriter.get_key_value (p. 1406)

References **DataReader.get_key_value_untyped()**.

8.124.2.17 lookup_instance()

```
InstanceHandle_t lookup_instance (
            Foo key_holder )
```

Retrieves the instance `handle` that corresponds to an instance `key_holder`.

Useful for keyed data types.

This operation takes as a parameter an instance and returns a handle that can be used in subsequent operations that accept an instance handle as an argument. The instance parameter is only used for the purpose of examining the fields that define the key. If the instance is unknown to the DataReader, or if for any other reason the Service is unable to provide an instance handle, the Service will return the special value **com.rti.dds.infrastructure.InstanceHandle_t.↩ HANDLE_NIL** (p. 1447).

Parameters

key_holder	<<***in***>> *(*p. *404)* a user data type specific key holder.

Returns

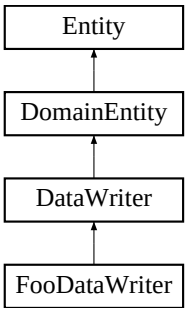
the instance handle associated with this instance. If **com.rti.ndds.example.Foo** (p. 1358) has no key, this method has no effect and returns **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447)

References **DataReader.lookup_instance_untyped()**.

8.125 FooDataWriter Class Reference

*<<**interface**>> (p. 403) <<**generic**>> (p. 403)* User data type specific data writer.

Inheritance diagram for FooDataWriter:



Public Member Functions

- **InstanceHandle_t register_instance** (**Foo** instance_data)

  Informs RTI Connext that the application will be modifying a particular instance.
- **InstanceHandle_t register_instance_w_timestamp** (**Foo** instance_data, **Time_t** source_timestamp)

  Performs the same functions as register_instance except that the application provides the value for the `source_timestamp`.
- **InstanceHandle_t register_instance_w_params** (**Foo** instance_data, **WriteParams_t** params)

  *Performs the same function as **com.rti.ndds.example.FooDataWriter.register_instance** (p. 1390) and **com.rti.ndds.example.FooDataWriter.register_instance_w_timestamp** (p. 1391) except that it also provides the values contained in* `params`.
- void **unregister_instance** (**Foo** instance_data, **InstanceHandle_t** handle)

  *Reverses the action of **com.rti.ndds.example.FooDataWriter.register_instance** (p. 1390).*
- void **unregister_instance_w_timestamp** (**Foo** instance_data, **InstanceHandle_t** handle, **Time_t** source_timestamp)

  *Performs the same function as **com.rti.ndds.example.FooDataWriter.unregister_instance** (p. 1392) except that it also provides the value for the* `source_timestamp`.
- void **unregister_instance_w_params** (**Foo** instance_data, **WriteParams_t** params)

  *Performs the same function as **com.rti.ndds.example.FooDataWriter.unregister_instance** (p. 1392) and com.rti.ndds.example.FooDataWriter.FooDataWriter.unregister_instance_w_timestamp except that it also provides the values contained in* `params`.
- void **write** (**Foo** instance_data, **InstanceHandle_t** handle)

  Modifies the value of a data instance.
- void **write_w_timestamp** (**Foo** instance_data, **InstanceHandle_t** handle, **Time_t** source_timestamp)

  *Performs the same function as **com.rti.ndds.example.FooDataWriter.write** (p. 1397) except that it also provides the value for the* `source_timestamp`.
- void **write_w_params** (**Foo** instance_data, **WriteParams_t** params)

  *Performs the same function as **com.rti.ndds.example.FooDataWriter.write** (p. 1397) and **com.rti.ndds.example.FooDataWriter.write_w_timestamp** (p. 1401) except that it also provides the values contained in* `params`.
- void **dispose** (**Foo** instance_data, **InstanceHandle_t** instance_handle)

  Requests the middleware to delete the instance.

- void **dispose_w_timestamp** (**Foo** instance_data, **InstanceHandle_t** instance_handle, **Time_t** source_↩ timestamp)

  Performs the same functions as dispose except that the application provides the value for the `source_timestamp` *that is made available to* ***com.rti.dds.subscription.DataReader*** *(*p. *707) objects by means of the* `source_timestamp` *attribute inside the* ***com.rti.dds.subscription.SampleInfo*** *(*p. *1944).*
- void **dispose_w_params** (**Foo** instance_data, **WriteParams_t** params)

  Performs the same function as ***com.rti.ndds.example.FooDataWriter.dispose*** *(*p. *1403) and* ***com.rti.ndds.example.↩ FooDataWriter.dispose_w_timestamp*** *(*p. *1405) except that it also provides the values contained in* `params`*.*
- void **get_key_value** (**Foo** key_holder, **InstanceHandle_t** handle)

  Retrieve the instance `key` *that corresponds to an instance* `handle`*.*
- **InstanceHandle_t lookup_instance** (**Foo** key_holder)

  Retrieve the instance `handle` *that corresponds to an instance* `key_holder`*.*

8.125.1 Detailed Description

<<***interface***>> *(*p. *403)* <<***generic***>> *(*p. *403)* User data type specific data writer.

Defines the user data type specific writer interface generated for each application class.

The concrete user data type writer automatically generated by the implementation is an incarnation of this class.

8.125.2 Member Function Documentation

8.125.2.1 register_instance()

```
InstanceHandle_t register_instance (
            Foo instance_data )
```

Informs RTI Connext that the application will be modifying a particular instance.

This operation is only useful for keyed data types. Using it for non-keyed types causes no effect and returns **com.↩ rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447). The operation takes as a parameter an instance (of which only the key value is examined) and returns a `handle` that can be used in successive **write()** (p. 1397) or **dispose()** (p. 1403) operations.

The operation gives RTI Connext an opportunity to pre-configure itself to improve performance.

The use of this operation by an application is optional even for keyed types. If an instance has not been pre-registered, the application can use the special value **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447) as the **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443) parameter to the write or dispose operation and RTI Connext will auto-register the instance.

For best performance, the operation should be invoked prior to calling any operation that modifies the instance, such as **com.rti.ndds.example.FooDataWriter.write** (p. 1397), **com.rti.ndds.example.FooDataWriter.write_w_↩ timestamp** (p. 1401), **com.rti.ndds.example.FooDataWriter.dispose** (p. 1403) and **com.rti.ndds.example.Foo↩ DataWriter.dispose_w_timestamp** (p. 1405) and the handle used in conjunction with the data for those calls.

When this operation is used, RTI Connext will automatically supply the value of the `source_timestamp` that is used.

This operation may fail and return **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447) if **com.rti.↩ dds.infrastructure.ResourceLimitsQosPolicy.max_instances** (p. 1896) limit has been exceeded.

The operation is **idempotent**. If it is called for an already registered instance, it just returns the already allocated handle. This may be used to lookup and retrieve the handle allocated to a given instance.

This operation can only be called after **com.rti.dds.publication.DataWriter** (p. 818) has been enabled. Otherwise, **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447) will be returned.

Parameters

instance_data	*<<**in**>> (p. 404)* The instance that should be registered. Of this instance, only the fields that represent the key are examined by the function. Cannot be NULL.

Returns

For keyed data type, a handle that can be used in the calls that take a **com.rti.dds.infrastructure.Instance↩ Handle_t** (p. 1443), such as write, dispose, unregister_instance, or return **com.rti.dds.infrastructure.Instance↩ Handle_t.HANDLE_NIL** (p. 1447) on failure. If the instance_data is of a data type that has no keys, this function always returns **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447).

See also

com.rti.ndds.example.FooDataWriter.unregister_instance (p. 1392), **com.rti.ndds.example.FooData↩ Writer.get_key_value** (p. 1406), **Relationship between registration, liveliness and ownership** (p. 1642)

References **DataWriter.register_instance_untyped()**.

8.125.2.2 register_instance_w_timestamp()

```
InstanceHandle_t register_instance_w_timestamp (
            Foo instance_data,
            Time_t source_timestamp )
```

Performs the same functions as register_instance except that the application provides the value for the `source_↩ timestamp`.

The provided `source_timestamp` potentially affects the relative order in which readers observe events from multiple writers. Refer to **DESTINATION_ORDER** (p. 468) QoS policy for details.

This operation may fail and return **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447) if **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_instances** (p. 1896) limit has been exceeded.

This operation can only be called after **com.rti.dds.publication.DataWriter** (p. 818) has been enabled. Otherwise, **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447) will be returned.

Parameters

instance_data	<<***in***>> *(p. 404)* The instance that should be registered. Of this instance, only the fields that represent the key are examined by the function. Cannot be NULL.
source_timestamp	<<***in***>> *(p. 404)* The timestamp value must be greater than or equal to the timestamp value used in the last writer operation (used in a *register*, *unregister*, *dispose*, or *write*, with either the automatically supplied timestamp or the application provided timestamp). This timestamp may potentially affect the order in which readers observe events from multiple writers. Cannot be NULL.

Returns

For keyed data type, return a handle that can be used in the calls that take a **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443), such as write, dispose, unregister_instance, or return **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447) on failure. If the instance_data is of a data type that has no keys, this function always return **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447).

See also

com.rti.ndds.example.FooDataWriter.unregister_instance (p. 1392), **com.rti.ndds.example.FooDataWriter.get_key_value** (p. 1406)

References **DataWriter.register_instance_w_timestamp_untyped()**.

8.125.2.3 register_instance_w_params()

```
InstanceHandle_t register_instance_w_params (
            Foo instance_data,
            WriteParams_t params )
```

Performs the same function as **com.rti.ndds.example.FooDataWriter.register_instance** (p. 1390) and **com.rti.ndds.example.FooDataWriter.register_instance_w_timestamp** (p. 1391) except that it also provides the values contained in `params`.

See also

com.rti.ndds.example.FooDataWriter.write_w_params (p. 1402)

8.125.2.4 unregister_instance()

```
void unregister_instance (
              Foo instance_data,
              InstanceHandle_t handle )
```

Reverses the action of **com.rti.ndds.example.FooDataWriter.register_instance** (p. 1390).

This operation is useful only for keyed data types. Using it for non-keyed types causes no effect and reports no error. The operation takes as a parameter an instance (of which only the key value is examined) and a handle.

This operation should only be called on an instance that is currently registered. This includes instances that have been auto-registered by calling operations such as write or dispose as described in **com.rti.ndds.example.FooDataWriter.register_instance** (p. 1390). Otherwise, this operation may fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899).

This only need be called just once per instance, regardless of how many times register_instance was called for that instance.

When this operation is used, RTI Connext will automatically supply the value of the `source_timestamp` that is used.

This operation informs RTI Connext that the **com.rti.dds.publication.DataWriter** (p. 818) is no longer going to provide any information about the instance. This operation also indicates that RTI Connext can locally remove all information regarding that instance. The application should not attempt to use the `handle` previously allocated to that instance after calling this function.

The special value **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447) can be used for the parameter `handle`. This indicates that the identity of the instance should be automatically deduced from the `instance_data` (by means of the `key`).

If `handle` is any value other than **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447), then it must correspond to an instance that has been registered. If there is no correspondence, the operation will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899).

RTI Connext will not detect the error when the handle is any value other than **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447), corresponds to an instance that has been registered, but does not correspond to the instance deduced from the `instance_data` (by means of the `key`). RTI Connext will treat as if the **unregister_instance()** (p. 1392) operation is for the instance as indicated by the `handle`.

If, after a **com.rti.ndds.example.FooDataWriter.unregister_instance** (p. 1392), the application wants to modify (**com.rti.ndds.example.FooDataWriter.write** (p. 1397) or **com.rti.ndds.example.FooDataWriter.dispose** (p. 1403)) an instance, it has to register it again, or else use the special `handle` value **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447).

This operation does not indicate that the instance is deleted (that is the purpose of **com.rti.ndds.example.FooDataWriter.dispose** (p. 1403)). The operation **com.rti.ndds.example.FooDataWriter.unregister_instance** (p. 1392) just indicates that the **com.rti.dds.publication.DataWriter** (p. 818) no longer has anything to say about the instance. **com.rti.dds.subscription.DataReader** (p. 707) entities that are reading the instance may receive a sample with **com.rti.dds.subscription.InstanceStateKind.NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 1452) for the instance, unless there are other **com.rti.dds.publication.DataWriter** (p. 818) objects writing that same instance.

com.rti.dds.infrastructure.WriterDataLifecycleQosPolicy.autodispose_unregistered_instances (p. 2321) controls whether instances are automatically disposed when they are unregistered.

This operation can affect the ownership of the data instance (see **OWNERSHIP** (p. 494)). If the **com.rti.dds.publication.DataWriter** (p. 818) was the exclusive owner of the instance, then calling **unregister_instance()** (p. 1392) will relinquish that ownership.

If **com.rti.dds.infrastructure.ReliabilityQosPolicy.kind** (p. 1831) is set to **com.rti.dds.infrastructure.ReliabilityQosPolicyKind.RELIABLE_RELIABILITY_QOS** (p. 1836) and the unregistration would overflow the resource limits of this writer or of a reader, this operation may block for up to **com.rti.dds.infrastructure.ReliabilityQosPolicy.max_blocking_time** (p. 1831); if this writer is still unable to unregister after that period, this method will fail with **com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904).

Parameters

instance_data	<<***in***>> *(p. 404)* The instance that should be unregistered. If **com.rti.ndds.example.Foo** (p. 1358) *has* a key and `instance_handle` is **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447), only the fields that represent the key are examined by the function. Otherwise, `instance_data` is not used. If `instance_data` is used, it must represent an instance that has been registerd. Otherwise, this method may fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) . If **com.rti.ndds.example.Foo** (p. 1358) *has* a key, `instance_data` can be NULL only if `handle` is not **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447). Otherwise, this method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899).
handle	<<***in***>> *(p. 404)* represents the `instance` to be unregistered. If **com.rti.ndds.example.Foo** (p. 1358) *has* a key and `handle` is **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447), `handle` is not used and `instance` is deduced from `instance_data`. If **com.rti.ndds.example.Foo** (p. 1358) has no key, `handle` is not used. If `handle` is used, it must represent an instance that has been registered. Otherwise, this method may fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899). This method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if `handle` is NULL. If **com.rti.ndds.example.Foo** (p. 1358) *has* a key, `handle` cannot be **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447) if `instance_data` is NULL. Otherwise, this method will report the error **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899).

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902)

See also

com.rti.ndds.example.FooDataWriter.register_instance (p. 1390)

com.rti.ndds.example.FooDataWriter.FooDataWriter.unregister_instance_w_timestamp

com.rti.ndds.example.FooDataWriter.get_key_value (p. 1406)

Relationship between registration, liveliness and ownership (p. 1642)

References **DataWriter.unregister_instance_untyped()**.

8.125.2.5 unregister_instance_w_timestamp()

```
void unregister_instance_w_timestamp (
                Foo instance_data,
                InstanceHandle_t handle,
                Time_t source_timestamp )
```

Performs the same function as **com.rti.ndds.example.FooDataWriter.unregister_instance** (p. 1392) except that it also provides the value for the `source_timestamp`.

The provided `source_timestamp` potentially affects the relative order in which readers observe events from multiple writers. Refer to **DESTINATION_ORDER** (p. 468) QoS policy for details.

The constraints on the values of the `handle` parameter and the corresponding error behavior are the same specified for the **com.rti.ndds.example.FooDataWriter.unregister_instance** (p. 1392) operation.

This operation may block and may time out (**com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904)) under the same circumtances described for the unregister_instance operation.

Parameters

instance_data	<<***in***>> *(p. 404)* The instance that should be unregistered. If **com.rti.ndds.example.Foo** (p. 1358) *has* a key and `instance_handle` is **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447), only the fields that represent the key are examined by the function. Otherwise, `instance_data` is not used. If `instance_data` is used, it must represent an instance that has been registerd. Otherwise, this method may fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899). If **com.rti.ndds.example.Foo** (p. 1358) *has* a key, `instance_data` can be NULL only if `handle` is not **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447). Otherwise, this method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899).
handle	<<***in***>> *(p. 404)* represents the `instance` to be unregistered. If **com.rti.ndds.example.Foo** (p. 1358) *has* a key and `handle` is **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447), `handle` is not used and `instance` is deduced from `instance_data`. If **com.rti.ndds.example.Foo** (p. 1358) has no key, `handle` is not used. If `handle` is used, it must represent an instance that has been registered. Otherwise, this method may fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899). This method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if `handle` is NULL. If **com.rti.ndds.example.Foo** (p. 1358) *has* a key, `handle` cannot be **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447) if `instance_data` is NULL. Otherwise, this method will report the error **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899).
source_timestamp	<<***in***>> *(p. 404)* The timestamp value must be greater than or equal to the timestamp value used in the last writer operation (used in a *register*, *unregister*, *dispose*, or *write*, with either the automatically supplied timestamp or the application provided timestamp). This timestamp may potentially affect the order in which readers observe events from multiple writers. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

See also

com.rti.ndds.example.FooDataWriter.register_instance (p. 1390)

com.rti.ndds.example.FooDataWriter.unregister_instance (p. 1392)

com.rti.ndds.example.FooDataWriter.get_key_value (p. 1406)

References **DataWriter.unregister_instance_w_timestamp_untyped()**.

8.125.2.6 unregister_instance_w_params()

```
void unregister_instance_w_params (
              Foo instance_data,
              WriteParams_t params )
```

Performs the same function as **com.rti.ndds.example.FooDataWriter.unregister_instance** (p. 1392) and com.rti.↩ ndds.example.FooDataWriter.FooDataWriter.unregister_instance_w_timestamp except that it also provides the values contained in `params`.

See also

com.rti.ndds.example.FooDataWriter.write_w_params (p. 1402)

com.rti.ndds.example.FooDataWriter.dispose_w_params (p. 1406)

8.125.2.7 write()

```
void write (
              Foo instance_data,
              InstanceHandle_t handle )
```

Modifies the value of a data instance.

When this operation is used, RTI Connext will automatically supply the value of the `source_timestamp` that is made available to **com.rti.dds.subscription.DataReader** (p. 707) objects by means of the `source_timestamp` attribute inside the **com.rti.dds.subscription.SampleInfo** (p. 1944). (Refer to **com.rti.dds.subscription.SampleInfo** (p. 1944) and **DESTINATION_ORDER** (p. 468) QoS policy for details).

As a side effect, this operation asserts liveliness on the **com.rti.dds.publication.DataWriter** (p. 818) itself, the **com.↩ rti.dds.publication.Publisher** (p. 1767) and the **com.rti.dds.domain.DomainParticipant** (p. 948).

Note that the special value **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447) can be used for the parameter `handle`. This indicates the identity of the instance should be automatically deduced from the `instance↩ _data` (by means of the `key`).

If `handle` is any value other than **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447), then it must correspond to an instance that has been registered. If there is no correspondence, the operation will fail with **com.rti.↩ dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899).

RTI Connext will not detect the error when the handle is any value other than **com.rti.dds.infrastructure.Instance↩ Handle_t.HANDLE_NIL** (p. 1447), corresponds to an instance that has been registered, but does not correspond to the instance deduced from the `instance_data` (by means of the `key`). RTI Connext will treat as if the **write()** (p. 1397) operation is for the instance as indicated by the `handle`.

This operation may block if the **RELIABILITY** (p. 510) `kind` is set to **com.rti.dds.infrastructure.ReliabilityQos↩ PolicyKind.RELIABLE_RELIABILITY_QOS** (p. 1836) and the modification would cause data to be lost or else cause one of the limits specified in the **RESOURCE_LIMITS** (p. 511) to be exceeded.

This operation will not block when using **com.rti.dds.infrastructure.ReliabilityQosPolicyKind.BEST_EFFORT_RELIABILITY_QOS** (p. 1836). If you are using BEST_EFFORT Reliability in combination with com.rti.dds.infrastructure.PublishModeQosPolicyKind.PublishModeQosPolicyKind.ASYNCHRONOUS_PUBLISH_MODE_QOS, then instead of being blocked, samples that are queued to be sent by the asynchronous publishing thread will be overwritten when the number of DDS samples that are currently queued has reached the `depth` QoS value in the **com.rti.dds.infrastructure.HistoryQosPolicy** (p. 1435).

If **com.rti.dds.infrastructure.ReliabilityQosPolicy.max_blocking_time** (p. 1831) elapses before the **com.rti.dds.publication.DataWriter** (p. 818) can store the modification without exceeding the limits, the operation will fail and return **com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904) for KEEP_ALL configurations.

Here is how the write operation behaves when com.rti.dds.infrastructure.HistoryQosPolicyKind.HistoryQosPolicyKind.KEEP_LAST_HISTORY_QOS and **com.rti.dds.infrastructure.ReliabilityQosPolicyKind.RELIABLE_RELIABILITY_QOS** (p. 1836) are used:

- The send window size is determined by the **com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t.max_send_window_size** (p. 1924) and **com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t.min_send_window_size** (p. 1924) fields in the **com.rti.dds.infrastructure.DataWriterProtocolQosPolicy** (p. 860). If a send window is specified (max_send_window_size is not UNLIMITED) and the window is full, the write operation will block until one of the samples in the send window is protocol-acknowledged (ACKed) (1) or until the **com.rti.dds.infrastructure.ReliabilityQosPolicy.max_blocking_time** (p. 1831) expires.
- Then, the **com.rti.dds.publication.DataWriter** (p. 818) will try to add the new sample to the writer history.
- If the instance associated with the sample is present in the writer history and there are `depth` (in the **HISTORY** (p. 487)) samples in the instance, the DataWriter will replace the oldest sample of that instance independently of that sample's acknowledged status, and the write operation will return com.rti.dds.infrastructure.RETCODE_OK. Otherwise, no sample will be replaced and the write operation will continue.
- If the instance associated with the sample is not present in the writer history and **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_instances** (p. 1896) is exceeded, the DataWriter will try to replace an existing instance (and its samples) according to the value of **com.rti.dds.infrastructure.DataWriterResourceLimitsQosPolicy.instance_replacement** (p. 896) (see **com.rti.dds.infrastructure.DataWriterResourceLimitsInstanceReplacementKind** (p. 889)).
  - If no instance can be replaced, the write operation returns **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903).
- If **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_samples** (p. 1896) is exceeded, the DataWriter will try to drop a sample from a different instance as follows:
  - The DataWriter will try first to remove a fully ACKed (2) sample from a different instance 'I' as long as that sample is not the last remaining sample for the instance 'I'. To find this sample, the DataWriter starts iterating from the oldest sample in the writer history to the newest sample.
  - If no such sample is found, the DataWriter will replace the oldest sample in the writer history.
- The sample is added to the writer history, and the write operation returns com.rti.dds.infrastructure.RETCODE_OK.

Here is how the write operation behaves when com.rti.dds.infrastructure.HistoryQosPolicyKind.HistoryQosPolicyKind.KEEP_ALL_HISTORY_QOS and **com.rti.dds.infrastructure.ReliabilityQosPolicyKind.RELIABLE_RELIABILITY_QOS** (p. 1836) are used:

- The send window size is determined by the **com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t.max_send_window_size** (p. 1924) and **com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t.min_send_window_size** (p. 1924) fields in the **DATA_WRITER_PROTOCOL** (p. 465). If a send window is specified (max_send_window_size is not UNLIMITED) and the window is full, the write operation will block until one of the samples in the send window is protocol-acknowledged (ACKed) (1) or until the **com.rti.dds.infrastructure.ReliabilityQosPolicy.max_blocking_time** (p. 1831) expires.
  - If the max_blocking_time expires, the write operation returns **com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904).
- When a sample is protocol-ACKed (1) before max_blocking_time expires, the DataWriter will try to add the sample to the writer history as follows:
  - If the instance associated with the sample is not present in the writer history and max_instances is exceeded, the DataWriter will try to replace an existing instance (and its samples) according to the value of **com.rti.dds.infrastructure.DataWriterResourceLimitsQosPolicy.instance_replacement** (p. 896) (see **com.rti.dds.infrastructure.DataWriterResourceLimitsInstanceReplacementKind** (p. 889)).
    - If no instance can be replaced, the write operation returns **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903).
  - If **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_samples** (p. 1896) is exceeded, the DataWriter will go through the samples in the order in which they were added, and it will replace the first sample that is fully ACKed (2).
    - If no fully ACKed sample is found, the DataWriter will block (3) until a sample is fully ACKed and can be replaced or **com.rti.dds.infrastructure.ReliabilityQosPolicy.max_blocking_time** (p. 1831) expires. If the max_blocking_time expires, the write operation will return **com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904).
  - If **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_samples_per_instance** (p. 1897) is exceeded, the DataWriter will go through the samples of the instance in the order in which they were added, and it will replace the first sample that is fully ACKed.
    - If no fully ACKed sample is found, the DataWriter will block (3) until a sample is fully ACKed and can be replaced or the max_blocking_time expires. If the max_blocking_time expires, the write operation will return **com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904).
  - The sample is added to the writer history, and the write operation returns com.rti.dds.infrastructure.RETCODE_OK.

If there are no instance resources left, this operation may fail with **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903). Calling **com.rti.ndds.example.FooDataWriter.unregister_instance** (p. 1392) may help freeing up some resources.

This operation will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903) if the timestamp is less than the timestamp used in the last writer operation (*register*, *unregister*, *dispose*, or *write*, with either the automatically supplied timestamp or the application-provided timestamp).

See **com.rti.dds.infrastructure.ReliabilityQosPolicyAcknowledgmentModeKind** (p. 1834) for more information on the following notes:

(1) A sample in the writer history is considered "protocol ACKed" when the sample has been individually ACKed at the RTPS protocol level by each one of the DataReaders that matched the DataWriter at the moment the sample was added to the writer queue.

- Late joiners do not change the protocol ACK state of a sample. If a sample is marked as protocol ACKed because it has been acknowledged by all the matching DataReaders and a DataReader joins later on, the historical sample is still considered protocol ACKed even if it has not been received by the late joiner.

- If a sample 'S1' is protocol ACKed and a TopicQuery is received, triggering the publication of 'S1', the sample is still considered protocol ACKed. If a sample 'S1' is not ACKed and a TopicQuery is received triggering the publication of 'S1', the DataWriter will require that both the matching DataReaders on the live RTPS channel and the DataReader on the TopicQuery channel individually protocol ACK the sample in order to consider the sample protocol ACKed.

(2) A sample in the writer history is considered "fully ACKed" when all of the following conditions are met:

- The sample is protocol-ACKed.
- The sample has been "application-level ACKed" by all the DataReaders matching the DataWriter that have their **com.rti.dds.infrastructure.ReliabilityQosPolicy.acknowledgment_kind** (p. 1832) set to **com.rti.dds.infrastructure.ReliabilityQosPolicyAcknowledgmentModeKind.APPLICATION_EXPLICIT_↩ ACKNOWLEDGMENT_MODE** (p. 1835) or **com.rti.dds.infrastructure.ReliabilityQosPolicyAcknowledgment↩ ModeKind.APPLICATION_AUTO_ACKNOWLEDGMENT_MODE** (p. 1834). Once the sample is application-level ACKed, it cannot change its status to not ACKed after new DataReaders are matched. (Application-level ACK occurs when the application acknowledges receipt of a sample.)
- If required subscriptions are enabled (see **com.rti.dds.infrastructure.AvailabilityQosPolicy** (p. 597)), the sample must also be ACKed by all the required subscriptions configured on the DataWriter.

(3) It is possible within a single call to the write operation for a DataWriter to block both when the send window is full and then again when **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_samples** (p. 1896) or **com.rti.↩ dds.infrastructure.ResourceLimitsQosPolicy.max_samples_per_instance** (p. 1897) is exceeded. This can happen because blocking on the send window only considers protocol-ACKed samples, while blocking based on resource limits considers fully-ACKed samples. In any case, the total max blocking time of a single call to the write operation will not exceed **com.rti.dds.infrastructure.ReliabilityQosPolicy.max_blocking_time** (p. 1831).

Parameters

instance_data	*<<**in**>> (p. 404)* The data to write.

This method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if `instance_data` is NULL.

Parameters

handle	*<<**in**>> (p. 404)* Either the handle returned by a previous call to **com.rti.ndds.example.FooDataWriter.register_instance** (p. 1390), or else the special value **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447). If **com.rti.ndds.example.Foo** (p. 1358) *has* a key and `handle` is not **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447), `handle` must represent a registered instance of type **com.rti.ndds.example.Foo** (p. 1358). Otherwise, this method may fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899).

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903), **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903), or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

MT Safety:

It is UNSAFE to modify `instance_data` before the operation has finished. The operation is otherwise SAFE.

com.rti.dds.subscription.DataReader (p. 707)

com.rti.ndds.example.FooDataWriter.write_w_timestamp (p. 1401)

DESTINATION_ORDER (p. 468)

References **DataWriter.write_untyped()**.

8.125.2.8 write_w_timestamp()

```
void write_w_timestamp (
                Foo instance_data,
                InstanceHandle_t handle,
                Time_t source_timestamp )
```

Performs the same function as **com.rti.ndds.example.FooDataWriter.write** (p. 1397) except that it also provides the value for the `source_timestamp`.

Explicitly provides the timestamp that will be available to the **com.rti.dds.subscription.DataReader** (p. 707) objects by means of the `source_timestamp` attribute inside the **com.rti.dds.subscription.SampleInfo** (p. 1944). (Refer to **com.rti.dds.subscription.SampleInfo** (p. 1944) and **DESTINATION_ORDER** (p. 468) QoS policy for details)

The constraints on the values of the `handle` parameter and the corresponding error behavior are the same specified for the **com.rti.ndds.example.FooDataWriter.write** (p. 1397) operation.

This operation may block and time out (**com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904)) under the same circumtances described for **com.rti.ndds.example.FooDataWriter.write** (p. 1397).

If there are no instance resources left, this operation may fail with **com.rti.dds.infrastructure.RETCODE_OUT_OF_↩ RESOURCES** (p. 1903). Calling **com.rti.ndds.example.FooDataWriter.unregister_instance** (p. 1392) may help free up some resources.

This operation may fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) under the same circumstances described for the write operation.

Parameters

instance_data	<<***in***>> *(p. 404)* The data to write. This method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if `instance_data` is NULL.
handle	<<***in***>> *(p. 404)* Either the handle returned by a previous call to **com.rti.ndds.example.FooDataWriter.register_instance** (p. 1390), or else the special value **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447). If **com.rti.ndds.example.Foo** (p. 1358) *has* a key and `handle` is not **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447), `handle` must represent a registered instance of type **com.rti.ndds.example.Foo** (p. 1358). Otherwise, this method may fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899). This method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if `handle` is NULL.
source_timestamp	<<***in***>> *(p. 404)* When using com.rti.dds.infrastructure.DestinationOrderQosPolicyKind.↩ DestinationOrderQosPolicyKind.BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS the timestamp value must be greater than or equal to the timestamp value used in the last writer operation (*register*, *unregister*, *dispose*, or *write*, with either the automatically supplied timestamp or the application-provided timestamp) However, if it is less than the timestamp of the previous operation but the difference is less than the **com.rti.dds.infrastructure.DestinationOrderQosPolicy.source_timestamp_tolerance** (p. 905), the timestamp of the previous operation will be used as the source timestamp of this sample. Otherwise, if the difference is greater than **com.rti.dds.infrastructure.DestinationOrderQosPolicy.source_timestamp_tolerance** (p. 905), the function will return **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899).

Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904), **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903), or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

com.rti.ndds.example.FooDataWriter.write (p. 1397)

com.rti.dds.subscription.DataReader (p. 707)

DESTINATION_ORDER (p. 468)

References **DataWriter.write_w_timestamp_untyped()**.

8.125.2.9 write_w_params()

```
void write_w_params (
            Foo instance_data,
            WriteParams_t params )
```

Performs the same function as **com.rti.ndds.example.FooDataWriter.write** (p. 1397) and **com.rti.ndds.example.↩ FooDataWriter.write_w_timestamp** (p. 1401) except that it also provides the values contained in `params`.

Allows provision of the sample identity, related sample identity, source timestamp, instance handle, and publication priority contained in `params`.

This operation may block and time out (**com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904)) under the same circumstances described for **com.rti.ndds.example.FooDataWriter.write** (p. 1397).

If there are no instance resources left, this operation may fail with **com.rti.dds.infrastructure.RETCODE_OUT_OF↩ _RESOURCES** (p. 1903). Calling **com.rti.ndds.example.FooDataWriter.unregister_instance_w_params** (p. 1396) may help free up some resources.

This operation may fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) under the same circumstances described for the **com.rti.ndds.example.FooDataWriter.write** (p. 1397).

Parameters

instance_data	<<***in***>> *(*p. *404)* The data to write. This method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if `instance_data` is NULL.
params	<<***inout***>> *(*p. *404)* The write parameters. Note that this is an inout parameter if you activate com.rti.dds.infrastructure.WriteParams_t.replace_auto; otherwise it won't be modified. This method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if `params` is NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904), **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

See also

com.rti.ndds.example.FooDataWriter.write (p. 1397)

com.rti.dds.subscription.DataReader (p. 707)

8.125.2.10 dispose()

```
void dispose (
                Foo instance_data,
                InstanceHandle_t instance_handle )
```

Requests the middleware to delete the instance.

This operation is useful only for keyed data types. Using it for non-keyed types has no effect and reports no error.

When an instance is disposed, the **com.rti.dds.publication.DataWriter** (p. 818) communicates this state change to **com.rti.dds.subscription.DataReader** (p. 707) objects by propagating a dispose sample. When the instance changes to a disposed state, you can see the state change on the DataReader by looking at **com.rti.dds.subscription.SampleInfo.instance_state** (p. 1949). Disposed instances have the value **com.rti.dds.subscription.InstanceStateKind.NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 1452).

The resources allocated to dispose instances on the DataWriter are not removed by default. The removal of the resources allocated to a dispose instance on the DataWriter queue can be controlled by using the QoS **com.rti.dds.infrastructure.WriterDataLifecycleQosPolicy.autopurge_disposed_instances_delay** (p. 2322).

Likewise, on the DataReader, the removal of the resources associated with an instance in the dispose state can be controlled by using the QoS **com.rti.dds.infrastructure.ReaderDataLifecycleQosPolicy.autopurge_disposed_instances_delay** (p. 1824).

This operation does not modify the value of the instance. The `instance_data` parameter is passed just for the purposes of identifying the instance.

When this operation is used, RTI Connext will automatically supply the value of the `source_timestamp` that is made available to **com.rti.dds.subscription.DataReader** (p. 707) objects by means of the source_timestamp attribute inside the **com.rti.dds.subscription.SampleInfo** (p. 1944).

The constraints on the values of the handle parameter and the corresponding error behavior are the same specified for the **com.rti.ndds.example.FooDataWriter.unregister_instance** (p. 1392) operation.

The special value **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447) can be used for the parameter `instance_handle`. This indicates the identity of the instance should be automatically deduced from the `instance_data` (by means of the `key`).

If `instance_handle` is any value other than **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447), then it must correspond to an instance that has been registered. If there is no correspondence, the operation will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899).

RTI Connext will not detect the error when the `instance_handle` is any value other than **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447), and the `instance_handle` corresponds to an instance that has been registered but does not correspond to the instance deduced from the `instance_data` (by means of the `key`). In this case, the instance that will be disposed is the instance corresponding to the `instance_handle`, not to the `instance_data`.

This operation may block and time out (**com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904)) under the same circumstances described for **com.rti.ndds.example.FooDataWriter.write** (p. 1397).

If there are no instance resources left, this operation may fail with **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903). Calling **com.rti.ndds.example.FooDataWriter.unregister_instance** (p. 1392) may help free up some resources.

Parameters

instance_data	*<<**in**>> (p. 404)* The data to dispose. If **com.rti.ndds.example.Foo** (p. 1358) *has* a key and `instance_handle` is **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447), only the fields that represent the key are examined by the function. Otherwise, `instance_data` is not used. If **com.rti.ndds.example.Foo** (p. 1358) *has* a key, `instance_data` can be NULL only if `instance_handle` is not **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447). Otherwise, this method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899).

Parameters

instance_handle	<<***in***>> *(*p. *404)* Either the handle returned by a previous call to **com.rti.ndds.example.FooDataWriter.register_instance** (p. 1390), or else the special value **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447). If **com.rti.ndds.example.Foo** (p. 1358) *has* a key and `instance_handle` is **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447), `instance_handle` is not used and it is deduced from `instance_data`. If **com.rti.ndds.example.Foo** (p. 1358) has no key, `instance_handle` is not used. If `instance_handle` is used, it must represent an instance of type **com.rti.ndds.example.Foo** (p. 1358) that has been written or registered with this writer. Otherwise, this method fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899). This method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if `instance_handle` is NULL. If **com.rti.ndds.example.Foo** (p. 1358) *has* a key, `instance_handle` cannot be **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447) if `instance_data` is NULL. Otherwise, this method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899).

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904), **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

See also

com.rti.ndds.example.FooDataWriter.dispose_w_timestamp (p. 1405)

Relationship between registration, liveliness and ownership (p. 1642)

References **DataWriter.dispose_untyped()**.

8.125.2.11 dispose_w_timestamp()

```
void dispose_w_timestamp (
              Foo instance_data,
              InstanceHandle_t instance_handle,
              Time_t source_timestamp )
```

Performs the same functions as dispose except that the application provides the value for the `source_timestamp` that is made available to **com.rti.dds.subscription.DataReader** (p. 707) objects by means of the `source_timestamp` attribute inside the **com.rti.dds.subscription.SampleInfo** (p. 1944).

The constraints on the values of the `handle` parameter and the corresponding error behavior are the same specified for the **com.rti.ndds.example.FooDataWriter.dispose** (p. 1403) operation.

This operation may block and time out (**com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904)) under the same circumtances described for **com.rti.ndds.example.FooDataWriter.write** (p. 1397).

If there are no instance resources left, this operation may fail with **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903). Calling **com.rti.ndds.example.FooDataWriter.unregister_instance** (p. 1392) may help freeing up some resources.

Parameters

instance_data	<<***in***>> *(p. 404)* The data to dispose. If **com.rti.ndds.example.Foo** (p. 1358) *has* a key and `instance_handle` is **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447), only the fields that represent the key are examined by the function. Otherwise, `instance_data` is not used. If **com.rti.ndds.example.Foo** (p. 1358) *has* a key, `instance_data` can be NULL only if `instance_handle` is not **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447). Otherwise, this method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899).
instance_handle	<<***in***>> *(p. 404)* Either the handle returned by a previous call to **com.rti.ndds.example.FooDataWriter.register_instance** (p. 1390), or else the special value **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447). If **com.rti.ndds.example.Foo** (p. 1358) *has* a key and `handle` is not **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447), `handle` must represent a registered instance of type **com.rti.ndds.example.Foo** (p. 1358). Otherwise, this method may fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899). This method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if `handle` is NULL.
source_timestamp	<<***in***>> *(p. 404)* The timestamp value must be greater than or equal to the timestamp value used in the last writer operation (used in a *register*, *unregister*, *dispose*, or *write*, with either the automatically supplied timestamp or the application provided timestamp). This timestamp may potentially affect the order in which readers observe events from multiple writers. This timestamp will be available to the **com.rti.dds.subscription.DataReader** (p. 707) objects by means of the `source_timestamp` attribute inside the **com.rti.dds.subscription.SampleInfo** (p. 1944). Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904), **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

See also

com.rti.ndds.example.FooDataWriter.dispose (p. 1403)

References **DataWriter.dispose_w_timestamp_untyped()**.

8.125.2.12 dispose_w_params()

```
void dispose_w_params (
            Foo instance_data,
            WriteParams_t params )
```

Performs the same function as **com.rti.ndds.example.FooDataWriter.dispose** (p. 1403) and **com.rti.ndds.↩ example.FooDataWriter.dispose_w_timestamp** (p. 1405) except that it also provides the values contained in `params`.

See also

com.rti.ndds.example.FooDataWriter.write_w_params (p. 1402)

8.125.2.13 get_key_value()

```
void get_key_value (
                Foo key_holder,
                InstanceHandle_t handle )
```

Retrieve the instance `key` that corresponds to an instance `handle`.

Useful for keyed data types.

The operation will only fill the fields that form the `key` inside the `key_holder` instance. If the type has no keys, this method has no effect and exits with no error.

For keyed data types, this operation may fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if the `handle` does not correspond to an existing data-object known to the **com.rti.dds.publication.DataWriter** (p. 818).

Parameters

key_holder	<<***inout***>> *(p. 404)* a user data type specific key holder, whose `key` fields are filled by this operation. If **com.rti.ndds.example.Foo** (p. 1358) has no key, this method has no effect.

This method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if `key_holder` is NULL.

Parameters

handle	<<***in***>> *(p. 404)* the `instance` whose key is to be retrieved. If **com.rti.ndds.example.Foo** (p. 1358) *has* a key, `handle` must represent a registered instance of type **com.rti.ndds.example.Foo** (p. 1358). Otherwise, this method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899). If **com.rti.ndds.example.Foo** (p. 1358) *has* a key and `handle` is **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447), this method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899). This method will fail with **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) if `handle` is NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

See also

com.rti.ndds.example.FooDataReader.get_key_value (p. 1387)

References **DataWriter.get_key_value_untyped()**.

8.125.2.14 lookup_instance()

```
InstanceHandle_t lookup_instance (
            Foo key_holder )
```

Retrieve the instance `handle` that corresponds to an instance `key_holder`.

Useful for keyed data types.

This operation takes as a parameter an instance and returns a handle that can be used in subsequent operations that accept an instance handle as an argument. The instance parameter is only used for the purpose of examining the fields that define the key. This operation does not register the instance in question. If the instance has not been previously registered, or if for any other reason RTI Connext is unable to provide an instance handle, RTI Connext will return the special value HANDLE_NIL.

Parameters

key_holder	*<<**in**>> (p. 404)* a user data type specific key holder.

Returns

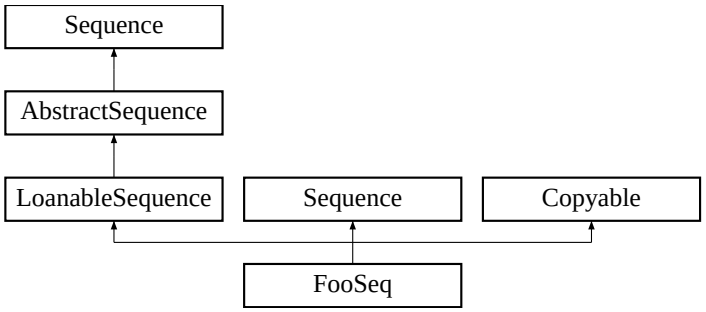
the instance handle associated with this instance. If **com.rti.ndds.example.Foo** (p. 1358) has no key, this method has no effect and returns **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447)

References **DataWriter.lookup_instance_untyped()**.

8.126 FooSeq Class Reference

*<<**interface**>> (p. 403) <<**generic**>> (p. 403)* A type-safe, ordered collection of elements. The type of these elements is referred to in this documentation as **`com.rti.ndds.example.Foo`** (p. 1358).

Inheritance diagram for FooSeq:



Public Member Functions

- Object **copy_from** (Object src)

8.126.1 Detailed Description

<<***interface***>> *(p. 403)* <<***generic***>> *(p. 403)* A type-safe, ordered collection of elements. The type of these elements is referred to in this documentation as **com.rti.ndds.example.Foo** (p. 1358).

For users who define data types in OMG IDL, this type corresponds to the IDL express sequence<**Foo** (p. 1358)>.

For any user-data type **Foo** (p. 1358) that an application defines for the purpose of data-distribution with RTI Connext, a **FooSeq** (p. 1408) is generated. We refer to an IDL sequence<**Foo** (p. 1358)> as **FooSeq** (p. 1408).

A sequence is a type-safe List that makes a distinction between its allocated size and its logical size (much like the ArrayList class). The Collection.size() method returns the logical size.

A new sequence is created for elements of a particular Class, which does not change throughout the lifetime of a sequence instance.

To add an element to a sequence, use the **add()** (p. 1542) method inherited from the standard interface java.↩ util.List; this will implicitly increase the sequence's size. Or, to pre-allocate space for several elements at once, use com.rti.dds.infrastructure.com.rti.dds.util.Sequence.Sequence.setMaximum.

An attempt to add an element to a sequence that is not of the correct element type will result in a ClassCastException. (Note that null is considered to belong to any type.)

8.126.2 Member Function Documentation

8.126.2.1 copy_from()

```
Object copy_from (
            Object src )
```

Copy data into this object from another. The result of this method is that both this and src will be the same size and contain the same data.

Parameters

src	The Object which contains the data to be copied

Returns

`this`

Exceptions

NullPointerException	If `src` is null.
ClassCastException	If `src` is not a `Sequence` OR if one of the objects contained in the `Sequence` is not of the expected type.

  <<***extension***>> *(*p. *403) Creates a new **`Foo`** (*p. *`1358`*) sample from an existing `DynamicData` sample.*

Static Public Member Functions

- static String **get_type_name** ()

  Get the default name for this type.
- static void **register_type** (**DomainParticipant** participant, String type_name)

  Allows an application to communicate to RTI Connext the existence of a data type.
- static **TypeCode** **getTypeCode** ()

  *<<**extension**>> (p. 403) Retrieves the TypeCode for the Type.*

8.127.1 Detailed Description

*<<**interface**>> (p. 403) <<**generic**>> (p. 403)* User data type specific interface.

Defines the user data type specific interface generated for each application class.

The concrete user data type automatically generated by the implementation is an incarnation of this class.

See also

the `Code Generator User's Manual`

8.127.2 Member Function Documentation

8.127.2.1 get_type_name()

```
static String get_type_name ( )  [static]
```

Get the default name for this type.

Can be used for calling **com.rti.ndds.example.FooTypeSupport.register_type** (p. 1411) or creating **com.rti.dds.topic.Topic** (p. 2116)

Returns

default name for this type

See also

com.rti.ndds.example.FooTypeSupport.register_type (p. 1411)

com.rti.dds.domain.DomainParticipant.create_topic (p. 984)

8.127.2.2 register_type()

```
static void register_type (
              DomainParticipant participant,
             String type_name )  [static]
```

Allows an application to communicate to RTI Connext the existence of a data type.

The *generated* implementation of the operation embeds all the knowledge that has to be communicated to the middleware in order to make it able to manage the contents of data of that type. This includes in particular the key definition that will allow RTI Connext to distinguish different instances of the same type.

The same **com.rti.dds.topic.TypeSupport** (p. 2252) can be registered multiple times with a **com.rti.dds.domain.↩ DomainParticipant** (p. 948) using the same or different values for the `type_name`. If `register_type` is called multiple times on the same **com.rti.dds.topic.TypeSupport** (p. 2252) with the same **com.rti.dds.domain.Domain↩ Participant** (p. 948) and `type_name`, the second (and subsequent) registrations are ignored but the operation returns com.rti.dds.infrastructure.RETCODE_OK.

Precondition

Cannot use the same `type_name` to register two different **com.rti.dds.topic.TypeSupport** (p. 2252) with the same **com.rti.dds.domain.DomainParticipant** (p. 948), or else the operation will fail and **com.rti.dds.↩ infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903) will be returned.

Parameters

participant	<<***in***>> *(*p. *404)* the **com.rti.dds.domain.DomainParticipant** (p. 948) to register the data type **Foo** (p. 1358) with. Cannot be NULL.
type_name	<<***in***>> *(*p. *404)* the type name under with the data type **Foo** (p. 1358) is registered with the participant; this type name is used when creating a new **com.rti.dds.topic.Topic** (p. 2116). (See **com.rti.dds.domain.DomainParticipant.create_topic** (p. 984).) The name may not be NULL or longer than 255 characters.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903) or **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903).

MT Safety:

UNSAFE on the FIRST call. It is not safe for two threads to simultaneously make the first call to register a type. Subsequent calls are thread safe.

See also

com.rti.dds.domain.DomainParticipant.create_topic (p. 984)

8.127.2.3 getTypeCode()

```
static  TypeCode getTypeCode ( )  [static]
```

<<***extension***>> *(p. 403)* Retrieves the TypeCode for the Type.

This method retrieves the **com.rti.dds.typecode.TypeCode** (p. 2183) for the Type. A **com.rti.dds.typecode.TypeCode** (p. 2183) is a mechanism for representing a type at runtime. RTI Connext can use type codes to send type definitions on the network. A **com.rti.dds.typecode.TypeCode** (p. 2183) value consists of a type code *kind* (represented by the **com.rti.dds.typecode.TCKind** (p. 2094) enumeration) and a list of *members* (that is, fields). These members are recursive: each one has its own **com.rti.dds.typecode.TypeCode** (p. 2183), and in the case of complex types (structures, arrays, and so on), these contained type codes contain their own members.

Returns

The TypeCode for this type

8.127.2.4 copy_data()

```
Object copy_data (
             Object destination,
             Object source )
```

This is a concrete implementation of this method inherited from the base class. This method will perform a deep copy of `source` into `destination`.

Parameters

source	The Object which contains the data to be copied.
destination	The object where data will be copied to.

Returns

Returns `destination`.

Exceptions

NullPointerException	If `destination` or `source` is null.
ClassCastException	If either `destination` or `this` is not a **`Foo`** (p. 1358) type.

References **Foo.copy_from()**.

8.127.2.5 serialize_to_cdr_buffer() [1/2]

```
long serialize_to_cdr_buffer (
            byte[] buffer,
            long length,
             Foo src )
```

<<***extension***>> *(p. 403)* Serializes the input sample into a CDR buffer of octets.

This method serializes a sample into a buffer of octets using Common Data Representation (CDR). Calling this method is equivalent to calling **com.rti.ndds.example.FooTypeSupport.serialize_to_cdr_buffer** (p. 1413) with **com.rti.dds.infrastructure.DataRepresentationQosPolicy.AUTO_DATA_REPRESENTATION** (p. 464) as the representation.

The input buffer must be big enough to store the serialized representation of the sample. Otherwise, the method will return an error.

To determine the minimum size of the input buffer, the user must call this method with the buffer set to null.

For more information about CDR in Connext, see `Data Representation` in the Core Libraries Extensible Types Guide.

Parameters

src	<<***in***>> *(p. 404)*. Input sample. Cannot be null.
buffer	<<***out***>> *(p. 404)*. Serialization buffer.
length	<<***in***>> *(p. 404)*. When `buffer` is not null, `length` must contain the size of the input buffer when the method is invoked. This parameter is ignored when `buffer` is set to null.

Returns

When `buffer` is set to null, this method will return a buffer size big enough to hold the serialized data. Notice that the size is conservative and it may be greater than the actual size after serialization. When `buffer` is different than null, this method will return the actual size of the serialized content. This is the size that must be provided to the **com.rti.ndds.example.FooTypeSupport.deserialize_from_cdr_buffer** (p. 1415).

Exceptions

One	of the **Standard Return Codes** (p. 513) , java.lang.IllegalStateException

8.127.2.6 serialize_to_cdr_buffer() [2/2]

```
long serialize_to_cdr_buffer (
            byte[] buffer,
            long length,
             Foo src,
            short representation )
```

*<<**extension**>> (p. 403)* Serializes the input sample into a buffer of octets.

This method serializes a sample into a buffer of octets using the input data representation. See **com.rti.ndds.example.FooTypeSupport.serialize_to_cdr_buffer** (p. 1413) for details.

Parameters

src	*<<**in**>> (p. 404).* Input sample. Cannot be null.
buffer	*<<**out**>> (p. 404).* Serialization buffer.
length	*<<**in**>> (p. 404).* Serialization buffer length.
representation	*<<**in**>> (p. 404).* Representation used to serialize the data.

Returns

Size of the serialized content.

Exceptions

One	of the **Standard Return Codes** (p. 513) , java.lang.IllegalStateException

8.127.2.7 deserialize_from_cdr_buffer()

```
void deserialize_from_cdr_buffer (
              Foo dst,
             byte[] buffer,
             long length )
```

*<<**extension**>> (p. 403)* Deserializes a sample from a buffer of octets.

This method deserializes a sample from a CDR buffer of octets.

The content of the buffer generated by the method **com.rti.ndds.example.FooTypeSupport.serialize_to_cdr_buffer** (p. 1413) can be provided to this method to get the sample back.

Parameters

dst	*<<**out**>> (p. 404).* Output sample. Cannot be null.
buffer	*<<**in**>> (p. 404).* Deserialization buffer. Cannot be null.
length	*<<**in**>> (p. 404).* Length of the serialized representation of the sample in the buffer.

Exceptions

One	of the **Standard Return Codes** (p. 513) , java.lang.IllegalStateException

8.127.2.8 data_to_string() [1/2]

```
String data_to_string (
            Foo src,
            PrintFormatProperty formatProperty )
```

<<***extension***>> *(p. 403)* Transforms a data sample into a human-readable string representation.

This method takes a data sample and creates a string representation of the data.

If the size of the output string is longer than the size of an unsigned 32-bit integer, this operation will fail with **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903).

This method is only provided for types that were generated with typecodes.

Parameters

src	<<***out***>> *(p. 404)*. The sample to get the string representation of. Cannot be null.
formatProperty	<<***in***>> *(p. 404)*. Properties describing what the format of the output string should be.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903) , java.lang.IllegalStateException

8.127.2.9 data_to_string() [2/2]

```
String data_to_string (
            Foo src )
```

<<***extension***>> *(p. 403)* Transforms a data sample into a human-readable string representation using the default values for **com.rti.dds.topic.PrintFormatProperty** (p. 1686).

See also

com.rti.ndds.example.FooTypeSupport.data_to_string (p. 1416)

8.127.2.10 data_from_string() [1/2]

```
Foo data_from_string (
            String str,
             PrintFormatKind printFormat )
```

<<***extension***>> *(*p. *403)* Creates a new sample from a string.

This method takes a string representation of the data and creates a new data sample.

Parameters

str	<<***in***>> *(p. 404)*. The JSON string representation
printFormat	<<***in***>> *(p. 404)*. Must be set to **com.rti.dds.topic.PrintFormatKind.JSON_PRINT_FORMAT** (p. 1686), the only format currently supported.

8.127.2.11 data_from_string() [2/2]

```
Foo data_from_string (
            String str )
```

<<***extension***>> *(p. 403)* Creates a new **Foo** (p. 1358) sample from a JSON string.

This method is an overload that does not take a PrintFormatKind.

Parameters

str	<<***in***>> *(p. 404)*. The JSON string representation

See also

com.rti.ndds.example.FooTypeSupport.data_from_string (p. 1416)

8.127.2.12 data_to_dynamicdata()

```
DynamicData data_to_dynamicdata (
            Object data )
```

<<***extension***>> *(p. 403)* Creates a new DynamicData sample from an existing **Foo** (p. 1358) sample

This method takes a **Foo** (p. 1358) sample and creates a new DynamicData sample from it. The resulting Dynamic↩ Data sample will have the same type and contain the same values as the **Foo** (p. 1358) sample.

Parameters

data	<<***in***>> *(p. 404)*. The **Foo** (p. 1358) sample that will be transformed into a DynamicData sample.

See also

com.rti.ndds.example.FooTypeSupport.data_from_dynamicdata (p. 1418).

8.127.2.13 data_from_dynamicdata()

```
Foo data_from_dynamicdata (
            DynamicData dynamicData )
```

<<***extension***>> *(p. 403)* Creates a new **Foo** (p. 1358) sample from an existing DynamicData sample.

This method takes a DynamicData sample and uses it to create a new **Foo** (p. 1358) sample.

A precondition for this operation is that the type of the DynamicData need to be assignable to **Foo** (p. 1358). If this not the case, the behavior is undefined.

Parameters

dynamicData	<<***in***>> *(p. 404)*. The DynamicData sample to be transformed into a **Foo** (p. 1358) sample.

See also

com.rti.ndds.example.FooTypeSupport.data_to_dynamicdata (p. 1418)

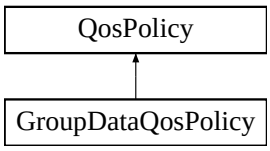
com.rti.ndds.example.FooTypeSupport.getTypeCode (p. 1412)

com.rti.dds.typecode.TypeCode.TypeCode.assignable

8.128 GroupDataQosPolicy Class Reference

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 53) during discovery.

Inheritance diagram for GroupDataQosPolicy:



Public Attributes

- final **ByteSeq value**

  <<***spec***>> *(p. 132) a sequence of octets*

8.128.1 Detailed Description

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 53) during discovery.

Entity:

com.rti.dds.publication.Publisher (p. 1767), **com.rti.dds.subscription.Subscriber** (p. 2039)

Properties:

RxO (p. 506) = NO
Changeable (p. 507) = **YES** (p. 507)

See also

com.rti.dds.domain.DomainParticipant.get_builtin_subscriber (p. 998)

8.128.2 Usage

The additional information is attached to a **com.rti.dds.publication.Publisher** (p. 1767) or **com.rti.dds.subscription.Subscriber** (p. 2039). This extra data is not used by RTI Connext itself. When a remote application discovers the **com.rti.dds.publication.Publisher** (p. 1767) or **com.rti.dds.subscription.Subscriber** (p. 2039), it can access that information and use it for its own purposes.

Use cases for this QoS policy, as well as the **com.rti.dds.infrastructure.TopicDataQosPolicy** (p. 2128) and **com.rti.dds.infrastructure.UserDataQosPolicy** (p. 2272), are often application-to-application identification, authentication, authorization, and encryption purposes. For example, applications can use Group or User Data to send security certificates to each other for RSA-type security.

In combination with **com.rti.dds.subscription.DataReaderListener** (p. 757), **com.rti.dds.publication.DataWriterListener** (p. 853) and operations such as **com.rti.dds.domain.DomainParticipant.ignore_publication** (p. 1003) and **com.rti.dds.domain.DomainParticipant.ignore_subscription** (p. 1004), this QoS policy can help an application to define and enforce its own security policies. For example, an application can implement matching policies similar to those of the **com.rti.dds.infrastructure.PartitionQosPolicy** (p. 1664), except the decision can be made based on an application-defined policy.

The use of this QoS is not limited to security; it offers a simple, yet flexible extensibility mechanism.

Important: RTI Connext stores the data placed in this policy in pre-allocated pools. It is therefore necessary to configure RTI Connext with the maximum size of the data that will be stored in policies of this type. This size is configured with **com.rti.dds.infrastructure.DomainParticipantResourceLimitsQosPolicy.publisher_group_data_max_length** (p. 1097) and **com.rti.dds.infrastructure.DomainParticipantResourceLimitsQosPolicy.subscriber_group_data_max_length** (p. 1097).

8.128.3 Member Data Documentation

8.128.3.1 value

```
final ByteSeq value
```

<<***spec***>> *(*p. *132)* a sequence of octets

[default] Empty (zero-sized)

[range] Octet sequence of length [0,max_length]

Categories

Mutable (p. 338), **Application-Defined Metadata** (p. 191), **Discovery Metadata** (p. 348)

8.129 GuardCondition Class Reference

<<***interface***>> *(*p. *403)* A specific **com.rti.dds.infrastructure.Condition** (p. 686) whose `trigger_value` is completely under the control of the application.

Inherits AbstractNativeObject, AutoCloseable, and NativeCondition.

Public Member Functions

- **GuardCondition** ()
  No argument constructor.
- void **set_trigger_value** (boolean value)
  Set the guard condition trigger value.
- boolean **get_trigger_value** ()
  Retrieve the `trigger_value`.
- void **delete** ()
  Destructor.
- void **close** ()
  *See **delete()** (*p. *1423).*

8.129.1 Detailed Description

<<***interface***>> *(*p. *403)* A specific **com.rti.dds.infrastructure.Condition** (p. 686) whose `trigger_value` is completely under the control of the application.

The **com.rti.dds.infrastructure.GuardCondition** (p. 1421) provides a way for an application to manually wake up a **com.rti.dds.infrastructure.WaitSet** (p. 2287). This is accomplished by attaching the **com.rti.dds.infrastructure.↩ GuardCondition** (p. 1421) to the **com.rti.dds.infrastructure.WaitSet** (p. 2287) and then setting the `trigger_value` by means of the **com.rti.dds.infrastructure.GuardCondition.set_trigger_value** (p. 1422) operation.

Important: **GuardCondition** (p. 1421) allocates native resources. When a **GuardCondition** (p. 1421) is no longer being used, **close()** (p. 1423) must be called.

See also

com.rti.dds.infrastructure.WaitSet (p. 2287)

8.129.2 Constructor & Destructor Documentation

8.129.2.1 GuardCondition()

```
GuardCondition ( )
```

No argument constructor.

Construct a new guard condition with trigger value com.rti.dds.infrastructure.false.

Exceptions

com.rti.dds.infrastructure.RETCODE_OUT_OF_↩ RESOURCES *(p. 1903)*	if a new **com.rti.dds.infrastructure.GuardCondition** (p. 1421) could not be allocated.

Important: The **com.rti.dds.infrastructure.GuardCondition** (p. 1421) allocates native resources. When **com.rti.↩ dds.infrastructure.GuardCondition** (p. 1421) is no longer being used, user should call **com.rti.dds.infrastructure.↩ GuardCondition.delete** (p. 1423) explicitly to properly cleanup all native resources.

8.129.3 Member Function Documentation

8.129.3.1 set_trigger_value()

```
void set_trigger_value (
             boolean value )
```

Set the guard condition trigger value.

Parameters

value	<<***in***>> *(p. 404)* the new trigger value.

8.129.3.2 get_trigger_value()

```
boolean get_trigger_value ( )
```

Retrieve the `trigger_value`.

Returns

the trigger value.

Implements **Condition** (p. 686).

8.129.3.3 delete()

```
void delete ( )
```

Destructor.

Releases the resources associated with this object.

Calling this method multiple times on the same object is safe; subsequent deletions will have no effect.

Referenced by **GuardCondition.close()**.

8.129.3.4 close()

```
void close ( )
```

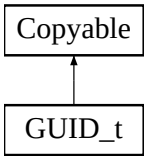
See **delete()** (p. 1423).

References **GuardCondition.delete()**.

8.130 GUID_t Class Reference

Type for *GUID* (Global Unique Identifier) representation.

Inheritance diagram for GUID_t:



Public Member Functions

- **GUID_t** (**GUID_t** guid)

  Copy constructor.
- **GUID_t** (byte[ ] **value**)

  Constructor.
- Object **copy_from** (Object src)

  Copy value of a data type from source.

Public Attributes

- byte[ ] **value** = {0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0}

  A 16 byte array containing the GUID value.

Static Public Attributes

- static final **GUID_t GUID_UNKNOWN**

  Unknown GUID.
- static final **GUID_t GUID_AUTO**

  Indicates that RTI Connext should choose an appropriate virtual GUID.
- static final **GUID_t GUID_ZERO**

  Zero GUID.

8.130.1 Detailed Description

Type for *GUID* (Global Unique Identifier) representation.

Represents a 128 bit GUID.

8.130.2 Constructor & Destructor Documentation

8.130.2.1 GUID_t() [1/2]

```
GUID_t (
            GUID_t guid )
```

Copy constructor.

Parameters

guid	The GUID instance to copy. It must not be null.

References **GUID_t.value**.

8.130.2.2 GUID_t() [2/2]

```
GUID_t (
            byte[] value )
```

Constructor.

Parameters

value	GUID value as a 16 byte array. It must not be null.

References **GUID_t.value**.

8.130.3 Member Function Documentation

8.130.3.1 copy_from()

```
Object copy_from (
            Object src )
```

Copy value of a data type from source.

Copy data into *this* object from another. This copy is intended to be a deep copy, so that all data members (recursively) are copied (not just resetting Object references).

This operation returns the object that is copied if copy is successful.

Parameters

src	<<***in***>> *(*p. *404)* The Object which contains the data to be copied.

Returns

Generally, return *this* but special cases (such as Enum) exist.

Exceptions

NullPointerException	If *src* is null.
ClassCastException	If *src* is not the same type as *this*.

Implements **Copyable** (p. 701).

8.130.4 Member Data Documentation

8.130.4.1 GUID_UNKNOWN

```
final GUID_t GUID_UNKNOWN [static]
```

Unknown GUID.

8.130.4.2 GUID_AUTO

```
final GUID_t GUID_AUTO [static]
```

Initial value:

```
=
        new GUID_t(new byte[]{0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0})
```

Indicates that RTI Connext should choose an appropriate virtual GUID.

If this special value is assigned to **com.rti.dds.infrastructure.DataWriterProtocolQosPolicy.virtual_guid** (p. 862) or **com.rti.dds.infrastructure.DataReaderProtocolQosPolicy.virtual_guid** (p. 762), RTI Connext will assign the virtual GUID automatically based on the RTPS or physical GUID.

8.130.4.3 GUID_ZERO

```
final GUID_t GUID_ZERO [static]
```

Zero GUID.

8.130.4.4 value

```
byte [] value = {0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0}
```

A 16 byte array containing the GUID value.

Referenced by **BuiltinTopicKey_t.from_guid()**, **GUID_t.GUID_t()**, and **BuiltinTopicKey_t.to_guid()**.

8.131 HeapMonitoring Class Reference

Heap Monitoring APIs.

Static Public Member Functions

- static native boolean **enable** ()
  Starts monitoring the heap memory used by RTI Connext.
- static boolean **enable** (**HeapMonitoringParams** params)
  Starts monitoring the heap memory used by RTI Connext.
- static native void **disable** ()
  Stops monitoring the heap memory used by RTI Connext.
- static native boolean **pause** ()
  Pauses heap monitoring.
- static native boolean **resume** ()
  Resumes heap monitoring.
- static native boolean **take_heap_snapshot** (String filename, boolean print_details)
  Saves the current heap memory usage in a file.

8.131.1 Detailed Description

Heap Monitoring APIs.

8.131.2 Member Function Documentation

8.131.2.1 enable() [1/2]

```
static native boolean enable ( )  [static]
```

Starts monitoring the heap memory used by RTI Connext.

This function must be called before any other function in the RTI Connext library is called.

Once heap monitoring is enabled, you can take heap snapshots by using **com.rti.ndds.utility.HeapMonitoring.take↩ _heap_snapshot** (p. 1429).

Use this method only for debugging purposes, since it may introduce a significant performance impact.

MT Safety:

UNSAFE. It is not safe to call this method while another thread may be simultaneously calling another heap-related method, including this one.

Returns

com.rti.dds.infrastructure.true if success. Otherwise, com.rti.dds.infrastructure.false

See also

com.rti.ndds.utility.HeapMonitoring.disable (p. 1428)

8.131.2.2 enable() [2/2]

```
static boolean enable (
            HeapMonitoringParams params )  [static]
```

Starts monitoring the heap memory used by RTI Connext.

Perfoms the same function as **com.rti.ndds.utility.HeapMonitoring.enable** (p. 1427) except that it also provides the values in params. Those values will set the format used in the snapshot **com.rti.ndds.utility.HeapMonitoring.take_↩ heap_snapshot** (p. 1429).

Returns

com.rti.dds.infrastructure.true if success. Otherwise, com.rti.dds.infrastructure.false

See also

com.rti.ndds.utility.HeapMonitoring.disable (p. 1428)

8.131.2.3 disable()

```
static native void disable ( )  [static]
```

Stops monitoring the heap memory used by RTI Connext.

This method must be the last method called from RTI Connext.

See also

com.rti.ndds.utility.HeapMonitoring.enable (p. 1427)

8.131.2.4 pause()

```
static native boolean pause ( )  [static]
```

Pauses heap monitoring.

New memory allocations will not be monitored and they will not appear in the snapshot generated by **com.rti.ndds.↩ utility.HeapMonitoring.take_heap_snapshot** (p. 1429).

Returns

com.rti.dds.infrastructure.true if success. Otherwise, com.rti.dds.infrastructure.false

See also

com.rti.ndds.utility.HeapMonitoring.resume (p. 1428)

8.131.2.5 resume()

```
static native boolean resume ( )  [static]
```

Resumes heap monitoring.

Returns

com.rti.dds.infrastructure.true if success. Otherwise, com.rti.dds.infrastructure.false

See also

com.rti.ndds.utility.HeapMonitoring.pause (p. 1428)

8.131.2.6 take_heap_snapshot()

```
static native boolean take_heap_snapshot (
             String filename,
             boolean print_details )  [static]
```

Saves the current heap memory usage in a file.

After **com.rti.ndds.utility.HeapMonitoring.enable** (p. 1427) is called, you may invoke this method periodically to save the current heap memory usage to a file.

By comparing two snapshots, you can tell if new memory has been allocated and in many cases where. This is why this operation can be used to debug unexpected memory growth.

The format of a snapshot is as follows:

First, there is a memory usage summary like this:

```
<P>
                    Product Version: NDDSCORE_BUILD_6.0.0.0_20200316T123411Z_RTI_ENG

                    Process virtual memory: 2552352768

                    Process physical memory: 16187392

                    Current application heap usage: 10532131

                    Approximate total heap usage: 203331110

                    High watermark: 10532131

                    Alloc count: 17634

                    Free count: 3518
```

- Process virtual memory: The amount of virtual memory in bytes taken by the process. This memory includes RTI Connext and non-RTI Connext memory.
- Process virtual memory: The amount of physical memory in bytes taken by the process.

- Current application heap usage: The amount of heap memory in bytes used by the middleware. For Java and .NET APIs, this memory only accounts for unmanaged RTI Connext memory, not memory living in the managed heap. This value does not include overhead memory allocations that are used by the Heap Monitoring utility. It therefore provides the heap usage that is used when Heap Monitoring is disabled and does not reflect the actual amount of memory that has been allocated by the middleware. That value is accounted for in 'Approximate total heap usage'.
- Approximate total heap usage: The amount of heap memory in bytes used by the middleware, including overhead allocations from the Heap Monitoring utility. When the Heap Monitoring utility is enabled, every allocation has an additional overhead number of bytes allocated so that the middleware can keep track of the meta-data that is output in the heap snapshots. This overhead is not accounted for in the 'Current application heap usage' summary field, but is included in this field. For Java and .NET APIs, this memory only accounts for unmanaged RTI Connext memory, not memory living in the managed heap.
- High watermark: The maximum amount of heap usage by RTI Connext since **com.rti.ndds.utility.Heap↩ Monitoring.enable** (p. 1427) was invoked.
- Alloc count: The number of invocations to malloc, realloc, or calloc operations done by RTI Connext.
- Free count: The number of invocations to the free operation done by RTI Connext.

After the previous summary, and only if you set the parameter print_details to com.rti.dds.infrastructure.true, the method will print the details of every single outstanding heap allocation done by RTI Connext. For example:

```
<P>
                block_id, timestamp, block_size, alloc_method_name, type_name, pool_alloc, pool_buffer_size,
    pool_buffer_count, topic_name, function_name, activity_context

                23087, 1586943520, 16, RTIOsapiHeap_allocateArray, struct RTIEncapsulationInfo, MALLOC, 0,
    0, PRESServiceRequest, PRESWriterHistoryDriver_new,
    "0X101175A,0X76DD63D7,0X984377BC:0X1C1{Name=ShapeTypeParticipant,Domain=110}|CREATE
    Participant|ENABLE|:0X80000088{Entity=Pu,Domain=110}|CREATE Writer WITH TOPIC PRESServiceRequest"
```

- block_id: Block ID of the allocation. This number increases with every allocation.
- timestamp: Timestamp in UTC seconds corresponding to the time where the allocation was done.
- block_size: The number of bytes allocated.
- alloc_method_name: The allocation RTI Connext method name.
- type_name: The allocation typename.
- pool_alloc: Indicates if the heap allocation is a RTI Connext pool allocation (POOL) or a regular allocation (MALLOC).
- pool_buffer_size: For pool allocations, this number indicates the size of the elements in the pool in number of bytes. block_size is equal to (pool_buffer_size $*$ pool_buffer_count).
- pool_buffer_count: For pool allocations, this number indicates the number of buffers allocated for the pool. block↩ _size is equal to (pool_buffer_size $*$ pool_buffer_count).
- topic_name: The topic name associated with the allocation or 'n/a' if it is not available.
- function_name: function name associated with the allocation or 'n/a' if it is not available.
- activity_context: **Activity Context** (p. 540)

Parameters

filename	*<<**in**>> (p. 404).* Name of file in which to store the snapshot.
print_details	*<<**in**>> (p. 404).* Indicates if the snapshot will contain only the memory usage summary or the details of the individual allocations.

Returns

com.rti.dds.infrastructure.true if success. Otherwise, com.rti.dds.infrastructure.false

8.132 HeapMonitoringParams Class Reference

Input parameters for enabling heap monitoring. They will be used for configuring the format of the snapshot.

Inherits Struct.

Public Attributes

- **HeapMonitoringSnapshotOutputFormat snapshot_output_format**
  Specify the format of the output of the snapshot.
- **HeapMonitoringSnapshotContentFormat snapshot_content_format**
  It is a bitmap to decide which information of the snapshot will be displayed.

8.132.1 Detailed Description

Input parameters for enabling heap monitoring. They will be used for configuring the format of the snapshot.

8.132.2 Member Data Documentation

8.132.2.1 snapshot_output_format

```
HeapMonitoringSnapshotOutputFormat snapshot_output_format
```

Initial value:

```
= HeapMonitoringSnapshotOutputFormat.NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT_OUTPUT_FORMAT_STANDARD
```

Specify the format of the output of the snapshot.

The enum can take two options:

- **com.rti.ndds.utility.HeapMonitoringSnapshotOutputFormat.NDDS_UTILITY_HEAP_MONITORING_↩ SNAPSHOT_OUTPUT_FORMAT_STANDARD** (p. 1434):
  The output of the snapshot will be in plain text.

- **com.rti.ndds.utility.HeapMonitoringSnapshotOutputFormat.NDDS_UTILITY_HEAP_MONITORING_↩ SNAPSHOT_OUTPUT_FORMAT_COMPRESSED** (p. 1435):
  The output of the snapshot will be compressed using Zlib techonology.
  The file can be uncompressed using zlib-flate.

[default] com.rti.ndds.utility.HeapMonitoringSnapshotOutputFormat.NDDS_UTILITY_HEAP_MONITORING_↩ SNAPSHOT_OUTPUT_FORMAT_STANDARD (p. 1434).

8.132.2.2 snapshot_content_format

```
HeapMonitoringSnapshotContentFormat snapshot_content_format
```

Initial value:

```
=
        HeapMonitoringSnapshotContentFormat.NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT_CONTENT_DEFAULT
```

It is a bitmap to decide which information of the snapshot will be displayed.

```suggestion Bitmap that specifies the field to display in the snapshot.

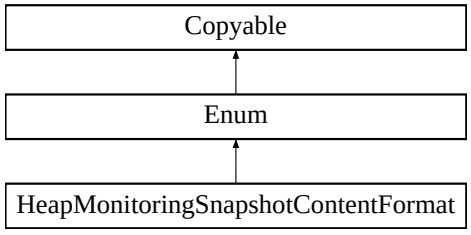
You can combine these values by logically ORing them together. For example: (**com.rti.ndds.utility.HeapMonitoring↩ SnapshotContentFormat.NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT_CONTENT_BIT_TOPIC** (p. 1433) | com.rti.ndds.utility.HeapMonitoringSnapshotContentFormat.NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT_↩ CONTENT_BIT_FUNCTION)

**[default] com.rti.ndds.utility.HeapMonitoringSnapshotContentFormat.NDDS_UTILITY_HEAP_MONITORING_↩ SNAPSHOT_CONTENT_DEFAULT** (p. 1433)

## 8.133 HeapMonitoringSnapshotContentFormat Class Reference

Bitmap used to decide which information of the snapshot will be displayed.

Inheritance diagram for HeapMonitoringSnapshotContentFormat:



### Static Public Attributes

- static final **HeapMonitoringSnapshotContentFormat NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT↩ _CONTENT_BIT_TOPIC**

  *Add the topic to the snapshot of heap monitoring.*
- static final **HeapMonitoringSnapshotContentFormat RTI_OSAPI_HEAP_SNAPSHOT_CONTENT_BIT_↩ FUNCTION**

  *Add the function name to the snapshot of heap monitoring.*
- static final **HeapMonitoringSnapshotContentFormat NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT↩ _CONTENT_BIT_ACTIVITY**

  *Add the activity context to the snapshot of heap monitoring. The user can select the information that will be part of the activity context by using the API **com.rti.ndds.config.ActivityContext.set_attribute_mask** (p. 542).*
- static final **HeapMonitoringSnapshotContentFormat NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT↩ _CONTENT_DEFAULT**

  *Add all the optional attributes to the snapshot of heap monitoring.*
- static final **HeapMonitoringSnapshotContentFormat NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT↩ _CONTENT_MINIMAL**

  *Not add any optional attribute to the snapshot of heap monitoring.*
```

Additional Inherited Members

8.133.1 Detailed Description

Bitmap used to decide which information of the snapshot will be displayed.

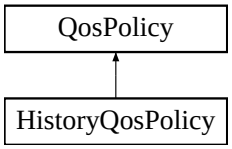
8.135 HistoryQosPolicy Class Reference

<<***spec***>> *(*p. *132)* Specifies the behavior of RTI Connext in the case where the value of a sample changes (one or more times) before it can be successfully communicated to one or more existing subscribers.

Inheritance diagram for HistoryQosPolicy:



Public Attributes

- **HistoryQosPolicyKind kind**

  <<***basic***>> *(*p. *123)* <<***spec***>> *(*p. *132) Specifies the kind of history to be kept.*
- int **depth**

  <<***basic***>> *(*p. *123)* <<***spec***>> *(*p. *132) Specifies the number of samples per instance to be kept, when the* `kind` *is com.rti.dds.infrastructure.HistoryQosPolicyKind.HistoryQosPolicyKind.KEEP_LAST_HISTORY_QOS*

8.135.1 Detailed Description

<<***spec***>> *(*p. *132)* Specifies the behavior of RTI Connext in the case where the value of a sample changes (one or more times) before it can be successfully communicated to one or more existing subscribers.

This QoS policy specifies how much data must to stored by RTI Connext for a **com.rti.dds.publication.DataWriter** (p. 818) or **com.rti.dds.subscription.DataReader** (p. 707). It controls whether RTI Connext should deliver only the most recent value, attempt to deliver all intermediate values, or do something in between.

On the publishing side, this QoS policy controls the samples that should be maintained by the **com.rti.dds.↩ publication.DataWriter** (p. 818) on behalf of existing **com.rti.dds.subscription.DataReader** (p. 707) entities. The behavior with regards to a **com.rti.dds.subscription.DataReader** (p. 707) entities discovered after a sample is written is controlled by the **DURABILITY** (p. 481) policy.

On the subscribing side, this QoS policy controls the samples that should be maintained until the application "takes" them from RTI Connext.

Entity:

com.rti.dds.topic.Topic (p. 2116), **com.rti.dds.subscription.DataReader** (p. 707), **com.rti.dds.publication.↩ DataWriter** (p. 818)

Properties:

RxO (p. 506) = NO
Changeable (p. 507) = **UNTIL ENABLE** (p. 507)

See also

com.rti.dds.infrastructure.ReliabilityQosPolicy (p. 1829)

com.rti.dds.infrastructure.HistoryQosPolicy (p. 1435)

8.135.2 Usage

This policy controls the behavior of RTI Connext when the value of an instance changes before it is finally communicated to **com.rti.dds.subscription.DataReader** (p. 707) entities.

When a **com.rti.dds.publication.DataWriter** (p. 818) sends data, or a **com.rti.dds.subscription.DataReader** (p. 707) receives data, the data sent or received is stored in a cache whose contents are controlled by this QoS policy. This QoS policy interacts with **com.rti.dds.infrastructure.ReliabilityQosPolicy** (p. 1829) by controlling whether RTI Connext guarantees that *all* of the sent data is received (com.rti.dds.infrastructure.HistoryQosPolicyKind.HistoryQosPolicy↩ Kind.KEEP_ALL_HISTORY_QOS) or if only the last N data values sent are guaranteed to be received (com.rti.dds.↩ infrastructure.HistoryQosPolicyKind.HistoryQosPolicyKind.KEEP_LAST_HISTORY_QOS)–this is a reduced level of reliability.

The amount of data that is sent to new DataReaders who have configured their **com.rti.dds.infrastructure.Durability↩ QosPolicy** (p. 1116) to receive previously published data is controlled by **com.rti.dds.infrastructure.DurabilityQos↩ Policy.writer_depth** (p. 1119), not by the History QoS policy.

Note that the History QoS policy does not control the *physical* sizes of the send and receive queues. The memory allocation for the queues is controlled by the **com.rti.dds.infrastructure.ResourceLimitsQosPolicy** (p. 1894).

If `kind` is com.rti.dds.infrastructure.HistoryQosPolicyKind.HistoryQosPolicyKind.KEEP_LAST_HISTORY_QOS (the default), then RTI Connext will only attempt to keep the latest values of the instance and discard the older ones. In this case, the value of `depth` regulates the maximum number of values (up to and including the most current one) RTI Connext will maintain and deliver until the samples are fully acknowledged. After N values have been sent or received, any new data will overwrite the oldest data in the queue. Thus the queue acts like a circular buffer of length *N*.

For keyed-data, there is different behavior on the publishing and subscribing sides associated with how invalid samples representing the disposal of or unregistration from an instance affect history.

On the publishing side, unregistering from or disposing of an instance creates an invalid sample that is accounted for in the history depth. This means that an invalid sample may replace a value that is currently being stored in the writer queue.

On the subscribing side, however, invalid samples do not count towards history depth and will not replace a value that is being stored in the reader queue.

On both the publishing and subscribing sides, there can only ever be one invalid sample per-instance and that one sample can be in different states depending on whether the instance has been disposed, unregistered, or both.

The default (and most common setting) for `depth` is 1, indicating that only the most recent value should be delivered.

If `kind` is com.rti.dds.infrastructure.HistoryQosPolicyKind.HistoryQosPolicyKind.KEEP_ALL_HISTORY_QOS, then RTI Connext will attempt to maintain and deliver all the values of the instance to existing subscribers. The resources that RTI Connext can use to keep this history are limited by the settings of the **RESOURCE_LIMITS** (p. 511). If the limit is reached, then the behavior of RTI Connext will depend on the **RELIABILITY** (p. 510). If the Reliability `kind` is **com.rti.dds.infrastructure.ReliabilityQosPolicyKind.BEST_EFFORT_RELIABILITY_QOS** (p. 1836), then the old values will be discarded. If Reliability `kind` is RELIABLE, then RTI Connext will block the **com.rti.dds.publication.DataWriter** (p. 818) until it can deliver the necessary old values to all subscribers.

8.135.3 Consistency

This QoS policy's `depth` must be consistent with the **RESOURCE_LIMITS** (p. 511) `max_samples_per_instance`. For these two QoS to be consistent, they must verify that *depth* <= *max_samples_per_instance*.

See also

com.rti.dds.infrastructure.ResourceLimitsQosPolicy (p. 1894)

8.135.4 Member Data Documentation

8.135.4.1 kind

```
HistoryQosPolicyKind kind
```

<<***basic***>> *(p. 123)* <<***spec***>> *(p. 132)* Specifies the kind of history to be kept.

For DataWriters, the samples are only kept either until they are fully acknowledged by all matching DataReaders or until they are replaced or removed. Samples can be replaced or removed for a number of reasons, including but not limited to **com.rti.dds.infrastructure.LifespanQosPolicy** (p. 1526) expiration, replacement because the **com.rti.dds.infrastructure.HistoryQosPolicy.depth** (p. 1438) has been exceeded, or one of the **com.rti.dds.infrastructure.ResourceLimitsQosPolicy** (p. 1894) settings has been exceeded.

[default] com.rti.dds.infrastructure.HistoryQosPolicyKind.HistoryQosPolicyKind.KEEP_LAST_HISTORY_QOS

Categories

Immutable (p. 292), **Applied Per-Instance** (p. 346), **Reliability** (p. 266), **Data Availability** (p. 200)

8.135.4.2 depth

```
int depth
```

<<***basic***>> *(p. 123)* <<***spec***>> *(p. 132)* Specifies the number of samples per instance to be kept, when the `kind` is com.rti.dds.infrastructure.HistoryQosPolicyKind.HistoryQosPolicyKind.KEEP_LAST_HISTORY_QOS

If a value other than 1 (the default) is specified, it should be consistent with the settings of the **RESOURCE_LIMITS** (p. 511) policy. That is:

depth <= **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_samples_per_instance** (p. 1897)

When the `kind` is com.rti.dds.infrastructure.HistoryQosPolicyKind.HistoryQosPolicyKind.KEEP_ALL_HISTORY_QOS, the depth has no effect. Its implied value is `infinity` (in practice limited by the settings of the **RESOURCE_LIMITS** (p. 511) policy).

When a DataWriter responds to a TopicQuery, the samples that are evaluated against the TopicQuery filter are only those samples that fall within the **com.rti.dds.infrastructure.DurabilityQosPolicy.writer_depth** (p. 1119), not this depth.

[default] 1

[range] [1,100 million], <= **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_samples_per_instance** (p. 1897)

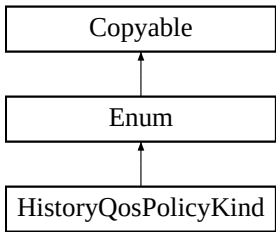
Categories

Immutable (p. 292), **Applied Per-Instance** (p. 346), **Reliability** (p. 266), **Data Availability** (p. 200)

8.136 HistoryQosPolicyKind Class Reference

Kinds of history.

Inheritance diagram for HistoryQosPolicyKind:



Static Public Attributes

- static final **HistoryQosPolicyKind KEEP_LAST_HISTORY_QOS**
  [default] *Keep the last* `depth` *samples.*
- static final **HistoryQosPolicyKind KEEP_ALL_HISTORY_QOS**
  Keep all the samples.

Additional Inherited Members

8.136.1 Detailed Description

Kinds of history.

QoS:

com.rti.dds.infrastructure.HistoryQosPolicy (p. 1435)

8.136.2 Member Data Documentation

8.136.2.1 KEEP_LAST_HISTORY_QOS

`final` **`HistoryQosPolicyKind`** `KEEP_LAST_HISTORY_QOS [static]`

[default] Keep the last `depth` samples.

On the publishing side, RTI Connext will only attempt to keep the most recent `depth` samples of each instance of data (identified by its key) managed by the **com.rti.dds.publication.DataWriter** (p. 818). Invalid samples representing a disposal or unregistration of an instance count towards the depth and may replace other DDS samples currently in the DataWriter queue for the same instance.

On the subscribing side, the **com.rti.dds.subscription.DataReader** (p. 707) will only attempt to keep the most recent `depth` samples received for each instance (identified by its key) until the application takes them via the **com.rti.dds.↩ subscription.DataReader** (p. 707) 's **take()** operation.
Invalid samples representing a disposal or unregistration of an instance do not count towards the history depth and will not replace other DDS samples currently in the DataReader queue for the same instance.

8.136.2.2 KEEP_ALL_HISTORY_QOS

```
final HistoryQosPolicyKind KEEP_ALL_HISTORY_QOS [static]
```

Keep *all* the samples.

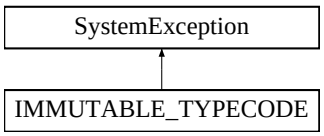
On the publishing side, RTI Connext will attempt to keep all samples (representing each value written) of each instance of data (identified by its key) managed by the **com.rti.dds.publication.DataWriter** (p. 818) until they can be delivered to all subscribers.

On the subscribing side, RTI Connext will attempt to keep all samples of each instance of data (identified by its key) managed by the **com.rti.dds.subscription.DataReader** (p. 707). These samples are kept until the application takes them from RTI Connext via the **take()** operation.

8.137 IMMUTABLE_TYPECODE Class Reference

An attempt was made to modify a **com.rti.dds.typecode.TypeCode** (p. 2183) that was received from a remote object.

Inheritance diagram for IMMUTABLE_TYPECODE:



8.137.1 Detailed Description

An attempt was made to modify a **com.rti.dds.typecode.TypeCode** (p. 2183) that was received from a remote object.

The built-in publication and subscription readers provide access to information about the remote **com.rti.dds.↩ publication.DataWriter** (p. 818) and **com.rti.dds.subscription.DataReader** (p. 707) entities in the distributed system. Among other things, the data from these built-in readers contains the **com.rti.dds.typecode.TypeCode** (p. 2183) for these entities. Modifying this received **com.rti.dds.typecode.TypeCode** (p. 2183) is not permitted.

8.138 InconsistentTopicStatus Class Reference

com.rti.dds.infrastructure.StatusKind.StatusKind.INCONSISTENT_TOPIC_STATUS

Inherits Status.

Public Attributes

- int **total_count**

  *Total cumulative count of the pairs (**com.rti.dds.subscription.DataReader** (p. 707),**com.rti.dds.publication.DataWriter** (p. 818)) whose topic names match the **com.rti.dds.topic.Topic** (p. 2116) to which this status is attached and whose types are inconsistent according to the rules defined in **com.rti.dds.infrastructure.TypeConsistencyEnforcementQosPolicy** (p. 2246).*

- int **total_count_change**

  *The incremental number of inconsistent pairs (**com.rti.dds.subscription.DataReader** (p. 707),**com.rti.dds.publication.DataWriter** (p. 818)) for the **com.rti.dds.topic.Topic** (p. 2116) to which this status is attached, that have been discovered since the last time this status was read.*

8.138.1 Detailed Description

com.rti.dds.infrastructure.StatusKind.StatusKind.INCONSISTENT_TOPIC_STATUS

Entity:

com.rti.dds.topic.Topic (p. 2116)

Listener:

com.rti.dds.topic.TopicListener (p. 2131)

Every time a **com.rti.dds.subscription.DataReader** (p. 707) and **com.rti.dds.publication.DataWriter** (p. 818) with the same **com.rti.dds.topic.Topic** (p. 2116) do not match because the type-consistency enforcement policy fails, the inconsistent topic status is updated for the **com.rti.dds.topic.Topic** (p. 2116).

```
int total_count_change
```

The incremental number of inconsistent pairs (**com.rti.dds.subscription.DataReader** (p. 707),**com.rti.dds.↩ publication.DataWriter** (p. 818)) for the **com.rti.dds.topic.Topic** (p. 2116) to which this status is attached, that have been discovered since the last time this status was read.

8.139 InetAddressSeq Class Reference

Declares IDL `sequence<` com.rti.dds.infrastructure.java.net.InetAddress `>`

Inherits ArraySequence.

Public Member Functions

- **InetAddressSeq** ()

  Construct a new empty sequence.
- **InetAddressSeq** (int initial_maximum)

  Construct a new empty sequence with the given maximum.
- **InetAddressSeq** (Collection addresses)

  Construct a new sequence containing all of the given addresses.

8.139.1 Detailed Description

Declares IDL `sequence<` com.rti.dds.infrastructure.java.net.InetAddress `>`

Instantiates:

<<***generic***>> *(*p. *403)* com.rti.dds.infrastructure.com.rti.dds.util.Sequence

See also

com.rti.dds.infrastructure.java.net.InetAddress

8.139.2 Constructor & Destructor Documentation

8.139.2.1 InetAddressSeq() [1/3]

```
InetAddressSeq ( )
```

Construct a new empty sequence.

8.139.2.2 InetAddressSeq() [2/3]

```
InetAddressSeq (
            int initial_maximum )
```

Construct a new empty sequence with the given maximum.

8.139.2.3 InetAddressSeq() [3/3]

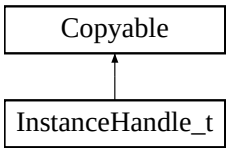
```
InetAddressSeq (
            Collection addresses )
```

Construct a new sequence containing all of the given addresses.

8.140 InstanceHandle_t Class Reference

Type definition for an instance handle.

Inheritance diagram for InstanceHandle_t:



Public Member Functions

- **InstanceHandle_t** ()
- **InstanceHandle_t** (**InstanceHandle_t** src)
- boolean **is_nil** ()

  Compare this handle to ***com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL*** *(*p. *1447**).*
- Object **copy_from** (Object src)

  Copy value of a data type from source.
- boolean **equals** (Object other)

  Compares this instance handle with another handle for equality.
- int **compare** (**InstanceHandle_t** other)

  Compares this instance handle with another handle.

Static Public Attributes

- static final **InstanceHandle_t HANDLE_NIL**

  The NIL instance handle.

8.140.1 Detailed Description

Type definition for an instance handle.

Handle to identify different instances of the same **com.rti.dds.topic.Topic** (p. 2116) of a certain type.

See also

com.rti.ndds.example.FooDataWriter.register_instance (p. 1390)

com.rti.dds.subscription.SampleInfo.instance_handle (p. 1949)

8.140.2 Constructor & Destructor Documentation

8.140.2.1 InstanceHandle_t() [1/2]

```
InstanceHandle_t ( )
```

Construct a new instance handle equal to the nil handle.

See also

HANDLE_NIL (p. 1447)

Referenced by **InstanceHandle_t.copy_from()**, and **InstanceHandle_t.equals()**.

8.140.2.2 InstanceHandle_t() [2/2]

```
InstanceHandle_t (
            InstanceHandle_t src )
```

Construct a new instance handle equal to the given handle.

Exceptions

NullPointerException	if src is null

References **InstanceHandle_t.copy_from()**.

8.140.3 Member Function Documentation

8.140.3.1 is_nil()

```
boolean is_nil ( )
```

Compare this handle to **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447).

Returns

com.rti.dds.infrastructure.true if the given instance handle is equal to **com.rti.dds.infrastructure.Instance↩ Handle_t.HANDLE_NIL** (p. 1447) or com.rti.dds.infrastructure.false otherwise.

See also

com.rti.dds.infrastructure.InstanceHandle_t.equals (p. 1446)

8.140.3.2 copy_from()

```
Object copy_from (
            Object src )
```

Copy value of a data type from source.

Copy data into *this* object from another. This copy is intended to be a deep copy, so that all data members (recursively) are copied (not just resetting Object references).

This operation returns the object that is copied if copy is successful.

Parameters

src	<<***in***>> *(p. 404)* The Object which contains the data to be copied.

Returns

Generally, return *this* but special cases (such as Enum) exist.

Exceptions

NullPointerException	If *src* is null.
ClassCastException	If *src* is not the same type as *this*.

Implements **Copyable** (p. 701).

References **InstanceHandle_t.InstanceHandle_t()**.

Referenced by **SampleInfo.copy_from()**, **WriteParams_t.copy_from()**, **InstanceHandle_t.InstanceHandle_t()**, and **WriteParams_t.WriteParams_t()**.

8.140.3.3 equals()

```
boolean equals (
             Object other )
```

Compares this instance handle with another handle for equality.

Parameters

other	<<***in***>> *(p. 404)* The other handle to be compared with this handle. Cannot be null.

Returns

com.rti.dds.infrastructure.true if the two handles have equal values, or com.rti.dds.infrastructure.false otherwise.

See also

com.rti.dds.infrastructure.InstanceHandle_t.is_nil (p. 1445)

References **InstanceHandle_t.equals()**, and **InstanceHandle_t.InstanceHandle_t()**.

Referenced by **InstanceHandle_t.equals()**, and **WriteParams_t.WriteParams_t()**.

8.140.3.4 compare()

```
int compare (
              InstanceHandle_t other )
```

Compares this instance handle with another handle.

Parameters

other	<<***in***>> *(p. 404)* The other handle to be compared with this handle. Cannot be null.

Returns

If the two handles are equal, the function returns 0. If self is greater than other the function returns a positive number; otherwise, it returns a negative number.

See also

com.rti.dds.infrastructure.InstanceHandle_t.is_nil (p. 1445)

8.140.4 Member Data Documentation

8.140.4.1 HANDLE_NIL

```
final InstanceHandle_t HANDLE_NIL [static]
```

The NIL instance handle.

Special **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443) value

See also

com.rti.dds.infrastructure.InstanceHandle_t.is_nil (p. 1445)

Referenced by **InstanceHandleSeq.fill()**, **DynamicDataWriter.lookup_instance()**, **DynamicDataWriter.register_instance()**, **DynamicDataWriter.register_instance_w_timestamp()**, and **WriteParams_t.WriteParams_t()**.

8.141 InstanceHandleSeq Class Reference

Instantiates `com.rti.dds.infrastructure.com.rti.dds.util.Sequence` < **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443) > .

Inherits ArraySequence.

Public Member Functions

- **InstanceHandleSeq** ()

  *Construct a new empty sequence for **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443) elements.*
- **InstanceHandleSeq** (int initial_maximum)

  *Construct a new empty sequence for **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443) elements.*
- **InstanceHandleSeq** (Collection<?> elements)

  *Construct a new sequence containing the given **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443) elements.*
- void **fill** (int size)

  Fill this sequence with the given number of instance handles.

8.141.1 Detailed Description

Instantiates `com.rti.dds.infrastructure.com.rti.dds.util.Sequence` < **com.rti.dds.infrastructure.↩ InstanceHandle_t** (p. 1443) > .

When reading into this sequence (as with **com.rti.dds.publication.DataWriter.get_matched_subscriptions** (p. 830) or **com.rti.dds.subscription.DataReader.get_matched_publications** (p. 723)), the contents of any existing handles in this sequence will be overwritten to avoid the expense of allocating new handles. Therefore, it is generally not a good idea to add handles to a sequence that you obtained elsewhere (e.g. from a Status object or as a result of calling **com.↩ rti.ndds.example.FooDataWriter.register_instance** (p. 1390)). Any null elements will be replaced by new handles. To avoid allocating new handles on the fly, use the method **com.rti.dds.infrastructure.InstanceHandleSeq.fill** (p. 1449).

Instantiates:

<<***generic***>> *(p. 403)* com.rti.dds.infrastructure.com.rti.dds.util.Sequence

See also

com.rti.dds.infrastructure.InstanceHandle_t (p. 1443)

com.rti.dds.infrastructure.com.rti.dds.util.Sequence

8.141.2 Constructor & Destructor Documentation

8.141.2.1 InstanceHandleSeq() [1/3]

```
InstanceHandleSeq ( )
```

Construct a new empty sequence for **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443) elements.

The maximum of the sequence will be set to a default value.

8.141.2.2 InstanceHandleSeq() [2/3]

```
InstanceHandleSeq (
            int initial_maximum )
```

Construct a new empty sequence for **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443) elements.

The maximum of the sequence will be set to the given value.

Parameters

initial_maximum	<<***in***>> *(*p. *404)* Maximum length of sequence.

8.141.2.3 InstanceHandleSeq() [3/3]

```
InstanceHandleSeq (
            Collection<?> elements )
```

Construct a new sequence containing the given **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443) elements.

The maximum of the sequence will be set to the size of the given collection.

Parameters

elements	<<***in***>> *(*p. *404)* Elements to construct a sequence with.

8.141.3 Member Function Documentation

8.141.3.1 fill()

```
void fill (
            int size )
```

Fill this sequence with the given number of instance handles.

Ensure that this sequence has at least the given size and that all elements up to that count are non-null.

Parameters

size	<<***in***>> *(*p. *404)* Size of sequence to ensure.

Exceptions

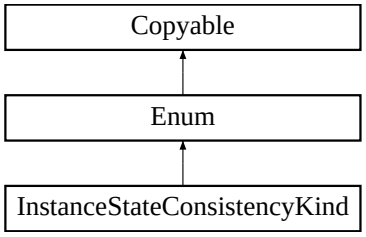
RETCODE_BAD_PARAMETER *(*p. *1899)*	If size $<$ 0

References **InstanceHandle_t.HANDLE_NIL**.

8.142 InstanceStateConsistencyKind Class Reference

<<***extension***>> *(*p. *138)* Whether instance state consistency is enabled.

Inheritance diagram for InstanceStateConsistencyKind:



Static Public Attributes

- static final **InstanceStateConsistencyKind NO_RECOVER_INSTANCE_STATE_CONSISTENCY**

  Instance state is not restored on a DataReader after reconnecting with a DataWriter until the DataWriter sends a new sample.
- static final **InstanceStateConsistencyKind RECOVER_INSTANCE_STATE_CONSISTENCY**

  Instance state is restored on the DataReader after it reconnects with a DataWriter that has regained liveliness, even before the DataWriter sends a new sample.

Additional Inherited Members

8.142.1 Detailed Description

<<***extension***>> *(*p. *138)* Whether instance state consistency is enabled.

QoS:

com.rti.dds.infrastructure.ReliabilityQosPolicy (p. 1829)

8.142.2 Member Data Documentation

8.142.2.1 NO_RECOVER_INSTANCE_STATE_CONSISTENCY

```
final InstanceStateConsistencyKind NO_RECOVER_INSTANCE_STATE_CONSISTENCY [static]
```

Instance state is not restored on a DataReader after reconnecting with a DataWriter until the DataWriter sends a new sample.

When DataReaders rediscover DataWriters, they will not request updated instance state data. DataWriters always provide instance state data alongside each sample update regardless of this setting.

8.142.2.2 RECOVER_INSTANCE_STATE_CONSISTENCY

```
final InstanceStateConsistencyKind RECOVER_INSTANCE_STATE_CONSISTENCY [static]
```

Instance state is restored on the DataReader after it reconnects with a DataWriter that has regained liveliness, even before the DataWriter sends a new sample.

When DataReaders rediscover DataWriters, they will request updated instance state data. DataWriters will respond to requests for updated instance state data and publish updates on a builtin channel. DataWriters still provide instance state data alongside each sample update regardless of this setting.

The following limitation applies to using RECOVER_INSTANCE_STATE_CONSISTENCY: If the **com.rti.dds.infrastructure.DestinationOrderQosPolicyKind** (p. 906) is set to com.rti.dds.infrastructure.DestinationOrderQosPolicyKind.DestinationOrderQosPolicyKind.BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS, RECOVER_INSTANCE_STATE_CONSISTENCY can only be used if scope is set to com.rti.dds.infrastructure.DestinationOrderQosPolicyScopeKind.DestinationOrderQosPolicyScopeKind.INSTANCE_SCOPE_DESTINATIONORDER_QOS (the default).

8.143 InstanceStateKind Class Reference

Indicates if the samples are from a live **com.rti.dds.publication.DataWriter** (p. 818) or not.

Static Public Attributes

- static final int **ALIVE_INSTANCE_STATE** = 0x0001 << 0

  Instance is currently in existence.
- static final int **NOT_ALIVE_DISPOSED_INSTANCE_STATE** = 0x0001 << 1

  Not alive disposed instance. The instance has been disposed by a DataWriter.
- static final int **NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** = 0x0001 << 2

  *Not alive no writers for instance. None of the **com.rti.dds.publication.DataWriter** (p. 818) objects that are currently alive (according to the **LIVELINESS** (p. 489)) are writing the instance.*
- static final int **ANY_INSTANCE_STATE** = 0xffff

  Any instance state ALIVE_INSTANCE_STATE | NOT_ALIVE_DISPOSED_INSTANCE_STATE | NOT_ALIVE_NO_WRITERS_INSTANCE_STATE.
- static final int **NOT_ALIVE_INSTANCE_STATE** = 0x006

  Not alive instance state NOT_ALIVE_DISPOSED_INSTANCE_STATE | NOT_ALIVE_NO_WRITERS_INSTANCE_STATE.

8.143.1 Detailed Description

Indicates if the samples are from a live **com.rti.dds.publication.DataWriter** (p. 818) or not.

For each instance, the middleware internally maintains an instance state. The instance state can be:

- **com.rti.dds.subscription.InstanceStateKind.ALIVE_INSTANCE_STATE** (p. 1452) indicates that (a) samples have been received for the instance, (b) there are live **com.rti.dds.publication.DataWriter** (p. 818) entities writing the instance, and (c) the instance has not been explicitly disposed (or else more samples have been received after it was disposed).

- **com.rti.dds.subscription.InstanceStateKind.NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 1452) indicates the instance was explicitly disposed by a **com.rti.dds.publication.DataWriter** (p. 818) by means of the dispose operation.

- **com.rti.dds.subscription.InstanceStateKind.NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 1452) indicates the instance has been declared as not-alive by the **com.rti.dds.subscription.DataReader** (p. 707) because it detected that there are no live **com.rti.dds.publication.DataWriter** (p. 818) entities writing that instance.

The precise behavior events that cause the instance state to change depends on the setting of the OWNERSHIP QoS:

- If **OWNERSHIP** (p. 494) is set to **com.rti.dds.infrastructure.OwnershipQosPolicyKind.EXCLUSIVE_↩ OWNERSHIP_QOS** (p. 1646), then the instance state becomes **com.rti.dds.subscription.InstanceState↩ Kind.NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 1452) only if the **com.rti.dds.publication.DataWriter** (p. 818) that "owns" the instance explicitly disposes it. The instance state becomes **com.rti.dds.subscription.↩ InstanceStateKind.ALIVE_INSTANCE_STATE** (p. 1452) again only if the **com.rti.dds.publication.DataWriter** (p. 818) that owns the instance writes it.

- If **OWNERSHIP** (p. 494) is set to **com.rti.dds.infrastructure.OwnershipQosPolicyKind.SHARED_↩ OWNERSHIP_QOS** (p. 1646), then the instance state becomes **com.rti.dds.subscription.InstanceState↩ Kind.NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 1452) if any **com.rti.dds.publication.DataWriter** (p. 818) explicitly disposes the instance. The instance state becomes **com.rti.dds.subscription.Instance↩ StateKind.ALIVE_INSTANCE_STATE** (p. 1452) as soon as any **com.rti.dds.publication.DataWriter** (p. 818) writes the instance again.

The instance state available in the **com.rti.dds.subscription.SampleInfo** (p. 1944) is a snapshot of the instance state of the instance at the time the collection was obtained (i.e. at the time read or take was called). The instance state is therefore the same for all samples in the returned collection that refer to the same instance.

8.143.2 Member Data Documentation

8.143.2.1 ALIVE_INSTANCE_STATE

```
final int ALIVE_INSTANCE_STATE = 0x0001 << 0  [static]
```

Instance is currently in existence.

8.143.2.2 NOT_ALIVE_DISPOSED_INSTANCE_STATE

```
final int NOT_ALIVE_DISPOSED_INSTANCE_STATE = 0x0001 << 1  [static]
```

Not alive disposed instance. The instance has been disposed by a DataWriter.

8.143.2.3 NOT_ALIVE_NO_WRITERS_INSTANCE_STATE

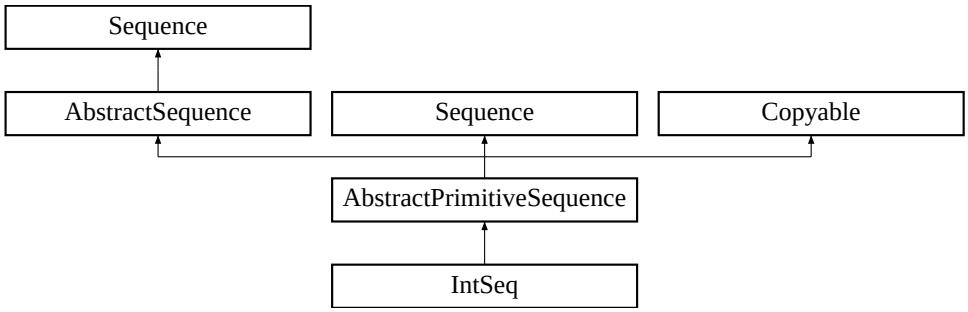
```
final int NOT_ALIVE_NO_WRITERS_INSTANCE_STATE = 0x0001 << 2  [static]
```

Not alive no writers for instance. None of the **com.rti.dds.publication.DataWriter** (p. 818) objects that are currently alive (according to the **LIVELINESS** (p. 489)) are writing the instance.

8.144 IntSeq Class Reference

Instantiates `com.rti.dds.infrastructure.com.rti.dds.util.Sequence` < com.rti.dds.infrastructure.↩ int >

Inheritance diagram for IntSeq:



Public Member Functions

- **IntSeq** ()

  Constructs an empty sequence of integers with an initial maximum of zero.
- **IntSeq** (int initialMaximum)

  Constructs an empty sequence of integers with the given initial maximum.
- **IntSeq** (int[ ] ints)

  Constructs a new sequence containing the given integers.
- boolean **addAllInt** (int[ ] elements, int offset, int length)

  Append `length` elements from the given array to this sequence, starting at index `offset` in that array.
- boolean **addAllInt** (int[ ] elements)
- void **addInt** (int element)

  Append the element to the end of the sequence.
- void **addInt** (int index, int element)

  Shift all elements in the sequence starting from the given index and add the element to the given index.
- int **getInt** (int index)

  Returns the integer at the given index.
- int **setInt** (int index, int element)

  Set the new integer at the given index and return the old integer.
- void **setInt** (int dstIndex, int[ ] elements, int srcIndex, int length)

  Copy a portion of the given array into this sequence.

- int[ ] **toArrayInt** (int[ ] array)

  Return an array containing copy of the contents of this sequence.
- int **getMaximum** ()

  Get the current maximum number of elements that can be stored in this sequence.
- Object **get** (int index)

  *A wrapper for **getInt(int)** (p. 1456) that returns a java.lang.Integer.*
- Object **set** (int index, Object element)

  *A wrapper for **setInt()** (p. 1456).*
- void **add** (int index, Object element)

  *A wrapper for **addInt(int, int)** (p. 1456).*

8.144.1 Detailed Description

Instantiates `com.rti.dds.infrastructure.com.rti.dds.util.Sequence` < com.rti.dds.infrastructure.↩ int >

Instantiates:

<<***generic***>> *(p. 403)* com.rti.dds.infrastructure.com.rti.dds.util.Sequence

com.rti.dds.infrastructure.int

com.rti.dds.infrastructure.com.rti.dds.util.Sequence

8.144.2 Constructor & Destructor Documentation

8.144.2.1 IntSeq() [1/3]

```
IntSeq ( )
```

Constructs an empty sequence of integers with an initial maximum of zero.

8.144.2.2 IntSeq() [2/3]

```
IntSeq (
            int initialMaximum )
```

Constructs an empty sequence of integers with the given initial maximum.

8.144.2.3 IntSeq() [3/3]

```
IntSeq (
            int[] ints )
```

Constructs a new sequence containing the given integers.

Parameters

ints	the initial contents of this sequence

Exceptions

NullPointerException	if the input array is null

References **IntSeq.addAllInt()**.

8.144.3 Member Function Documentation

8.144.3.1 addAllInt() [1/2]

```
boolean addAllInt (
            int[] elements,
            int offset,
            int length )
```

Append `length` elements from the given array to this sequence, starting at index `offset` in that array.

Exceptions

NullPointerException	if the given array is null.

Referenced by **IntSeq.addAllInt()**, and **IntSeq.IntSeq()**.

8.144.3.2 addAllInt() [2/2]

```
boolean addAllInt (
            int[] elements )
```

Exceptions

NullPointerException	if the given array is null

References **IntSeq.addAllInt()**.

8.144.3.3 addInt() [1/2]

```
void addInt (
            int element )
```

Append the element to the end of the sequence.

Referenced by **IntSeq.add()**.

8.144.3.4 addInt() [2/2]

```
void addInt (
            int index,
            int element )
```

Shift all elements in the sequence starting from the given index and add the element to the given index.

8.144.3.5 getInt()

```
int getInt (
            int index )
```

Returns the integer at the given index.

Exceptions

IndexOutOfBoundsException	if the index is out of bounds.

Referenced by **IntSeq.get()**, **DynamicData.get_uint_seq()**, and **DynamicData.set_ushort_seq()**.

8.144.3.6 setInt() [1/2]

```
int setInt (
            int index,
            int element )
```

Set the new integer at the given index and return the old integer.

Exceptions

IndexOutOfBoundsException	if the index is out of bounds.

Referenced by **IntSeq.set()**.

8.144.3.7 setInt() [2/2]

```
void setInt (
            int dstIndex,
            int[] elements,
            int srcIndex,
            int length )
```

Copy a portion of the given array into this sequence.

Parameters

dstIndex	the index at which to start copying into this sequence.
elements	an array of primitive elements.
srcIndex	the index at which to start copying from the given array.
length	the number of elements to copy.

Exceptions

IndexOutOfBoundsException	if copying would cause access of data outside array bounds.

8.144.3.8 toArrayInt()

```
int[] toArrayInt (
            int[] array )
```

Return an array containing copy of the contents of this sequence.

Parameters

array	The array into which this sequence should be copied. It may be null. If it is, or if array length is too small, the array will be ignored, and a new array of the necessary length will be created and copied into instead.

Returns

A non-null array containing a copy of the contents of this sequence.

8.144.3.9 getMaximum()

```
int getMaximum ( )
```

Get the current maximum number of elements that can be stored in this sequence.

The `maximum` of the sequence represents the maximum number of elements that the underlying buffer can hold. It does not represent the current number of elements.

The `maximum` is a non-negative number. It is initialized when the sequence is first created.

The `maximum` can be changed implicitly by adding an element to the sequence with **`add()`** (p. `1459`), or explicitly by calling com.rti.dds.infrastructure.com.rti.dds.util.Sequence.Sequence.setMaximum.

Returns

the current maximum of the sequence.

See also

com.rti.dds.infrastructure.com.rti.dds.util.Sequence.Sequence.size()

Implements **Sequence** (p. 1974).

Referenced by **DynamicData.get_int_seq()**, **DynamicData.get_uint_seq()**, **DynamicData.get_ushort_seq()**, **DynamicData.set_int_seq()**, and **DynamicData.set_ushort_seq()**.

8.144.3.10 get()

```
Object get (
             int index )
```

A wrapper for **getInt(int)** (p. 1456) that returns a java.lang.Integer.

See also

java.util.List::get(int)

Reimplemented from **AbstractPrimitiveSequence** (p. 576).

References **IntSeq.getInt()**.

8.144.3.11 set()

```
Object set (
             int index,
             Object element )
```

A wrapper for **setInt()** (p. 1456).

Exceptions

ClassCastException	if the element is not of type Integer.

See also

java.util.List::set(int, java.lang.Object)

Reimplemented from **AbstractPrimitiveSequence** (p. 576).

References **IntSeq.setInt()**.

Referenced by **DynamicData.get_ushort_seq()**, and **DynamicData.set_uint_seq()**.

8.144.3.12 add()

```
void add (
            int index,
            Object element )
```

A wrapper for **addInt(int, int)** (p. 1456).

Exceptions

ClassCastException	if the element is not of type Integer.

See also

java.util.List::add(int, java.lang.Object)

Reimplemented from **AbstractPrimitiveSequence** (p. 577).

References **IntSeq.addInt()**.

8.145 Sample< T >.Iterator< T > Interface Template Reference

Provides access to a collection of middleware-loaned samples.

Inherits ListIterator< Sample< T > >, and Closeable.

Inherited by SampleIteratorImpl< T >.

Public Member Functions

- int **size** ()

  Returns the number of samples.
- boolean **hasNext** ()
- **Sample**< T > **next** ()
- boolean **hasPrevious** ()
- **Sample**< T > **previous** ()
- int **nextIndex** ()
- int **previousIndex** ()
- void **remove** ()
- void **set** (**Sample**< T > o)
- void **add** (**Sample**< T > o)
- void **close** ()

  Returns the loaned samples to the middleware.

8.145.1 Detailed Description

Provides access to a collection of middleware-loaned samples.

The samples in this container are loaned from the middleware and must be returned at some point.

To return the loan, use **com.rti.connext.infrastructure.Sample<T>.Iterator<T>.close()** (p. 1462) , from `java.io.Closeable` or (since Java 7) enclose this object within a `try-with-resources` block (see **Taking loaned samples** (p. 394)).

Alternatively, if the loan is not returned by the application code, it will be automatically returned when this object is garbage-collected.

The contents of this container should not be modified and references to the samples it contains are only valid before the loan is returned.

This interface extends `java.util.ListIterator<Sample<T>>`. However any operations that modify the underlying list are not supported.

Template Parameters

T	The data type of the contained Samples

com.rti.connext.requestreply.Replier<TReq,TRep>.takeRequests(int) (p. 1854)

Taking loaned samples (p. 394)

Taking samples by copy (p. 395)

8.145.2 Member Function Documentation

8.145.2.1 size()

```
int size ( )
```

Returns the number of samples.

8.145.2.2 hasNext()

```
boolean hasNext ( )
```

From java.util.ListIterator<Sample<T>>

8.145.2.3 next()

```
Sample< T > next ( )
```

From java.util.ListIterator<Sample<T>>

8.145.2.4 hasPrevious()

```
boolean hasPrevious ( )
```

From java.util.ListIterator<Sample<T>>

8.145.2.5 previous()

```
Sample< T > previous ( )
```

From java.util.ListIterator<Sample<T>>

8.145.2.6 nextIndex()

```
int nextIndex ( )
```

From java.util.ListIterator<Sample<T>>

8.145.2.7 previousIndex()

```
int previousIndex ( )
```

From java.util.ListIterator<Sample<T>>

8.145.2.8 remove()

```
void remove ( )
```

Exceptions

UnsupportedOperationException	always.

8.145.2.9 set()

```
void set (
            Sample< T > o )
```

Exceptions

UnsupportedOperationException	always.

8.145.2.10 add()

```
void add (
            Sample< T > o )
```

Exceptions

UnsupportedOperationException	always.

8.145.2.11 close()

```
void close ( )
```

Returns the loaned samples to the middleware.

After calling this operation this object cannot be accessed again.

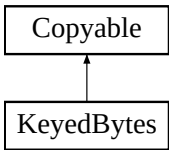
See also

com.rti.ndds.example.FooDataReader.return_loan (p. 1386) (for more information on how the middleware loans samples)

8.146 KeyedBytes Class Reference

Built-in type consisting of a variable-length array of opaque bytes and a string that is the key.

Inheritance diagram for KeyedBytes:



Public Member Functions

- **KeyedBytes** ()

  Default Constructor.
- **KeyedBytes** (**KeyedBytes** src)

  Copy constructor.
- **KeyedBytes** (int theLength)

  Constructor that specifies the allocated sizes.
- Object **copy_from** (Object src)

  Copy src into this object.

Public Attributes

- String **key**

  Instance key associated with the specified value.
- int **length**

  Number of bytes to serialize.
- int **offset**

  Offset from which to start serializing bytes.
- byte[ ] **value**

  com.rti.dds.type.builtin.com.rti.dds.type.builtin.Bytes array value.

8.146.1 Detailed Description

Built-in type consisting of a variable-length array of opaque bytes and a string that is the key.

8.146.2 Constructor & Destructor Documentation

8.146.2.1 KeyedBytes() [1/3]

```
KeyedBytes ( )
```

Default Constructor.

The default constructor initializes the newly created object with empty key, null value, zero length, and zero offset.

Referenced by **KeyedBytes.copy_from()**.

8.146.2.2 KeyedBytes() [2/3]

```
KeyedBytes (
            KeyedBytes src )
```

Copy constructor.

Parameters

src	<<***in***>> *(*p. *404)* Object to copy from.

Exceptions

NullPointerException	if src is null.

References **KeyedBytes.copy_from()**.

8.146.2.3 KeyedBytes() [3/3]

```
KeyedBytes (
            int theLength )
```

Constructor that specifies the allocated sizes.

After this method is called, key is initialized with the empty string and length and offset are set to zero.

Parameters

theLength	<<***in***>> *(*p. *404)* Size of the allocated bytes array. bytes array.

Exceptions

IllegalArgumentException	if size is negative

References **KeyedBytes.length**, **KeyedBytes.offset**, and **KeyedBytes.value**.

8.146.3 Member Function Documentation

8.146.3.1 copy_from()

```
Object copy_from (
            Object src )
```

Copy src into this object.

This method performs a deep copy of `src` and it allocates memory for the value if required.

Parameters

src	<<***in***>> *(*p. *404)* Object to copy from.

Returns

this if success. Otherwise, null.

Exceptions

NullPointerException	if `src` is null.

Implements **Copyable** (p. 701).

References **KeyedBytes.key**, **KeyedBytes.KeyedBytes()**, **KeyedBytes.length**, **KeyedBytes.offset**, and **Keyed↩ Bytes.value**.

Referenced by **KeyedBytes.KeyedBytes()**.

8.146.4 Member Data Documentation

8.146.4.1 key

```
String key
```

Instance key associated with the specified value.

Referenced by **KeyedBytes.copy_from()**, **KeyedBytesDataWriter.dispose()**, **KeyedBytesDataWriter.dispose_w_timestamp()**, **KeyedBytesDataReader.get_key_value()**, **KeyedBytesDataWriter.get_key_value()**, **KeyedBytesDataReader.lookup_instance()**, **KeyedBytesDataWriter.lookup_instance()**, **KeyedBytesDataWriter.register_instance()**, **KeyedBytesDataWriter.register_instance_w_timestamp()**, **KeyedBytesDataWriter.unregister_instance()**, **KeyedBytesDataWriter.unregister_instance_w_timestamp()**, **KeyedBytesDataWriter.write()**, and **KeyedBytesDataWriter.write_w_timestamp()**.

8.146.4.2 length

```
int length
```

Number of bytes to serialize.

Referenced by **KeyedBytes.copy_from()**, **KeyedBytes.KeyedBytes()**, **KeyedBytesDataWriter.write()**, and **KeyedBytesDataWriter.write_w_timestamp()**.

8.146.4.3 offset

```
int offset
```

Offset from which to start serializing bytes.

The first position of the bytes array has offset 0.

Referenced by **KeyedBytes.copy_from()**, **KeyedBytes.KeyedBytes()**, **KeyedBytesDataWriter.write()**, and **KeyedBytesDataWriter.write_w_timestamp()**.

8.146.4.4 value

```
byte [] value
```

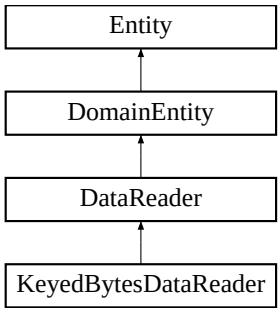
com.rti.dds.type.builtin.com.rti.dds.type.builtin.Bytes array value.

Referenced by **KeyedBytes.copy_from()**, **KeyedBytes.KeyedBytes()**, **KeyedBytesDataWriter.write()**, and **KeyedBytesDataWriter.write_w_timestamp()**.

8.147 KeyedBytesDataReader Class Reference

<<***interface***>> *(*p. *403)* Instantiates `DataReader` < com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytes >.

Inheritance diagram for KeyedBytesDataReader:



Public Member Functions

- void **read** (**KeyedBytesSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, int sample_states, int view_states, int instance_states)

  *Access a collection of data samples from the **com.rti.dds.subscription.DataReader** (*p. *707).*
- void **take** (**KeyedBytesSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, int sample_states, int view_states, int instance_states)

  *Access a collection of data-samples from the **com.rti.dds.subscription.DataReader** (*p. *707).*
- void **read_w_condition** (**KeyedBytesSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, **Read**↩ **Condition** condition)

  *Accesses via com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytesDataReader.read the samples that match the criteria specified in the **com.rti.dds.subscription.ReadCondition** (*p. *1816).*
- void **take_w_condition** (**KeyedBytesSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, **Read**↩ **Condition** condition)

  Analogous to com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytesDataReader.read_w_condition except it accesses samples via the com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytesDataReader.take operation.
- void **read_next_sample** (**KeyedBytes** received_data, **SampleInfo** sample_info)

  *Copies the next not-previously-accessed data value from the **com.rti.dds.subscription.DataReader** (*p. *707).*

8.148.2 Member Function Documentation

8.148.2.1 register_instance() [1/2]

```
InstanceHandle_t register_instance (
            KeyedBytes instance_data )
```

Informs RTI Connext that the application will be modifying a particular instance.

See also

com.rti.ndds.example.FooDataWriter.register_instance (p. 1390)

References **DataWriter.register_instance_untyped()**.

8.148.2.2 register_instance() [2/2]

```
InstanceHandle_t register_instance (
            String key )
```

<<***extension***>> *(p. 403)* Informs RTI Connext that the application will be modifying a particular instance.

See also

com.rti.ndds.example.FooDataWriter.register_instance (p. 1390)

References **KeyedBytes.key**, and **DataWriter.register_instance_untyped()**.

8.148.2.3 register_instance_w_timestamp() [1/2]

```
InstanceHandle_t register_instance_w_timestamp (
             KeyedBytes instance_data,
             Time_t source_timestamp )
```

Performs the same functions as com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytesDataWriter.register_instance except that the application provides the value for the `source_timestamp`.

See also

com.rti.ndds.example.FooDataWriter.register_instance_w_timestamp (p. 1391)

References **DataWriter.register_instance_w_timestamp_untyped()**.

8.148.2.4 register_instance_w_timestamp() [2/2]

```
InstanceHandle_t register_instance_w_timestamp (
            String key,
             Time_t source_timestamp )
```

<<***extension***>> *(p. 403)* Performs the same functions as com.rti.dds.type.builtin.com.rti.dds.type.builtin.Keyed↩ BytesDataWriter.KeyedBytesDataWriter.register_instance except that the application provides the value for the `source_timestamp`.

com.rti.ndds.example.FooDataWriter.register_instance_w_timestamp (p. 1391)

References **KeyedBytes.key**, and **DataWriter.register_instance_w_timestamp_untyped()**.

8.148.2.5 unregister_instance() [1/2]

```
void unregister_instance (
             KeyedBytes instance_data,
             InstanceHandle_t handle )
```

Reverses the action of com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytesDataWriter.register_instance.

See also

com.rti.ndds.example.FooDataWriter.unregister_instance (p. 1392)

References **DataWriter.unregister_instance_untyped()**.

8.148.2.6 unregister_instance() [2/2]

```
void unregister_instance (
            String key,
             InstanceHandle_t handle )
```

<<***extension***>> *(p. 403)* Reverses the action of com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytesData↩ Writer.KeyedBytesDataWriter.register_instance.

See also

com.rti.ndds.example.FooDataWriter.unregister_instance (p. 1392)

References **KeyedBytes.key**, and **DataWriter.unregister_instance_untyped()**.

8.148.2.7 unregister_instance_w_timestamp() [1/2]

```
void unregister_instance_w_timestamp (
             KeyedBytes instance_data,
             InstanceHandle_t handle,
             Time_t source_timestamp )
```

Performs the same function as com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytesDataWriter.unregister_↩ instance except that it also provides the value for the `source_timestamp`.

See also

com.rti.ndds.example.FooDataWriter.FooDataWriter.unregister_instance_w_timestamp

References **DataWriter.unregister_instance_w_timestamp_untyped()**.

8.148.2.8 unregister_instance_w_timestamp() [2/2]

```
void unregister_instance_w_timestamp (
            String key,
             InstanceHandle_t handle,
             Time_t source_timestamp )
```

<<***extension***>> *(p. 403)* Performs the same function as com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytes↩ DataWriter.KeyedBytesDataWriter.unregister_instance except that it also provides the value for the `source_↩ timestamp`.

See also

com.rti.ndds.example.FooDataWriter.FooDataWriter.unregister_instance_w_timestamp

References **KeyedBytes.key**, and **DataWriter.unregister_instance_w_timestamp_untyped()**.

8.148.2.9 write() [1/3]

```
void write (
             KeyedBytes instance_data,
             InstanceHandle_t handle )
```

Modifies the value of a com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytes data instance.

See also

com.rti.ndds.example.FooDataWriter.write (p. 1397)

References **DataWriter.write_untyped()**.

8.148.2.10 write() [2/3]

```
void write (
            String key,
            byte[] octets,
            int offset,
            int length,
             InstanceHandle_t handle )
```

<<***extension***>> *(p. 403)* Modifies the value of a com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytes data instance.

Parameters

key	<<***in***>> *(p. 404)* Instance key.
octets	<<***in***>> *(p. 404)* Array of bytes to be published.
offset	<<***in***>> *(p. 404)* Offset from which to start publishing.
length	<<***in***>> *(p. 404)* Number of bytes to be published.
handle	<<***in***>> *(p. 404)* Either the handle returned by a previous call to com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytesDataWriter.register_instance, or else the special value **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447). See **com.rti.ndds.example.FooDataWriter.write** (p. 1397).

See also

com.rti.ndds.example.FooDataWriter.write (p. 1397)

References **KeyedBytes.key**, **KeyedBytes.length**, **KeyedBytes.offset**, **KeyedBytes.value**, and **DataWriter.write_untyped()**.

8.148.2.11 write() [3/3]

```
void write (
             String key,
              ByteSeq octets,
              InstanceHandle_t handle )
```

<<***extension***>> *(p. 403)* Modifies the value of a com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytes data instance.

Parameters

key	<<***in***>> *(p. 404)* Instance key.
octets	<<***in***>> *(p. 404)* Sequence of bytes to be published.
handle	<<***in***>> *(p. 404)* Either the handle returned by a previous call to com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytesDataWriter.register_instance, or else the special value **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447). See **com.rti.ndds.example.FooDataWriter.write** (p. 1397).

See also

com.rti.ndds.example.FooDataWriter.write (p. 1397)

References **KeyedBytes.key**, **KeyedBytes.length**, **KeyedBytes.offset**, **AbstractPrimitiveSequence.size()**, **KeyedBytes.value**, and **DataWriter.write_untyped()**.

8.148.2.12 write_w_timestamp() [1/3]

```
void write_w_timestamp (
              KeyedBytes instance_data,
              InstanceHandle_t handle,
              Time_t source_timestamp )
```

Performs the same function as com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytesDataWriter.write except that it also provides the value for the `source_timestamp`.

See also

com.rti.ndds.example.FooDataWriter.write_w_timestamp (p. 1401)

References **DataWriter.write_w_timestamp_untyped()**.

8.148.2.13 write_w_timestamp() [2/3]

```
void write_w_timestamp (
             String key,
             byte[] octets,
             int offset,
             int length,
              InstanceHandle_t handle,
              Time_t source_timestamp )
```

Performs the same function as com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytesDataWriter.KeyedBytes↩ DataWriter.write except that it also provides the value for the `source_timestamp`.

Parameters

key	<<***in***>> *(p. 404)* Instance key.
octets	<<***in***>> *(p. 404)* Array of bytes to be published.
offset	<<***in***>> *(p. 404)* Offset from which to start publishing.
length	<<***in***>> *(p. 404)* Number of bytes to be published.
handle	<<***in***>> *(p. 404)* Either the handle returned by a previous call to com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytesDataWriter.register_instance, or else the special value **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447). See **com.rti.ndds.example.FooDataWriter.write** (p. 1397).
source_timestamp	<<***in***>> *(p. 404)* The timestamp value must be greater than or equal to the timestamp value used in the last writer operation. See **com.rti.ndds.example.FooDataWriter.write_w_timestamp** (p. 1401). Cannot be NULL.

See also

com.rti.ndds.example.FooDataWriter.write (p. 1397)

References **KeyedBytes.key**, **KeyedBytes.length**, **KeyedBytes.offset**, **KeyedBytes.value**, and **DataWriter.write_w_timestamp_untyped()**.

8.148.2.14 write_w_timestamp() [3/3]

```
void write_w_timestamp (
            String key,
             ByteSeq octets,
             InstanceHandle_t handle,
             Time_t source_timestamp )
```

Performs the same function as com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytesDataWriter.KeyedBytesDataWriter.write except that it also provides the value for the `source_timestamp`.

Parameters

key	<<***in***>> *(*p. *404)* Instance key.
octets	<<***in***>> *(*p. *404)* Sequence of bytes to be published.
handle	<<***in***>> *(*p. *404)* Either the handle returned by a previous call to com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytesDataWriter.register_instance, or else the special value **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447). See **com.rti.ndds.example.FooDataWriter.write** (p. 1397).
source_timestamp	<<***in***>> *(*p. *404)* The timestamp value must be greater than or equal to the timestamp value used in the last writer operation. See **com.rti.ndds.example.FooDataWriter.write_w_timestamp** (p. 1401). Cannot be NULL.

See also

com.rti.ndds.example.FooDataWriter.write (p. 1397)

References **KeyedBytes.key**, **KeyedBytes.length**, **KeyedBytes.offset**, **AbstractPrimitiveSequence.size()**, **KeyedBytes.value**, and **DataWriter.write_w_timestamp_untyped()**.

8.148.2.15 dispose() [1/2]

```
void dispose (
             KeyedBytes instance_data,
             InstanceHandle_t instance_handle )
```

Requests the middleware to delete the data.

See also

com.rti.ndds.example.FooDataWriter.dispose (p. 1403)

References **DataWriter.dispose_untyped()**.

8.148.2.16 dispose() [2/2]

```
void dispose (
            String key,
             InstanceHandle_t instance_handle )
```

<<***extension***>> *(*p. *403)* Requests the middleware to delete the data.

See also

com.rti.ndds.example.FooDataWriter.dispose (p. 1403)

References **DataWriter.dispose_untyped()**, and **KeyedBytes.key**.

8.148.2.17 dispose_w_timestamp() [1/2]

```
void dispose_w_timestamp (
             KeyedBytes instance_data,
             InstanceHandle_t instance_handle,
             Time_t source_timestamp )
```

Performs the same functions as com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytesDataWriter.dispose except that the application provides the value for the `source_timestamp` that is made available to **com.rti.dds.↩ subscription.DataReader** (p. 707) objects by means of the `source_timestamp` attribute inside the **com.rti.dds.↩ subscription.SampleInfo** (p. 1944).

See also

com.rti.ndds.example.FooDataWriter.dispose_w_timestamp (p. 1405)

References **DataWriter.dispose_w_timestamp_untyped()**.

8.148.2.18 dispose_w_timestamp() [2/2]

```
void dispose_w_timestamp (
            String key,
             InstanceHandle_t instance_handle,
             Time_t source_timestamp )
```

<<***extension***>> *(*p. *403)* Performs the same functions as com.rti.dds.type.builtin.com.rti.dds.type.builtin.Keyed↩ BytesDataWriter.KeyedBytesDataWriter.dispose except that the application provides the value for the `source↩ _timestamp` that is made available to **com.rti.dds.subscription.DataReader** (p. 707) objects by means of the `source_timestamp` attribute inside the **com.rti.dds.subscription.SampleInfo** (p. 1944).

See also

com.rti.ndds.example.FooDataWriter.dispose_w_timestamp (p. 1405)

References **DataWriter.dispose_w_timestamp_untyped()**, and **KeyedBytes.key**.

8.148.2.19 get_key_value() [1/2]

```
void get_key_value (
              KeyedBytes key_holder,
              InstanceHandle_t handle )
```

Retrieve the instance `key` that corresponds to an instance `handle`.

See also

com.rti.ndds.example.FooDataWriter.get_key_value (p. 1406)

References **DataWriter.get_key_value_untyped()**.

8.148.2.20 get_key_value() [2/2]

```
String get_key_value (
              InstanceHandle_t handle )
```

<<***extension***>> *(p. 403)* Retrieve the instance `key` that corresponds to an instance `handle`.

See also

com.rti.ndds.example.FooDataWriter.get_key_value (p. 1406)

References **DataWriter.get_key_value_untyped()**, and **KeyedBytes.key**.

8.148.2.21 lookup_instance() [1/2]

```
InstanceHandle_t lookup_instance (
              KeyedBytes key_holder )
```

Retrieve the instance `handle` that corresponds to an instance `key_holder`.

See also

com.rti.ndds.example.FooDataWriter.lookup_instance (p. 1407)

References **DataWriter.lookup_instance_untyped()**.

8.148.2.22 lookup_instance() [2/2]

```
InstanceHandle_t lookup_instance (
            String key )
```

<<***extension***>> *(*p. *403)* Retrieve the instance `handle` that corresponds to an instance `key`.

See also

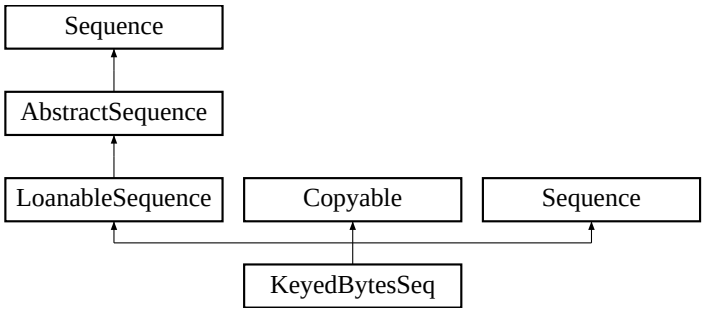
com.rti.ndds.example.FooDataWriter.lookup_instance (p. 1407)

References **KeyedBytes.key**, and **DataWriter.lookup_instance_untyped()**.

8.149 KeyedBytesSeq Class Reference

Instantiates `com.rti.dds.infrastructure.com.rti.dds.util.Sequence` < com.rti.dds.type.↩ builtin.com.rti.dds.type.builtin.KeyedBytes >.

Inheritance diagram for KeyedBytesSeq:



Public Member Functions

- **KeyedBytesSeq** ()

  Constructs an empty sequence of com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytes objects with an initial maximum of zero.
- **KeyedBytesSeq** (int initialMaximum)

  Constructs an empty sequence of com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytes objects with the given initial maximum.
- **KeyedBytesSeq** (Collection elements)

  Constructs a new sequence containing the given com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytes objects.
- **KeyedBytes get** (int index)

  Returns the element at the specified position in this sequence.
- Object **copy_from** (Object src)

8.149.1 Detailed Description

Instantiates com.rti.dds.infrastructure.com.rti.dds.util.Sequence < com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytes >.

Instantiates:

<<***generic***>> *(*p. *403)* com.rti.dds.infrastructure.com.rti.dds.util.Sequence

See also

com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytes

8.149.2 Constructor & Destructor Documentation

8.149.2.1 KeyedBytesSeq() [1/3]

```
KeyedBytesSeq ( )
```

Constructs an empty sequence of com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytes objects with an initial maximum of zero.

8.149.2.2 KeyedBytesSeq() [2/3]

```
KeyedBytesSeq (
            int initialMaximum )
```

Constructs an empty sequence of com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytes objects with the given initial maximum.

8.149.2.3 KeyedBytesSeq() [3/3]

```
KeyedBytesSeq (
            Collection elements )
```

Constructs a new sequence containing the given com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytes objects.

Parameters

elements	the initial contents of this sequence.

Exceptions

NullPointerException	if the input collection is null

8.149.3 Member Function Documentation

8.149.3.1 get()

```
KeyedBytes get (
            int index )
```

Returns the element at the specified position in this sequence.

See also

java.util.List::get(int)

Reimplemented from **LoanableSequence** (p. 1545).

8.149.3.2 copy_from()

```
Object copy_from (
            Object src )
```

Copy data into `this` object from another. The result of this method is that both `this` and `src` will be the same size and contain the same data.

Parameters

src	The Object which contains the data to be copied

Returns

`this`

Exceptions

NullPointerException	If `src` is null.
ClassCastException	If `src` is not a `Sequence` OR if one of the objects contained in the `Sequence` is not of the expected type.

See also

com.rti.dds.infrastructure.Copyable::copy_from (p. 701)(java.lang.Object)

Implements **Copyable** (p. 701).

Static Public Member Functions

- static void **register_type** (**DomainParticipant** participant, String type_name)

  Allows an application to communicate to RTI Connext the existence of the com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytes data type.
- static void **unregister_type** (**DomainParticipant** participant, String type_name)

  Allows an application to unregister the com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytes data type from RTI Connext. After calling unregister_type, no further communication using this type is possible.
- static String **get_type_name** ()

  Get the default name for the com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytes type.

8.150.1 Detailed Description

<<***interface***>> *(*p. *403)* com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytes type support.

8.150.2 Member Function Documentation

8.150.2.1 register_type()

```
static void register_type (
               DomainParticipant participant,
              String type_name )  [static]
```

Allows an application to communicate to RTI Connext the existence of the com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytes data type.

By default, The com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytes built-in type is automatically registered when a DomainParticipant is created using the type_name returned by com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytesTypeSupport.get_type_name. Therefore, the usage of this function is optional and it is only required when the automatic built-in type registration is disabled using the participant property "dds.builtin_type.auto_register".

This method can also be used to register the same com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytesTypeSupport with a **com.rti.dds.domain.DomainParticipant** (p. 948) using different values for the type_name.

If `register_type` is called multiple times with the same **com.rti.dds.domain.DomainParticipant** (p. 948) and `type_name`, the second (and subsequent) registrations are ignored by the operation.

Parameters

participant	<<***in***>> *(*p. *404)* the **com.rti.dds.domain.DomainParticipant** (p. 948) to register the data type com.rti.dds.type.builtin.com.rti.dds.type.builtin.Bytes with. Cannot be null.
type_name	<<***in***>> *(*p. *404)* the type name under with the data type com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytes is registered with the participant; this type name is used when creating a new **com.rti.dds.topic.Topic** (p. 2116). (See **com.rti.dds.domain.DomainParticipant.create_topic** (p. 984).) The name may not be null or longer than 255 characters.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903) or **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903).

MT Safety:

UNSAFE on the FIRST call. It is not safe for two threads to simultaneously make the first call to register a type. Subsequent calls are thread safe.

See also

com.rti.dds.domain.DomainParticipant.create_topic (p. 984)

8.150.2.2 unregister_type()

```
static void unregister_type (
              DomainParticipant participant,
             String type_name )  [static]
```

Allows an application to unregister the com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytes data type from RTI Connext. After calling unregister_type, no further communication using this type is possible.

Precondition

The com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytes type with `type_name` is registered with the participant and all **com.rti.dds.topic.Topic** (p. 2116) objects referencing the type have been destroyed. If the type is not registered with the participant, or if any **com.rti.dds.topic.Topic** (p. 2116) is associated with the type, the operation will fail with **com.rti.dds.infrastructure.RETCODE_ERROR** (p. 1900).

Postcondition

All information about the type is removed from RTI Connext. No further communication using this type is possible.

Parameters

participant	*<<**in**>> (p. 404)* the **com.rti.dds.domain.DomainParticipant** (p. 948) to unregister the data type com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytes from. Cannot be null.
type_name	*<<**in**>> (p. 404)* the type name under with the data type com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytes is registered with the participant. The name should match a name that has been previously used to register a type with the participant. Cannot be null.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) or **com.rti.dds.infrastructure.RETCODE_ERROR** (p. 1900)

MT Safety:

SAFE.

See also

com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytesTypeSupport.register_type

8.150.2.3 get_type_name()

```
static String get_type_name ( )  [static]
```

Get the default name for the com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytes type.

Can be used for calling com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytesTypeSupport.register_type or creating **com.rti.dds.topic.Topic** (p. 2116).

Returns

default name for the com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytes type.

See also

com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedBytesTypeSupport.register_type

com.rti.dds.domain.DomainParticipant.create_topic (p. 984)

8.150.2.4 get_serialized_sample_max_size()

```
long get_serialized_sample_max_size (
             Object endpoint_data,
             boolean include_encapsulation,
             short final_encapsulation_id,
             long currentAlignment )
```

Coverity is complaining about endpoint_data being null, because it is called from create_native_bufferI which is a performance test method. This method is just used against two types in our testers.

Coverity is complaining about a possible null dereference, but it is not possible. Adding a null check to avoid the report.

References **ExtensibilityKind.EXTENSIBLE_EXTENSIBILITY**.

8.150.2.5 serialize_to_cdr_buffer() [1/2]

```
long serialize_to_cdr_buffer (
            byte[] buffer,
            long length,
             KeyedBytes src )
```

<<***extension***>> *(*p. *403)* Serializes the input sample into a CDR buffer of octets.

See also

com.rti.ndds.example.FooTypeSupport.serialize_to_cdr_buffer (p. 1413)

Referenced by **KeyedBytesTypeSupport.data_to_string()**.

8.150.2.6 serialize_to_cdr_buffer() [2/2]

```
long serialize_to_cdr_buffer (
            byte[] buffer,
            long length,
             KeyedBytes src,
            short representation )
```

<<***extension***>> *(*p. *403)* Serializes the input sample into a buffer of octets.

See also

com.rti.ndds.example.FooTypeSupport.serialize_to_cdr_buffer (p. 1413)

8.150.2.7 data_to_string() [1/2]

```
String data_to_string (
             KeyedBytes src,
             PrintFormatProperty property )
```

<<***extension***>> *(*p. *403)* Get the string representation of an input sample.

See also

com.rti.ndds.example.FooTypeSupport.data_to_string (p. 1416)

References **DynamicData.from_cdr_buffer()**, **DynamicData.PROPERTY_DEFAULT**, **KeyedBytesTypeSupport.↩ serialize_to_cdr_buffer()**, and **DynamicData.to_string()**.

Referenced by **KeyedBytesTypeSupport.data_to_string()**.

8.150.2.8 data_to_string() [2/2]

```
String data_to_string (
              KeyedBytes src )
```

<<***extension***>> *(*p. *403)* Get the string representation of an input sample.

Use the default values for **com.rti.dds.topic.PrintFormatProperty** (p. 1686) to create the output string.

See also

com.rti.ndds.example.FooTypeSupport.data_to_string (p. 1416)

References **KeyedBytesTypeSupport.data_to_string()**.

8.150.2.9 deserialize_from_cdr_buffer()

```
void deserialize_from_cdr_buffer (
              KeyedBytes dst,
             byte[] buffer,
             long length )
```

<<***extension***>> *(*p. *403)* Deserializes a sample from a buffer of octets.

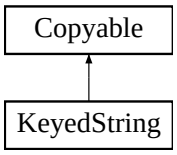
8.151 KeyedString Class Reference

Keyed string built-in type.

Inheritance diagram for KeyedString:



Public Member Functions

- **KeyedString** ()
  Default Constructor.
- **KeyedString** (String **key**, String **value**)
- **KeyedString** (**KeyedString** src)
  Copy constructor.
- Object **copy_from** (Object src)
  Copy value of a data type from source.

Public Attributes

- String **key**
  Instance key associated with the specified value.
- String **value**
  String value.

8.151.1 Detailed Description

Keyed string built-in type.

8.151.2 Constructor & Destructor Documentation

8.151.2.1 KeyedString() [1/3]

```
KeyedString ( )
```

Default Constructor.

The default constructor initializes the newly created object with empty key and value.

Referenced by **KeyedString.copy_from()**.

8.151.2.2 KeyedString() [2/3]

```
KeyedString (
            String key,
            String value )
```

Creates a **KeyedString** (p. 1494) with a key and a value

References **KeyedString.key**, and **KeyedString.value**.

8.151.2.3 KeyedString() [3/3]

```
KeyedString (
             KeyedString src )
```

Copy constructor.

Parameters

src	<<***in***>> *(*p. *404)* Object to copy from.

Exceptions

NullPointerException	if src is null.

References **KeyedString.copy_from()**.

8.151.3 Member Function Documentation

8.151.3.1 copy_from()

```
Object copy_from (
             Object src )
```

Copy value of a data type from source.

Copy data into *this* object from another. This copy is intended to be a deep copy, so that all data members (recursively) are copied (not just resetting Object references).

This operation returns the object that is copied if copy is successful.

Parameters

src	<<***in***>> *(*p. *404)* The Object which contains the data to be copied.

Returns

Generally, return *this* but special cases (such as Enum) exist.

Exceptions

NullPointerException	If *src* is null.
ClassCastException	If *src* is not the same type as *this*.

Implements **Copyable** (p. 701).

References **KeyedString.key**, **KeyedString.KeyedString()**, and **KeyedString.value**.

Referenced by **KeyedString.KeyedString()**.

8.151.4 Member Data Documentation

8.151.4.1 key

`String key`

Instance key associated with the specified value.

Referenced by **KeyedString.copy_from()**, **KeyedStringDataWriter.dispose()**, **KeyedStringDataWriter.dispose_w_timestamp()**, **KeyedStringDataReader.get_key_value()**, **KeyedStringDataWriter.get_key_value()**, **KeyedString.KeyedString()**, **KeyedStringDataReader.lookup_instance()**, **KeyedStringDataWriter.lookup_instance()**, **KeyedStringDataWriter.register_instance()**, **KeyedStringDataWriter.register_instance_w_timestamp()**, **KeyedStringDataWriter.unregister_instance()**, **KeyedStringDataWriter.unregister_instance_w_timestamp()**, **KeyedStringDataWriter.write()**, and **KeyedStringDataWriter.write_w_timestamp()**.

8.151.4.2 value

`String value`

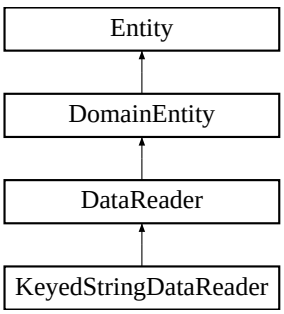
String value.

Referenced by **KeyedString.copy_from()**, **KeyedString.KeyedString()**, **KeyedStringDataWriter.write()**, and **KeyedStringDataWriter.write_w_timestamp()**.

8.152 KeyedStringDataReader Class Reference

<<***interface***>> *(*p. *403)* Instantiates `DataReader` < com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedString >.

Inheritance diagram for KeyedStringDataReader:



Public Member Functions

- void **read** (**KeyedStringSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, int sample_states, int view_states, int instance_states)

  *Access a collection of data samples from the **com.rti.dds.subscription.DataReader** (*p. *707).*

- void **take** (**KeyedStringSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, int sample_states, int view_states, int instance_states)

  *Access a collection of data-samples from the **com.rti.dds.subscription.DataReader** (*p. *707).*

- void **read_w_condition** (**KeyedStringSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, **Read↩ Condition** condition)

  *Accesses via com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedStringDataReader.read the samples that match the criteria specified in the **com.rti.dds.subscription.ReadCondition** (*p. *1816).*

- void **take_w_condition** (**KeyedStringSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, **Read↩ Condition** condition)

  Analogous to com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedStringDataReader.read_w_condition except it accesses samples via the com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedStringDataReader.take operation.

- void **read_next_sample** (**KeyedString** received_data, **SampleInfo** sample_info)

  *Copies the next not-previously-accessed data value from the **com.rti.dds.subscription.DataReader** (*p. *707).*

- void **take_next_sample** (**KeyedString** received_data, **SampleInfo** sample_info)

  *Copies the next not-previously-accessed data value from the **com.rti.dds.subscription.DataReader** (*p. *707).*

- void **read_instance** (**KeyedStringSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, **Instance↩ Handle_t** a_handle, int sample_states, int view_states, int instance_states)

  *Access a collection of data samples from the **com.rti.dds.subscription.DataReader** (*p. *707).*

- void **take_instance** (**KeyedStringSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, **Instance↩ Handle_t** a_handle, int sample_states, int view_states, int instance_states)

  *Access a collection of data samples from the **com.rti.dds.subscription.DataReader** (*p. *707).*

- void **read_instance_w_condition** (**KeyedStringSeq** received_data, **SampleInfoSeq** info_seq, int max_↩ samples, **InstanceHandle_t** a_handle, **ReadCondition** condition)

  *Accesses via com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedStringDataReader.read_instance the samples that match the criteria specified in the **com.rti.dds.subscription.ReadCondition** (*p. *1816).*

- void **take_instance_w_condition** (**KeyedStringSeq** received_data, **SampleInfoSeq** info_seq, int max_↩ samples, **InstanceHandle_t** a_handle, **ReadCondition** condition)

  *Accesses via com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedStringDataReader.take_instance the samples that match the criteria specified in the **com.rti.dds.subscription.ReadCondition** (*p. *1816).*

- void **read_next_instance** (**KeyedStringSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, **InstanceHandle_t** a_handle, int sample_states, int view_states, int instance_states)

  *Access a collection of data samples from the **com.rti.dds.subscription.DataReader** (*p. *707).*

- void **take_next_instance** (**KeyedStringSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, **InstanceHandle_t** a_handle, int sample_states, int view_states, int instance_states)

  *Access a collection of data samples from the **com.rti.dds.subscription.DataReader** (*p. *707).*

- void **read_next_instance_w_condition** (**KeyedStringSeq** received_data, **SampleInfoSeq** info_seq, int max↩ _samples, **InstanceHandle_t** a_handle, **ReadCondition** condition)

  *Accesses via com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedStringDataReader.read_next_instance the samples that match the criteria specified in the **com.rti.dds.subscription.ReadCondition** (*p. *1816).*

- void **take_next_instance_w_condition** (**KeyedStringSeq** received_data, **SampleInfoSeq** info_seq, int max↩ _samples, **InstanceHandle_t** a_handle, **ReadCondition** condition)

  *Accesses via com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedStringDataReader.take_next_instance the samples that match the criteria specified in the **com.rti.dds.subscription.ReadCondition** (*p. *1816).*

- void **return_loan** (**KeyedStringSeq** received_data, **SampleInfoSeq** info_seq)

*Indicates to the **com.rti.dds.subscription.DataReader** (p. 707) that the application is done accessing the collection of `received_data` and `info_seq` obtained by some earlier invocation of read or take on the **com.rti.dds.subscription.DataReader** (p. 707).*

- void **get_key_value** (**KeyedString** key_holder, **InstanceHandle_t** handle)

  Retrieve the instance `key` that corresponds to an instance `handle`.
- String **get_key_value** (**InstanceHandle_t** handle)

  *<<**extension**>> (p. 403) Retrieve the instance `key` that corresponds to an instance `handle`.*
- **InstanceHandle_t lookup_instance** (**KeyedString** key_holder)

  Retrieve the instance `handle` that corresponds to an instance `key_holder`.
- **InstanceHandle_t lookup_instance** (String key)

  *<<**extension**>> (p. 403) Retrieve the instance `handle` that corresponds to an instance `key`.*

Additional Inherited Members

8.152.1 Detailed Description

com.rti.ndds.example.FooDataReader.read_next_instance (p. 1376)

References **DataReader.read_next_instance_untyped()**.

8.152.2.12 take_next_instance()

```
void take_next_instance (
              KeyedStringSeq received_data,
              SampleInfoSeq info_seq,
             int max_samples,
              InstanceHandle_t a_handle,
             int sample_states,
             int view_states,
             int instance_states )
```

Access a collection of data samples from the **com.rti.dds.subscription.DataReader** (p. 707).

See also

com.rti.ndds.example.FooDataReader.take_next_instance (p. 1378)

References **DataReader.take_next_instance_untyped()**.

8.152.2.13 read_next_instance_w_condition()

```
void read_next_instance_w_condition (
              KeyedStringSeq received_data,
              SampleInfoSeq info_seq,
             int max_samples,
              InstanceHandle_t a_handle,
              ReadCondition condition )
```

Accesses via com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedStringDataReader.read_next_instance the samples that match the criteria specified in the **com.rti.dds.subscription.ReadCondition** (p. 1816).

See also

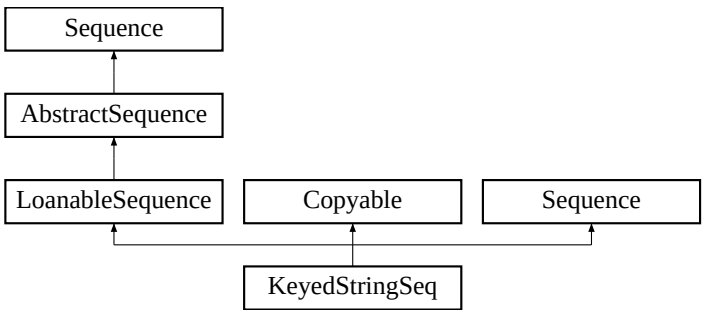
References **KeyedString.key**, and **DataWriter.lookup_instance_untyped()**.

8.154 KeyedStringSeq Class Reference

Instantiates `com.rti.dds.infrastructure.com.rti.dds.util.Sequence` < com.rti.dds.type.↩ builtin.com.rti.dds.type.builtin.KeyedString > .

Inheritance diagram for KeyedStringSeq:



Public Member Functions

- **KeyedStringSeq** ()

  Constructs an empty sequence of com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedString objects with an initial maximum of zero.
- **KeyedStringSeq** (int initialMaximum)

  Constructs an empty sequence of com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedString objects with the given initial maximum.
- **KeyedStringSeq** (Collection elements)

  Constructs a new sequence containing the given com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedString objects.
- **KeyedString get** (int index)

  Returns the element at the specified position in this sequence.
- Object **copy_from** (Object src)

8.154.1 Detailed Description

Instantiates `com.rti.dds.infrastructure.com.rti.dds.util.Sequence` < com.rti.dds.type.↩ builtin.com.rti.dds.type.builtin.KeyedString > .

Instantiates:

<<***generic***>> *(*p. *403)* com.rti.dds.infrastructure.com.rti.dds.util.Sequence

See also

com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedString

8.154.2 Constructor & Destructor Documentation

8.154.2.1 KeyedStringSeq() [1/3]

```
KeyedStringSeq ( )
```

Constructs an empty sequence of com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedString objects with an initial maximum of zero.

8.154.2.2 KeyedStringSeq() [2/3]

```
KeyedStringSeq (
            int initialMaximum )
```

Constructs an empty sequence of com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedString objects with the given initial maximum.

8.154.2.3 KeyedStringSeq() [3/3]

```
KeyedStringSeq (
            Collection elements )
```

Constructs a new sequence containing the given com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedString objects.

Parameters

elements	the initial contents of this sequence.

Exceptions

NullPointerException	if the input collection is null

8.154.3 Member Function Documentation

8.154.3.1 get()

```
KeyedString get (
            int index )
```

Returns the element at the specified position in this sequence.

See also

java.util.List::get(int)

Reimplemented from **LoanableSequence** (p. 1545).

8.154.3.2 copy_from()

```
Object copy_from (
            Object src )
```

Copy data into `this` object from another. The result of this method is that both `this` and `src` will be the same size and contain the same data.

Parameters

src	The Object which contains the data to be copied

Returns

`this`

Exceptions

NullPointerException	If `src` is null.
ClassCastException	If `src` is not a `Sequence` OR if one of the objects contained in the `Sequence` is not of the expected type.

See also

com.rti.dds.infrastructure.Copyable::copy_from (p. 701)(java.lang.Object)

Implements **Copyable** (p. 701).

Static Public Member Functions

- static void **register_type** (**DomainParticipant** participant, String type_name)

  Allows an application to communicate to RTI Connext the existence of the com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedString data type.
- static void **unregister_type** (**DomainParticipant** participant, String type_name)

  Allows an application to unregister the com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedString data type from RTI Connext. After calling unregister_type, no further communication using this type is possible.
- static String **get_type_name** ()

  Get the default name for the com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedString type.

8.155.1 Detailed Description

<<***interface***>> *(*p. *403)* Keyed string type support.

8.155.2 Member Function Documentation

8.155.2.1 register_type()

```
static void register_type (
              DomainParticipant participant,
             String type_name )  [static]
```

Allows an application to communicate to RTI Connext the existence of the com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedString data type.

By default, The com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedString built-in type is automatically registered when a DomainParticipant is created using the type_name returned by com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedStringTypeSupport.get_type_name. Therefore, the usage of this function is optional and it is only required when the automatic built-in type registration is disabled using the participant property "dds.builtin_type.auto_register".

This method can also be used to register the same com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedStringTypeSupport with a **com.rti.dds.domain.DomainParticipant** (p. 948) using different values for the type_name.

If `register_type` is called multiple times with the same **com.rti.dds.domain.DomainParticipant** (p. 948) and `type_name`, the second (and subsequent) registrations are ignored by the operation.

Parameters

participant	<<***in***>> *(*p. *404)* the **com.rti.dds.domain.DomainParticipant** (p. 948) to register the data type com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedString with. Cannot be null.
type_name	<<***in***>> *(*p. *404)* the type name under with the data type com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedString is registered with the participant; this type name is used when creating a new **com.rti.dds.topic.Topic** (p. 2116). (See **com.rti.dds.domain.DomainParticipant.create_topic** (p. 984).) The name may not be null or longer than 255 characters.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903) or **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903).

MT Safety:

UNSAFE on the FIRST call. It is not safe for two threads to simultaneously make the first call to register a type. Subsequent calls are thread safe.

See also

com.rti.dds.domain.DomainParticipant.create_topic (p. 984)

8.155.2.2 unregister_type()

```
static void unregister_type (
              DomainParticipant participant,
             String type_name )  [static]
```

Allows an application to unregister the com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedString data type from RTI Connext. After calling unregister_type, no further communication using this type is possible.

Precondition

The com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedString type with `type_name` is registered with the participant and all **com.rti.dds.topic.Topic** (p. 2116) objects referencing the type have been destroyed. If the type is not registered with the participant, or if any **com.rti.dds.topic.Topic** (p. 2116) is associated with the type, the operation will fail with **com.rti.dds.infrastructure.RETCODE_ERROR** (p. 1900).

Postcondition

All information about the type is removed from RTI Connext. No further communication using this type is possible.

Parameters

participant	*<<**in**>> (p. 404)* the **com.rti.dds.domain.DomainParticipant** (p. 948) to unregister the data type com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedString from. Cannot be null.
type_name	*<<**in**>> (p. 404)* the type name under with the data type com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedString is registered with the participant. The name should match a name that has been previously used to register a type with the participant. Cannot be null.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) or **com.rti.dds.infrastructure.RETCODE_ERROR** (p. 1900)

MT Safety:

SAFE.

See also

com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedStringTypeSupport.register_type

8.155.2.3 get_type_name()

```
static String get_type_name ( )  [static]
```

Get the default name for the com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedString type.

Can be used for calling com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedStringTypeSupport.register_type or creating **com.rti.dds.topic.Topic** (p. 2116).

Returns

default name for the com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedString type.

See also

com.rti.dds.type.builtin.com.rti.dds.type.builtin.KeyedStringTypeSupport.register_type

com.rti.dds.domain.DomainParticipant.create_topic (p. 984)

8.155.2.4 get_serialized_sample_max_size()

```
long get_serialized_sample_max_size (
             Object endpoint_data,
             boolean include_encapsulation,
             short final_encapsulation_id,
             long currentAlignment )
```

Coverity is complaining about endpoint_data being null, because it is called from create_native_bufferI which is a performance test method. This method is just used against two types in our testers.

Coverity is complaining about a possible null dereference, but it is not possible. Adding a null check to avoid the report.

References **ExtensibilityKind.EXTENSIBLE_EXTENSIBILITY**.

8.155.2.5 serialize_to_cdr_buffer() [1/2]

```
long serialize_to_cdr_buffer (
            byte[] buffer,
            long length,
             KeyedString src )
```

Changeable (p. 507) = **YES** (p. 507)

See also

com.rti.dds.infrastructure.PublishModeQosPolicy (p. 1797)

com.rti.dds.publication.FlowController (p. 1348)

8.156.2 Usage

This policy provides a means for the application to indicate to the middleware the urgency of the data communication. By having a non-zero `duration`, RTI Connext can optimize its internal operation.

RTI Connext uses it in conjunction with com.rti.dds.infrastructure.PublishModeQosPolicyKind.PublishModeQos↩ PolicyKind.ASYNCHRONOUS_PUBLISH_MODE_QOS **com.rti.dds.publication.DataWriter** (p. 818) instances associated with a com.rti.dds.publication.FlowControllerSchedulingPolicy.FlowControllerSchedulingPolicy.EDF_FLOW↩ _CONTROLLER_SCHED_POLICY **com.rti.dds.publication.FlowController** (p. 1348) only. Together with the time of write, **com.rti.dds.infrastructure.LatencyBudgetQosPolicy.duration** (p. 1525) determines the deadline of each individual sample. RTI Connext uses this information to prioritize the sending of asynchronously published data; see **com.rti.dds.infrastructure.AsynchronousPublisherQosPolicy** (p. 593).

8.156.3 Compatibility

The value offered is considered compatible with the value requested if and only if the inequality *offered duration* <= *requested duration* evaluates to 'TRUE'.

8.156.4 Member Data Documentation

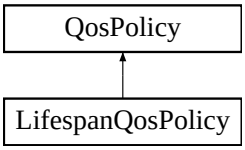
8.158 LifespanQosPolicy Class Reference

<<***spec***>> *(p. 132)* Specifies how long the data written by the **com.rti.dds.publication.DataWriter** (p. 818) is considered valid.

Inheritance diagram for LifespanQosPolicy:



Public Attributes

- final **Duration_t duration**

  *<<**basic**>> (p. 123) <<**spec**>> (p. 132) Maximum duration for the data's validity.*

8.158.1 Detailed Description

*<<**spec**>> (p. 132)* Specifies how long the data written by the **com.rti.dds.publication.DataWriter** (p. 818) is considered valid.

Each data sample written by the **com.rti.dds.publication.DataWriter** (p. 818) has an associated expiration time beyond which the data should not be delivered to any application. Once the sample expires, the data will be removed from the **com.rti.dds.subscription.DataReader** (p. 707) caches as well as from the transient and persistent information caches.

The expiration time of each sample from the **com.rti.dds.publication.DataWriter** (p. 818)'s cache is computed by adding the duration specified by this QoS policy to the time when the sample is added to the **com.rti.dds.publication.↩ DataWriter** (p. 818)'s cache. This timestamp is not necessarily equal to the sample's source timestamp that can be provided by the user using the **com.rti.ndds.example.FooDataWriter.write_w_timestamp** (p. 1401) or **com.rti.ndds.↩ example.FooDataWriter.write_w_params** (p. 1402) API.

The expiration time of each sample from the **com.rti.dds.subscription.DataReader** (p. 707)'s cache is computed by adding the duration to the reception timestamp.

See also

com.rti.ndds.example.FooDataWriter.write (p. 1397)

com.rti.ndds.example.FooDataWriter.write_w_timestamp (p. 1401)

Entity:

com.rti.dds.topic.Topic (p. 2116), **com.rti.dds.publication.DataWriter** (p. 818)

Properties:

RxO (p. 506) = N/A
Changeable (p. 507) = **YES** (p. 507)

8.158.2 Usage

The Lifespan QoS policy can be used to control how much data is stored by RTI Connext. Even if it is configured to store "all" of the data sent or received for a topic (see **com.rti.dds.infrastructure.HistoryQosPolicy** (p. 1435)), the total amount of data it stores may be limited by this QoS policy.

You may also use this QoS policy to ensure that applications do not receive or act on data, commands or messages that are too old and have 'expired.'

To avoid inconsistencies, multiple writers of the same instance should have the same lifespan.

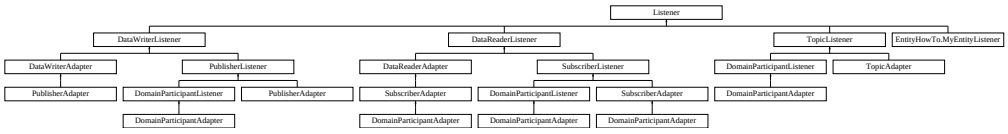
8.159 Listener Interface Reference

<<***interface***>> *(*p. *403)* Abstract base class for all **Listener** (p. 1528) interfaces.

Inheritance diagram for Listener:



8.159.1 Detailed Description

<<***interface***>> *(*p. *403)* Abstract base class for all **Listener** (p. 1528) interfaces.

Entity:

com.rti.dds.infrastructure.Entity (p. 1320)

QoS:

All QoS Policies (p. 501)

Status:

Status Kinds (p. 514)

All the supported kinds of concrete **com.rti.dds.infrastructure.Listener** (p. 1528) interfaces (one per concrete **com.↩ rti.dds.infrastructure.Entity** (p. 1320) type) derive from this root and add methods whose prototype depends on the concrete **Listener** (p. 1528).

Listeners provide a way for RTI Connext to asynchronously alert the application when there are relevant status changes.

Almost every application will have to implement listener interfaces.

Each dedicated listener presents a list of operations that correspond to the relevant communication status changes to which an application may respond.

The same **com.rti.dds.infrastructure.Listener** (p. 1528) instance may be shared among multiple entities if you so desire. Consequently, the provided parameter contains a reference to the concerned **com.rti.dds.infrastructure.↩ Entity** (p. 1320).

8.159.2 Access to Plain Communication Status

The general mapping between the plain communication statuses (see **Status Kinds** (p. 514)) and the listeners' operations is as follows:

- For each communication status, there is a corresponding operation whose name is `on_<communication_status>`(), which takes a parameter of type `<communication_status>` as listed in **Status Kinds** (p. 514).
- `on_<communication_status>` is available on the relevant **com.rti.dds.infrastructure.Entity** (p. 1320) as well as those that embed it, as expressed in the following figure:

listener processing. The most *specific* relevant enabled listener is called."

- When the application attaches a listener on an entity, it must set a mask. The mask indicates to RTI Connext which operations are enabled within the listener (cf. operation **com.rti.dds.infrastructure.Entity** (p. 1320) set_listener()).
- When a plain communication status changes, RTI Connext triggers the most specific relevant listener operation that is enabled. In case the most specific relevant listener operation corresponds to an application-installed 'nil' listener the operation will be considered handled by a NO-OP operation that does not reset the communication status.

This behavior allows the application to set a default behavior (e.g., in the listener associated with the **com.rti.dds.domain.DomainParticipant** (p. 948)) and to set dedicated behaviors only where needed.

8.159.3 Access to Read Communication Status

The two statuses related to data arrival are treated slightly differently. Since they constitute the core purpose of the Data Distribution Service, there is no need to provide a default mechanism (as is done for the plain communication statuses above).

The rule is as follows. Each time the read communication status changes:

- First, RTI Connext tries to trigger the **com.rti.dds.subscription.SubscriberListener.on_data_on_readers** (p. 2064) with a parameter of the related **com.rti.dds.subscription.Subscriber** (p. 2039);
- If this does not succeed (there is no listener or the operation is not enabled), RTI Connext tries to trigger **com.rti.dds.subscription.DataReaderListener.on_data_available** (p. 760) on all the related **com.rti.dds.subscription.DataReaderListener** (p. 757) objects, with a parameter of the related **com.rti.dds.subscription.DataReader** (p. 707).

The rationale is that either the application is interested in relations among data arrivals and it must use the first option (and then get the corresponding **com.rti.dds.subscription.DataReader** (p. 707) objects by calling **com.rti.dds.subscription.Subscriber.get_datareaders** (p. 2050) on the related **com.rti.dds.subscription.Subscriber** (p. 2039) and then get the data by calling **com.rti.ndds.example.FooDataReader.read** (p. 1361) or **com.rti.ndds.example.FooDataReader.take** (p. 1363) on the returned **com.rti.dds.subscription.DataReader** (p. 707) objects), or it wants to treat each **com.rti.dds.subscription.DataReader** (p. 707) independently and it may choose the second option (and then get the data by calling **com.rti.ndds.example.FooDataReader.read** (p. 1361) or **com.rti.ndds.example.FooDataReader.take** (p. 1363) on the related **com.rti.dds.subscription.DataReader** (p. 707)).

Note that if **com.rti.dds.subscription.SubscriberListener.on_data_on_readers** (p. 2064) is called, RTI Connext will *not* try to call **com.rti.dds.subscription.DataReaderListener.on_data_available** (p. 760). However, an application can force a call to the **com.rti.dds.subscription.DataReader** (p. 707) objects that have data by calling **com.rti.dds.subscription.Subscriber.notify_datareaders** (p. 2052).

8.159.4 Operations Allowed in Listener Callbacks

See `Restricted Operations in Listener Callbacks`, in the Core Libraries User's Manual.

8.159.5 Best Practices with Listeners

Note that all the issues described below are avoided by using **com.rti.dds.infrastructure.WaitSet** (p. 2287).

Avoid blocking or performing a lot of processing in Listener (p. 1528) callbacks

Listeners are invoked by internal threads that perform critical functions within the middleware and need to run in a timely manner. By default, Connext DDS creates a few threads to use to receive data and only a single thread to handle periodic events.

Because of this, user applications installing Listeners should never block in a **Listener** (p. 1528) callback. There are several negative consequences of blocking in a listener callback:

- The application may lose data for the DataReader the listener is installed on, because the receive thread is not removing it from the socket buffer and it gets overwritten.
- The application may receive strictly reliable data with a delay, because the receive thread is not removing it from the socket buffer and if it gets overwritten it must be re-sent.
- The application may lose or delay data for other DataReaders, because by default all DataReaders created with the same DomainParticipant share the same threads.
- The application may not be notified of periodic events on time

If the application needs to make a blocking call when data is available, or when another event occurs, the application should use **com.rti.dds.infrastructure.WaitSet** (p. 2287).

Avoid taking application mutexes/semaphores in Listener (p. 1528) callbacks

Taking application mutexes/sempahores within a **Listener** (p. 1528) callback may lead to unexpected deadlock scenarios.

When a **Listener** (p. 1528) callback is invoked the EA (Exclusive Area) of the **Entity** (p. 1320) 'E' to which the callback applies is taken by the middleware.

If the application takes an application mutex 'M' within a critical section in which the application makes DDS calls affecting 'E', this may lead to following deadlock:

The middleware thread is within the entity EA trying to acquire the mutex 'M'. At the same time, the application thread has acquired 'M' and is blocked trying to acquire the entity EA.

Do not write data with a DataWriter within the on_data_available callback

Avoid writing data with a DataWriter within the **com.rti.dds.subscription.DataReaderListener::on_data_available()** (p. 760) callback. If the write operation blocks because e.g. the send window is full, this will lead to a deadlock.

Do not call wait_for_acknowledgements within the on_data_available callback

Do not call the **com.rti.dds.publication.DataWriter.wait_for_acknowledgments** (p. 834) within the **com.rti.dds.↩ subscription.DataReaderListener::on_data_available()** (p. 760) callback. This will lead to deadlock.

8.160 LivelinessChangedStatus Class Reference

com.rti.dds.infrastructure.StatusKind.StatusKind.LIVELINESS_CHANGED_STATUS

Inherits Status.

Public Member Functions

- **LivelinessChangedStatus** ()

  The no-argument constructor for this status object.
- **LivelinessChangedStatus** (**LivelinessChangedStatus** src)

  A copy constructor.

Public Attributes

- int **alive_count**

  *The total count of currently alive **com.rti.dds.publication.DataWriter** (p. 818) entities that write the **com.rti.dds.topic.Topic** (p. 2116) that this **com.rti.dds.subscription.DataReader** (p. 707) reads.*
- int **not_alive_count**

  *The total count of currently not_alive **com.rti.dds.publication.DataWriter** (p. 818) entities that write the **com.rti.dds.topic.Topic** (p. 2116) that this **com.rti.dds.subscription.DataReader** (p. 707) reads.*
- int **alive_count_change**

  The change in the alive_count since the last time the listener was called or the status was read.
- int **not_alive_count_change**

  The change in the not_alive_count since the last time the listener was called or the status was read.
- final **InstanceHandle_t last_publication_handle**

  *This InstanceHandle can be used to look up which remote **com.rti.dds.publication.DataWriter** (p. 818) was the last to cause this **DataReader** (p. 707)'s status to change, using **com.rti.dds.subscription.DataReader.get_matched_publication_data** (p. 724).*

8.160.1 Detailed Description

com.rti.dds.infrastructure.StatusKind.StatusKind.LIVELINESS_CHANGED_STATUS

The **com.rti.dds.subscription.DataReaderListener.on_liveliness_changed** (p. 759) callback may be invoked for the following reasons:

- The liveliness of any **com.rti.dds.publication.DataWriter** (p. 818) matching this **DataReader** (p. 707) (as defined by the **com.rti.dds.infrastructure.LivelinessQosPolicyKind** (p. 1539) setting) is lost.
- A DataWriter's liveliness is recovered after being lost.
- A new matching DataWriter has been discovered.
- A matching DataWriter has been deleted.

- A QoS Policy has changed such that a DataWriter that matched this **DataReader** (p. 707) before no longer matches (such as a change to the **com.rti.dds.infrastructure.PartitionQosPolicy** (p. 1664)). In this case, RTI Connext will no longer keep track of the DataWriter's liveliness. Furthermore, consider two scenarios:
  - DataWriter was alive when it and **DataReader** (p. 707) stopped matching: **com.rti.dds.subscription.LivelinessChangedStatus.alive_count** (p. 1533) will decrease (since there's one less matching alive DataWriter) and **com.rti.dds.subscription.LivelinessChangedStatus.not_alive_count** (p. 1533) will remain the same (since the DataWriter is still alive).
  - DataWriter was not alive when it and **DataReader** (p. 707) stopped matching: **com.rti.dds.subscription.LivelinessChangedStatus.alive_count** (p. 1533) will remain the same (since the matching DataWriter was not alive) and **com.rti.dds.subscription.LivelinessChangedStatus.not_alive_count** (p. 1533) will decrease (since there's one less not-alive matching DataWriter).

    Note: There are several ways that a DataWriter and **DataReader** (p. 707) can become incompatible after the DataWriter has lost liveliness. For example, when the **com.rti.dds.infrastructure.LivelinessQosPolicyKind** (p. 1539) is set to DDS_MANUAL_BY_PARTICIPANT_LIVELINESS_QOS, it is possible that the DataWriter has not asserted its liveliness in a timely manner, and then a QoS change occurs on the DataWriter or **DataReader** (p. 707) that makes the entities incompatible.
- A QoS Policy (such as the **com.rti.dds.infrastructure.PartitionQosPolicy** (p. 1664)) has changed such that a DataWriter that was unmatched with the **DataReader** (p. 707) now matches.

8.160.2 Constructor & Destructor Documentation

8.160.2.1 LivelinessChangedStatus() [1/2]

```
LivelinessChangedStatus ( )
```

The no-argument constructor for this status object.

8.160.2.2 LivelinessChangedStatus() [2/2]

```
LivelinessChangedStatus (
            LivelinessChangedStatus src )
```

A copy constructor.

Exceptions

NullPointerException	if the given status is null.

References **LivelinessChangedStatus.alive_count**, **LivelinessChangedStatus.alive_count_change**, **LivelinessChangedStatus.last_publication_handle**, **LivelinessChangedStatus.not_alive_count**, and **LivelinessChangedStatus.not_alive_count_change**.

8.160.3 Member Data Documentation

8.160.3.1 alive_count

```
int alive_count
```

The total count of currently alive **com.rti.dds.publication.DataWriter** (p. 818) entities that write the **com.rti.dds.topic.Topic** (p. 2116) that this **com.rti.dds.subscription.DataReader** (p. 707) reads.

Referenced by **LivelinessChangedStatus.LivelinessChangedStatus()**.

8.160.3.2 not_alive_count

```
int not_alive_count
```

The total count of currently not_alive **com.rti.dds.publication.DataWriter** (p. 818) entities that write the **com.rti.dds.topic.Topic** (p. 2116) that this **com.rti.dds.subscription.DataReader** (p. 707) reads.

Referenced by **LivelinessChangedStatus.LivelinessChangedStatus()**.

8.160.3.3 alive_count_change

```
int alive_count_change
```

The change in the alive_count since the last time the listener was called or the status was read.

Referenced by **LivelinessChangedStatus.LivelinessChangedStatus()**.

8.160.3.4 not_alive_count_change

```
int not_alive_count_change
```

The change in the not_alive_count since the last time the listener was called or the status was read.

Note that a positive not_alive_count_change means one of the following:

- The DomainParticipant containing the matched DataWriter has lost liveliness or has been deleted.
- The matched DataWriter has lost liveliness or has been deleted.

Referenced by **LivelinessChangedStatus.LivelinessChangedStatus()**.

8.160.3.5 last_publication_handle

```
final InstanceHandle_t last_publication_handle
```

This InstanceHandle can be used to look up which remote **com.rti.dds.publication.DataWriter** (p. 818) was the last to cause this **DataReader** (p. 707)'s status to change, using **com.rti.dds.subscription.DataReader.get_matched_publication_data** (p. 724).

It's possible that the DataWriter has been purged from the discovery database. (See the "Discovery Overview" section of the User's Manual.) If so, the **com.rti.dds.subscription.DataReader.get_matched_publication_data** (p. 724) method will not be able to return information about the DataWriter. In this case, the only way to get information about the lost DataWriter is if you cached the information previously.

Referenced by **LivelinessChangedStatus.LivelinessChangedStatus()**.

8.161 LivelinessLostStatus Class Reference

com.rti.dds.infrastructure.StatusKind.StatusKind.LIVELINESS_LOST_STATUS

Inherits Status.

Public Attributes

- int **total_count**

  *Total cumulative number of times that a previously-alive **com.rti.dds.publication.DataWriter** (p. 818) became not alive due to a failure to to actively signal its liveliness within the offered liveliness period.*
- int **total_count_change**

  The incremental changes in total_count since the last time the listener was called or the status was read.

8.161.1 Detailed Description

com.rti.dds.infrastructure.StatusKind.StatusKind.LIVELINESS_LOST_STATUS

Entity:

com.rti.dds.publication.DataWriter (p. 818)

Listener:

com.rti.dds.publication.DataWriterListener (p. 853)

The liveliness that the **com.rti.dds.publication.DataWriter** (p. 818) has committed through its **com.rti.dds.infrastructure.LivelinessQosPolicy** (p. 1535) was not respected; thus **com.rti.dds.subscription.DataReader** (p. 707) entities will consider the **com.rti.dds.publication.DataWriter** (p. 818) as no longer "alive/active".

8.161.2 Member Data Documentation

8.161.2.1 total_count

```
int total_count
```

Total cumulative number of times that a previously-alive **com.rti.dds.publication.DataWriter** (p. 818) became not alive due to a failure to to actively signal its liveliness within the offered liveliness period.

This count does not change when an already not alive **com.rti.dds.publication.DataWriter** (p. 818) simply remains not alive for another liveliness period.

8.161.2.2 total_count_change

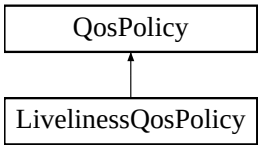
```
int total_count_change
```

The incremental changes in total_count since the last time the listener was called or the status was read.

8.162 LivelinessQosPolicy Class Reference

Specifies and configures the mechanism that allows **com.rti.dds.subscription.DataReader** (p. 707) entities to detect when **com.rti.dds.publication.DataWriter** (p. 818) entities become disconnected or "dead.".

Inheritance diagram for LivelinessQosPolicy:



Public Attributes

- **LivelinessQosPolicyKind kind**

  *<<**basic**>> (p. 123) <<**spec**>> (p. 132) The kind of liveliness desired.*
- final **Duration_t lease_duration**

  *<<**basic**>> (p. 123) <<**spec**>> (p. 132) The duration within which a **com.rti.dds.publication.DataWriter** (p. 818) must be asserted, or else it is assumed to be not alive.*
- int **assertions_per_lease_duration**

  *<<**basic**>> (p. 123) <<**extension**>> (p. 138) The number of assertions a **com.rti.dds.publication.DataWriter** (p. 818) will send during a its **com.rti.dds.infrastructure.LivelinessQosPolicy.lease_duration** (p. 1538).*

8.162.1 Detailed Description

Specifies and configures the mechanism that allows **com.rti.dds.subscription.DataReader** (p. 707) entities to detect when **com.rti.dds.publication.DataWriter** (p. 818) entities become disconnected or "dead.".

The liveliness status of a **com.rti.dds.publication.DataWriter** (p. 818) is used to maintain instance ownership in combination with the setting of the **OWNERSHIP** (p. 494) policy. The application is also informed via **com.rti.dds.↩ infrastructure.Listener** (p. 1528) when an **com.rti.dds.publication.DataWriter** (p. 818) is no longer alive.

A **com.rti.dds.publication.DataWriter** (p. 818) commits to signalling its liveliness at intervals not to exceed the **com.↩ rti.dds.infrastructure.LivelinessQosPolicy.lease_duration** (p. 1538) configured on the **com.rti.dds.publication.↩ DataWriter** (p. 818). The rate at which the **com.rti.dds.publication.DataWriter** (p. 818) will signal its liveliness is defined by **com.rti.dds.infrastructure.LivelinessQosPolicy.assertions_per_lease_duration** (p. 1538).

The **com.rti.dds.subscription.DataReader** (p. 707) lease_duration specifies the maximum period at which matching DataWriters must have their liveliness asserted.

In addition, in the subscribing application Connext DDS uses an internal thread that wakes up at the period set by the DataReader's lease_duration to see if a DataWriter lease_duration has been violated.

Important: The DataReader lease_duration only configures how often a DataReader will check the liveliness of the matching DataWriters. The DataWriter lease_duration configures the period at which a DataWriter must assert its liveliness and is the value that the DataReader uses to determine if a matching DataWriter is alive or not.

Listeners are used to notify a **com.rti.dds.subscription.DataReader** (p. 707) of loss of liveliness and **com.rti.dds.↩ publication.DataWriter** (p. 818) of violations to the liveliness contract. The on_liveliness_lost() callback is only called *once*, after the first time the lease_duration is exceeded (when the **com.rti.dds.publication.DataWriter** (p. 818) first loses liveliness).

This QoS policy can be used during system integration to ensure that applications have been coded to meet design specifications. It can also be used during runtime to detect when systems are performing outside of design specifications. Receiving applications can take appropriate actions in response to disconnected DataWriters.

Entity:

com.rti.dds.topic.Topic (p. 2116), **com.rti.dds.subscription.DataReader** (p. 707), **com.rti.dds.publication.↩ DataWriter** (p. 818)

Status:

com.rti.dds.infrastructure.StatusKind.StatusKind.LIVELINESS_LOST_STATUS, **com.rti.dds.publication.↩ LivelinessLostStatus** (p. 1534);
com.rti.dds.infrastructure.StatusKind.StatusKind.LIVELINESS_CHANGED_STATUS, **com.rti.dds.subscription.↩ LivelinessChangedStatus** (p. 1531);
com.rti.dds.infrastructure.StatusKind.StatusKind.REQUESTED_INCOMPATIBLE_QOS_STATUS, com.rti.dds.↩ infrastructure.StatusKind.StatusKind.OFFERED_INCOMPATIBLE_QOS_STATUS

Properties:

RxO (p. 506) = YES
Changeable (p. 507) = **UNTIL ENABLE** (p. 507)

8.162.2 Usage

This policy controls the mechanism and parameters used by RTI Connext to ensure that particular DataWriters on the network are still alive. The liveliness can also affect the ownership of a particular instance, as determined by the **OWNERSHIP** (p. 494) policy.

This policy has several settings to support both data types that are updated periodically as well as those that are changed sporadically. It also allows customisation for different application requirements in terms of the kinds of failures that will be detected by the liveliness mechanism.

The com.rti.dds.infrastructure.LivelinessQosPolicyKind.LivelinessQosPolicyKind.AUTOMATIC_LIVELINESS_QOS liveliness setting is most appropriate for applications that only need to detect failures at the process-level, but not application-logic failures within a process. RTI Connext takes responsibility for renewing the leases at the required rates and thus, as long as the local process where a **com.rti.dds.domain.DomainParticipant** (p. 948) is running and the link connecting it to remote participants remains connected, the entities within the **com.rti.dds.domain.DomainParticipant** (p. 948) will be considered alive. This requires the lowest overhead.

The manual settings (com.rti.dds.infrastructure.LivelinessQosPolicyKind.LivelinessQosPolicyKind.MANUAL_BY_↩ PARTICIPANT_LIVELINESS_QOS, com.rti.dds.infrastructure.LivelinessQosPolicyKind.LivelinessQosPolicyKind.↩ MANUAL_BY_TOPIC_LIVELINESS_QOS) require the application on the publishing side to periodically assert the liveliness before the lease expires to indicate the corresponding **com.rti.dds.infrastructure.Entity** (p. 1320) is still alive. The action can be explicit by calling the **com.rti.dds.publication.DataWriter.assert_liveliness** (p. 836) operation or implicit by writing some data.

The two possible manual settings control the granularity at which the application must assert liveliness.

- The setting com.rti.dds.infrastructure.LivelinessQosPolicyKind.LivelinessQosPolicyKind.MANUAL_BY_↩ PARTICIPANT_LIVELINESS_QOS requires only that one **com.rti.dds.infrastructure.Entity** (p. 1320) within a participant is asserted to be alive to deduce all other **com.rti.dds.infrastructure.Entity** (p. 1320) objects within the same **com.rti.dds.domain.DomainParticipant** (p. 948) are also alive.

- The setting com.rti.dds.infrastructure.LivelinessQosPolicyKind.LivelinessQosPolicyKind.MANUAL_BY_TOPIC↩ _LIVELINESS_QOS requires that at least one instance within the **com.rti.dds.publication.DataWriter** (p. 818) is asserted.

Changes in **LIVELINESS** (p. 489) must be detected by the Service with a time-granularity greater or equal to the **com.↩ rti.dds.infrastructure.LivelinessQosPolicy.lease_duration** (p. 1538). This ensures that the value of the **com.rti.↩ dds.subscription.LivelinessChangedStatus** (p. 1531) is updated at least once during each lease_duration and the related Listeners and **com.rti.dds.infrastructure.WaitSet** (p. 2287) s are notified within a lease_duration from the time the **LIVELINESS** (p. 489) changed.

8.162.3 Compatibility

The value offered is considered compatible with the value requested if and only if the following conditions are met:

- the inequality *offered kind* >= *requested kind* evaluates to 'TRUE'. For the purposes of this inequality, the values of **com.rti.dds.infrastructure.LivelinessQosPolicyKind** (p. 1539) kind are considered ordered such that↩ : com.rti.dds.infrastructure.LivelinessQosPolicyKind.LivelinessQosPolicyKind.AUTOMATIC_LIVELINESS_QOS < com.rti.dds.infrastructure.LivelinessQosPolicyKind.LivelinessQosPolicyKind.MANUAL_BY_PARTICIPANT_↩ LIVELINESS_QOS < com.rti.dds.infrastructure.LivelinessQosPolicyKind.LivelinessQosPolicyKind.MANUAL_↩ BY_TOPIC_LIVELINESS_QOS.

- the inequality *offered* `lease_duration` <= *requested* `lease_duration` evaluates to com.rti.dds.↩ infrastructure.true.

Relationship between registration, liveliness and ownership (p. 1642)

8.162.4 Member Data Documentation

8.162.4.1 kind

```
LivelinessQosPolicyKind kind
```

<<***basic***>> *(p. 123)* <<***spec***>> *(p. 132)* The kind of liveliness desired.

[default] com.rti.dds.infrastructure.LivelinessQosPolicyKind.LivelinessQosPolicyKind.AUTOMATIC_LIVELINESS_QOS

Categories

Immutable (p. 292), **Discovery Metadata** (p. 348), **Matching** (p. 355), **Liveliness** (p. 239)

8.162.4.2 lease_duration

```
final  Duration_t lease_duration
```

<<***basic***>> *(p. 123)* <<***spec***>> *(p. 132)* The duration within which a **com.rti.dds.publication.DataWriter** (p. 818) must be asserted, or else it is assumed to be not alive.

For a DataWriter, the lease_duration specifies a timeout by which liveliness must be asserted for the DataWriter, or the DataWriter will be considered inactive or not alive.

For a DataReader, the lease_duration specifies the maximum period at which the DataReader will check to see if the matching DataWriters are still alive according to the DataWriters lease_duration value.

Important: The DataWriter lease_duration is the value that the DataReader uses to determine if a matching DataWriter is alive or not.

Writer-side filtering is disabled if the writer's lease_duration is set to a finite value.

[default] com.rti.dds.infrastructure.Duration_t.DURATION_INFINITE (p. 1133)

[range] [0,1 year] or **com.rti.dds.infrastructure.Duration_t.DURATION_INFINITE** (p. 1133)

Categories

Immutable (p. 292), **Discovery Metadata** (p. 348), **Matching** (p. 355), **Liveliness** (p. 239)

8.162.4.3 assertions_per_lease_duration

```
int assertions_per_lease_duration
```

<<***basic***>> *(p. 123)* <<***extension***>> *(p. 138)* The number of assertions a **com.rti.dds.publication.DataWriter** (p. 818) will send during a its **com.rti.dds.infrastructure.LivelinessQosPolicy.lease_duration** (p. 1538).

This field only applies to a **com.rti.dds.publication.DataWriter** (p. 818) and is not considered during QoS compatibility checks.

The default value is 3. A higher value will make the liveliness mechanism more robust against packet losses, but it will also increase the network traffic.

[default] 3

[range] [2, 100 million]

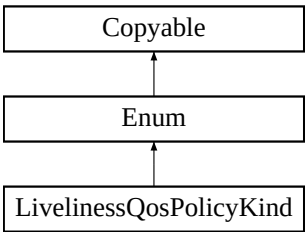
Categories

Immutable (p. 292), **Liveliness** (p. 239)

8.163 LivelinessQosPolicyKind Class Reference

Kinds of liveliness.

Inheritance diagram for LivelinessQosPolicyKind:



Static Public Attributes

- static final **LivelinessQosPolicyKind AUTOMATIC_LIVELINESS_QOS**

  [default] *The infrastructure will automatically signal liveliness for the* ***com.rti.dds.publication.DataWriter*** *(p. 818) (s) at least as often as required by the* ***com.rti.dds.publication.DataWriter*** *(p. 818) (S)* `lease_duration`*.*
- static final **LivelinessQosPolicyKind MANUAL_BY_PARTICIPANT_LIVELINESS_QOS**

  RTI Connext will assume that as long as at least one ***com.rti.dds.publication.DataWriter*** *(p. 818) belonging to the* ***com.rti.dds.domain.DomainParticipant*** *(p. 948) (or the* ***com.rti.dds.domain.DomainParticipant*** *(p. 948) itself) has asserted its liveliness, then the other DataWriters belonging to that same* ***com.rti.dds.domain.DomainParticipant*** *(p. 948) are also alive.*
- static final **LivelinessQosPolicyKind MANUAL_BY_TOPIC_LIVELINESS_QOS**

  RTI Connext will only assume liveliness of the ***com.rti.dds.publication.DataWriter*** *(p. 818) if the application has asserted liveliness of that* ***com.rti.dds.publication.DataWriter*** *(p. 818) itself.*

Additional Inherited Members

8.163.1 Detailed Description

Kinds of liveliness.

QoS:

com.rti.dds.infrastructure.LivelinessQosPolicy (p. 1535)

8.163.2 Member Data Documentation

8.163.2.1 AUTOMATIC_LIVELINESS_QOS

```
final LivelinessQosPolicyKind AUTOMATIC_LIVELINESS_QOS [static]
```

[default] The infrastructure will automatically signal liveliness for the **com.rti.dds.publication.DataWriter** (p. 818) (s) at least as often as required by the **com.rti.dds.publication.DataWriter** (p. 818) (S) `lease_duration`.

A **com.rti.dds.publication.DataWriter** (p. 818) with this setting does not need to take any specific action in order to be considered 'alive.' The **com.rti.dds.publication.DataWriter** (p. 818) is only 'not alive' when the participant to which it belongs terminates (gracefully or not), or when there is a network problem that prevents the current participant from contacting that remote participant.

8.163.2.2 MANUAL_BY_PARTICIPANT_LIVELINESS_QOS

```
final LivelinessQosPolicyKind MANUAL_BY_PARTICIPANT_LIVELINESS_QOS [static]
```

RTI Connext will assume that as long as at least one **com.rti.dds.publication.DataWriter** (p. 818) belonging to the **com.rti.dds.domain.DomainParticipant** (p. 948) (or the **com.rti.dds.domain.DomainParticipant** (p. 948) itself) has asserted its liveliness, then the other DataWriters belonging to that same **com.rti.dds.domain.DomainParticipant** (p. 948) are also alive.

The user application takes responsibility to signal liveliness to RTI Connext either by calling **com.rti.dds.domain.↩ DomainParticipant.assert_liveliness** (p. 1005), or by calling **com.rti.dds.publication.DataWriter.assert_liveliness** (p. 836), or **com.rti.ndds.example.FooDataWriter.write** (p. 1397) on any **com.rti.dds.publication.DataWriter** (p. 818) belonging to the **com.rti.dds.domain.DomainParticipant** (p. 948).

8.163.2.3 MANUAL_BY_TOPIC_LIVELINESS_QOS

```
final LivelinessQosPolicyKind MANUAL_BY_TOPIC_LIVELINESS_QOS [static]
```

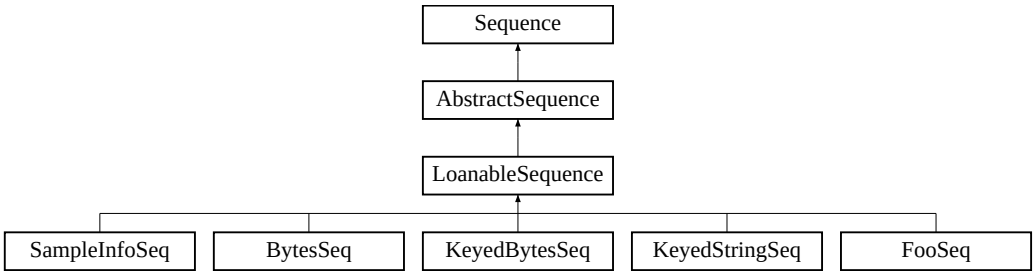
RTI Connext will only assume liveliness of the **com.rti.dds.publication.DataWriter** (p. 818) if the application has asserted liveliness of that **com.rti.dds.publication.DataWriter** (p. 818) itself.

The user application takes responsibility to signal liveliness to RTI Connext using the **com.rti.dds.publication.Data↩ Writer.assert_liveliness** (p. 836) method, or by writing some data.

8.164 LoanableSequence Class Reference

A sequence capable of storing its elements directly or taking out a loan on them from an internal middleware store.

Inheritance diagram for LoanableSequence:



Public Member Functions

- **LoanableSequence** (Class elementType)

  Construct a new sequence for elements of the given type.
- **LoanableSequence** (Class elementType, int maximum)

  Construct a new sequence for elements of the given type.

8.164.2 Constructor & Destructor Documentation

8.164.2.1 LoanableSequence() [1/3]

```
LoanableSequence (
            Class elementType )
```

Construct a new sequence for elements of the given type.

8.164.2.2 LoanableSequence() [2/3]

```
LoanableSequence (
            Class elementType,
            int maximum )
```

Construct a new sequence for elements of the given type.

8.164.2.3 LoanableSequence() [3/3]

```
LoanableSequence (
            Class elementType,
            Collection elements )
```

Construct a new sequence for elements of the given type.

8.164.3 Member Function Documentation

8.164.3.1 add() [1/2]

```
boolean add (
            Object element )
```

Appends the specified element.

Reimplemented from **AbstractSequence** (p. 584).

Referenced by **BytesSeq.copy_from()**, **KeyedBytesSeq.copy_from()**, **KeyedStringSeq.copy_from()**, and **Foo↩Seq.copy_from()**.

8.164.3.2 add() [2/2]

```
void add (
            int index,
            Object element )
```

Inserts an element at the specified location.

Reimplemented from **AbstractSequence** (p. 583).

8.164.3.3 clear()

```
void clear ( )
```

Removes all of the elements.

8.164.3.4 hasOwnership()

```
final boolean hasOwnership ( )
```

Return the value of the owned flag.

Returns

com.rti.dds.infrastructure.true if sequence owns the underlying buffer, or com.rti.dds.infrastructure.false if it has an outstanding loan.

Referenced by **LoanableSequence.get()**, **LoanableSequence.getMaximum()**, and **LoanableSequence.size()**.

8.164.3.5 getMaximum()

```
int getMaximum ( )
```

Get the current maximum number of elements that can be stored in this sequence.

The `maximum` of the sequence represents the maximum number of elements that the underlying buffer can hold. It does not represent the current number of elements.

The `maximum` is a non-negative number. It is initialized when the sequence is first created.

The `maximum` can be changed implicitly by adding an element to the sequence with **`add()`** (p. 1542), or explicitly by calling com.rti.dds.infrastructure.com.rti.dds.util.Sequence.Sequence.setMaximum.

Returns

the current maximum of the sequence.

See also

com.rti.dds.infrastructure.com.rti.dds.util.Sequence.Sequence.size()

Implements **Sequence** (p. 1974).

References **LoanableSequence.hasOwnership()**.

Referenced by **BytesSeq.copy_from()**, **KeyedBytesSeq.copy_from()**, **KeyedStringSeq.copy_from()**, and **Foo↩Seq.copy_from()**.

8.164.3.6 setMaximum()

```
void setMaximum (
             int new_max )
```

Resize this sequence to a new desired maximum.

This operation does nothing if the new desired maximum matches the current maximum.

Note: If you add an element with **`add()`** (p. 1542), the sequence's size is increased implicitly.

Postcondition

length == MINIMUM(original length, new_max)

Parameters

new_max	Must be >= 0.

Reimplemented from **AbstractSequence** (p. 582).

Referenced by **BytesSeq.copy_from()**, **KeyedBytesSeq.copy_from()**, **KeyedStringSeq.copy_from()**, and **Foo↩Seq.copy_from()**.

8.164.3.7 set()

```
Object set (
             int index,
             Object element )
```

Replaces the element at the specified position in this sequence with the specified element.

See also

java.util.List::set(int, java.lang.Object)

8.164.3.8 get()

```
Object get (
             int index )
```

Returns the element at the specified position in this sequence.

See also

java.util.List::get(int)

Reimplemented in **SampleInfoSeq** (p. 1957), **BytesSeq** (p. 658), **KeyedBytesSeq** (p. 1488), and **KeyedStringSeq** (p. 1517).

References **LoanableSequence.hasOwnership()**.

8.164.3.9 size()

```
int size ( )
```

Returns the length of the sequence.

See also

java.util.List::get(int)

References **LoanableSequence.hasOwnership()**.

8.165 Locator_t Class Reference

<<***extension***>> *(*p. *138)* Type used to represent the addressing information needed to send a message to an RTPS Endpoint using one of the supported transports.

Inherits Struct.

Public Member Functions

- **Locator_t** ()
  Constructor.

Public Attributes

- int **kind**
  The kind of locator.
- int **port**
  the port number
- final byte[ ] **address** = new byte[**ADDRESS_LENGTH_MAX**]
  *A **com.rti.dds.infrastructure.Locator_t.ADDRESS_LENGTH_MAX** (*p. *1550) octet field to hold the IP address.*

Static Public Attributes

- static final int **KIND_INVALID**

  Locator of this kind is invalid.
- static final int **PORT_INVALID**

  An invalid port.
- static final byte[ ] **ADDRESS_INVALID**

  An invalid address.
- static final **Locator_t INVALID**

  An invalid locator.
- static final int **KIND_UDPv4**

  A locator for a UDPv4 address.
- static final int **KIND_UDPv4_WAN**

  A locator for a UDPv4 asymmetric transport address.
- static final int **KIND_SHMEM**

  A locator for an address acessed via shared memory.
- static final int **KIND_SHMEM_510**

  A locator for an address acessed via shared memory for RTI Connext 5.1.0 and earlier.
- static final int **KIND_UDPv6**

  A locator for a UDPv6 address.
- static final int **KIND_UDPv6_510**

  A locator for a UDPv6 address for RTI Connext 5.1.0 and earlier.
- static final int **KIND_RESERVED**

  Locator of this kind is reserved.
- static final int **ADDRESS_LENGTH_MAX** = 16

  Declares length of address field in locator.

8.165.1 Detailed Description

<<***extension***>> *(*p. *138)* Type used to represent the addressing information needed to send a message to an RTPS Endpoint using one of the supported transports.

8.165.2 Constructor & Destructor Documentation

8.165.2.1 Locator_t()

```
Locator_t ( )
```

Constructor.

8.165.3 Member Data Documentation

8.165.3.1 KIND_INVALID

```
final int KIND_INVALID  [static]
```

Locator of this kind is invalid.

8.165.3.2 PORT_INVALID

```
final int PORT_INVALID  [static]
```

An invalid port.

8.165.3.3 ADDRESS_INVALID

```
final byte [] ADDRESS_INVALID  [static]
```

Initial value:

```
= {0,0,0,0,
                                                0,0,0,0,
                                                0,0,0,0,
                                                0,0,0,0}
```

An invalid address.

8.165.3.4 INVALID

```
final  Locator_t INVALID  [static]
```

Initial value:

```
= new Locator_t(
        KIND_INVALID, PORT_INVALID, ADDRESS_INVALID)
```

An invalid locator.

8.165.3.5 KIND_UDPv4

```
final int KIND_UDPv4  [static]
```

A locator for a UDPv4 address.

8.165.3.6 KIND_UDPv4_WAN

```
final int KIND_UDPv4_WAN  [static]
```

A locator for a UDPv4 asymmetric transport address.

8.165.3.7 KIND_SHMEM

```
final int KIND_SHMEM  [static]
```

A locator for an address acessed via shared memory.

8.165.3.8 KIND_SHMEM_510

```
final int KIND_SHMEM_510  [static]
```

A locator for an address acessed via shared memory for RTI Connext 5.1.0 and earlier.

8.165.3.9 KIND_UDPv6

```
final int KIND_UDPv6  [static]
```

A locator for a UDPv6 address.

8.165.3.10 KIND_UDPv6_510

```
final int KIND_UDPv6_510  [static]
```

A locator for a UDPv6 address for RTI Connext 5.1.0 and earlier.

8.165.3.11 KIND_RESERVED

```
final int KIND_RESERVED  [static]
```

Locator of this kind is reserved.

8.165.3.12 ADDRESS_LENGTH_MAX

```
final int ADDRESS_LENGTH_MAX = 16  [static]
```

Declares length of address field in locator.

8.165.3.13 kind

```
int kind
```

The kind of locator.

If the **Locator_t** (p. 1546) kind is **com.rti.dds.infrastructure.Locator_t.KIND_UDPv4** (p. 1548), the address contains an IPv4 address. In this case, the leading 12 octets of the **com.rti.dds.infrastructure.Locator_t.address** (p. 1550) must be zero. The last 4 octets of **com.rti.dds.infrastructure.Locator_t.address** (p. 1550) are used to store the IPv4 address.

If the **Locator_t** (p. 1546) kind is **com.rti.dds.infrastructure.Locator_t.KIND_UDPv6** (p. 1549), the address contains an IPv6 address. IPv6 addresses typically use a shorthand hexadecimal notation that maps one-to-one to the 16 octets in the **com.rti.dds.infrastructure.Locator_t.address** (p. 1550) field.

8.165.3.14 port

```
int port
```

the port number

8.165.3.15 address

```
final byte [] address = new byte[ ADDRESS_LENGTH_MAX]
```

A **com.rti.dds.infrastructure.Locator_t.ADDRESS_LENGTH_MAX** (p. 1550) octet field to hold the IP address.

8.166 LocatorFilter_t Class Reference

<<***extension***>> *(*p. *138)* Specifies the configuration of an individual channel within a MultiChannel DataWriter.

Inherits Struct.

Public Member Functions

- **LocatorFilter_t** ()
  Constructor.
- **LocatorFilter_t** (**LocatorFilter_t** src)
  Constructor.
- **LocatorFilter_t** (**LocatorSeq locators**, String **filter_expression**)
  Constructor.

Public Attributes

- **LocatorSeq locators**
  <<***extension***>> *(*p. *138) Sequence containing from one to 16* ***com.rti.dds.infrastructure.Locator_t*** *(*p. *1546), used to specify the multicast address locators of an individual channel within a MultiChannel DataWriter.*
- String **filter_expression**
  <<***extension***>> *(*p. *138) A logical expression used to determine the data that will be published in the channel.*

8.166.1 Detailed Description

<<***extension***>> *(*p. *138)* Specifies the configuration of an individual channel within a MultiChannel DataWriter.

QoS:

com.rti.dds.infrastructure.LocatorFilterQosPolicy (p. 1553)

8.166.2 Constructor & Destructor Documentation

8.166.2.1 LocatorFilter_t() [1/3]

```
LocatorFilter_t ( )
```

Constructor.

8.166.2.2 LocatorFilter_t() [2/3]

```
LocatorFilter_t (
            LocatorFilter_t src )
```

Constructor.

Parameters

src	<<***in***>> *(*p. *404)* Locator used to initialized the new locator.

References **LocatorFilter_t.filter_expression**, and **LocatorFilter_t.locators**.

8.166.2.3 LocatorFilter_t() [3/3]

```
LocatorFilter_t (
            LocatorSeq locators,
            String filter_expression )
```

Constructor.

Parameters

locators	<<***in***>> *(*p. *404)* Locators.
filter_expression	<<***in***>> *(*p. *404)* Filter expression.

References **LocatorFilter_t.filter_expression**, and **LocatorFilter_t.locators**.

8.166.3 Member Data Documentation

8.166.3.1 locators

```
LocatorSeq locators
```

Initial value:

```
=
        new LocatorSeq()
```

<<***extension***>> *(*p. *138)* Sequence containing from one to 16 **com.rti.dds.infrastructure.Locator_t** (p. 1546), used to specify the multicast address locators of an individual channel within a MultiChannel DataWriter.

[default] Empty sequence.

Referenced by **LocatorFilter_t.LocatorFilter_t()**.

8.166.3.2 filter_expression

```
String filter_expression
```

<<***extension***>> *(p. 138)* A logical expression used to determine the data that will be published in the channel.

If the expression evaluates to TRUE, a sample will be published on the channel.

An empty string always evaluates the expression to TRUE.

A NULL value is not allowed.

The syntax of the expression will depend on the value of **com.rti.dds.infrastructure.LocatorFilterQosPolicy.filter_name** (p. 1554)

See also

Queries and Filters Syntax (p. 108)

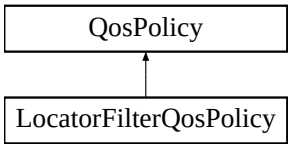
[default] NULL (invalid value)

Referenced by **LocatorFilter_t.LocatorFilter_t()**.

8.167 LocatorFilterQosPolicy Class Reference

<<***extension***>> *(p. 138)* The QoS policy used to report the configuration of a MultiChannel DataWriter as part of **com.rti.dds.publication.builtin.PublicationBuiltinTopicData** (p. 1753).

Inheritance diagram for LocatorFilterQosPolicy:



Public Attributes

- final **LocatorFilterSeq locator_filters**

  <<***extension***>> *(p. 138) A sequence of* ***com.rti.dds.infrastructure.LocatorFilter_t*** *(p. 1551). Each* ***com.rti.dds.infrastructure.LocatorFilter_t*** *(p. 1551) reports the configuration of a single channel of a MultiChannel DataWriter.*
- String **filter_name**

  <<***extension***>> *(p. 138) Name of the filter class used to describe the filter expressions of a MultiChannel DataWriter.*

8.167.1 Detailed Description

<<***extension***>> *(p. 138)* The QoS policy used to report the configuration of a MultiChannel DataWriter as part of **com.rti.dds.publication.builtin.PublicationBuiltinTopicData** (p. 1753).

Entity:

com.rti.dds.publication.builtin.PublicationBuiltinTopicData (p. 1753)

Properties:

RxO (p. 506) = N/A
Changeable (p. 507) = **NO** (p. 507)

8.167.2 Member Data Documentation

8.167.2.1 locator_filters

```
final  LocatorFilterSeq locator_filters
```

<<***extension***>> *(p. 138)* A sequence of **com.rti.dds.infrastructure.LocatorFilter_t** (p. 1551). Each **com.rti.dds.↩ infrastructure.LocatorFilter_t** (p. 1551) reports the configuration of a single channel of a MultiChannel DataWriter.

A sequence length of zero indicates the **com.rti.dds.infrastructure.MultiChannelQosPolicy** (p. 1616) is not in use.

[default] Empty sequence.

8.167.2.2 filter_name

```
String filter_name
```

<<***extension***>> *(p. 138)* Name of the filter class used to describe the filter expressions of a MultiChannel DataWriter.

The following builtin filters are supported: **com.rti.dds.domain.DomainParticipant.SQLFILTER_NAME** (p. 52) and **com.rti.dds.domain.DomainParticipant.STRINGMATCHFILTER_NAME** (p. 52).

[default] com.rti.dds.domain.DomainParticipant.STRINGMATCHFILTER_NAME (p. 52)

8.168 LocatorFilterSeq Class Reference

Declares IDL sequence< **com.rti.dds.infrastructure.LocatorFilter_t** (p. 1551) >.

Inherits ArraySequence.

8.168.1 Detailed Description

Declares IDL `sequence<` **com.rti.dds.infrastructure.LocatorFilter_t** (p. 1551) `>`.

A sequence of **com.rti.dds.infrastructure.LocatorFilter_t** (p. 1551) used to report the channels' properties. If the length of the sequence is zero, the **com.rti.dds.infrastructure.MultiChannelQosPolicy** (p. 1616) is not in use.

Instantiates:

<<***generic***>> *(*p. *403)* com.rti.dds.infrastructure.com.rti.dds.util.Sequence

See also

com.rti.dds.infrastructure.LocatorFilter_t (p. 1551)

8.169 LocatorSeq Class Reference

Declares IDL `sequence <` **com.rti.dds.infrastructure.Locator_t** (p. 1546) `>`

Inherits ArraySequence.

8.169.1 Detailed Description

Declares IDL `sequence <` **com.rti.dds.infrastructure.Locator_t** (p. 1546) `>`

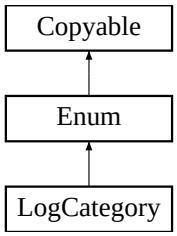
See also

com.rti.dds.infrastructure.Locator_t (p. 1546)

8.170 LogCategory Class Reference

Categories of logged messages.

Inheritance diagram for LogCategory:



Static Public Attributes

- static final **LogCategory NDDS_CONFIG_LOG_CATEGORY_PLATFORM**

  Log messages pertaining to the underlying platform (hardware and OS) on which RTI Connext is running are in this category.
- static final **LogCategory NDDS_CONFIG_LOG_CATEGORY_COMMUNICATION**

  Log messages pertaining to data serialization and deserialization and network traffic are in this category.
- static final **LogCategory NDDS_CONFIG_LOG_CATEGORY_DATABASE**

  Log messages pertaining to the internal database in which RTI Connext objects are stored are in this category.
- static final **LogCategory NDDS_CONFIG_LOG_CATEGORY_ENTITIES**

  Log messages pertaining to local and remote entities, and to a subset of the discovery process, are in this category. (To see all discovery-related messages, use the DISCOVERY category.)
- static final **LogCategory NDDS_CONFIG_LOG_CATEGORY_API**

  Log messages pertaining to the API layer of RTI Connext (such as method argument validation) are in this category.
- static final **LogCategory NDDS_CONFIG_LOG_CATEGORY_DISCOVERY**

  Log messages pertaining to discovery are in this category.
- static final **LogCategory NDDS_CONFIG_LOG_CATEGORY_SECURITY**

  Log messages pertaining to security are in this category. These messages include any messages logged by RTI Connext components even if they are not related to the Security Plugins.
- static final **LogCategory NDDS_CONFIG_LOG_CATEGORY_USER**

  Log messages that are generated by the user using the following log APIs: ***com.rti.ndds.config.Logger.emergency*** *(p. 1565),* ***com.rti.ndds.config.Logger.alert*** *(p. 1565),* ***com.rti.ndds.config.Logger.critical*** *(p. 1566),* ***com.rti.ndds.config.Logger.error*** *(p. 1566),* ***com.rti.ndds.config.Logger.warning*** *(p. 1566),* ***com.rti.ndds.config.Logger.notice*** *(p. 1566),* ***com.rti.ndds.config.Logger.informational*** *(p. 1566),* ***com.rti.ndds.config.Logger.debug*** *(p. 1567).*
- static final **LogCategory NDDS_CONFIG_LOG_CATEGORY_ALL**

  Log messages pertaining to all categories in RTI Connext.

Additional Inherited Members

8.170.1 Detailed Description

Categories of logged messages.

The **com.rti.ndds.config.Logger.get_verbosity_by_category** (p. 1562) and **com.rti.ndds.config.Logger.set_verbosity_by_category** (p. 1562) can be used to specify different verbosities for different categories of messages.

8.170.2 Member Data Documentation

8.170.2.1 NDDS_CONFIG_LOG_CATEGORY_PLATFORM

```
final LogCategory NDDS_CONFIG_LOG_CATEGORY_PLATFORM [static]
```

Log messages pertaining to the underlying platform (hardware and OS) on which RTI Connext is running are in this category.

8.170.2.2 NDDS_CONFIG_LOG_CATEGORY_COMMUNICATION

final **LogCategory** NDDS_CONFIG_LOG_CATEGORY_COMMUNICATION [static]

Log messages pertaining to data serialization and deserialization and network traffic are in this category.

8.170.2.3 NDDS_CONFIG_LOG_CATEGORY_DATABASE

final **LogCategory** NDDS_CONFIG_LOG_CATEGORY_DATABASE [static]

Log messages pertaining to the internal database in which RTI Connext objects are stored are in this category.

8.170.2.4 NDDS_CONFIG_LOG_CATEGORY_ENTITIES

final **LogCategory** NDDS_CONFIG_LOG_CATEGORY_ENTITIES [static]

Log messages pertaining to local and remote entities, and to a subset of the discovery process, are in this category. (To see all discovery-related messages, use the DISCOVERY category.)

8.170.2.5 NDDS_CONFIG_LOG_CATEGORY_API

final **LogCategory** NDDS_CONFIG_LOG_CATEGORY_API [static]

Log messages pertaining to the API layer of RTI Connext (such as method argument validation) are in this category.

8.170.2.6 NDDS_CONFIG_LOG_CATEGORY_DISCOVERY

final **LogCategory** NDDS_CONFIG_LOG_CATEGORY_DISCOVERY [static]

Log messages pertaining to discovery are in this category.

8.170.2.7 NDDS_CONFIG_LOG_CATEGORY_SECURITY

```
final LogCategory NDDS_CONFIG_LOG_CATEGORY_SECURITY [static]
```

Log messages pertaining to security are in this category. These messages include any messages logged by RTI Connext components even if they are not related to the Security Plugins.

8.170.2.8 NDDS_CONFIG_LOG_CATEGORY_USER

```
final LogCategory NDDS_CONFIG_LOG_CATEGORY_USER [static]
```

Log messages that are generated by the user using the following log APIs: **com.rti.ndds.config.Logger.emergency** (p. 1565), **com.rti.ndds.config.Logger.alert** (p. 1565), **com.rti.ndds.config.Logger.critical** (p. 1566), **com.rti.↩ ndds.config.Logger.error** (p. 1566), **com.rti.ndds.config.Logger.warning** (p. 1566), **com.rti.ndds.config.Logger.↩ notice** (p. 1566), **com.rti.ndds.config.Logger.informational** (p. 1566), **com.rti.ndds.config.Logger.debug** (p. 1567).

8.170.2.9 NDDS_CONFIG_LOG_CATEGORY_ALL

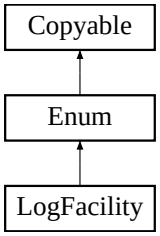
```
final LogCategory NDDS_CONFIG_LOG_CATEGORY_ALL [static]
```

Log messages pertaining to all categories in RTI Connext.

8.171 LogFacility Class Reference

A number that identifies the source of a log message.

Inheritance diagram for LogFacility:



Static Public Attributes

- static final **LogFacility NDDS_CONFIG_LOG_FACILITY_USER**

  *A log message produced by the APIs that log user messages in **com.rti.ndds.config.Logger** (p. 1560) (e.g, **com.rti.ndds.config.Logger.emergency** (p. 1565)).*
- static final **LogFacility NDDS_CONFIG_LOG_FACILITY_SECURITY_EVENT**

  A security-related message logged by the RTI Security Plugins Logging Plugin.
- static final **LogFacility NDDS_CONFIG_LOG_FACILITY_SERVICE**

  A log message produced by an Infrastructure Service, such as Routing Service.
- static final **LogFacility NDDS_CONFIG_LOG_FACILITY_MIDDLEWARE**

  A log message produced by RTI Connext Core Libraries.

Additional Inherited Members

8.171.1 Detailed Description

A number that identifies the source of a log message.

In the Syslog Protocol, the Facility is a numerical code that represents the machine process that created a Syslog event. RTI Connext uses the facility to represent the source of a given log message.

8.171.2 Member Data Documentation

8.171.2.1 NDDS_CONFIG_LOG_FACILITY_USER

```
final LogFacility NDDS_CONFIG_LOG_FACILITY_USER [static]
```

A log message produced by the APIs that log user messages in **com.rti.ndds.config.Logger** (p. 1560) (e.g, **com.rti.ndds.config.Logger.emergency** (p. 1565)).

Numerical code: 1

8.171.2.2 NDDS_CONFIG_LOG_FACILITY_SECURITY_EVENT

```
final LogFacility NDDS_CONFIG_LOG_FACILITY_SECURITY_EVENT [static]
```

A security-related message logged by the RTI Security Plugins Logging Plugin.

Numerical code: 10

8.171.2.3 NDDS_CONFIG_LOG_FACILITY_SERVICE

```
final  LogFacility NDDS_CONFIG_LOG_FACILITY_SERVICE  [static]
```

A log message produced by an Infrastructure Service, such as Routing Service.

Infrastructure Services operate using the Core Libraries. The messages that the Core Libraries create are categorized under the MIDDLEWARE facility. Log messages that are directly generated by the Infrastructure Service itself are marked with the SERVICE facility.

Numerical code: 22

8.171.2.4 NDDS_CONFIG_LOG_FACILITY_MIDDLEWARE

```
final  LogFacility NDDS_CONFIG_LOG_FACILITY_MIDDLEWARE  [static]
```

A log message produced by RTI Connext Core Libraries.

Numerical code: 23

8.172 Logger Class Reference

<<***interface***>> *(*p. *403)* The singleton type used to configure RTI Connext logging.

Public Member Functions

- **LogVerbosity get_verbosity** ()

  Get the verbosity at which RTI Connext is currently logging diagnostic information.
- **LogVerbosity get_verbosity_by_category** (**LogCategory** category)

  Get the verbosity at which RTI Connext is currently logging diagnostic information in the given category.
- void **set_verbosity** (**LogVerbosity** verbosity)

  Set the verbosity at which RTI Connext will log diagnostic information.
- void **set_verbosity_by_category** (**LogCategory** category, **LogVerbosity** verbosity)

  Set the verbosity at which RTI Connext will log diagnostic information in the given category.
- File **get_output_file** ()

  Get the file to which the logged output is redirected.
- void **set_output_file** (File out) throws IOException

  Set the file to which the logged output is redirected.
- void **set_output_file_set** (String file_prefix, String file_suffix, int max_capacity, int max_files) throws IOException

  Configure a set of files to redirect the logged output.
- **LoggerDevice get_output_device** ()

  Return the user device registered with the logger.
- void **set_output_device** (**LoggerDevice** device) throws IOException

  Register a ***com.rti.ndds.config.LoggerDevice*** *(*p. *1567).*
- **LogPrintFormat get_print_format** ()

*Get the current message format for the log level **com.rti.ndds.config.LogLevel.NDDS_CONFIG_LOG_LEVEL_ERROR** (p. 1573).*

- boolean **set_print_format_by_log_level** (**LogPrintFormat** print_format, **LogLevel** log_level)

  *Set the message format, by log level, that RTI Connext will use to log diagnostic information. When the **Activity Context** (p. 540) is printed, the user can select the information that will be part of the **Activity Context** (p. 540) by using the API **com.rti.ndds.config.ActivityContext.set_attribute_mask** (p. 542).*

- **LogPrintFormat get_print_format_by_log_level** (**LogLevel** log_level)

  Get the current message format, by log level, that RTI Connext is using to log diagnostic information.

- boolean **set_print_format** (**LogPrintFormat** print_format)

  *Set the message format that RTI Connext will use to log diagnostic information for all the log levels, except for **com.rti.ndds.config.LogLevel.NDDS_CONFIG_LOG_LEVEL_FATAL_ERROR** (p. 1573). When the **Activity Context** (p. 540) is printed, the user can select the information that will be part of the **Activity Context** (p. 540) by using the API **com.rti.ndds.config.ActivityContext.set_attribute_mask** (p. 542).*

- void **emergency** (String msg)

  *Logs message with **com.rti.ndds.config.SyslogLevel.NDDS_CONFIG_SYSLOG_LEVEL_EMERGENCY** (p. 2085) and **com.rti.ndds.config.LogCategory.NDDS_CONFIG_LOG_CATEGORY_USER** (p. 1558)..*

- void **alert** (String msg)

  *Logs message with **com.rti.ndds.config.SyslogLevel.NDDS_CONFIG_SYSLOG_LEVEL_ALERT** (p. 2085) and **com.rti.ndds.config.LogCategory.NDDS_CONFIG_LOG_CATEGORY_USER** (p. 1558)..*

- void **critical** (String msg)

  *Logs message with **com.rti.ndds.config.SyslogLevel.NDDS_CONFIG_SYSLOG_LEVEL_CRITICAL** (p. 2085) and **com.rti.ndds.config.LogCategory.NDDS_CONFIG_LOG_CATEGORY_USER** (p. 1558)..*

- void **error** (String msg)

  *Logs message with **com.rti.ndds.config.SyslogLevel.NDDS_CONFIG_SYSLOG_LEVEL_ERROR** (p. 2085) and **com.rti.ndds.config.LogCategory.NDDS_CONFIG_LOG_CATEGORY_USER** (p. 1558)..*

- void **warning** (String msg)

  *Logs message with **com.rti.ndds.config.SyslogLevel.NDDS_CONFIG_SYSLOG_LEVEL_WARNING** (p. 2085) and **com.rti.ndds.config.LogCategory.NDDS_CONFIG_LOG_CATEGORY_USER** (p. 1558)..*

- void **notice** (String msg)

  *Logs message with **com.rti.ndds.config.SyslogLevel.NDDS_CONFIG_SYSLOG_LEVEL_NOTICE** (p. 2086) and **com.rti.ndds.config.LogCategory.NDDS_CONFIG_LOG_CATEGORY_USER** (p. 1558)..*

- void **informational** (String msg)

  *Logs message with **com.rti.ndds.config.SyslogLevel.NDDS_CONFIG_SYSLOG_LEVEL_INFORMATIONAL** (p. 2086) and **com.rti.ndds.config.LogCategory.NDDS_CONFIG_LOG_CATEGORY_USER** (p. 1558)..*

- void **debug** (String msg)

  *Logs message with **com.rti.ndds.config.SyslogLevel.NDDS_CONFIG_SYSLOG_LEVEL_DEBUG** (p. 2086) and **com.rti.ndds.config.LogCategory.NDDS_CONFIG_LOG_CATEGORY_USER** (p. 1558)..*

Static Public Member Functions

- static **Logger get_instance** ()

  Get the singleton instance of this type.

8.172.1 Detailed Description

<<***interface***>> *(p. 403)* The singleton type used to configure RTI Connext logging.

8.172.2 Member Function Documentation

8.172.2.1 get_instance()

```
static Logger get_instance ( ) [static]
```

Get the singleton instance of this type.

8.172.2.2 get_verbosity()

```
LogVerbosity get_verbosity ( )
```

Get the verbosity at which RTI Connext is currently logging diagnostic information.

The default verbosity if **com.rti.ndds.config.Logger.set_verbosity** (p. 1562) is never called is **com.rti.ndds.config.LogVerbosity.NDDS_CONFIG_LOG_VERBOSITY_ERROR** (p. 1580).

If **com.rti.ndds.config.Logger.set_verbosity_by_category** (p. 1562) has been used to set different verbosities for different categories of messages, this method will return the maximum verbosity of all categories.

8.172.2.3 get_verbosity_by_category()

```
LogVerbosity get_verbosity_by_category (
            LogCategory category )
```

Get the verbosity at which RTI Connext is currently logging diagnostic information in the given category.

The default verbosity if **com.rti.ndds.config.Logger.set_verbosity** (p. 1562) and **com.rti.ndds.config.Logger.set_verbosity_by_category** (p. 1562) are never called is **com.rti.ndds.config.LogVerbosity.NDDS_CONFIG_LOG_VERBOSITY_ERROR** (p. 1580).

References **Enum.ordinal()**.

8.172.2.4 set_verbosity()

```
void set_verbosity (
            LogVerbosity verbosity )
```

Set the verbosity at which RTI Connext will log diagnostic information.

Note: Logging at high verbosities will be detrimental to your application's performance. Your default setting should typically remain at **com.rti.ndds.config.LogVerbosity.NDDS_CONFIG_LOG_VERBOSITY_WARNING** (p. 1580) or below. (The default verbosity if you never set it is **com.rti.ndds.config.LogVerbosity.NDDS_CONFIG_LOG_VERBOSITY_ERROR** (p. 1580).)

References **Enum.ordinal()**.

8.172.2.5 set_verbosity_by_category()

```
void set_verbosity_by_category (
              LogCategory category,
              LogVerbosity verbosity )
```

Set the verbosity at which RTI Connext will log diagnostic information in the given category.

References **Enum.ordinal()**.

8.172.2.6 get_output_file()

```
File get_output_file ( )
```

Get the file to which the logged output is redirected.

If no output file has been registered through **com.rti.ndds.config.Logger.set_output_file** (p. 1563), this method will return NULL. In this case, logged output will on most platforms go to standard out as if through printf.

8.172.2.7 set_output_file()

```
void set_output_file (
             File out ) throws IOException
```

Set the file to which the logged output is redirected.

The file passed may be NULL, in which case further logged output will be redirected to the platform-specific default output location (standard out on most platforms).

For better performance when log messages are generated frequently, the log messages are not flushed into a file immediately after they are generated. In other words, while writing a log message, RTI Connext only calls the function fwrite() (see https://pubs.opengroup.org/onlinepubs/009695399/functions/fwrite.html); it does not call the function fflush() (see https://pubs.opengroup.org/onlinepubs/009695399/functions/fflush.html). If your application requires a different flushing behavior, you may use **com.rti.ndds.config.Logger.set_output_device** (p. 1564) to configure a custom logging device.

8.172.2.8 set_output_file_set()

```
void set_output_file_set (
             String file_prefix,
             String file_suffix,
             int max_capacity,
             int max_files ) throws IOException
```

Configure a set of files to redirect the logged output.

The logged output will be redirected to a set of files whose names are configured with a prefix and a suffix. The maximum number of bytes configures how many bytes to write into a file before opening the next file. After reaching the maximum number of files, the first one is overwritten.

For example, if the prefix is 'Foo', the suffix is '.txt', the max number of bytes is 1GB, and the max number of files is 3, the logger will create (at most) these files: Foo1.txt, Foo2.txt, and Foo3.txt. It will write to Foo1.txt, and after writing 1GB, it will move on to Foo2.txt, then to Foo3.txt, then to Foo1.txt again, and so on.

To stop logging to these files and redirect the output to the platform-specific location, pass NULL, NULL, 0, 0.

See **com.rti.ndds.config.Logger.set_output_file** (p. 1563) for the flushing behavior.

8.172.2.9 get_output_device()

```
LoggerDevice get_output_device ( )
```

Return the user device registered with the logger.

Returns

Registered user device or NULL if no user device is registered.

8.172.2.10 set_output_device()

```
void set_output_device (
            LoggerDevice device ) throws IOException
```

Register a **com.rti.ndds.config.LoggerDevice** (p. 1567).

Register the specified logging device with the logger.

There can be at most only one device registered with the logger at any given time.

When a device is installed, the logger will stop sending the log messages to the standard output and to the file set with **com.rti.ndds.config.Logger.set_output_file** (p. 1563).

To remove an existing device, use this method with NULL as the device parameter. After a device is removed the logger will continue sending log messages to the standard output and to the output file.

To replace an existing device with a new device, use this method providing the new device as the device parameter.

When a device is unregistered (by setting it to NULL), **com.rti.ndds.config.LoggerDevice** (p. 1567) calls the method **com.rti.ndds.config.LoggerDevice.close** (p. 1568).

Parameters

device	<<***in***>> *(p. 404)* Logging device.

8.172.2.11 get_print_format()

```
LogPrintFormat get_print_format ( )
```

Get the current message format for the log level **com.rti.ndds.config.LogLevel.NDDS_CONFIG_LOG_LEVEL_↩ ERROR** (p. 1573).

Use **com.rti.ndds.config.Logger.get_print_format_by_log_level** (p. 1565) to retrieve the format for other log levels.

If **com.rti.ndds.config.Logger.set_print_format** (p. 1565) is never called, the default format is **com.rti.ndds.config.↩ LogPrintFormat.NDDS_CONFIG_LOG_PRINT_FORMAT_DEFAULT** (p. 1577).

8.172.2.12 set_print_format_by_log_level()

```
boolean set_print_format_by_log_level (
              LogPrintFormat print_format,
              LogLevel log_level )
```

Set the message format, by log level, that RTI Connext will use to log diagnostic information. When the **Activity Context** (p. 540) is printed, the user can select the information that will be part of the **Activity Context** (p. 540) by using the API **com.rti.ndds.config.ActivityContext.set_attribute_mask** (p. 542).

References **Enum.ordinal()**.

8.172.2.13 get_print_format_by_log_level()

```
 LogPrintFormat get_print_format_by_log_level (
              LogLevel log_level )
```

Get the current message format, by log level, that RTI Connext is using to log diagnostic information.

If **com.rti.ndds.config.Logger.set_print_format** (p. 1565) is never called, the default format is **com.rti.ndds.config.↩ LogPrintFormat.NDDS_CONFIG_LOG_PRINT_FORMAT_DEFAULT** (p. 1577).

References **Enum.ordinal()**.

8.172.2.14 set_print_format()

```
boolean set_print_format (
              LogPrintFormat print_format )
```

Set the message format that RTI Connext will use to log diagnostic information for all the log levels, except for **com.rti.↩ ndds.config.LogLevel.NDDS_CONFIG_LOG_LEVEL_FATAL_ERROR** (p. 1573). When the **Activity Context** (p. 540) is printed, the user can select the information that will be part of the **Activity Context** (p. 540) by using the API **com.↩ rti.ndds.config.ActivityContext.set_attribute_mask** (p. 542).

References **Enum.ordinal()**.

8.172.2.15 emergency()

```
void emergency (
             String msg )
```

Logs message with **com.rti.ndds.config.SyslogLevel.NDDS_CONFIG_SYSLOG_LEVEL_EMERGENCY** (p. 2085) and **com.rti.ndds.config.LogCategory.NDDS_CONFIG_LOG_CATEGORY_USER** (p. 1558)..

8.172.2.16 alert()

```
void alert (
            String msg )
```

Logs message with **com.rti.ndds.config.SyslogLevel.NDDS_CONFIG_SYSLOG_LEVEL_ALERT** (p. 2085) and **com.rti.ndds.config.LogCategory.NDDS_CONFIG_LOG_CATEGORY_USER** (p. 1558)..

8.172.2.17 critical()

```
void critical (
            String msg )
```

Logs message with **com.rti.ndds.config.SyslogLevel.NDDS_CONFIG_SYSLOG_LEVEL_CRITICAL** (p. 2085) and **com.rti.ndds.config.LogCategory.NDDS_CONFIG_LOG_CATEGORY_USER** (p. 1558)..

8.172.2.18 error()

```
void error (
            String msg )
```

Logs message with **com.rti.ndds.config.SyslogLevel.NDDS_CONFIG_SYSLOG_LEVEL_ERROR** (p. 2085) and **com.rti.ndds.config.LogCategory.NDDS_CONFIG_LOG_CATEGORY_USER** (p. 1558)..

8.172.2.19 warning()

```
void warning (
            String msg )
```

Logs message with **com.rti.ndds.config.SyslogLevel.NDDS_CONFIG_SYSLOG_LEVEL_WARNING** (p. 2085) and **com.rti.ndds.config.LogCategory.NDDS_CONFIG_LOG_CATEGORY_USER** (p. 1558)..

8.172.2.20 notice()

```
void notice (
            String msg )
```

Logs message with **com.rti.ndds.config.SyslogLevel.NDDS_CONFIG_SYSLOG_LEVEL_NOTICE** (p. 2086) and **com.rti.ndds.config.LogCategory.NDDS_CONFIG_LOG_CATEGORY_USER** (p. 1558)..

8.172.2.21 informational()

```
void informational (
            String msg )
```

Logs message with **com.rti.ndds.config.SyslogLevel.NDDS_CONFIG_SYSLOG_LEVEL_INFORMATIONAL** (p. 2086) and **com.rti.ndds.config.LogCategory.NDDS_CONFIG_LOG_CATEGORY_USER** (p. 1558)..

8.172.2.22 debug()

```
void debug (
            String msg )
```

Logs message with **com.rti.ndds.config.SyslogLevel.NDDS_CONFIG_SYSLOG_LEVEL_DEBUG** (p. 2086) and **com.rti.ndds.config.LogCategory.NDDS_CONFIG_LOG_CATEGORY_USER** (p. 1558)..

8.173 LoggerDevice Interface Reference

*<<**interface**>> (p. 403)* Logging device interface. Use for user-defined logging devices.

Public Member Functions

- void **write** (**LogMessage** message)
  Write a log message to a specified logging device.
- void **close** ()
  Close the logging device.

8.173.1 Detailed Description

*<<**interface**>> (p. 403)* Logging device interface. Use for user-defined logging devices.

Interface for handling log messages.

By default, the logger sends the log messages generated by RTI Connext to the standard output.

You can use the method **com.rti.ndds.config.Logger.set_output_file** (p. 1563) to redirect the log messages to a file.

To further customize the management of generated log messages, the logger offers the method **com.rti.ndds.config.↩ Logger.set_output_device** (p. 1564) that allows you to install a user-defined logging device.

The logging device installed by the user must implement this interface.

Note: It is not safe to make any calls to the RTI Connext core library, including calls to **com.rti.dds.domain.Domain↩ Participant.get_current_time** (p. 1010), from any of the logging device operations.

8.173.2 Member Function Documentation

8.173.2.1 write()

```
void write (
            LogMessage message )
```

Write a log message to a specified logging device.

Note: It is not safe to make any calls to the RTI Connext core library, including calls to **com.rti.dds.domain.Domain↩ Participant.get_current_time** (p. 1010), from any of the logging device operations.

Parameters

message	<<***in***>> *(p. 404)* Message to log.

8.173.2.2 close()

```
void close ( )
```

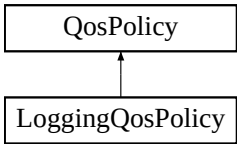
Close the logging device.

Note: It is not safe to make any calls to the RTI Connext core library, including calls to **com.rti.dds.domain.Domain↩ Participant.get_current_time** (p. 1010), from any of the logging device operations.

8.174 LoggingQosPolicy Class Reference

<<***extension***>> *(p. 138)* Configures the RTI Connext logging facility.

Inheritance diagram for LoggingQosPolicy:



Public Attributes

- **LogVerbosity verbosity**

  <<***basic***>> *(*p. *123)* <<***extension***>> *(*p. *138) The verbosities at which RTI Connext diagnostic information is logged.*
- **LogCategory category**

  <<***basic***>> *(*p. *123)* <<***extension***>> *(*p. *138) Categories of logged messages.*
- **LogPrintFormat print_format**

  <<***extension***>> *(*p. *138) The format used to output RTI Connext diagnostic information.*
- String **output_file**

  <<***basic***>> *(*p. *123)* <<***extension***>> *(*p. *138) Specifies the file to which log messages will be redirected to.*
- String **output_file_suffix**

  <<***basic***>> *(*p. *123)* <<***extension***>> *(*p. *138) Sets the file suffix when logging to a set of files*
- int **max_bytes_per_file**

  <<***extension***>> *(*p. *138) Specifies the maximum number of bytes a single file can contain*
- int **max_files**

  <<***extension***>> *(*p. *138) Specifies the maximum number of files to create before overwritting the previous ones.*

8.174.1 Detailed Description

<<***extension***>> *(*p. *138)* Configures the RTI Connext logging facility.

All the properties associated with RTI Connext logging can be configured using this QoS policy. This allows you to configure logging using XML QoS Profiles. See the "Troubleshooting" chapter in the `User's Manual` for details.

Entity:

com.rti.dds.domain.DomainParticipantFactory (p. 1039)

Properties:

RxO (p. 506) = NO
Changeable (p. 507) = **Changeable** (p. 507)

8.174.2 Member Data Documentation

8.174.2.1 verbosity

```
LogVerbosity verbosity
```

<<***basic***>> *(*p. *123)* <<***extension***>> *(*p. *138)* The verbosities at which RTI Connext diagnostic information is logged.

[default] com.rti.ndds.config.LogVerbosity.NDDS_CONFIG_LOG_VERBOSITY_ERROR (p. 1580)

Categories

Mutable (p. 338), **Logging** (p. 242), **Debuggability** (p. 205)

8.174.2.2 category

```
LogCategory category
```

<<***basic***>> *(*p. *123)* <<***extension***>> *(*p. *138)* Categories of logged messages.

[default] Logging will be enabled for all the categories.

Categories

Mutable (p. 338), **Logging** (p. 242), **Debuggability** (p. 205)

8.174.2.3 print_format

```
LogPrintFormat print_format
```

<<***extension***>> *(*p. *138)* The format used to output RTI Connext diagnostic information.

[default] com.rti.ndds.config.LogPrintFormat.NDDS_CONFIG_LOG_PRINT_FORMAT_DEFAULT (p. 1577).

Categories

Mutable (p. 338), **Logging** (p. 242), **Debuggability** (p. 205)

8.174.2.4 output_file

```
String output_file
```

<<***basic***>> *(*p. *123)* <<***extension***>> *(*p. *138)* Specifies the file to which log messages will be redirected to.

If the value of ouput_file is set to NULL, log messages will sent to standard output.

If **com.rti.dds.infrastructure.LoggingQosPolicy.max_bytes_per_file** (p. 1571) is not **com.rti.dds.infrastructure.↩ ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511), this is used as the file name preffix for a set of numbered files.

[default] NULL

com.rti.ndds.config.Logger.set_output_file_name

com.rti.ndds.config.Logger.set_output_file_set (p. 1563)

Categories

Mutable (p. 338), **Logging** (p. 242), **Debuggability** (p. 205)

8.174.2.5 output_file_suffix

```
String output_file_suffix
```

<<***basic***>> *(*p. *123)* <<***extension***>> *(*p. *138)* Sets the file suffix when logging to a set of files

Note

This field only applies when idref_LoggingQosPolicy_max_bytes_per_file is different than **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511).

It specifies the suffix to use for the set of files used to redirect the logging output. The preffix is **com.rti.dds.infrastructure.LoggingQosPolicy.output_file** (p. 1570).

[default] NULL

[default] No suffix

See also

com.rti.ndds.config.Logger.set_output_file_set (p. 1563)

Categories

Mutable (p. 338), **Logging** (p. 242), **Debuggability** (p. 205)

8.174.2.6 max_bytes_per_file

```
int max_bytes_per_file
```

<<***extension***>> *(*p. *138)* Specifies the maximum number of bytes a single file can contain

When this field is different than **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511), it enables logging to separate files as they reach this size.

[default] com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED (p. 511) (a single file is used)

See also

com.rti.ndds.config.Logger.set_output_file_set (p. 1563)

Categories

Mutable (p. 338), **Logging** (p. 242), **Debuggability** (p. 205), **Middleware Memory Management** (p. 244)

8.174.2.7 max_files

```
int max_files
```

<<***extension***>> *(*p. *138)* Specifies the maximum number of files to create before overwritting the previous ones.

Note

This field only applies when idref_LoggingQosPolicy_max_bytes_per_file is differenet than **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511).

When this field is different than **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511), and the number of files reaches this number, future logging messages overwrite the previously created files.

[default] com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED (p. 511) (files aren't overwritten)

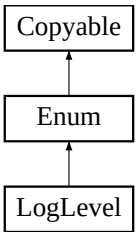
8.175 LogLevel Class Reference

Level category assigned to RTI Connext log messages returned to an output device.

Inheritance diagram for LogLevel:



Static Public Attributes

- static final **LogLevel NDDS_CONFIG_LOG_LEVEL_FATAL_ERROR**
  The message describes a fatal error.
- static final **LogLevel NDDS_CONFIG_LOG_LEVEL_ERROR**
  The message describes an error.
- static final **LogLevel NDDS_CONFIG_LOG_LEVEL_WARNING**
  The message describes a warning.
- static final **LogLevel NDDS_CONFIG_LOG_LEVEL_STATUS_LOCAL**
  The message contains information about the lifecycles of local RTI Connext objects will be logged.
- static final **LogLevel NDDS_CONFIG_LOG_LEVEL_STATUS_REMOTE**
  The message contains information about the lifecycles of remote RTI Connext objects will be logged.
- static final **LogLevel NDDS_CONFIG_LOG_LEVEL_DEBUG**
  The message contains debug information that might be relevant to your application.

Additional Inherited Members

8.175.1 Detailed Description

Level category assigned to RTI Connext log messages returned to an output device.

8.175.2 Member Data Documentation

8.175.2.1 NDDS_CONFIG_LOG_LEVEL_FATAL_ERROR

```
final LogLevel NDDS_CONFIG_LOG_LEVEL_FATAL_ERROR [static]
```

The message describes a fatal error.

A fatal error indicates an unrecoverable situation in the functioning of RTI Connext. Error messages with this log level usually indicate a violation of an internal invariant or a segfault, and may include the function call stack where the fatal error happened.

8.175.2.2 NDDS_CONFIG_LOG_LEVEL_ERROR

```
final LogLevel NDDS_CONFIG_LOG_LEVEL_ERROR [static]
```

The message describes an error.

An error indicates a non-fatal problem in the functioning of RTI Connext. Errors are usually recoverable and will not stop application execution, although they may prevent some features from working properly. The most common cause of non-fatal errors is incorrect configuration and incorrect arguments.

8.175.2.3 NDDS_CONFIG_LOG_LEVEL_WARNING

```
final LogLevel NDDS_CONFIG_LOG_LEVEL_WARNING [static]
```

The message describes a warning.

A warning indicates that RTI Connext is taking an action that may or may not be what you intended. Some configuration information is also logged at this verbosity to aid in debugging.

8.175.2.4 NDDS_CONFIG_LOG_LEVEL_STATUS_LOCAL

```
final LogLevel NDDS_CONFIG_LOG_LEVEL_STATUS_LOCAL [static]
```

The message contains information about the lifecycles of local RTI Connext objects will be logged.

8.175.2.5 NDDS_CONFIG_LOG_LEVEL_STATUS_REMOTE

```
final LogLevel NDDS_CONFIG_LOG_LEVEL_STATUS_REMOTE [static]
```

The message contains information about the lifecycles of remote RTI Connext objects will be logged.

8.175.2.6 NDDS_CONFIG_LOG_LEVEL_DEBUG

```
final LogLevel NDDS_CONFIG_LOG_LEVEL_DEBUG [static]
```

The message contains debug information that might be relevant to your application.

8.176 LogMessage Class Reference

A log message's input parameter to a logging device, including the text and additional information.

Inherits Struct.

Public Attributes

- String **text**
  Message text.
- **LogLevel level**
  Message level.
- boolean **is_security_message**
  Indicates if the message is a security-related message.
- boolean **is_license_message**
  Indicates if the message is a license-related message.
- int **message_id**
  A numeric code that identifies a specific log message.
- **Duration_t timestamp**
  The time when the log message was printed.
- **LogFacility facility**
  *The Facility associated with the log message. See **com.rti.ndds.config.LogFacility** (p. 1558).*

8.176.1 Detailed Description

A log message's input parameter to a logging device, including the text and additional information.

8.176.2 Member Data Documentation

8.176.2.1 text

```
String text
```

Message text.

8.176.2.2 level

```
LogLevel level
```

Message level.

8.176.2.3 is_security_message

```
boolean is_security_message
```

Indicates if the message is a security-related message.

A "security-related message" is a log message that meets any of the following:

- A security event logged with the RTI Security Plugins Logging Plugin.
- Any regular message coming from the RTI Security Plugins.
- RTI TLS Support log messages related to OpenSSL (e.g., SSL handshake failures or certificate validation failures).

8.176.2.4 is_license_message

```
boolean is_license_message
```

Indicates if the message is a license-related message.

When using a licensed version of RTI Connext (such as the RTI Connext Express edition), certain messages related to the license, such as the trial expiration date or license limitations, are logged when a DomainParticipant is created. This flag indicates whether the message is one of those license-related messages.

8.176.2.5 message_id

```
int message_id
```

A numeric code that identifies a specific log message.

Two log messages that have the same message_id will have a similar structure. E.g. "ERROR: Failed to get Data↩ WriterQos" and "ERROR: Failed to get TopicName". In this case, the message_id is associated to the get failure.

8.176.2.6 timestamp

```
Duration_t timestamp
```

The time when the log message was printed.

8.176.2.7 facility

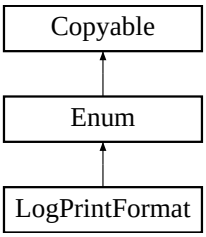
```
LogFacility facility
```

The Facility associated with the log message. See **com.rti.ndds.config.LogFacility** (p. 1558).

8.177 LogPrintFormat Class Reference

The format used to output RTI Connext diagnostic information.

Inheritance diagram for LogPrintFormat:



Static Public Attributes

- static final **LogPrintFormat NDDS_CONFIG_LOG_PRINT_FORMAT_DEFAULT**

  *(default) Print message, method name, log level, **Activity Context** (p. 540) (what was happening when the event occurred), and logging category.*
- static final **LogPrintFormat NDDS_CONFIG_LOG_PRINT_FORMAT_TIMESTAMPED**

  *Print message, method name, log level, **Activity Context** (p. 540), logging category, and timestamp.*
- static final **LogPrintFormat NDDS_CONFIG_LOG_PRINT_FORMAT_VERBOSE**

  Print message with all available context information (includes thread identifier, message location).
- static final **LogPrintFormat NDDS_CONFIG_LOG_PRINT_FORMAT_VERBOSE_TIMESTAMPED**

  Print message with all available context information, and timestamp.
- static final **LogPrintFormat NDDS_CONFIG_LOG_PRINT_FORMAT_DEBUG**

  Print a set of fields (including message number and backtrace information) that may be useful for internal debugging.
- static final **LogPrintFormat NDDS_CONFIG_LOG_PRINT_FORMAT_MINIMAL**

  Print only message number and message location.
- static final **LogPrintFormat NDDS_CONFIG_LOG_PRINT_FORMAT_MAXIMAL**

  Print all available fields.

Additional Inherited Members

8.177.1 Detailed Description

The format used to output RTI Connext diagnostic information.

8.177.2 Member Data Documentation

8.177.2.1 NDDS_CONFIG_LOG_PRINT_FORMAT_DEFAULT

```
final LogPrintFormat NDDS_CONFIG_LOG_PRINT_FORMAT_DEFAULT [static]
```

(default) Print message, method name, log level, **Activity Context** (p. 540) (what was happening when the event occurred), and logging category.

8.177.2.2 NDDS_CONFIG_LOG_PRINT_FORMAT_TIMESTAMPED

```
final LogPrintFormat NDDS_CONFIG_LOG_PRINT_FORMAT_TIMESTAMPED [static]
```

Print message, method name, log level, **Activity Context** (p. 540), logging category, and timestamp.

8.177.2.3 NDDS_CONFIG_LOG_PRINT_FORMAT_VERBOSE

final **LogPrintFormat** NDDS_CONFIG_LOG_PRINT_FORMAT_VERBOSE [static]

Print message with all available context information (includes thread identifier, message location).

8.177.2.4 NDDS_CONFIG_LOG_PRINT_FORMAT_VERBOSE_TIMESTAMPED

final **LogPrintFormat** NDDS_CONFIG_LOG_PRINT_FORMAT_VERBOSE_TIMESTAMPED [static]

Print message with all available context information, and timestamp.

8.177.2.5 NDDS_CONFIG_LOG_PRINT_FORMAT_DEBUG

final **LogPrintFormat** NDDS_CONFIG_LOG_PRINT_FORMAT_DEBUG [static]

Print a set of fields (including message number and backtrace information) that may be useful for internal debugging.

8.177.2.6 NDDS_CONFIG_LOG_PRINT_FORMAT_MINIMAL

final **LogPrintFormat** NDDS_CONFIG_LOG_PRINT_FORMAT_MINIMAL [static]

Print only message number and message location.

8.177.2.7 NDDS_CONFIG_LOG_PRINT_FORMAT_MAXIMAL

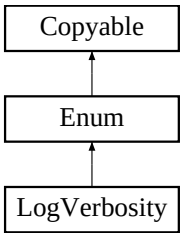
final **LogPrintFormat** NDDS_CONFIG_LOG_PRINT_FORMAT_MAXIMAL [static]

Print all available fields.

8.178 LogVerbosity Class Reference

The verbosities at which RTI Connext diagnostic information is logged.

Inheritance diagram for LogVerbosity:



Static Public Attributes

- static final **LogVerbosity NDDS_CONFIG_LOG_VERBOSITY_SILENT**

  No further output will be logged.
- static final **LogVerbosity NDDS_CONFIG_LOG_VERBOSITY_ERROR**

  Only error and fatal error messages will be logged.
- static final **LogVerbosity NDDS_CONFIG_LOG_VERBOSITY_WARNING**

  Both error and warning messages will be logged.
- static final **LogVerbosity NDDS_CONFIG_LOG_VERBOSITY_STATUS_LOCAL**

  Errors, warnings, and verbose information about the lifecycles of local RTI Connext objects will be logged.
- static final **LogVerbosity NDDS_CONFIG_LOG_VERBOSITY_STATUS_REMOTE**

  Errors, warnings, and verbose information about the lifecycles of remote RTI Connext objects will be logged.
- static final **LogVerbosity NDDS_CONFIG_LOG_VERBOSITY_STATUS_ALL**

  Errors, warnings, verbose information about the lifecycles of local and remote RTI Connext objects, and periodic information about RTI Connext threads will be logged.

Additional Inherited Members

8.178.1 Detailed Description

The verbosities at which RTI Connext diagnostic information is logged.

8.178.2 Member Data Documentation

8.178.2.1 NDDS_CONFIG_LOG_VERBOSITY_SILENT

```
final LogVerbosity NDDS_CONFIG_LOG_VERBOSITY_SILENT [static]
```

No further output will be logged.

8.178.2.2 NDDS_CONFIG_LOG_VERBOSITY_ERROR

```
final LogVerbosity NDDS_CONFIG_LOG_VERBOSITY_ERROR [static]
```

Only error and fatal error messages will be logged.

An error indicates something wrong in the functioning of RTI Connext. The most common cause of errors is incorrect configuration.

8.178.2.3 NDDS_CONFIG_LOG_VERBOSITY_WARNING

```
final LogVerbosity NDDS_CONFIG_LOG_VERBOSITY_WARNING [static]
```

Both error and warning messages will be logged.

A warning indicates that RTI Connext is taking an action that may or may not be what you intended. Some configuration information is also logged at this verbosity to aid in debugging.

8.178.2.4 NDDS_CONFIG_LOG_VERBOSITY_STATUS_LOCAL

```
final LogVerbosity NDDS_CONFIG_LOG_VERBOSITY_STATUS_LOCAL [static]
```

Errors, warnings, and verbose information about the lifecycles of local RTI Connext objects will be logged.

8.178.2.5 NDDS_CONFIG_LOG_VERBOSITY_STATUS_REMOTE

```
final LogVerbosity NDDS_CONFIG_LOG_VERBOSITY_STATUS_REMOTE [static]
```

Errors, warnings, and verbose information about the lifecycles of remote RTI Connext objects will be logged.

8.178.2.6 NDDS_CONFIG_LOG_VERBOSITY_STATUS_ALL

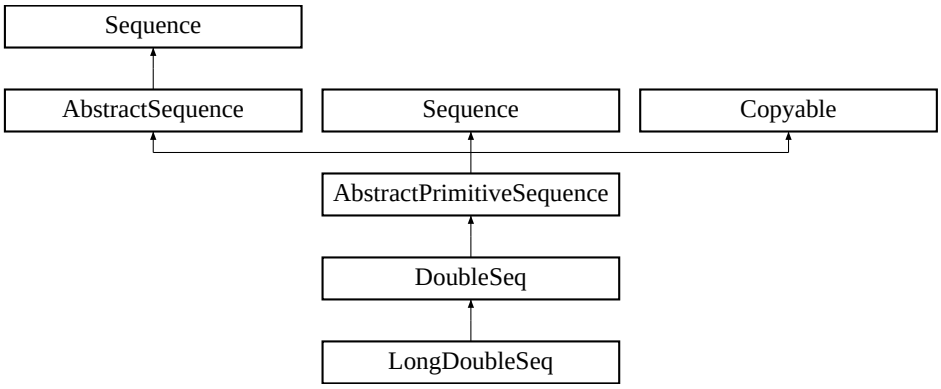
```
final  LogVerbosity NDDS_CONFIG_LOG_VERBOSITY_STATUS_ALL  [static]
```

Errors, warnings, verbose information about the lifecycles of local and remote RTI Connext objects, and periodic information about RTI Connext threads will be logged.

8.179 LongDoubleSeq Class Reference

Instantiates `com.rti.dds.infrastructure.com.rti.dds.util.Sequence` < com.rti.dds.infrastructure.↩ LongDouble >

Inheritance diagram for LongDoubleSeq:



Public Member Functions

- **LongDoubleSeq** ()

  Constructs an empty sequence of long doubles with an initial maximum of zero.
- **LongDoubleSeq** (int initialMaximum)

  Constructs an empty sequence of long doubles with the given initial maximum.
- **LongDoubleSeq** (double[ ] doubles)

  Constructs a new sequence containing the given long doubles.

8.179.1 Detailed Description

Instantiates `com.rti.dds.infrastructure.com.rti.dds.util.Sequence` < com.rti.dds.infrastructure.↩ LongDouble >

Instantiates:

<<***generic***>> *(*p. *403)* com.rti.dds.infrastructure.com.rti.dds.util.Sequence

See also

com.rti.dds.infrastructure.LongDouble

com.rti.dds.infrastructure.com.rti.dds.util.Sequence

8.179.2 Constructor & Destructor Documentation

8.179.2.1 LongDoubleSeq() [1/3]

```
LongDoubleSeq ( )
```

Constructs an empty sequence of long doubles with an initial maximum of zero.

8.179.2.2 LongDoubleSeq() [2/3]

```
LongDoubleSeq (
            int initialMaximum )
```

Constructs an empty sequence of long doubles with the given initial maximum.

8.179.2.3 LongDoubleSeq() [3/3]

```
LongDoubleSeq (
            double[] doubles )
```

Constructs a new sequence containing the given long doubles.

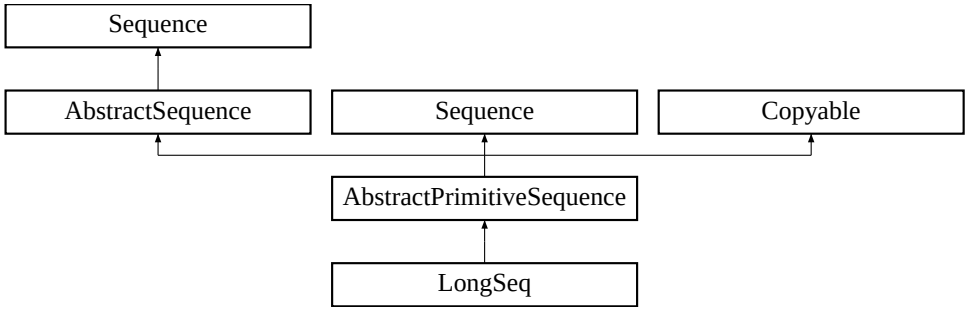
Parameters

doubles	the initial contents of this sequence

8.180 LongSeq Class Reference

Instantiates `com.rti.dds.infrastructure.com.rti.dds.util.Sequence` < long >

Inheritance diagram for LongSeq:



Public Member Functions

- **LongSeq** ()

  Constructs an empty sequence of long integers with an initial maximum of zero.
- **LongSeq** (int initialMaximum)

  Constructs an empty sequence of long integers with the given initial maximum.
- **LongSeq** (long[ ] longs)

  Constructs a new sequence containing the given longs.
- boolean **addAllLong** (long[ ] elements, int offset, int length)

  Append `length` *elements from the given array to this sequence, starting at index* `offset` *in that array.*
- boolean **addAllLong** (long[ ] elements)
- void **addLong** (long element)

  Append the element to the end of the sequence.
- void **addLong** (int index, long element)

  Shift all elements in the sequence starting from the given index and add the element to the given index.
- long **getLong** (int index)

  Returns the long at the given index.
- long **setLong** (int index, long element)

  Set the new long at the given index and return the old long.
- void **setLong** (int dstIndex, long[ ] elements, int srcIndex, int length)

  Copy a portion of the given array into this sequence.
- long[ ] **toArrayLong** (long[ ] array)

  Return an array containing copy of the contents of this sequence.
- int **getMaximum** ()

  Get the current maximum number of elements that can be stored in this sequence.
- Object **get** (int index)

  A wrapper for ***getLong(int)*** *(*p. *1586**) that return a java.lang.Long.*
- Object **set** (int index, Object element)

  A wrapper for ***setLong()*** *(*p. *1586**).*
- void **add** (int index, Object element)

  A wrapper for addLong(int, int).

8.180.1 Detailed Description

Instantiates com.rti.dds.infrastructure.com.rti.dds.util.Sequence < long >

Instantiates:

<<***generic***>> *(*p. *403)* com.rti.dds.infrastructure.com.rti.dds.util.Sequence

See also

long

com.rti.dds.infrastructure.com.rti.dds.util.Sequence

8.180.2 Constructor & Destructor Documentation

8.180.2.1 LongSeq() [1/3]

```
LongSeq ( )
```

Constructs an empty sequence of long integers with an initial maximum of zero.

8.180.2.2 LongSeq() [2/3]

```
LongSeq (
            int initialMaximum )
```

Constructs an empty sequence of long integers with the given initial maximum.

8.180.2.3 LongSeq() [3/3]

```
LongSeq (
            long[] longs )
```

Constructs a new sequence containing the given longs.

Parameters

longs	the initial contents of this sequence

Exceptions

NullPointerException	if the input array is null

References **LongSeq.addAllLong()**.

8.180.3 Member Function Documentation

8.180.3.1 addAllLong() [1/2]

```
boolean addAllLong (
            long[] elements,
            int offset,
            int length )
```

Append `length` elements from the given array to this sequence, starting at index `offset` in that array.

Exceptions

NullPointerException	if the given array is null.

Referenced by **LongSeq.addAllLong()**, and **LongSeq.LongSeq()**.

8.180.3.2 addAllLong() [2/2]

```
boolean addAllLong (
            long[] elements )
```

Exceptions

NullPointerException	if the given array is null

References **LongSeq.addAllLong()**.

8.180.3.3 addLong() [1/2]

```
void addLong (
            long element )
```

Append the element to the end of the sequence.

Referenced by **LongSeq.add()**.

8.180.3.4 addLong() [2/2]

```
void addLong (
             int index,
             long element )
```

Shift all elements in the sequence starting from the given index and add the element to the given index.

8.180.3.5 getLong()

```
long getLong (
             int index )
```

Returns the long at the given index.

Exceptions

IndexOutOfBoundsException	if the index is out of bounds.

Referenced by **LongSeq.get()**, **DynamicData.get_ulong_seq()**, and **DynamicData.set_uint_seq()**.

8.180.3.6 setLong() [1/2]

```
long setLong (
             int index,
             long element )
```

Set the new long at the given index and return the old long.

Exceptions

IndexOutOfBoundsException	if the index is out of bounds.

Referenced by **LongSeq.set()**.

8.180.3.7 setLong() [2/2]

```
void setLong (
            int dstIndex,
            long[] elements,
            int srcIndex,
            int length )
```

Copy a portion of the given array into this sequence.

Parameters

dstIndex	the index at which to start copying into this sequence.
elements	an array of primitive elements.
srcIndex	the index at which to start copying from the given array.
length	the number of elements to copy.

Exceptions

IndexOutOfBoundsException	if copying would cause access of data outside array bounds.

8.180.3.8 toArrayLong()

```
long[] toArrayLong (
            long[] array )
```

Return an array containing copy of the contents of this sequence.

Parameters

array	The array into which this sequence should be copied. It may be null. If it is, or if array length is too small, the array will be ignored, and a new array of the necessary length will be created and copied into instead.

Returns

A non-null array containing a copy of the contents of this sequence.

8.180.3.9 getMaximum()

```
int getMaximum ( )
```

Get the current maximum number of elements that can be stored in this sequence.

The `maximum` of the sequence represents the maximum number of elements that the underlying buffer can hold. It does not represent the current number of elements.

The `maximum` is a non-negative number. It is initialized when the sequence is first created.

The `maximum` can be changed implicitly by adding an element to the sequence with **`add()`** (p. 1589), or explicitly by calling com.rti.dds.infrastructure.com.rti.dds.util.Sequence.Sequence.setMaximum.

Returns

the current maximum of the sequence.

See also

com.rti.dds.infrastructure.com.rti.dds.util.Sequence.Sequence.size()

Implements **Sequence** (p. 1974).

Referenced by **DynamicData.get_long_seq()**, **DynamicData.get_uint_seq()**, **DynamicData.set_long_seq()**, and **DynamicData.set_uint_seq()**.

8.180.3.10 get()

```
Object get (
             int index )
```

A wrapper for **getLong(int)** (p. 1586) that return a java.lang.Long.

See also

java.util.List::get(int)

Reimplemented from **AbstractPrimitiveSequence** (p. 576).

References **LongSeq.getLong()**.

8.180.3.11 set()

```
Object set (
             int index,
             Object element )
```

A wrapper for **setLong()** (p. 1586).

Exceptions

ClassCastException	if the element is not of type Long.

See also

java.util.List::set(int, java.lang.Object)

Reimplemented from **AbstractPrimitiveSequence** (p. 576).

References **LongSeq.setLong()**.

Referenced by **DynamicData.get_uint_seq()**, and **DynamicData.set_ulong_seq()**.

8.180.3.12 add()

```
void add (
             int index,
             Object element )
```

A wrapper for addLong(int, int).

Exceptions

ClassCastException	if the element is not of type Long.

See also

java.util.List::add(int, java.lang.Object)

Reimplemented from **AbstractPrimitiveSequence** (p. 577).

References **LongSeq.addLong()**.

8.181 MonitoringDedicatedParticipantSettings Class Reference

<<***extension***>> *(*p. *138)* Configures the use of a dedicated **com.rti.dds.domain.DomainParticipant** (p. 948) to distribute the RTI Connext application telemetry data.

Inherits Struct.

  *<<**basic**>> (p. 123) <<**extension**>> (p. 138) Determines the initial list of peers that the discovery process will contact to send announcements about the presence of the **com.rti.dds.infrastructure.MonitoringDistributionSettings.dedicated_participant** (p. 1594).*

8.181.1 Detailed Description

<<**extension**>> *(p. 138)* Configures the use of a dedicated **com.rti.dds.domain.DomainParticipant** (p. 948) to distribute the RTI Connext application telemetry data.

8.181.2 Constructor & Destructor Documentation

8.181.2.1 MonitoringDedicatedParticipantSettings() [1/2]

```
MonitoringDedicatedParticipantSettings ( )
```

Constructor.

8.181.2.2 MonitoringDedicatedParticipantSettings() [2/2]

```
MonitoringDedicatedParticipantSettings (
            MonitoringDedicatedParticipantSettings src )
```

Copy constructor.

Parameters

src	<<***in***>> *(*p. *404)* Source object.

References **MonitoringDedicatedParticipantSettings.collector_initial_peers**, **MonitoringDedicatedParticipant↩ Settings.domain_id**, **MonitoringDedicatedParticipantSettings.enable**, and **MonitoringDedicatedParticipant↩ Settings.participant_qos_profile_name**.

8.181.3 Member Data Documentation

8.181.3.1 enable

```
boolean enable
```

<<***basic***>> *(*p. *123)* <<***extension***>> *(*p. *138)* Enables the use of a dedicated **com.rti.dds.domain.Domain↩ Participant** (p. 948) to distribute the RTI Connext application telemetry data.

Setting this value to com.rti.dds.infrastructure.false is not currently supported.

[default] com.rti.dds.infrastructure.true

Categories

Mutable (p. 338), **Debuggability** (p. 205), **QoS Profile Management** (p. 264)

Referenced by **MonitoringDedicatedParticipantSettings.MonitoringDedicatedParticipantSettings()**.

8.181.3.2 domain_id

```
int domain_id
```

<<***basic***>> *(*p. *123)* <<***extension***>> *(*p. *138)* The domain ID used in the creation of RTI Monitoring Library 2.0 **com.rti.dds.domain.DomainParticipant** (p. 948).

By default, the RTI Monitoring Library 2.0 DomainParticipant is created in domain 101 with the domain tag 'RTI_o11y'. The domain tag provides further isolation in case the application also uses domain 101.

The domain ID can be changed using this field. Changing the domain tag is not recommended. However, if you need to change it, you must do so by configuring the domain tag in the **com.rti.dds.domain.DomainParticipantQos** (p. 1073) of the profile set in **com.rti.dds.infrastructure.MonitoringDedicatedParticipantSettings.participant_qos_profile↩ _name** (p. 1591).

[default] 101

Categories

Mutable (p. 338), **Debuggability** (p. 205), **Discovery** (p. 212), **Discovery Isolation** (p. 220)

Referenced by **MonitoringDedicatedParticipantSettings.MonitoringDedicatedParticipantSettings()**.

8.181.3.3 participant_qos_profile_name

```
String participant_qos_profile_name
```

<<***extension***>> *(*p. *138)* The fully qualified name of the profile used to configure the **com.rti.dds.domain.Domain↩ Participant** (p. 948) that will be used to distribute telemetry data.

If null (the default value) then RTI Monitoring Library 2.0 uses **com.rti.dds.infrastructure.BuiltinQosProfiles.↩ PROFILE_GENERIC_MONITORING2** (p. 436).

[default] null

Categories

Mutable (p. 338), **Debuggability** (p. 205), **QoS Profile Management** (p. 264)

Referenced by **MonitoringDedicatedParticipantSettings.MonitoringDedicatedParticipantSettings()**.

8.181.3.4 collector_initial_peers

```
final StringSeq collector_initial_peers
```

<<***basic***>> *(*p. *123)* <<***extension***>> *(*p. *138)* Determines the initial list of peers that the discovery process will contact to send announcements about the presence of the **com.rti.dds.infrastructure.MonitoringDistributionSettings.↩ dedicated_participant** (p. 1594).

These initial peers should correspond with the RTI Observability Collector Service with which RTI Monitoring Library 2.0 has to communicate. The collector_initial_peers works the same as initial_peers for other DomainParticipants, except that it allows you to easily specify the initial peer(s) for the RTI Monitoring Library 2.0 **com.rti.dds.domain.Domain↩ Participant** (p. 948), which may have different initial peer(s) than those used by your application.

If no collector_initial_peers are specified, or if it is explicitly set to an empty list, the **com.rti.dds.infrastructure.↩ DiscoveryQosPolicy.initial_peers** (p. 945) list of **com.rti.dds.infrastructure.MonitoringDedicatedParticipant↩ Settings.participant_qos_profile_name** (p. 1591) will be used as the initial peers of **com.rti.dds.infrastructure.↩ MonitoringDistributionSettings.dedicated_participant** (p. 1594).

[default] An empty sequence.

See also

com.rti.dds.infrastructure.DiscoveryQosPolicy.initial_peers (p. 945) for further information about initial peers.

  *<<**basic**>> (p. 123) <<**extension**>> (p. 138) Period at which the event metric thread publishes the event metrics that have changed since the last time they were published.*

8.183.1 Detailed Description

*<<**extension**>> (p. 138)* Configures the distribution of event metrics.

Event metrics are provided to RTI Monitoring Library 2.0 when they change.

For example, if the liveliness of a **com.rti.dds.publication.DataWriter** (p. 818) is lost, a matching **com.rti.dds.subscription.DataReader** (p. 707) will push the new value of **com.rti.dds.subscription.LivelinessChangedStatus** (p. 1531) to RTI Monitoring Library 2.0 so that the liveliness status change can be distributed.

There are three kinds of event metrics:

- **Configuration metrics:** Provided to RTI Monitoring Library 2.0 by pushing changes to QoS policies.
- **Status metrics:** Provided to RTI Monitoring Library 2.0 by pushing changes to the event statuses such as **com.rti.dds.subscription.LivelinessChangedStatus** (p. 1531).
- **Resource metrics:** Provided to RTI Monitoring Library 2.0 when a resource (such as **com.rti.dds.publication.DataWriter** (p. 818)) is created or deleted.

The event metrics that will be distributed for an observable resource can be configured with **com.rti.dds.infrastructure.MonitoringTelemetryData.metrics** (p. 1615).

8.183.2 Constructor & Destructor Documentation

8.183.2.1 MonitoringEventDistributionSettings() [1/2]

```
MonitoringEventDistributionSettings ( )
```

Constructor.

8.183.2.2 MonitoringEventDistributionSettings() [2/2]

```
MonitoringEventDistributionSettings (
            MonitoringEventDistributionSettings src )
```

Copy constructor.

Parameters

src	<<***in***>> *(*p. *404)* Source object.

8.183.3 Member Data Documentation

8.183.3.1 concurrency_level

```
int concurrency_level
```

<<***extension***>> *(*p. *138)* Defines how concurrent the push of event metrics to RTI Monitoring Library 2.0 is.

With a concurrency_level of one, all the event metrics pushed to RTI Monitoring Library 2.0 will be stored in a single queue protected by a single mutex.

With a concurrency_level of 'n', RTI Monitoring Library 2.0 will create 'n' queues for event metrics, each queue protected by its own mutex. Each resource (e.g, a **com.rti.dds.subscription.DataReader** (p. 707)) will be associated with one of the queues when the resource is registered with RTI Monitoring Library 2.0. Therefore, all the event metrics for a single resource always go to the same queue.

The event metrics for two resources associated with different event queues can be pushed in parallel. This is why a higher concurrency_level provides more concurrency.

The event metrics added to the event queues are processed by a single thread configured using **com.rti.dds.↩ infrastructure.MonitoringEventDistributionSettings.thread** (p. 1598).

[default] 5

[range] [1, 100]

Categories

Mutable (p. 338), **Concurrency** (p. 195), **Debuggability** (p. 205)

8.183.3.2 datawriter_qos_profile_name

```
String datawriter_qos_profile_name
```

<<***extension***>> *(*p. *138)* The fully qualified name of the profile used to configure the **com.rti.dds.publication.DataWriter** (p. 818) that distributes event metrics.

The **com.rti.dds.publication.DataWriter** (p. 818) Topic is com.rti.ndds.utility.MONITORING_EVENT_TOPIC_NAME.

If null (the default value), then RTI Monitoring Library 2.0 uses **com.rti.dds.infrastructure.BuiltinQosProfiles.PROFILE_GENERIC_MONITORING2** (p. 436).

[default] null

Categories

Mutable (p. 338), **Debuggability** (p. 205), **QoS Profile Management** (p. 264)

8.183.3.3 thread

```
ThreadSettings_t thread = new ThreadSettings_t()
```

<<***extension***>> *(*p. *138)* The settings of the event metric thread.

The event metric thread periodically publishes the event metrics pushed into RTI Monitoring Library 2.0 event metric queues after they change their values.

The thread runs at the period configured using **com.rti.dds.infrastructure.MonitoringEventDistributionSettings.publication_period** (p. 1598).

[default] DDS_THREAD_SETTINGS_DEFAULT

8.184.1 Detailed Description

<<***extension***>> *(*p. *138)* Configures the distribution of log messages.

Log messages are pushed into RTI Monitoring Library 2.0 and published by the logging thread.

The logging thread only publishes a log message with a Syslog level smaller than or equal to the forwarding level of the **com.rti.ndds.config.LogFacility** (p. 1558) associated with the log message.

The default value of the forwarding level for all facilities is **com.rti.ndds.config.SyslogVerbosity.NDDS_CONFIG↩ _SYSLOG_VERBOSITY_WARNING** (p. 2088). This value can be changed with the **com.rti.dds.infrastructure.↩ MonitoringTelemetryData.logs** (p. 1615) QoS Policy or by sending a command to RTI Monitoring Library 2.0.

In this release, commands can only be sent from the RTI Observability Dashboards.

RTI Monitoring Library 2.0 can be configured to keep a history of log messages for later distribution when a log snapshot is requested by a RTI Observability Collector Service.

The log messages maintained in the history are the last 'n' messages published by the logging thread (where 'n' is the value of **com.rti.dds.infrastructure.MonitoringLoggingDistributionSettings.max_historical_logs** (p. 1601)).

8.184.2 Constructor & Destructor Documentation

8.184.2.1 MonitoringLoggingDistributionSettings() [1/2]

MonitoringLoggingDistributionSettings ( )
```

Constructor.

8.184.2.2 MonitoringLoggingDistributionSettings() [2/2]

```
MonitoringLoggingDistributionSettings (
            MonitoringLoggingDistributionSettings src )
```

Copy constructor.

Parameters

src	<<***in***>> *(*p. *404)* Source object.

8.184.3 Member Data Documentation

8.184.3.1 concurrency_level

```
int concurrency_level
```

<<***extension***>> *(*p. *138)* Defines how concurrent the push of log messages to RTI Monitoring Library 2.0 is.

With a concurrency_level of one, all the log messages pushed to RTI Monitoring Library 2.0 will be stored into a single queue protected by a single mutex.

With a concurrency_level of 'n', RTI Monitoring Library 2.0 will create 'n' queues for log messages, each queue protected by its own mutex.

The log messages generated by a single thread will always be pushed to the same queue. The log messages for two threads associated with different log queues can be pushed in parallel. This is why a higher concurrency_level provides more concurrency.

The log messages added to the log queues are processed and published by a single thread configured using **com.↩ rti.dds.infrastructure.MonitoringLoggingDistributionSettings.thread** (p. 1601).

[default] 5

[range] [1, 100]

Categories

- **StringSeq disabled_metrics_selection**

  <<***extension***>> *(*p. *138) A sequence of POSIX fnmatch patterns that mach the names of the metrics that should not be collected and distributed for the observable resources selected by* ***com.rti.dds.infrastructure.MonitoringMetric↩ Selection.resource_selection*** *(*p. *1606).*

8.186.1 Detailed Description

<<***extension***>> *(*p. *138)* This data structure is used to configure event and periodic metrics collection and distribution for a specific set of observable resources.

8.186.2 Constructor & Destructor Documentation

8.186.2.1 MonitoringMetricSelection() [1/2]

```
MonitoringMetricSelection ( )
```

Constructor.

8.186.2.2 MonitoringMetricSelection() [2/2]

```
MonitoringMetricSelection (
            MonitoringMetricSelection src )
```

Copy constructor.

Parameters

src	<<***in***>> *(p. 404)* Source object.

References **StringSeq.copy_from()**, **MonitoringMetricSelection.disabled_metrics_selection**, **MonitoringMetricSelection.enabled_metrics_selection**, and **MonitoringMetricSelection.resource_selection**.

8.186.3 Member Data Documentation

8.186.3.1 resource_selection

```
String resource_selection
```

<<***extension***>> *(p. 138)* An expression pattern that selects a subset of resources by matching the pattern to the resource names. **com.rti.dds.infrastructure.MonitoringMetricSelection.enabled_metrics_selection** (p. 1606) and **com.rti.dds.infrastructure.MonitoringMetricSelection.disabled_metrics_selection** (p. 1607) are applied to this subset of resources.

Examples of resource expression patterns:

- /applications/myApp/domain_participants/myParticipant
- /applications/∗/domain_participants/∗/subscribers/∗
- /applications/myApp/domain_participants/GUID(1234.5678.4321.8765)
- //myEntity

The first expression refers to a DomainParticipant named "myParticipant" that belongs to an application named "myApp". The second expression applies to all the Subscribers in the system (resource name wildcards follow the POSIX fnmatch syntax). The third expression refers to a DomainParticipant with a specific resource GUID in the "myApp" application. The last expression uses the XPath "//" operator. It matches observable resources named "myEntity" no matter where they are located in the resource hiearchy.

See the Telemetry Data / Resources chapter of the RTI Connext Observability Framework documentation for further information on the observable resource names and expression patterns.

Categories

Mutable (p. 338), **Debuggability** (p. 205)

Referenced by **MonitoringMetricSelection.MonitoringMetricSelection()**.

8.186.3.2 enabled_metrics_selection

```
StringSeq enabled_metrics_selection
```

<<***extension***>> *(*p. *138)* A sequence of POSIX fnmatch patterns that match the names of the metrics that should be collected and distributed for the observable resources selected by **com.rti.dds.infrastructure.MonitoringMetric↩ Selection.resource_selection** (p. 1606).

This sequence is evaluated first, followed by **com.rti.dds.infrastructure.MonitoringMetricSelection.disabled_↩ metrics_selection** (p. 1607). Therefore, if the same metric is enabled and disabled at the same time, the disablement will be the final result.

The patterns in the sequence are evaluated in order.

Examples of valid patterns:

- dds_data_writer_qos_durability_writer_depth
- dds_data_reader_qos_reliability_∗
- dds_application_∗

The first pattern refers to a specific DataWriter metric (**com.rti.dds.infrastructure.DurabilityQosPolicy.writer_depth** (p. 1119)). The second pattern refers to all the DataReader **com.rti.dds.infrastructure.ReliabilityQosPolicy** (p. 1829) metrics. The last pattern selects all the available application metrics.

See the Telemetry Data / Metrics chapter of the RTI Connext Observability Framework documentation for further information on the metric names and metric patterns.

Categories

Mutable (p. 338), **Debuggability** (p. 205)

Referenced by **MonitoringMetricSelection.MonitoringMetricSelection()**.

8.186.3.3 disabled_metrics_selection

```
StringSeq disabled_metrics_selection
```

<<***extension***>> *(*p. *138)* A sequence of POSIX fnmatch patterns that mach the names of the metrics that should not be collected and distributed for the observable resources selected by **com.rti.dds.infrastructure.MonitoringMetric↩ Selection.resource_selection** (p. 1606).

This sequence is evaluated after **com.rti.dds.infrastructure.MonitoringMetricSelection.enabled_metrics_selection** (p. 1606). Therefore, if the same metric is enabled and disabled at the same time, the disablement will be the final result.

The patterns in the sequence are evaluated in order.

Examples of valid patterns:

- dds_data_writer_qos_durability_writer_depth
- dds_data_reader_qos_reliability_∗
- dds_application_∗

The first pattern refers to a specific DataWriter metric (**com.rti.dds.infrastructure.DurabilityQosPolicy.writer_depth** (p. 1119)). The second pattern refers to all the DataReader **com.rti.dds.infrastructure.ReliabilityQosPolicy** (p. 1829) metrics. The last pattern selects all the available application metrics.

See the Telemetry Data / Metrics chapter of the RTI Connext Observability Framework documentation for further information on the metric names and metric patterns.

  *<<**basic**>> (p. 123) <<**extension**>> (p. 138) Period at which the periodic metric thread polls and publishes the periodic metrics.*

8.188.1 Detailed Description

<<***extension***>> *(p. 138)* Configures the distribution of periodic metrics.

Periodic metrics change often, and they are polled and published periodically by a thread created by RTI Monitoring Library 2.0.

RTI Monitoring Library 2.0 obtains periodic metrics by polling the current value of periodic statuses such as **com.rti.dds.publication.DataWriterProtocolStatus** (p. 867).

The periodic metrics that will be distributed for an observable resource can be configured with **com.rti.dds.infrastructure.MonitoringTelemetryData.metrics** (p. 1615).

  <<***extension***>> *(*p. *138) Configures the distribution of telemetry data.*
- **MonitoringTelemetryData telemetry_data**

  <<***extension***>> *(*p. *138) Configures the telemetry data that will be distributed.*

8.189.1 Detailed Description

<<***extension***>> *(*p. *138)* Configures the use of RTI Monitoring Library 2.0 to collect and distribute RTI Connext telemetry data.

8.189.2 Member Data Documentation

8.189.2.1 enable

```
boolean enable
```

*<<**basic**>> (p. 123) <<**extension**>> (p. 138)* Enables the collection and distribution of telemetry data for an RTI Connext application using RTI Monitoring Library 2.0.

RTI Monitoring Library 2.0 is automatically enabled when the the rtimonitoring2 shared library is in the library search path.

RTI Monitoring Library 2.0 is **not automatically enabled** for RTI Connext RTI DDS Ping, RTI DDS Spy, RTI Monitor, RTI Admin Console nor RTI Observability Collector Service.

You can override the default behavior and control whether RTI Monitoring Library 2.0 is enabled or disabled in two ways in order of precedence:

- **Environment variable:** Set `RTI_MONITORING2_ENABLE` to `true` or `false`. This is the simplest way to enable or disable the library without modifying your application or its configuration.
- **QoS policy:** Set this field to com.rti.dds.infrastructure.true or com.rti.dds.infrastructure.false programmatically or via XML.

The environment variable should not be changed at runtime. If you need to **enable** or **disable** RTI Monitoring Library 2.0 at runtime, use this field instead.

Note: Enabling and disabling RTI Monitoring Library 2.0 while DDS Entities are being created or deleted is not a safe operation. The entities created while RTI Monitoring Library 2.0 is being enabled may not be monitored.

Categories

Mutable (p. 338), **Debuggability** (p. 205)

8.189.2.2 application_name

```
String application_name
```

<<***basic***>> *(*p. *123)* <<***extension***>> *(*p. *138)* The name of the resource that represents this RTI Connext application.

When this member is set to a value other than null , the resource identifier representing this application will be:

/applications/<application_name>

This is the resource identifier that will be used to send commands to this application from the RTI Observability Dashboards.

The application_name should be unique across the RTI Connext system; however, RTI Monitoring Library 2.0 does not currently enforce uniqueness.

When this member is set to null , RTI Monitoring Library 2.0 will automatically assign a resource identifier with this format:

/applications/<host_name:process_id:uuid>

[default] null

  <<***basic***>> *(*p. *123)* <<***extension***>> *(*p. *138) Sequence of* ***com.rti.dds.infrastructure.MonitoringMetricSelection*** *(*p. *1605) containing the event and periodic metrics that will be collected and distributed for a given set of observable resources.*
- **MonitoringLoggingForwardingSettings logs**

  <<***basic***>> *(*p. *123)* <<***extension***>> *(*p. *138)* ***com.rti.dds.infrastructure.MonitoringLoggingForwardingSettings*** *(*p. *1602) containing the* ***com.rti.ndds.config.SyslogVerbosity*** *(*p. *2086) levels that will be forwarded for the different* ***com.rti.ndds.config.LogFacility*** *(*p. *1558).*

8.190.1 Detailed Description

<<***extension***>> *(*p. *138)* Configures the telemetry data that will be distributed.

8.190.2 Constructor & Destructor Documentation

8.190.2.1 MonitoringTelemetryData() [1/2]

```
MonitoringTelemetryData ( )
```

Constructor.

8.190.2.2 MonitoringTelemetryData() [2/2]

```
MonitoringTelemetryData (
            MonitoringTelemetryData src )
```

Copy constructor.

Parameters

src	<<***in***>> *(p. 404)* Source object.

References **MonitoringTelemetryData.logs**, and **MonitoringTelemetryData.metrics**.

8.190.3 Member Data Documentation

8.190.3.1 metrics

MonitoringMetricSelectionSeq metrics

<<***basic***>> *(p. 123)* <<***extension***>> *(p. 138)* Sequence of **com.rti.dds.infrastructure.MonitoringMetric↩ Selection** (p. 1605) containing the event and periodic metrics that will be collected and distributed for a given set of observable resources.

The different **com.rti.dds.infrastructure.MonitoringMetricSelection** (p. 1605) in the sequence are evaluated in order.

[default] An empty sequence, meaning that no metrics will be collected and distributed for any observable resource.

See also

com.rti.dds.infrastructure.MonitoringEventDistributionSettings (p. 1595) and **com.rti.dds.infrastructure.↩ MonitoringPeriodicDistributionSettings** (p. 1608) for further information on how RTI Monitoring Library 2.↩ 0 distributes **metrics** (p. 1615).

Categories

Mutable (p. 338), **Debuggability** (p. 205)

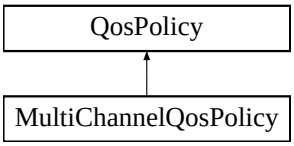
8.191 MultiChannelQosPolicy Class Reference

<<***extension***>> *(p. 138)* Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data.

Inheritance diagram for MultiChannelQosPolicy:



Public Attributes

- final **ChannelSettingsSeq channels**

  <<***extension***>> (p. *138) A sequence of* ***com.rti.dds.infrastructure.ChannelSettings_t*** *(p. 666) used to configure the channels' properties. If the length of the sequence is zero, the QoS policy will be ignored.*
- String **filter_name**

  <<***extension***>> (p. *138) Name of the filter class used to describe the filter expressions of a MultiChannel DataWriter.*

8.191.1 Detailed Description

<<***extension***>> *(p. 138)* Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data.

This QoS policy is used to partition the data published by a **com.rti.dds.publication.DataWriter** (p. 818) across multiple channels. A *channel* is defined by a filter expression and a sequence of multicast locators.

Entity:

com.rti.dds.publication.DataWriter (p. 818)

Properties:

RxO (p. 506) = N/A
Changeable (p. 507) = **NO** (p. 507)

8.191.2 Usage

By using this QoS, a **com.rti.dds.publication.DataWriter** (p. 818) can be configured to send data to different multicast groups based on the content of the data. Using syntax similar to those used in Content-Based Filters, you can associate different multicast addresses with filter expressions that operate on the values of the fields within the data. When your application's code calls **com.rti.ndds.example.FooDataWriter.write** (p. 1397), data is sent to any multicast address for which the data passes the filter.

Multi-channel DataWriters can be used to trade off network bandwidth with the unnecessary processing of unwanted data for situations where there are multiple DataReaders that are interested in different subsets of data that come from the same data stream (Topic). For example, in Financial applications, the data stream may be quotes for different stocks at an exchange. Applications usually only want to receive data (quotes) for only a subset of the stocks being traded. In tracking applications, a data stream may carry information on hundreds or thousands of objects being tracked, but again, applications may only be interested in a subset.

The problem is that the most efficient way to deliver data to multiple applications is to use multicast, so that a data value is only sent once on the network for any number of subscribers to the data. However, using multicast, an application will receive *all* of the data sent and not just the data in which it is interested, thus extra CPU time is wasted to throw away unwanted data. With this QoS, you can analyze the data-usage patterns of your applications and optimize network vs. CPU usage by partitioning the data into multiple multicast streams. While network bandwidth is still being conserved by sending data only once using multicast, most applications will only need to listen to a subset of the multicast addresses and receive a reduced amount of unwanted data.

Your system can gain more of the benefits of using multiple multicast groups if your network uses Layer 2 Ethernet switches. Layer 2 switches can be configured to only route multicast packets to those ports that have added membership to specific multicast groups. Using those switches will ensure that only the multicast packets used by applications on a node are routed to the node; all others are filtered-out by the switch.

8.191.3 Member Data Documentation

8.191.3.1 channels

```
final ChannelSettingsSeq channels
```

<<***extension***>> *(p. 138)* A sequence of **com.rti.dds.infrastructure.ChannelSettings_t** (p. 666) used to configure the channels' properties. If the length of the sequence is zero, the QoS policy will be ignored.

A sequence length of zero indicates the **com.rti.dds.infrastructure.MultiChannelQosPolicy** (p. 1616) is not in use.

The sequence length cannot be greater than **com.rti.dds.infrastructure.DomainParticipantResourceLimitsQos↩ Policy.channel_seq_max_length** (p. 1102).

[default] Empty sequence.

Categories

Immutable (p. 292), **Discovery Metadata** (p. 348), **Data Availability** (p. 200)

8.191.3.2 filter_name

```
String filter_name
```

<<***extension***>> *(*p. *138)* Name of the filter class used to describe the filter expressions of a MultiChannel DataWriter.

The following builtin filters are supported:

- **com.rti.dds.domain.DomainParticipant.SQLFILTER_NAME** (p. 52)
- **com.rti.dds.domain.DomainParticipant.STRINGMATCHFILTER_NAME** (p. 52)

[default] com.rti.dds.domain.DomainParticipant.STRINGMATCHFILTER_NAME (p. 52)

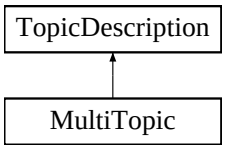
Categories

Immutable (p. 292), **Discovery Metadata** (p. 348), **Data Availability** (p. 200), **Content Filtering** (p. 198)

8.192 MultiTopic Interface Reference

[Not supported (optional)] <<***interface***>> *(*p. *403)* A specialization of **com.rti.dds.topic.TopicDescription** (p. 2129) that allows subscriptions that combine/filter/rearrange data coming from several topics.

Inheritance diagram for MultiTopic:



Public Member Functions

- String **get_subscription_expression** ()

  Get the expression for this ***com.rti.dds.topic.MultiTopic*** *(*p. *1618).*
- void **get_expression_parameters** (**StringSeq** parameters)

  Get the expression parameters.
- void **set_expression_parameters** (**StringSeq** parameters)

  Set the `expression_parameters`*.*

8.192.1 Detailed Description

[Not supported (optional)] <<*interface*>> *(p. 403)* A specialization of **com.rti.dds.topic.TopicDescription** (p. 2129) that allows subscriptions that combine/filter/rearrange data coming from several topics.

com.rti.dds.topic.MultiTopic (p. 1618) allows a more sophisticated subscription that can select and combine data received from multiple topics into a single resulting type (specified by the inherited `type_name`). The data will then be filtered (selection) and possibly re-arranged (aggregation/projection) according to a `subscription_expression` with parameters `expression_parameters`.

- The `subscription_expression` is a string that identifies the selection and re-arrangement of data from the associated topics. It is similar to an SQL statement where the SELECT part provides the fields to be kept, the FROM part provides the names of the topics that are searched for those fields, and the WHERE clause gives the content filter. The Topics combined may have different types but they are restricted in that the type of the fields used for the NATURAL JOIN operation must be the same.

- The `expression_parameters` attribute is a sequence of strings that give values to the 'parameters' (i.e. "%n" tokens) in the `subscription_expression`. The number of supplied parameters must fit with the requested values in the `subscription_expression` (i.e. the number of n tokens).

- **com.rti.dds.subscription.DataReader** (p. 707) entities associated with a **com.rti.dds.topic.MultiTopic** (p. 1618) are alerted of data modifications by the usual **com.rti.dds.infrastructure.Listener** (p. 1528) or **com.rti.dds.infrastructure.WaitSet** (p. 2287) / **com.rti.dds.infrastructure.Condition** (p. 686) mechanisms whenever modifications occur to the data associated with any of the topics relevant to the **com.rti.dds.topic.MultiTopic** (p. 1618).

Note that the source for data may not be restricted to a single topic.

com.rti.dds.subscription.DataReader (p. 707) entities associated with a **com.rti.dds.topic.MultiTopic** (p. 1618) may access instances that are "constructed" at the **com.rti.dds.subscription.DataReader** (p. 707) side from the instances written by multiple **com.rti.dds.publication.DataWriter** (p. 818) entities. The **com.rti.dds.topic.MultiTopic** (p. 1618) access instance will begin to exist as soon as all the constituting **com.rti.dds.topic.Topic** (p. 2116) instances are in existence. The `view_state` and `instance_state` is computed from the corresponding states of the constituting instances:

- The `view_state` of the **com.rti.dds.topic.MultiTopic** (p. 1618) instance is com.rti.dds.subscription.ViewStateKind.ViewStateKind.NEW_VIEW_STATE if at least one of the constituting instances has `view_state` = com.rti.dds.subscription.ViewStateKind.ViewStateKind.NEW_VIEW_STATE. Otherwise, it will be com.rti.dds.subscription.ViewStateKind.ViewStateKind.NOT_NEW_VIEW_STATE.

- The `instance_state` of the **com.rti.dds.topic.MultiTopic** (p. 1618) instance is **com.rti.dds.subscription.InstanceStateKind.ALIVE_INSTANCE_STATE** (p. 1452) if the `instance_state` of all the constituting **com.rti.dds.topic.Topic** (p. 2116) instances is **com.rti.dds.subscription.InstanceStateKind.ALIVE_INSTANCE_STATE** (p. 1452). It is **com.rti.dds.subscription.InstanceStateKind.NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 1452) if at least one of the constituting **com.rti.dds.topic.Topic** (p. 2116) instances is **com.rti.dds.subscription.InstanceStateKind.NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 1452). Otherwise, it is **com.rti.dds.subscription.InstanceStateKind.NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 1452).

Queries and Filters Syntax (p. 108) describes the syntax of `subscription_expression` and `expression_parameters`.

8.192.2 Member Function Documentation

8.192.2.1 get_subscription_expression()

```
String get_subscription_expression ( )
```

Get the expression for this **com.rti.dds.topic.MultiTopic** (p. 1618).

The expressions syntax is described in the DDS specification. It is specified when the **com.rti.dds.topic.MultiTopic** (p. 1618) is created.

Returns

`subscription_expression` of the **com.rti.dds.topic.MultiTopic** (p. 1618).

8.192.2.2 get_expression_parameters()

```
void get_expression_parameters (
              StringSeq parameters )
```

Get the expression parameters.

The expressions syntax is described in the DDS specification.

The `parameters` is either specified on the last successful call to **com.rti.dds.topic.MultiTopic.set_expression_↩ parameters** (p. 1620), or if **com.rti.dds.topic.MultiTopic.set_expression_parameters** (p. 1620) was never called, the `parameters` specified when the **com.rti.dds.topic.MultiTopic** (p. 1618) was created.

Parameters

parameters	<<***inout***>> *(p. 404)* Fill in this sequence with the expression parameters. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513)

8.192.2.3 set_expression_parameters()

```
void set_expression_parameters (
              StringSeq parameters )
```

Set the `expression_parameters`.

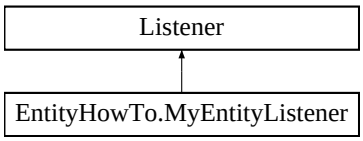
Changes the `expression_parameters` associated with the **com.rti.dds.topic.MultiTopic** (p. 1618).

Parameters

parameters	<<***in***>> *(p. 404)* the filter expression parameters

8.193 EntityHowTo.MyEntityListener Class Reference

Inheritance diagram for EntityHowTo.MyEntityListener:



8.193.1 Detailed Description

{

8.194 NetworkCapture Class Reference

Network Capture APIs.

Static Public Member Functions

- static native boolean **enable** ()
  Enable Network Capture.
- static native boolean **disable** ()
  Disable Network Capture.
- static boolean **set_default_params** (**NetworkCaptureParams** params)
  Set the default Network Capture parameters.
- static native boolean **start** (String filename)
  Start capturing traffic for all DomainParticipants, with the default parameters.
- static boolean **start** (**DomainParticipant** participant, String filename)
  Start capturing traffic for a DomainParticipant, with the default parameters.
- static boolean **start** (String filename, **NetworkCaptureParams** params)
  Start capturing traffic for all DomainParticipants, with the provided parameters.
- static boolean **start** (**DomainParticipant** participant, String filename, **NetworkCaptureParams** params)

Start capturing traffic for a DomainParticipant, with the provided parameters.

- static native boolean **stop** ()

  Stop capturing traffic for all participants.

- static boolean **stop** (**DomainParticipant** participant)

  Stop capturing traffic for a DomainParticipant.

- static native boolean **pause** ()

  Pause capturing traffic for all DomainParticipants.

- static boolean **pause** (**DomainParticipant** participant)

  Pause capturing traffic for a DomainParticipant.

- static native boolean **resume** ()

  Resume capturing traffic for all DomainParticipants.

- static boolean **resume** (**DomainParticipant** participant)

  Resume capturing traffic for a DomainParticipant.

8.194.1 Detailed Description

Network Capture APIs.

8.194.2 Member Function Documentation

8.194.2.1 enable()

```
static native boolean enable ( )  [static]
```

Enable Network Capture.

This method must be called before any other Network Capture method. It must also be called before creating the participants for which we want to capture traffic.

Use this method only for debugging purposes, since it may introduce a significant performance impact.

Returns

com.rti.dds.infrastructure.true if success. Otherwise, com.rti.dds.infrastructure.false

MT Safety:

UNSAFE. It is not safe to call this method while another thread may be simultaneously calling another Network Caputre related method, including this one.

See also

com.rti.ndds.utility.NetworkCapture.disable (p. 1622)

8.194.2.2 disable()

```
static native boolean disable ( )  [static]
```

Disable Network Capture.

This method must be the last Network Capture method to be called. It must also be called after deleting the participants for which we captured traffic. Disabling Network Capture without stopping it first is not ok!

Returns

com.rti.dds.infrastructure.true if success. Otherwise, com.rti.dds.infrastructure.false

MT Safety:

UNSAFE. It is not safe to call this method while another thread may be simultaneously calling another Network Capture related method, including this one.

See also

com.rti.ndds.utility.NetworkCapture.enable (p. 1622)

8.194.2.3 set_default_params()

```
static boolean set_default_params (
              NetworkCaptureParams params )  [static]
```

Set the default Network Capture parameters.

The default parameters are used when Network Capture is started without parameters, i.e., **com.rti.ndds.utility.↩ NetworkCapture.start** (p. 1624).

Precondition

This method requires first enabling Network Capture. See **com.rti.ndds.utility.NetworkCapture.enable** (p. 1622).

Parameters

params	<<***in***>> *(p. 404).* Configuration parameters that we want to set as defaults.

Returns

com.rti.dds.infrastructure.true if success. Otherwise, com.rti.dds.infrastructure.false

See also

com.rti.ndds.utility.NetworkCapture.start (p. 1624)

com.rti.ndds.utility.NetworkCapture.start(DomainParticipant, String) (p. 1624)

8.194.2.4 start() [1/4]

```
static native boolean start (
             String filename )  [static]
```

Start capturing traffic for all DomainParticipants, with the default parameters.

Precondition

This method requires first enabling Network Capture. See **com.rti.ndds.utility.NetworkCapture.enable** (p. 1622).

Parameters

filename	*<<**in**>> (p. 404).* The name of the output capture file will be based on this input parameter.

In particular, the name for the capture file is the concatenation of the `filename` input parameter, the `"_GUID-"` string followed by the decimal representation of bytes 8-11 of the DomainParticipant's GUID, and the file extension (`".pcap"`).

Returns

com.rti.dds.infrastructure.true if success. Otherwise, com.rti.dds.infrastructure.false

See also

com.rti.ndds.utility.NetworkCapture.stop (p. 1626)

com.rti.ndds.utility.NetworkCapture.start(DomainParticipant, String) (p. 1624)

8.194.2.5 start() [2/4]

```
static boolean start (
              DomainParticipant participant,
             String filename )  [static]
```

Start capturing traffic for a DomainParticipant, with the default parameters.

Precondition

This method requires first enabling Network Capture. See **com.rti.ndds.utility.NetworkCapture.enable** (p. 1622).

Parameters

participant	<<***in***>> *(*p. *404).* DomainParticipant for which we want to capture traffic.
filename	<<***in***>> *(*p. *404).* The name of the output capture file will be based on this input parameter.

In particular, the name for the capture file is the concatenation of the `filename` input parameter, and the file extension (`".pcap"`).

Returns

com.rti.dds.infrastructure.true if success. Otherwise, com.rti.dds.infrastructure.false

See also

com.rti.ndds.utility.NetworkCapture.stop(DomainParticipant) (p. 1627)

com.rti.ndds.utility.NetworkCapture.start(DDS:DomainParticipant^, System::String^, NetworkCaptureParams)

com.rti.ndds.utility.NetworkCapture.enable (p. 1622)

8.194.2.6 start() [3/4]

```
static boolean start (
             String filename,
              NetworkCaptureParams params )  [static]
```

Start capturing traffic for all DomainParticipants, with the provided parameters.

Precondition

This method requires first enabling Network Capture. See **com.rti.ndds.utility.NetworkCapture.enable** (p. 1622).

Perfoms the same function as **com.rti.ndds.utility.NetworkCapture.start** (p. 1624) except that it uses the provided parameters, instead of the default ones.

Parameters

filename	<<***in***>> *(*p. *404).* The name of the output capture file will be based on this input parameter.

In particular, the name for the capture file is the concatenation of the `filename` input parameter, the `"_GUID-"` string followed by the decimal representation of bytes 8-11 of the DomainParticipant's GUID, and the file extension (`".pcap"`).

Parameters

params	<<***in***>> *(*p. *404).* Configuration parameters for the capture.

Returns

com.rti.dds.infrastructure.true if success. Otherwise, com.rti.dds.infrastructure.false

See also

com.rti.ndds.utility.NetworkCapture.stop (p. 1626)

com.rti.ndds.utility.NetworkCapture.start(DDS:DomainParticipant^, System::String^, NetworkCaptureParams)

8.194.2.7 start() [4/4]

```
static boolean start (
             DomainParticipant participant,
            String filename,
             NetworkCaptureParams params )  [static]
```

Start capturing traffic for a DomainParticipant, with the provided parameters.

Precondition

This method requires enabling first Network Capture. See **com.rti.ndds.utility.NetworkCapture.enable** (p. 1622).

Parameters

participant	<<***in***>> *(p. 404).* DomainParticipant for which we want to capture traffic.
filename	<<***in***>> *(p. 404).* The name of the output capture file will be based on this input parameter.

In particular, the name for the capture file is the concatenation of the `filename` input parameter, and the file extension (`".pcap"`).

Parameters

params	<<***in***>> *(p. 404).* Parameters for configuring the capture.

Returns

com.rti.dds.infrastructure.true if success. Otherwise, com.rti.dds.infrastructure.false

See also

com.rti.ndds.utility.NetworkCapture.stop(DomainParticipant) (p. 1627)

com.rti.ndds.utility.NetworkCapture.start(DomainParticipant, String) (p. 1624)

8.194.2.8 stop() [1/2]

```
static native boolean stop ( ) [static]
```

Stop capturing traffic for all participants.

Precondition

This method requires enabling first Network Capture. See **com.rti.ndds.utility.NetworkCapture.enable** (p. 1622).

This method can (and must) be called after **com.rti.ndds.utility.NetworkCapture.start** (p. 1624), not **com.rti.ndds.↩ utility.NetworkCapture.start(DomainParticipant, String)** (p. 1624). That is, if we start capturing traffic globally (for all DomainParticipants), we must stop capturing traffic also globally. It is not possible to start capturing traffic for a participant but stop it globally.

It is possible to start capturing globally and then stop capturing for a participant, as long as we eventually stop capturing traffic globally.

We must stop capturing for a participant before deleting it.

Returns

com.rti.dds.infrastructure.true if success. Otherwise, com.rti.dds.infrastructure.false

See also

com.rti.ndds.utility.NetworkCapture.start (p. 1624)

com.rti.ndds.utility.NetworkCapture.stop(DomainParticipant) (p. 1627)

8.194.2.9 stop() [2/2]

```
static boolean stop (
            DomainParticipant participant ) [static]
```

Stop capturing traffic for a DomainParticipant.

Precondition

This method requires first enabling Network Capture. See **com.rti.ndds.utility.NetworkCapture.enable** (p. 1622).

Parameters

participant	<<***in***>> *(p. 404).* DomainParticipant for which we want to stop capturing traffic.

Returns

com.rti.dds.infrastructure.true if success. Otherwise, com.rti.dds.infrastructure.false

See also

com.rti.ndds.utility.NetworkCapture.start(DomainParticipant, String) (p. 1624)

com.rti.ndds.utility.NetworkCapture.stop (p. 1626)

8.194.2.10 pause() [1/2]

```
static native boolean pause ( )  [static]
```

Pause capturing traffic for all DomainParticipants.

Precondition

This method requires first enabling Network Capture. See **com.rti.ndds.utility.NetworkCapture.enable** (p. 1622).

Returns

com.rti.dds.infrastructure.true if success. Otherwise, com.rti.dds.infrastructure.false

See also

com.rti.ndds.utility.NetworkCapture.resume (p. 1629)

com.rti.ndds.utility.NetworkCapture.pause(DomainParticipant) (p. 1628)

8.194.2.11 pause() [2/2]

```
static boolean pause (
              DomainParticipant participant )  [static]
```

Pause capturing traffic for a DomainParticipant.

Precondition

This method requires first enabling Network Capture. See **com.rti.ndds.utility.NetworkCapture.enable** (p. 1622).

Parameters

participant	<<***in***>> *(p. 404).* DomainParticipant for which we want to pause capturing traffic.

Returns

com.rti.dds.infrastructure.true if success. Otherwise, com.rti.dds.infrastructure.false

See also

com.rti.ndds.utility.NetworkCapture.resume(DomainParticipant) (p. 1629)

com.rti.ndds.utility.NetworkCapture.pause (p. 1628)

8.194.2.12 resume() [1/2]

```
static native boolean resume ( )  [static]
```

Resume capturing traffic for all DomainParticipants.

Precondition

This method requires first enabling Network Capture. See **com.rti.ndds.utility.NetworkCapture.enable** (p. 1622).

Returns

com.rti.dds.infrastructure.true if success. Otherwise, com.rti.dds.infrastructure.false

See also

com.rti.ndds.utility.NetworkCapture.pause (p. 1628)

com.rti.ndds.utility.NetworkCapture.resume(DomainParticipant) (p. 1629)

8.194.2.13 resume() [2/2]

```
static boolean resume (
              DomainParticipant participant )  [static]
```

Resume capturing traffic for a DomainParticipant.

Precondition

This method requires first enabling Network Capture. See **com.rti.ndds.utility.NetworkCapture.enable** (p. 1622).

Parameters

participant	<<***in***>> *(p. 404).* DomainParticipant for which we want to resume capturing traffic.

Returns

com.rti.dds.infrastructure.true if success. Otherwise, com.rti.dds.infrastructure.false

See also

com.rti.ndds.utility.NetworkCapture.pause(DomainParticipant) (p. 1628)

com.rti.ndds.utility.NetworkCapture.resume (p. 1629)

8.195 NetworkCaptureContentKind Class Reference

Bitmap used to specify a content type, i.e., a part of the RTPS frame.

Static Public Attributes

- static final int **USER_SERIALIZED_DATA**

  The serialized data coming from a user.
- static final int **ENCRYPTED_DATA**

  The encrypted user data.
- static final int **MASK_DEFAULT**

  *Default mask for **com.rti.ndds.utility.NetworkCaptureContentKind** (p. 1630): do not remove any content.*
- static final int **MASK_NONE**

  The RTPS frames in the capture file will be saved as they are.
- static final int **MASK_ALL**

  The RTPS frames in the capture file will not include user data (either plain or encrypted).

8.195.1 Detailed Description

Bitmap used to specify a content type, i.e., a part of the RTPS frame.

Several values can be combined. Read **com.rti.ndds.utility.NetworkCaptureContentKind** (p. 1630) for typical combinations.

8.195.2 Member Data Documentation

8.195.2.1 USER_SERIALIZED_DATA

```
final int USER_SERIALIZED_DATA  [static]
```

The serialized data coming from a user.

8.195.2.2 ENCRYPTED_DATA

```
final int ENCRYPTED_DATA  [static]
```

The encrypted user data.

8.195.2.3 MASK_DEFAULT

```
final int MASK_DEFAULT  [static]
```

Default mask for **com.rti.ndds.utility.NetworkCaptureContentKind** (p. 1630): do not remove any content.

It is equivalent to **com.rti.ndds.utility.NetworkCaptureContentKind.MASK_NONE** (p. 1631).

[default] Do not remove any content.

8.195.2.4 MASK_NONE

```
final int MASK_NONE  [static]
```

The RTPS frames in the capture file will be saved as they are.

8.195.2.5 MASK_ALL

```
final int MASK_ALL  [static]
```

The RTPS frames in the capture file will not include user data (either plain or encrypted).

Its value is the result of setting the bits for removing user data and removing encrypted data: (**com.rti.ndds.↩ utility.NetworkCaptureContentKind.USER_SERIALIZED_DATA** (p. 1630)) | **com.rti.ndds.utility.NetworkCapture↩ ContentKind.ENCRYPTED_DATA** (p. 1631))

8.196 NetworkCaptureParams Class Reference

Input parameters for starting network capture.

Inherits Struct.

Public Attributes

- **StringSeq transports** = new **StringSeq**()
  List of transports to capture.
- int **dropped_content** = **NetworkCaptureContentKind.MASK_DEFAULT**
  Exclude contents from the capture file.
- int **traffic** = **NetworkCaptureTrafficKind.MASK_DEFAULT**
  Traffic direction to capture.
- boolean **parse_encrypted_content** = false
  If secure traffic should be decrypted or not.
- **ThreadSettings_t checkpoint_thread_settings** = new **ThreadSettings_t**()
  The properties of the checkpoint thread.
- int **frame_queue_size** = 2097152
  Size of the frame queue (Bytes).

8.196.1 Detailed Description

Input parameters for starting network capture.

8.196.2 Member Data Documentation

8.196.2.1 transports

```
StringSeq transports = new  StringSeq()
```

List of transports to capture.

Network Capture will only save RTPS frames if the associated transport protocol is part of this sequence.

[default] Empty sequence initializer. This means that by default all transports will be captured.

8.196.2.2 dropped_content

```
int dropped_content = NetworkCaptureContentKind.MASK_DEFAULT
```

Exclude contents from the capture file.

It accepts values from **com.rti.ndds.utility.NetworkCaptureContentKind** (p. 1630) .

We can choose to exclude user data or encrypted content from the capture file.

[default] No content is excluded - **com.rti.ndds.utility.NetworkCaptureContentKind.MASK_DEFAULT** (p. 1631).

8.196.2.3 traffic

```
int traffic = NetworkCaptureTrafficKind.MASK_DEFAULT
```

Traffic direction to capture.

It accepts values from **com.rti.ndds.utility.NetworkCaptureTrafficKind** (p. 1634) .

[default] Capture both inbound and outbound traffic - **com.rti.ndds.utility.NetworkCaptureTrafficKind.MASK_↩ DEFAULT** (p. 1635).

8.196.2.4 parse_encrypted_content

```
boolean parse_encrypted_content = false
```

If secure traffic should be decrypted or not.

Network Capture supports decryption of RTPS messages and submessages. It does not support decryption of the user data payload (<data_protection_kind> tag in the GovernanceDocument).

[default] com.rti.dds.infrastructure.false

8.196.2.5 checkpoint_thread_settings

```
ThreadSettings_t checkpoint_thread_settings = new ThreadSettings_t()
```

The properties of the checkpoint thread.

The checkpoint thread is a per-participant thread responsible for reading frames from a queue and saving them to disk (as soon as they are produced).

The members that can be configured are:

- **com.rti.dds.infrastructure.ThreadSettings_t.mask** (p. 2102). Default value of (**com.rti.dds.infrastructure.↩ ThreadSettingsKind.THREAD_SETTINGS_PRIORITY_ENFORCE** (p. 2106) | **com.rti.dds.infrastructure.↩ ThreadSettingsKind.THREAD_SETTINGS_STDIO** (p. 2106)).
- **com.rti.dds.infrastructure.ThreadSettings_t.priority** (p. 2102). Platform-dependent - Consult `Platform Notes` for additional details.
- **com.rti.dds.infrastructure.ThreadSettings_t.stack_size** (p. 2102). Platform-dependent - Consult `Platform Notes` for additional details.

8.196.2.6 frame_queue_size

```
int frame_queue_size = 2097152
```

Size of the frame queue (Bytes).

Network Capture enqueues frames before saving them to disk, which takes place in a separate thread.

Network Capture does not block if the queue becomes full. Attempting to enqueue a frame with a full frame queue will fail (frame won't be captured) with a log message.

The size of the queue is dependent on the network traffic (amount of frames that we want to capture) and system resources (how fast we can capture frames).

[default] 2097152 (2MB).

8.197 NetworkCaptureTrafficKind Class Reference

Bitmap used to specify whether we want to capture inbound or outbound traffic.

Static Public Attributes

- static final int **TRAFFIC_OUT**

  Do not capture outbound traffic.
- static final int **TRAFFIC_IN**

  Do not capture inbound traffic.
- static final int **MASK_DEFAULT**

  *Default mask for **com.rti.ndds.utility.NetworkCaptureTrafficKind** (p. 1634).*
- static final int **MASK_NONE**

  Do not capture any traffic.
- static final int **MASK_ALL**

  Capture all traffic (both inbound and outbound).

8.197.1 Detailed Description

Bitmap used to specify whether we want to capture inbound or outbound traffic.

Several values can be combined. Read **com.rti.ndds.utility.NetworkCaptureTrafficKind** (p. 1634) for typical combinations.

8.197.2 Member Data Documentation

8.197.2.1 TRAFFIC_OUT

```
final int TRAFFIC_OUT  [static]
```

Do not capture outbound traffic.

8.197.2.2 TRAFFIC_IN

```
final int TRAFFIC_IN  [static]
```

Do not capture inbound traffic.

8.197.2.3 MASK_DEFAULT

```
final int MASK_DEFAULT  [static]
```

Default mask for **com.rti.ndds.utility.NetworkCaptureTrafficKind** (p. 1634).

It is equivalent to **com.rti.ndds.utility.NetworkCaptureTrafficKind.MASK_ALL** (p. 1635).

[default] Capture all traffic: inbound and outbound.

8.197.2.4 MASK_NONE

```
final int MASK_NONE  [static]
```

Do not capture any traffic.

8.197.2.5 MASK_ALL

```
final int MASK_ALL  [static]
```

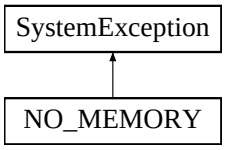
Capture all traffic (both inbound and outbound).

The value is equal to setting both the input and output bits of the mask: (**com.rti.ndds.utility.NetworkCaptureTraffic↩ Kind.TRAFFIC_OUT** (p. 1634) | **com.rti.ndds.utility.NetworkCaptureTrafficKind.TRAFFIC_IN** (p. 1635)).

8.198 NO_MEMORY Class Reference

Exception thrown when there is not enough memory for a dynamic memory allocation.

Inheritance diagram for NO_MEMORY:



8.198.1 Detailed Description

Exception thrown when there is not enough memory for a dynamic memory allocation.

8.199 ObjectHolder Class Reference

<<***extension***>> *(*p. *403)* Holder of object instance

Public Attributes

- Object **value** = null
  *Instance of Object embedded in **ObjectHolder** (*p. *1636).*

8.199.1 Detailed Description

<<***extension***>> *(*p. *403)* Holder of object instance

Holder of object instance. Can be used as an output parameter in a method for non-primitive types.

8.199.2 Member Data Documentation

8.199.2.1 value

```
Object value = null
```

Instance of Object embedded in **ObjectHolder** (p. 1636).

8.200 OfferedDeadlineMissedStatus Class Reference

com.rti.dds.infrastructure.StatusKind.StatusKind.OFFERED_DEADLINE_MISSED_STATUS

Inherits Status.

Public Attributes

- int **total_count**

  *Total cumulative count of the number of times the **com.rti.dds.publication.DataWriter** (p. 818) failed to write within its offered deadline.*
- int **total_count_change**

  The incremental changes in total_count since the last time the listener was called or the status was read.
- final **InstanceHandle_t last_instance_handle**

  *Handle to the last instance in the **com.rti.dds.publication.DataWriter** (p. 818) for which an offered deadline was missed.*

8.200.1 Detailed Description

com.rti.dds.infrastructure.StatusKind.StatusKind.OFFERED_DEADLINE_MISSED_STATUS

Entity:

com.rti.dds.publication.DataWriter (p. 818)

Listener:

com.rti.dds.publication.DataWriterListener (p. 853)

The deadline that the **com.rti.dds.publication.DataWriter** (p. 818) has committed through its **com.rti.dds.infrastructure.DeadlineQosPolicy** (p. 900) was not respected for a specific instance.

8.200.2 Member Data Documentation

8.200.2.1 total_count

```
int total_count
```

Total cumulative count of the number of times the **com.rti.dds.publication.DataWriter** (p. 818) failed to write within its offered deadline.

Missed deadlines accumulate; that is, each deadline period the `total_count` will be incremented by one.

8.200.2.2 total_count_change

```
int total_count_change
```

The incremental changes in total_count since the last time the listener was called or the status was read.

8.200.2.3 last_instance_handle

```
final InstanceHandle_t last_instance_handle
```

Handle to the last instance in the **com.rti.dds.publication.DataWriter** (p. 818) for which an offered deadline was missed.

8.201 OfferedIncompatibleQosStatus Class Reference

com.rti.dds.infrastructure.StatusKind.StatusKind.OFFERED_INCOMPATIBLE_QOS_STATUS

Inherits Status.

Public Attributes

- int **total_count**

  *Total cumulative number of times the concerned **com.rti.dds.publication.DataWriter** (p. 818) discovered a **com.rti.dds.subscription.DataReader** (p. 707) for the same **com.rti.dds.topic.Topic** (p. 2116), common partition with a requested QoS that is incompatible with that offered by the **com.rti.dds.publication.DataWriter** (p. 818).*
- int **total_count_change**

  The incremental changes in total_count since the last time the listener was called or the status was read.
- **QosPolicyId_t last_policy_id**

  *The **com.rti.dds.infrastructure.QosPolicyId_t** (p. 1806) of one of the policies that was found to be incompatible the last time an incompatibility was detected.*
- final **QosPolicyCountSeq policies**

  *A list containing for each policy the total number of times that the concerned **com.rti.dds.publication.DataWriter** (p. 818) discovered a **com.rti.dds.subscription.DataReader** (p. 707) for the same **com.rti.dds.topic.Topic** (p. 2116) and common partition with a requested QoS that is incompatible with that offered by the **com.rti.dds.publication.DataWriter** (p. 818).*

8.201.1 Detailed Description

com.rti.dds.infrastructure.StatusKind.StatusKind.OFFERED_INCOMPATIBLE_QOS_STATUS

Entity:

com.rti.dds.publication.DataWriter (p. 818)

Listener:

com.rti.dds.publication.DataWriterListener (p. 853)

The qos policy value was incompatible with what was requested.

8.201.2 Member Data Documentation

8.201.2.1 total_count

```
int total_count
```

Total cumulative number of times the concerned **com.rti.dds.publication.DataWriter** (p. 818) discovered a **com.↩ rti.dds.subscription.DataReader** (p. 707) for the same **com.rti.dds.topic.Topic** (p. 2116), common partition with a requested QoS that is incompatible with that offered by the **com.rti.dds.publication.DataWriter** (p. 818).

8.201.2.2 total_count_change

```
int total_count_change
```

The incremental changes in total_count since the last time the listener was called or the status was read.

8.201.2.3 last_policy_id

```
QosPolicyId_t last_policy_id
```

The **com.rti.dds.infrastructure.QosPolicyId_t** (p. 1806) of one of the policies that was found to be incompatible the last time an incompatibility was detected.

8.201.2.4 policies

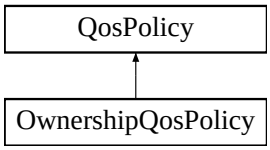
```
final QosPolicyCountSeq policies
```

A list containing for each policy the total number of times that the concerned **com.rti.dds.publication.DataWriter** (p. 818) discovered a **com.rti.dds.subscription.DataReader** (p. 707) for the same **com.rti.dds.topic.Topic** (p. 2116) and common partition with a requested QoS that is incompatible with that offered by the **com.rti.dds.publication.↩ DataWriter** (p. 818).

8.202 OwnershipQosPolicy Class Reference

<<***spec***>> *(p. 132)* Specifies whether it is allowed for multiple **com.rti.dds.publication.DataWriter** (p. 818) (s) to write the same instance of the data and if so, how these modifications should be arbitrated.

Inheritance diagram for OwnershipQosPolicy:



Public Attributes

- **OwnershipQosPolicyKind kind**
  <<***basic***>> (p. *123)* <<***spec***>> (p. *132) The kind of ownership*

8.202.1 Detailed Description

<<***spec***>> *(p. 132)* Specifies whether it is allowed for multiple **com.rti.dds.publication.DataWriter** (p. 818) (s) to write the same instance of the data and if so, how these modifications should be arbitrated.

Entity:

com.rti.dds.topic.Topic (p. 2116), **com.rti.dds.subscription.DataReader** (p. 707), **com.rti.dds.publication.↩ DataWriter** (p. 818)

Status:

com.rti.dds.infrastructure.StatusKind.StatusKind.OFFERED_INCOMPATIBLE_QOS_STATUS, com.rti.dds.↩ infrastructure.StatusKind.StatusKind.REQUESTED_INCOMPATIBLE_QOS_STATUS

Properties:

RxO (p. 506) = YES
Changeable (p. 507) = **UNTIL ENABLE** (p. 507)

See also

OWNERSHIP_STRENGTH (p. 495)

8.202.2 Usage

Along with the **OWNERSHIP_STRENGTH** (p. 495), this QoS policy specifies if **com.rti.dds.subscription.DataReader** (p. 707) entities can receive updates to the same instance (identified by its key) from multiple **com.rti.dds.publication.↩ DataWriter** (p. 818) entities at the same time.

There are two kinds of ownership, selected by the setting of the `kind:` SHARED and EXCLUSIVE.

8.202.2.1 SHARED ownership

com.rti.dds.infrastructure.OwnershipQosPolicyKind.SHARED_OWNERSHIP_QOS (p. 1646) indicates that RTI Connext does not enforce unique ownership for each instance. In this case, multiple writers can update the same data type instance. The subscriber to the **com.rti.dds.topic.Topic** (p. 2116) will be able to access modifications from all **com.rti.dds.publication.DataWriter** (p. 818) objects, subject to the settings of other QoS that may filter particular samples (e.g. the **TIME_BASED_FILTER** (p. 519) or **HISTORY** (p. 487) policy). In any case, there is no "filtering" of modifications made based on the identity of the **com.rti.dds.publication.DataWriter** (p. 818) that causes the modification.

8.202.2.2 EXCLUSIVE ownership

com.rti.dds.infrastructure.OwnershipQosPolicyKind.EXCLUSIVE_OWNERSHIP_QOS (p. 1646) indicates that each instance of a data type can only be modified by one **com.rti.dds.publication.DataWriter** (p. 818). In other words, at any point in time, a single **com.rti.dds.publication.DataWriter** (p. 818) owns each instance and is the only one whose modifications will be visible to the **com.rti.dds.subscription.DataReader** (p. 707) objects. The owner is determined by selecting the **com.rti.dds.publication.DataWriter** (p. 818) with the highest value of the **com.rti.dds.↩ infrastructure.OwnershipStrengthQosPolicy.value** (p. 1647) that is currently alive, as defined by the **LIVELINESS** (p. 489) policy, and has not violated its **DEADLINE** (p. 467) contract with regards to the data instance.

Ownership can therefore change as a result of:

- a **com.rti.dds.publication.DataWriter** (p. 818) in the system with a higher value of the strength that modifies the instance,
- a change in the strength value of the **com.rti.dds.publication.DataWriter** (p. 818) that owns the instance, and
- a change in the liveliness of the **com.rti.dds.publication.DataWriter** (p. 818) that owns the instance.
- a deadline with regards to the instance that is missed by the **com.rti.dds.publication.DataWriter** (p. 818) that owns the instance.

The behavior of the system is as if the determination was made independently by each **com.rti.dds.subscription.↩ DataReader** (p. 707). Each **com.rti.dds.subscription.DataReader** (p. 707) may detect the change of ownership at a different time. It is not a requirement that at a particular point in time all the **com.rti.dds.subscription.DataReader** (p. 707) objects for that **com.rti.dds.topic.Topic** (p. 2116) have a consistent picture of who owns each instance.

It is also not a requirement that the **com.rti.dds.publication.DataWriter** (p. 818) objects are aware of whether they own a particular instance. There is no error or notification given to a **com.rti.dds.publication.DataWriter** (p. 818) that modifies an instance it does not currently own.

The requirements are chosen to (a) preserve the decoupling of publishers and subscriber, and (b) allow the policy to be implemented efficiently.

It is possible that multiple **com.rti.dds.publication.DataWriter** (p. 818) objects with the same strength modify the same instance. If this occurs RTI Connext will pick one of the **com.rti.dds.publication.DataWriter** (p. 818) objects as the owner. It is not specified how the owner is selected. However, the algorithm used to select the owner guarantees that all **com.rti.dds.subscription.DataReader** (p. 707) objects will make the same choice of the particular **com.rti.dds.↩ publication.DataWriter** (p. 818) that is the owner. It also guarantees that the owner remains the same until there is a change in strength, liveliness, the owner misses a deadline on the instance, or a new **com.rti.dds.publication.Data↩ Writer** (p. 818) with higher same strength, or a new **com.rti.dds.publication.DataWriter** (p. 818) with same strength that should be deemed the owner according to the policy of the Service, modifies the instance.

Exclusive ownership is on an instance-by-instance basis. That is, a subscriber can receive values written by a lower strength **com.rti.dds.publication.DataWriter** (p. 818) as long as they affect instances whose values have not been set by the higher-strength **com.rti.dds.publication.DataWriter** (p. 818).

8.202.3 Compatibility

The value of the **com.rti.dds.infrastructure.OwnershipQosPolicyKind** (p. 1645) offered must exactly match the one requested or else they are considered incompatible.

8.202.4 Relationship between registration, liveliness and ownership

The need for registering/unregistering instances stems from two use cases:

- Ownership resolution on redundant systems
- Detection of loss in topological connectivity

These two use cases also illustrate the semantic differences between the **com.rti.ndds.example.FooDataWriter.↩ unregister_instance** (p. 1392) and **com.rti.ndds.example.FooDataWriter.dispose** (p. 1403).

8.202.4.1 Ownership Resolution on Redundant Systems

It is expected that users may use DDS to set up redundant systems where multiple **com.rti.dds.publication.DataWriter** (p. 818) entities are "capable" of writing the same instance. In this situation, the **com.rti.dds.publication.DataWriter** (p. 818) entities are configured such that:

- Either both are writing the instance "constantly"
- Or else they use some mechanism to classify each other as "primary" and "secondary", such that the primary is the only one writing, and the secondary monitors the primary and only writes when it detects that the primary "writer" is no longer writing.

Both cases above use the **com.rti.dds.infrastructure.OwnershipQosPolicyKind.EXCLUSIVE_OWNERSHIP_QOS** (p. 1646) and arbitrate themselves by means of the **com.rti.dds.infrastructure.OwnershipStrengthQosPolicy** (p. 1646). Regardless of the scheme, the desired behavior from the **com.rti.dds.subscription.DataReader** (p. 707) point of view is that **com.rti.dds.subscription.DataReader** (p. 707) normally receives data from the primary unless the "primary" writer stops writing, in which case the **com.rti.dds.subscription.DataReader** (p. 707) starts to receive data from the secondary **com.rti.dds.publication.DataWriter** (p. 818).

This approach requires some mechanism to detect that a **com.rti.dds.publication.DataWriter** (p. 818) (the primary) is no longer "writing" the data as it should. There are several reasons why this may happen and all must be detected (but not necessarily distinguished):

crash The writing process is no longer running (e.g. the whole application has crashed)

connectivity loss Connectivity to the writing application has been lost (e.g. network disconnection)

application fault The application logic that was writing the data is faulty and has stopped calling **com.rti.ndds.example.FooDataWriter.write** (p. 1397).

Arbitrating from a **com.rti.dds.publication.DataWriter** (p. 818) to one of a higher strength is simple and the decision can be taken autonomously by the **com.rti.dds.subscription.DataReader** (p. 707). Switching ownership from a higher strength **com.rti.dds.publication.DataWriter** (p. 818) to one of a lower strength **com.rti.dds.publication.DataWriter** (p. 818) requires that the **com.rti.dds.subscription.DataReader** (p. 707) can make a determination that the stronger **com.rti.dds.publication.DataWriter** (p. 818) is "no longer writing the instance".

8.202.4.1.1 Case where the data is periodically updated This determination is reasonably simple when the data is being written periodically at some rate. The **com.rti.dds.publication.DataWriter** (p. 818) simply states its offered **com.rti.dds.infrastructure.DeadlineQosPolicy** (p. 900) (maximum interval between updates), and the **com.rti.dds.subscription.DataReader** (p. 707) automatically monitors that the **com.rti.dds.publication.DataWriter** (p. 818) indeed updates the instance at least once per **com.rti.dds.infrastructure.DeadlineQosPolicy.period** (p. 902) set by the **com.rti.dds.subscription.DataReader** (p. 707). If the deadline is missed, the **com.rti.dds.subscription.DataReader** (p. 707) considers the **com.rti.dds.publication.DataWriter** (p. 818) "not alive" and automatically gives ownership to the next highest-strength **com.rti.dds.publication.DataWriter** (p. 818) that *is* alive.

8.202.4.1.2 Case where data is not periodically updated The case where the **com.rti.dds.publication.DataWriter** (p. 818) is not writing data periodically is also a very important use-case. Since the instance is not being updated at any fixed period, the "deadline" mechanism cannot be used to determine ownership. The liveliness solves this situation. Ownership is maintained while the **com.rti.dds.publication.DataWriter** (p. 818) is "alive" and for the **com.rti.dds.publication.DataWriter** (p. 818) to be alive it must fulfill its **com.rti.dds.infrastructure.LivelinessQosPolicy** (p. 1535) contract. The different means to renew liveliness (automatic, manual) combined by the implied renewal each time data is written handle the three conditions above [crash], [connectivity loss], and [application fault]. Note that to handle [application fault], LIVELINESS must be com.rti.dds.infrastructure.LivelinessQosPolicyKind.LivelinessQosPolicyKind.MANUAL_BY_TOPIC_LIVELINESS_QOS. The **com.rti.dds.publication.DataWriter** (p. 818) can retain ownership by periodically writing data or else calling assert_liveliness if it has no data to write. Alternatively if only protection against [crash] or [connectivity loss] is desired, it is sufficient that some task on the **com.rti.dds.publication.DataWriter** (p. 818) process periodically writes data or calls **com.rti.dds.domain.DomainParticipant.assert_liveliness** (p. 1005). However, this scenario requires that the **com.rti.dds.subscription.DataReader** (p. 707) knows what instances are being "written" by the **com.rti.dds.publication.DataWriter** (p. 818). That is the only way that the **com.rti.dds.subscription.DataReader** (p. 707) deduces the ownership of specific instances from the fact that the **com.rti.dds.publication.DataWriter** (p. 818) is still "alive". Hence the need for the **com.rti.dds.publication.DataWriter** (p. 818) to "register" and "unregister" instances. Note that while "registration" can be done lazily the first time the **com.rti.dds.publication.DataWriter** (p. 818) writes the instance, "unregistration," in general, cannot. Similar reasoning will lead to the fact that unregistration will also require a message to be sent to the **com.rti.dds.subscription.DataReader** (p. 707).

8.202.4.2 Detection of Loss in Topological Connectivity

There are applications that are designed in such a way that their correct operation requires some minimal topological connectivity, that is, the writer needs to have a minimum number of readers or alternatively the reader must have a minimum number of writers.

A common scenario is that the application does not start doing its logic until it knows that some specific writers have the minimum configured readers (e.g the alarm monitor is up).

A *more* common scenario is that the application logic will wait until some writers appear that can provide some needed source of information (e.g. the raw sensor data that must be processed).

Furthermore, once the application is running it is a requirement that this minimal connectivity (from the source of the data) is monitored and the application informed if it is ever lost. For the case where data is being written periodically, the **com.rti.dds.infrastructure.DeadlineQosPolicy** (p. 900) and the on_deadline_missed listener provides the notification. The case where data is not periodically updated requires the use of the **com.rti.dds.infrastructure.LivelinessQos↩ Policy** (p. 1535) in combination with register_instance/unregister_instance to detect whether the "connectivity" has been lost, and the notification is provided by means of **com.rti.dds.subscription.InstanceStateKind.NOT_ALIVE_NO_↩ WRITERS_INSTANCE_STATE** (p. 1452).

In terms of the required mechanisms, the scenario is very similar to the case of maintaining ownership. In both cases, the reader needs to know whether a writer is still "managing the current value of an instance" even though it is not continually writing it and this knowledge requires the writer to keep its liveliness plus some means to know which instances the writer is currently "managing" (i.e. the registered instances).

8.202.4.3 Semantic Difference between unregister_instance and dispose

com.rti.ndds.example.FooDataWriter.dispose (p. 1403) is semantically different from **com.rti.ndds.example.Foo↩ DataWriter.unregister_instance** (p. 1392). **com.rti.ndds.example.FooDataWriter.dispose** (p. 1403) indicates that the data instance no longer exists (e.g. a track that has disappeared, a simulation entity that has been destroyed, a record entry that has been deleted, etc.) whereas **com.rti.ndds.example.FooDataWriter.unregister_instance** (p. 1392) indicates that the writer is no longer taking responsibility for updating the value of the instance.

Deleting a **com.rti.dds.publication.DataWriter** (p. 818) is equivalent to unregistering all the instances it was writing, but is *not* the same as "disposing" all the instances.

For a **com.rti.dds.topic.Topic** (p. 2116) with **com.rti.dds.infrastructure.OwnershipQosPolicyKind.EXCLUSIVE_↩ OWNERSHIP_QOS** (p. 1646), if the current owner of an instance *disposes* it, the readers accessing the instance will see the instance_state as being "DISPOSED" and not see the values being written by the weaker writer (even after the stronger one has disposed the instance). This is because the **com.rti.dds.publication.DataWriter** (p. 818) that owns the instance is saying that the instance no longer exists (e.g. the master of the database is saying that a record has been deleted) and thus the readers should see it as such.

For a **com.rti.dds.topic.Topic** (p. 2116) with **com.rti.dds.infrastructure.OwnershipQosPolicyKind.EXCLUSIVE_↩ OWNERSHIP_QOS** (p. 1646), if the current owner of an instance *unregisters* it, then it will relinquish ownership of the instance and thus the readers may see the value updated by another writer (which will then become the owner). This is because the owner said that it no longer will be providing values for the instance and thus another writer can take ownership and provide those values.

8.202.5 Member Data Documentation

8.202.5.1 kind

```
OwnershipQosPolicyKind kind
```

<<***basic***>> *(*p. *123)* <<***spec***>> *(*p. *132)* The kind of ownership

[default] com.rti.dds.infrastructure.OwnershipQosPolicyKind.SHARED_OWNERSHIP_QOS (p. 1646)

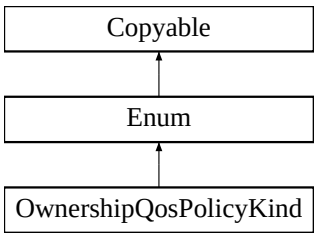
Categories

Immutable (p. 292), **Matching** (p. 355), **Discovery Metadata** (p. 348), **Applied Per-Instance** (p. 346), **Data Availability** (p. 200)

8.203 OwnershipQosPolicyKind Class Reference

Kinds of ownership.

Inheritance diagram for OwnershipQosPolicyKind:



Static Public Attributes

- static final **OwnershipQosPolicyKind SHARED_OWNERSHIP_QOS**

  [default] *Indicates shared ownership for each instance.*
- static final **OwnershipQosPolicyKind EXCLUSIVE_OWNERSHIP_QOS**

  Indicates each instance can only be owned by one ***com.rti.dds.publication.DataWriter*** *(*p. *818), but the owner of an instance can change dynamically.*

Additional Inherited Members

8.203.1 Detailed Description

Kinds of ownership.

QoS:

com.rti.dds.infrastructure.OwnershipQosPolicy (p. 1640)

8.203.2 Member Data Documentation

8.203.2.1 SHARED_OWNERSHIP_QOS

```
final OwnershipQosPolicyKind SHARED_OWNERSHIP_QOS [static]
```

[default] Indicates shared ownership for each instance.

Multiple writers are allowed to update the same instance and all the updates are made available to the readers. In other words there is no concept of an owner for the instances.

This is the **default** behavior if the **OWNERSHIP** (p. 494) policy is not specified or supported.

8.203.2.2 EXCLUSIVE_OWNERSHIP_QOS

```
final OwnershipQosPolicyKind EXCLUSIVE_OWNERSHIP_QOS [static]
```

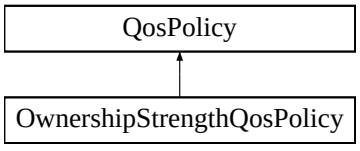
Indicates each instance can only be owned by one **com.rti.dds.publication.DataWriter** (p. 818), but the owner of an instance can change dynamically.

The selection of the owner is controlled by the setting of the **OWNERSHIP_STRENGTH** (p. 495) policy. The owner is always set to be the highest-strength **com.rti.dds.publication.DataWriter** (p. 818) object among the ones currently active (as determined by the **LIVELINESS** (p. 489)).

8.204 OwnershipStrengthQosPolicy Class Reference

Specifies the value of the strength used to arbitrate among multiple **com.rti.dds.publication.DataWriter** (p. 818) objects that attempt to modify the same instance of a data type (identified by **com.rti.dds.topic.Topic** (p. 2116) + key).

Inheritance diagram for OwnershipStrengthQosPolicy:



Public Attributes

- int **value**

  *<<**basic**>> (p. 123) <<**spec**>> (p. 132) The strength value used to arbitrate among multiple writers.*

8.204.1 Detailed Description

Specifies the value of the strength used to arbitrate among multiple **com.rti.dds.publication.DataWriter** (p. 818) objects that attempt to modify the same instance of a data type (identified by **com.rti.dds.topic.Topic** (p. 2116) + key).

This policy only applies if the **OWNERSHIP** (p. 494) policy is of kind **com.rti.dds.infrastructure.OwnershipQos↩ PolicyKind.EXCLUSIVE_OWNERSHIP_QOS** (p. 1646).

Entity:

com.rti.dds.publication.DataWriter (p. 818)

Properties:

RxO (p. 506) = N/A
Changeable (p. 507) = **YES** (p. 507)

The value of the **OWNERSHIP_STRENGTH** (p. 495) is used to determine the ownership of a data instance (identified by the key). The arbitration is performed by the **com.rti.dds.subscription.DataReader** (p. 707).

8.205.2 Member Data Documentation

8.205.2.1 key

```
final BuiltinTopicKey_t key
```

DCPS key to distinguish entries.

8.205.2.2 user_data

```
final UserDataQosPolicy user_data
```

Policy of the corresponding **DomainParticipant** (p. 948).

8.205.2.3 property

```
final PropertyQosPolicy property
```

<<***extension***>> *(p. 403)* Name value pair properties to be stored with **DomainParticipant** (p. 948)

8.205.2.4 rtps_protocol_version

```
final ProtocolVersion_t rtps_protocol_version
```

<<***extension***>> *(p. 403)* Version number of the RTPS wire protocol used.

8.205.2.5 rtps_vendor_id

```
final VendorId_t rtps_vendor_id
```

<<***extension***>> *(p. 403)* ID of vendor implementing the RTPS wire protocol.

8.205.2.6 dds_builtin_endpoints

```
int dds_builtin_endpoints
```

Bitmap of builtin endpoints supported by the participant.

Each bit indicates a builtin endpoint that may be available on the participant.

Bit	Endpoint
0	SPDPbuiltinParticipantWriter
1	SPDPbuiltinParticipantReader
2	SEDPbuiltinPublicationsWriter
3	SEDPbuiltinPublicationsReader
4	SEDPbuiltinSubscriptionsWriter
5	SEDPbuiltinSubscriptionsReader
10	BuiltinParticipantMessageWriter
11	BuiltinParticipantMessageReader
12	TypeLookupServiceRequestDataWriter
13	TypeLookupServiceRequestDataReader
14	TypeLookupServiceReplyDataWriter
15	TypeLookupServiceReplyDataReader
16	SEDPbuiltinPublicationsSecureWriter
17	SEDPbuiltinPublicationsSecureReader
18	SEDPbuiltinSubscriptionsSecureWriter
19	SEDPbuiltinSubscriptionsSecureReader
20	BuiltinParticipantMessageSecureWriter
21	BuiltinParticipantMessageSecureReader
22	BuiltinParticipantStatelessMessageWriter
23	BuiltinParticipantStatelessMessageReader
24	BuiltinParticipantVolatileMessageSecureWriter
25	BuiltinParticipantVolatileMessageSecureReader
26	SPDPbuiltinParticipantSecureWriter
27	SPDPbuiltinParticipantSecureReader

8.205.2.7 available_builtin_endpoints_ext

```
int available_builtin_endpoints_ext
```

Extended bitmap of builtin endpoints supported by the participant.

This bitmap is an extension of the **builtin.ParticipantBuiltinTopicData.dds_builtin_endpoints** (p. 1649) field. It is used to indicate additional builtin endpoints that may be available on the participant.

Bit	Endpoint
0	TypeLookupServiceRequestSecureWriter
1	TypeLookupServiceRequestSecureReader
2	TypeLookupServiceReplySecureWriter
3	TypeLookupServiceReplySecureReader

8.205.2.8 default_unicast_locators

```
final  LocatorSeq default_unicast_locators
```

<<***extension***>> *(p. 403)* Unicast locators used when individual entities do not specify unicast locators.

8.205.2.9 product_version

```
final  ProductVersion_t product_version
```

<<***extension***>> *(p. 403)* This is a vendor specific parameter. It gives the current version for rti-dds.

8.205.2.10 participant_name

```
final  EntityNameQosPolicy participant_name
```

<<***extension***>> *(p. 403)* The participant name and role name.

This parameter contains the name and the role name of the discovered participant.

8.205.2.11 partition

```
final  PartitionQosPolicy partition
```

<<***extension***>> *(p. 403)* PartitionQosPolicy of the participant.

8.205.2.12 trust_protection_info

```
final  ParticipantTrustProtectionInfo trust_protection_info
```

<<***extension***>> *(p. 403)* Trust Plugins protection information associated with the discovered **DomainParticipant** (p. 948).

Trust Plugins is a generic abstraction that represents any plugin intended to do transformation, interception, and validation of exchanged **DomainParticipant** (p. 948) data and metadata.

trust_protection_info contains information about how RTPS wire serialization, discovery, and liveliness interact with the loaded Trust Plugins. Two DomainParticipants will not match if their trust_protection_info is incompatible.

The meaning of the contents of this field may vary depending on what Trust Plugins the **DomainParticipant** (p. 948) is using. For information about how this field interacts with the RTI Security Plugins, please refer to the `RTI Security Plugins User's Manual`.

8.205.2.13 trust_algorithm_info

```
final ParticipantTrustAlgorithmInfo trust_algorithm_info
```

<<***extension***>> *(*p. *403)* Trust Plugins algorithms associated with the discovered **DomainParticipant** (p. 948).

Trust Plugins is a generic abstraction that represents any plugin intended to do transformation, interception, and validation of exchanged **DomainParticipant** (p. 948) data and metadata. trust_algorithm_info contains information about what algorithms the loaded Trust Plugins are running. Two DomainParticipants will not match if their trust_algorithm_info are incompatible.

The meaning of the contents of this field may vary depending on what Trust Plugins the **DomainParticipant** (p. 948) is using. For information about how this field interacts with the RTI Security Plugins, please refer to the `RTI Security Plugins User's Manual`.

8.205.2.14 domain_id

```
int domain_id
```

<<***extension***>> *(*p. *403)* Domain ID associated with the discovered participant.

8.205.2.15 transport_info

```
TransportInfoSeq transport_info
```

<<***extension***>> *(*p. *403)* A sequence of **com.rti.dds.infrastructure.TransportInfo_t** (p. 2154) containing information about each of the installed transports of the discovered participant.

This parameter contains a sequence of **com.rti.dds.infrastructure.TransportInfo_t** (p. 2154) containing the class_id and message_size_max for all installed transports of the discovered participant. The maximum number of **com.↩ rti.dds.infrastructure.TransportInfo_t** (p. 2154) that will be stored in this sequence is controlled by the Domain Participant's resource limit **com.rti.dds.infrastructure.DomainParticipantResourceLimitsQosPolicy.transport_info_↩ list_max_length** (p. 1106).

8.205.2.16 partial_configuration

```
boolean partial_configuration
```

<<***extension***>> *(*p. *403)* Indicates whether a **com.rti.dds.domain.builtin.ParticipantBuiltinTopicData** (p. 1647) only contains bootstrapping information.

If this is com.rti.dds.infrastructure.true, the **com.rti.dds.domain.builtin.ParticipantBuiltinTopicData** (p. 1647) only contains bootstrapping information. If it is com.rti.dds.infrastructure.false, it contains both bootstrapping and configuration information. The following fields are valid when this is set to com.rti.dds.infrastructure.true:

- **builtin.ParticipantBuiltinTopicData.key** (p. 1649)

- **builtin.ParticipantBuiltinTopicData.property** (p. 1649) (only dds.domain_participant.domain_tag is valid if set)
- **builtin.ParticipantBuiltinTopicData.rtps_protocol_version** (p. 1649)
- **builtin.ParticipantBuiltinTopicData.rtps_vendor_id** (p. 1649)
- **builtin.ParticipantBuiltinTopicData.product_version** (p. 1651)
- **builtin.ParticipantBuiltinTopicData.domain_id** (p. 1652)
- **builtin.ParticipantBuiltinTopicData.transport_info** (p. 1652)
- **builtin.ParticipantBuiltinTopicData.partition** (p. 1651)
- **builtin.ParticipantBuiltinTopicData.trust_protection_info** (p. 1651)
- **builtin.ParticipantBuiltinTopicData.trust_algorithm_info** (p. 1651)

All other fields are invalid.

This field will only be set to com.rti.dds.infrastructure.true if a participant using **com.rti.dds.infrastructure.Discovery↩ ConfigBuiltinPluginKind.SPDP2** (p. 914) receives a bootstrap message and **com.rti.dds.infrastructure.Discovery↩ ConfigQosPolicy.ignore_default_domain_announcements** (p. 932) is set to com.rti.dds.infrastructure.false (non-default).

If a participant is using **com.rti.dds.infrastructure.DiscoveryConfigBuiltinPluginKind.SPDP** (p. 914), this field will always be set to com.rti.dds.infrastructure.false.

8.206 ParticipantBuiltinTopicDataDataReader Class Reference

Instantiates `DataReader` < **com.rti.dds.domain.builtin.ParticipantBuiltinTopicData** (p. 1647) > .

Inherits DataReaderImpl.

8.206.1 Detailed Description

Instantiates `DataReader` < **com.rti.dds.domain.builtin.ParticipantBuiltinTopicData** (p. 1647) > .

com.rti.dds.subscription.DataReader (p. 707) of topic **com.rti.dds.domain.builtin.ParticipantBuiltinTopicData↩ TypeSupport.PARTICIPANT_TOPIC_NAME** (p. 410) used for accessing **com.rti.dds.domain.builtin.Participant↩ BuiltinTopicData** (p. 1647) of the remote **com.rti.dds.domain.DomainParticipant** (p. 948).

Instantiates:

8.210.3 Member Data Documentation

8.210.3.1 supported_mask

```
int supported_mask
```

Trust Plugins algorithms supported for interception of data and metadata exchanged by the DomainParticipant.

Referenced by **ParticipantTrustInterceptorAlgorithmInfo.ParticipantTrustInterceptorAlgorithmInfo()**.

8.210.3.2 builtin_endpoints_required_mask

```
int builtin_endpoints_required_mask
```

Trust Plugins algorithms used for interception of metadata exchanged by the discovery, service request, and liveliness builtin endpoints.

Referenced by **ParticipantTrustInterceptorAlgorithmInfo.ParticipantTrustInterceptorAlgorithmInfo()**.

8.210.3.3 builtin_kx_endpoints_required_mask

```
int builtin_kx_endpoints_required_mask
```

Trust Plugins algorithms used for interception of metadata exchanged by the key exchange builtin endpoints.

Referenced by **ParticipantTrustInterceptorAlgorithmInfo.ParticipantTrustInterceptorAlgorithmInfo()**.

8.210.3.4 user_endpoints_default_required_mask

```
int user_endpoints_default_required_mask
```

Default trust plugin algorithms used for interception of data exchanged by the user endpoints. This is the algorithm that remote DomainParticipants should assume when builtin_trust.EndpointTrustInterceptorAlgorithmInfo is not serialized.

Referenced by **ParticipantTrustInterceptorAlgorithmInfo.ParticipantTrustInterceptorAlgorithmInfo()**.

8.211 ParticipantTrustKeyEstablishmentAlgorithmInfo Class Reference

Trust Plugins key establishment algorithm information associated with the discovered DomainParticipant.

Inherits Struct.

Public Member Functions

- **ParticipantTrustKeyEstablishmentAlgorithmInfo** ()

  Create an instance with the default Trust Key Establishment Algorithm Info associated with the discovered Domain↩ Participant.
- **ParticipantTrustKeyEstablishmentAlgorithmInfo** (**TrustAlgorithmRequirements shared_secret**)

  Create an instance with the Trust Key Establishment Algorithm Info passed as input.

Public Attributes

- **TrustAlgorithmRequirements shared_secret**

  Trust Plugins key establishment algorithm requirements of the DomainParticipant in the context of deriving a shared secret.

8.211.1 Detailed Description

Trust Plugins key establishment algorithm information associated with the discovered DomainParticipant.

8.211.2 Constructor & Destructor Documentation

8.211.2.1 ParticipantTrustKeyEstablishmentAlgorithmInfo() [1/2]

```
ParticipantTrustKeyEstablishmentAlgorithmInfo ( )
```

Create an instance with the default Trust Key Establishment Algorithm Info associated with the discovered Domain↩ Participant.

The meaning of this field may vary depending on what Trust Plugins the DomainParticipant is using.

8.211.2.2 ParticipantTrustKeyEstablishmentAlgorithmInfo() [2/2]

```
ParticipantTrustKeyEstablishmentAlgorithmInfo (
            TrustAlgorithmRequirements shared_secret )
```

Create an instance with the Trust Key Establishment Algorithm Info passed as input.

The meaning of this field may vary depending on what Trust Plugins the DomainParticipant is using.

References **ParticipantTrustKeyEstablishmentAlgorithmInfo.shared_secret**.

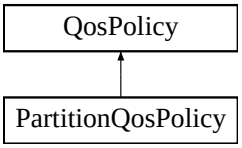
8.214 PartitionQosPolicy Class Reference

<<***spec***>> *(p. 132)* Set of strings that introduces logical partitions in **com.rti.dds.domain.DomainParticipant** (p. 948), **com.rti.dds.publication.Publisher** (p. 1767), or **com.rti.dds.subscription.Subscriber** (p. 2039) entities.

Inheritance diagram for PartitionQosPolicy:



Public Attributes

- final **StringSeq name**

  <<***basic***>> *(p. 123)* <<***spec***>> *(p. 132) A list of partition names*

8.214.1 Detailed Description

<<***spec***>> *(p. 132)* Set of strings that introduces logical partitions in **com.rti.dds.domain.DomainParticipant** (p. 948), **com.rti.dds.publication.Publisher** (p. 1767), or **com.rti.dds.subscription.Subscriber** (p. 2039) entities.

This QoS policy is used to set string identifiers that are used for partitioning entities that would otherwise be connected to and exchange data with each other:

- A **com.rti.dds.publication.DataWriter** (p. 818) within a **com.rti.dds.publication.Publisher** (p. 1767) only communicates with a **com.rti.dds.subscription.DataReader** (p. 707) in a **com.rti.dds.subscription.Subscriber** (p. 2039) if (in addition to matching the **com.rti.dds.topic.Topic** (p. 2116) and having compatible QoS) the **com.rti.dds.publication.Publisher** (p. 1767) and **com.rti.dds.subscription.Subscriber** (p. 2039) have a common partition name string.
- **com.rti.dds.domain.DomainParticipant** (p. 948) entities (with the same domain ID and domain tag) are visible to each other only if they have at least one partition name string in common.

Entity:

com.rti.dds.publication.Publisher (p. 1767), **com.rti.dds.subscription.Subscriber** (p. 2039), **com.rti.dds.domain.DomainParticipant** (p. 948)

Properties:

RxO (p. 506) = NO
Changeable (p. 507) = **YES** (p. 507)

8.214.2 Usage

The Partition QoS policy provides another way to control which entities will match-and thus communicate with-which other entities. It can be used to prevent entities that would have otherwise matched from talking to each other. Much in the same way that only applications within the same DDS domain will communicate with each other, only entities that belong to the same partition can talk to each other.

The Partition QoS policy allows you to add one or more strings, "partitions", to an entity:

- A DataWriter and DataReader for the same topic are only considered matched if their Publishers and Subscribers have partitions in common (intersecting partitions).
- DomainParticipants (with the same domain ID and domain tag) are visible to each other only if they have at least one partition in common.

Since the set of partitions for an entity can be dynamically changed, the Partition QoS policy is useful for creating temporary separation groups among entities that would otherwise be connected to and exchange data with each other.

DomainParticipant partitions and Publisher/Subscriber partitions are independent of each other. You can use both features independently or in combination to provide the right level of isolation.

Failure to match partitions is not considered an incompatible QoS and does not trigger any listeners or conditions. A change in this policy *can* potentially modify the "match" of existing DataReader and DataWriter entities. It may establish new "matches" that did not exist before, or break existing matches.

Partition strings are usually directly matched via string comparisons. However, partition strings can also contain wildcard symbols so that partitions can be matched via pattern matching. As long as the partitions or wildcard patterns of an entity intersect with the partitions or wildcard patterns of otherwise matching entities, the entities match; otherwise they do not.

These partition name patterns are regular expressions as defined by the POSIX fnmatch API (1003.2-1992 section B.6). A **com.rti.dds.domain.DomainParticipant** (p. 948), **com.rti.dds.publication.Publisher** (p. 1767), or **com.rti.dds.subscription.Subscriber** (p. 2039) entity may include regular expressions in partition names, but no two names that both contain wildcards will ever be considered to match. This means that although regular expressions may be used on the entities, RTI Connext will not try to match two regular expressions.

Each entity must belong to at least one logical partition. A regular expression is not considered to be a logical partition. If an entity has not specified a logical partition, it is assumed to be in the default partition. The default partition is defined to be an empty string (""). Put another way:

- An empty sequence of strings in this QoS policy is considered equivalent to a sequence containing only a single string, the empty string.
- A string sequence that contains only regular expressions and no literal strings, it is treated as if it had an additional element, the empty string.

Partitions are different from creating **com.rti.dds.infrastructure.Entity** (p. 1320) objects in different domains in several ways.

- First, entities belonging to different domains are completely isolated from each other; there is no traffic, meta-traffic or any other way for an application or RTI Connext itself to see entities in a domain it does not belong to.

- Second, a **com.rti.dds.infrastructure.Entity** (p. 1320) can only belong to one domain whereas a **com.rti.dds.↩ infrastructure.Entity** (p. 1320) can be in multiple partitions.

- Finally, as far as RTI Connext is concerned, each unique data instance is identified by the tuple **(DomainID, domain tag, com.rti.dds.topic.Topic (**p. **2116), key)**. Therefore two **com.rti.dds.infrastructure.Entity** (p. 1320) objects in different domains cannot refer to the same data instance. On the other hand, the same data instance can be made available (published) or requested (subscribed) on one or more partitions.

For more information, see the "PARTITION QosPolicy" section of the `Core Libraries User's Manual`.

8.214.3 Member Data Documentation

8.214.3.1 name

```
final StringSeq name
```

<<***basic***>> *(*p. *123)* <<***spec***>> *(*p. *132)* A list of partition names

Several restrictions apply to the partition names in this sequence. A violation of one of the following rules will result in a **com.rti.dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901) when setting a **com.rti.dds.↩ publication.Publisher** (p. 1767)'s or **com.rti.dds.subscription.Subscriber** (p. 2039)'s QoS.

- A partition name string cannot be NULL, nor can it contain the reserved comma character (',').

- The maximum number of partition name strings allowable in a **com.rti.dds.infrastructure.PartitionQosPolicy** (p. 1664) is specified on a domain basis in **com.rti.dds.infrastructure.DomainParticipantResourceLimits↩ QosPolicy.max_partitions** (p. 1098). The length of this sequence may not be greater than that value.

- The maximum cumulative length of all partition name strings in a **com.rti.dds.infrastructure.PartitionQosPolicy** (p. 1664) is specified on a domain basis in **com.rti.dds.infrastructure.DomainParticipantResourceLimits↩ QosPolicy.max_partition_cumulative_characters** (p. 1098).

[default] Empty sequence (zero-length sequence). Since no logical partition is specified, RTI Connext will assume the entity to be in default partition (empty string partition "").

[range] List of partition name with above restrictions

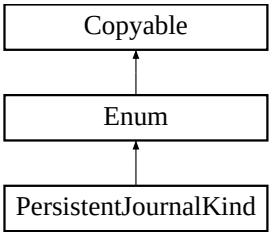
8.215 PersistentJournalKind Class Reference

Sets the journal mode of the persistent storage.

Inheritance diagram for PersistentJournalKind:



Static Public Attributes

- static final **PersistentJournalKind TRUNCATE_PERSISTENT_JOURNAL**

  Commits transactions by truncating the rollback journal to zero-length instead of deleting it.
- static final **PersistentJournalKind PERSIST_PERSISTENT_JOURNAL**

  Prevents the rollback journal from being deleted at the end of each transaction. Instead, the header of the journal is overwritten with zeros.
- static final **PersistentJournalKind MEMORY_PERSISTENT_JOURNAL**

  Stores the rollback journal in volatile RAM. This saves disk I/O.
- static final **PersistentJournalKind WAL_PERSISTENT_JOURNAL**

  Uses a write-ahead log instead of a rollback journal to implement transactions.
- static final **PersistentJournalKind OFF_PERSISTENT_JOURNAL**

  Completely disables the rollback journal. If the application crashes in the middle of a transaction when the OFF journaling mode is set, the persistent storage will very likely be corrupted.

Additional Inherited Members

8.215.1 Detailed Description

Sets the journal mode of the persistent storage.

The rollback journal is used in SQLite to store the state of the persistent storage before a transaction is committed.

QoS:

com.rti.dds.infrastructure.DurabilityQosPolicy (p. 1116)

8.215.2 Member Data Documentation

8.215.2.1 TRUNCATE_PERSISTENT_JOURNAL

```
final PersistentJournalKind TRUNCATE_PERSISTENT_JOURNAL [static]
```

Initial value:

```
=
            new PersistentJournalKind("TRUNCATE_PERSISTENT_JOURNAL", 1)
```

Commits transactions by truncating the rollback journal to zero-length instead of deleting it.

8.215.2.2 PERSIST_PERSISTENT_JOURNAL

```
final PersistentJournalKind PERSIST_PERSISTENT_JOURNAL [static]
```

Initial value:

```
=
            new PersistentJournalKind("PERSIST_PERSISTENT_JOURNAL", 2)
```

Prevents the rollback journal from being deleted at the end of each transaction. Instead, the header of the journal is overwritten with zeros.

8.215.2.3 MEMORY_PERSISTENT_JOURNAL

```
final PersistentJournalKind MEMORY_PERSISTENT_JOURNAL [static]
```

Initial value:

```
=
            new PersistentJournalKind("MEMORY_PERSISTENT_JOURNAL", 3)
```

Stores the rollback journal in volatile RAM. This saves disk I/O.

8.215.2.4 WAL_PERSISTENT_JOURNAL

```
final PersistentJournalKind WAL_PERSISTENT_JOURNAL [static]
```

Initial value:

```
=
            new PersistentJournalKind("WAL_PERSISTENT_JOURNAL", 4)
```

Uses a write-ahead log instead of a rollback journal to implement transactions.

8.215.2.5 OFF_PERSISTENT_JOURNAL

```
final PersistentJournalKind OFF_PERSISTENT_JOURNAL [static]
```

Initial value:

```
=
            new PersistentJournalKind("OFF_PERSISTENT_JOURNAL", 5)
```

Completely disables the rollback journal. If the application crashes in the middle of a transaction when the OFF journaling mode is set, the persistent storage will very likely be corrupted.

8.216 PersistentStorageSettings Class Reference

Configures durable writer history and durable reader state.

  <<***extension***>> (p. *138) Controls how often the reader state is stored into the database.*

8.216.1 Detailed Description

Configures durable writer history and durable reader state.

In a **com.rti.dds.publication.DataWriter** (p. 818), this structure configures durable writer history. This feature allows a DataWriter to persist its historical cache, so that it can survive shutdowns, crashes, and restarts. When an application restarts, each DataWriter that has been configured to have durable writer history automatically loads all of the data in this cache from disk and can carry on sending data as if it had never stopped executing.

In a **com.rti.dds.subscription.DataReader** (p. 707), this structure configures durable reader state. This feature allows a DataReader to persist its state and remember which data it has already received. When an application restarts, each DataReader that has been configured to have durable reader state automatically loads its state from disk and can carry on receiving data as if it had never stopped executing. Data that had already been received by the DataReader before the restart will be suppressed so that it is not even sent over the network.

RTI Connext uses SQLite to store the durable writer history and durable reader state.

QoS:

com.rti.dds.infrastructure.DurabilityQosPolicy (p. 1116)

8.216.2 Constructor & Destructor Documentation

8.216.2.1 PersistentStorageSettings() [1/2]

```
PersistentStorageSettings ( )
```

Constructor.

8.216.2.2 PersistentStorageSettings() [2/2]

```
PersistentStorageSettings (
            PersistentStorageSettings src )
```

Copy constructor.

Parameters

src	<<***in***>> *(p. 404)* Source object.

8.216.3 Member Data Documentation

8.216.3.1 enable

```
boolean enable = false
```

<<***extension***>> *(p. 138)* Enables durable writer history in a **com.rti.dds.publication.DataWriter** (p. 818) and durable reader state in a **com.rti.dds.subscription.DataReader** (p. 707).

When this field is set to com.rti.dds.infrastructure.true, the persistent storage configuration using this structure will take precedence over the configuration using the deprecated **dds.data_writer.history.odbc_plugin.builtin**.∗ and **dds.↩ data_reader.state**.∗ properties.

[default] com.rti.dds.infrastructure.false

Categories

Immutable (p. 292), **Durability** (p. 221)

8.216.3.2 file_name

```
String file_name = null
```

<<***extension***>> *(p. 138)* The file name where the durable writer history or durable reader state will be stored.

Setting this field to a value other than null is mandatory when enabling durable writer history or durable reader state.

If the file does not exist, it will be created.

If the file exists and **com.rti.dds.infrastructure.PersistentStorageSettings.restore** (p. 1673) is set to com.rti.dds.↩ infrastructure.true, the durable writer history or durable reader state will be restored from the file. Otherwise, the file will be overwritten.

Important: When the file exists, the fields **com.rti.dds.infrastructure.DataReaderProtocolQosPolicy.virtual_guid** (p. 762) and **com.rti.dds.infrastructure.DataWriterProtocolQosPolicy.virtual_guid** (p. 862) will be set by RTI Connext based on the file content. If you change these fields, the value will be ignored.

RTI Connext uses SQLite to store the durable writer history and durable reader state.

[default] null

Categories

Immutable (p. 292), **Durability** (p. 221)

8.216.3.3 trace_file_name

```
String trace_file_name = null
```

<<***extension***>> *(*p. *138)* The file name where to store the SQL statements executed when loading and storing the durable writer history or durable reader state.

Setting this field to a value other than null will enable tracing of the SQL statements executed when loading and storing the durable writer history or durable reader state.

Important: Enabling tracing will have a negative impact on performance. Use this feature only for debugging purposes.

[default] null

Categories

Immutable (p. 292), **Durability** (p. 221)

8.216.3.4 journal_kind

```
PersistentJournalKind journal_kind
```

Initial value:

```
=
        PersistentJournalKind.WAL_PERSISTENT_JOURNAL
```

<<***extension***>> *(*p. *138)* Sets the journal mode of the persistent storage.

[default] com.rti.dds.infrastructure.PersistentJournalKind.PersistentJournalKind.WAL_PERSISTENT_JOURNAL

Categories

Immutable (p. 292), **Durability** (p. 221)

8.216.3.5 synchronization_kind

```
PersistentSynchronizationKind synchronization_kind
```

Initial value:

```
=
        PersistentSynchronizationKind.NORMAL_PERSISTENT_SYNCHRONIZATION
```

<<***extension***>> *(*p. *138)* Sets the journal mode of the persistent storage.

[default] com.rti.dds.infrastructure.PersistentJournalKind.PersistentJournalKind.WAL_PERSISTENT_JOURNAL

Categories

Immutable (p. 292), **Durability** (p. 221)

8.216.3.6 vacuum

```
boolean vacuum = true
```

<<***extension***>> *(*p. *138)* Sets the auto-vacuum status of the storage.

When auto-vacuum is com.rti.dds.infrastructure.true, the storage files will be compacted automatically with every transaction.

When auto-vacuum is com.rti.dds.infrastructure.false, after data is deleted from the storage files, the files remain the same size.

[default] com.rti.dds.infrastructure.true

Categories

Immutable (p. 292), **Durability** (p. 221)

8.216.3.7 restore

```
boolean restore = true
```

<<***extension***>> *(*p. *138)* Indicates if the persisted writer history or reader state must be restored.

For a **com.rti.dds.publication.DataWriter** (p. 818), this field indicates whether or not the persisted writer history must be restored once the DataWriter is restarted.

For a **com.rti.dds.subscription.DataReader** (p. 707), this field indicates whether or not the persisted reader state must be restored once the DataReader is restarted.

[default] com.rti.dds.infrastructure.true

Categories

Immutable (p. 292), **Durability** (p. 221)

8.216.3.8 writer_instance_cache_allocation

```
AllocationSettings_t writer_instance_cache_allocation
```

Initial value:

```
=
            new AllocationSettings_t(
                    ReceiverPoolQosPolicy.LENGTH_AUTO,
                    ReceiverPoolQosPolicy.LENGTH_AUTO,
                    -1)
```

<<***extension***>> *(*p. *138)* Configures the resource limits associated with the instance durable writer history cache.

This field only applies to **com.rti.dds.publication.DataWriter** (p. 818) entities.

To minimize the number of accesses to the persisted storage, RTI Connext uses an instance cache.

Do not confuse this limit with the initial and maximum number of instances that can be maintained by a DataWriter in persistent storage. These resource limits are configured using **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_instances** (p. 1896) and **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.initial_instances** (p. 1898).

If **com.rti.dds.infrastructure.PersistentStorageSettings.writer_memory_state** (p. 1675) is set to com.rti.dds.infrastructure.true, then the value of **com.rti.dds.infrastructure.AllocationSettings_t.max_count** (p. 592) is set to **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511), overwriting any value set by the user.

com.rti.dds.infrastructure.AllocationSettings_t.incremental_count (p. 592) is ignored.

[range] com.rti.dds.infrastructure.AllocationSettings_t.max_count (p. 592) in interval [1, INT_MAX], **com.rti.dds.infrastructure.ReceiverPoolQosPolicy.LENGTH_AUTO** (p. 509), or **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511). **com.rti.dds.infrastructure.AllocationSettings_t.initial_count** (p. 591) in interval [1, INT_MAX], or **com.rti.dds.infrastructure.ReceiverPoolQosPolicy.LENGTH_AUTO** (p. 509).

com.rti.dds.infrastructure.ReceiverPoolQosPolicy.LENGTH_AUTO (p. 509) means that the value will be set to the equivalent value of **com.rti.dds.infrastructure.ResourceLimitsQosPolicy** (p. 1894).

[default] com.rti.dds.infrastructure.AllocationSettings_t.max_count (p. 592) = **com.rti.dds.infrastructure.ReceiverPoolQosPolicy.LENGTH_AUTO** (p. 509) (= **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_instances** (p. 1896)) and **com.rti.dds.infrastructure.AllocationSettings_t.initial_count** (p. 591) = **com.rti.dds.infrastructure.ReceiverPoolQosPolicy.LENGTH_AUTO** (p. 509) (= **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.initial_instances** (p. 1898)).

Categories

Immutable (p. 292), **Durability** (p. 221), **Sample Memory Management** (p. 276)

8.216.3.9 writer_sample_cache_allocation

```
AllocationSettings_t writer_sample_cache_allocation
```

Initial value:

```
=
            new AllocationSettings_t(
                    32,
                    32,
                    ReceiverPoolQosPolicy.LENGTH_AUTO)
```

<<***extension***>> *(*p. *138)* Configures the resource limits associated with the sample durable writer history cache.

This field only applies to **com.rti.dds.publication.DataWriter** (p. 818) entities.

To minimize the number of accesses to the persisted storage, RTI Connext uses a sample cache.

Do not confuse this limit with the initial and maximum number of samples that can be maintained by a DataWriter in persistent storage. These resource limits are configured using **com.rti.dds.infrastructure.ResourceLimitsQos↩ Policy.max_samples** (p. 1896) and **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.initial_samples** (p. 1897).

com.rti.dds.infrastructure.AllocationSettings_t.incremental_count (p. 592) is ignored.

[range] com.rti.dds.infrastructure.AllocationSettings_t.max_count (p. 592) in interval [1, INT_MAX], **com.rti.↩ dds.infrastructure.ReceiverPoolQosPolicy.LENGTH_AUTO** (p. 509), or **com.rti.dds.infrastructure.Resource↩ LimitsQosPolicy.LENGTH_UNLIMITED** (p. 511). **com.rti.dds.infrastructure.AllocationSettings_t.initial_count** (p. 591) in interval [1, INT_MAX], or **com.rti.dds.infrastructure.ReceiverPoolQosPolicy.LENGTH_AUTO** (p. 509).

com.rti.dds.infrastructure.ReceiverPoolQosPolicy.LENGTH_AUTO (p. 509) means that the value will be set to the equivalent value of **com.rti.dds.infrastructure.ResourceLimitsQosPolicy** (p. 1894).

[default] com.rti.dds.infrastructure.AllocationSettings_t.max_count (p. 592) = 32 and **com.rti.dds.infrastructure.↩ AllocationSettings_t.initial_count** (p. 591) = 32.

Categories

Immutable (p. 292), **Durability** (p. 221), **Sample Memory Management** (p. 276)

8.216.3.10 writer_memory_state

```
boolean writer_memory_state = true
```

<<***extension***>> *(*p. *138)* Determines how much state will be kept in memory by the durable writer history in order to avoid accessing the persistent storage in disk.

This field only applies to **com.rti.dds.publication.DataWriter** (p. 818) entities.

If this field is set to com.rti.dds.infrastructure.true, then **com.rti.dds.infrastructure.AllocationSettings_t.max_count** (p. 592) in **com.rti.dds.infrastructure.PersistentStorageSettings.writer_instance_cache_allocation** (p. 1673) is set to **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511), overwriting any value set by the user.

In addition, the durable writer history will keep a fixed state overhead per sample in memory. This mode provides the best durable writer history performance. However, the restore operation will be slower, and the maximum number of samples that the durable writer history can manage is limited by the available physical memory.

If this field is set to com.rti.dds.infrastructure.false, all the state will be kept in the underlying database. In this mode, the maximum number of samples in the durable writer history is not limited by the physical memory available.

This field is always set to com.rti.dds.infrastructure.false when the DataWriter is configured with **com.rti.dds.infrastructure.ReliabilityQosPolicy.acknowledgment_kind** (p. 1832) set to **com.rti.dds.infrastructure.ReliabilityQosPolicyAcknowledgmentModeKind.APPLICATION_AUTO_ACKNOWLEDGMENT_MODE** (p. 1834) or **com.rti.dds.infrastructure.ReliabilityQosPolicyAcknowledgmentModeKind.APPLICATION_EXPLICIT_ACKNOWLEDGMENT_MODE** (p. 1835), or **com.rti.dds.infrastructure.AvailabilityQosPolicy.enable_required_subscriptions** (p. 600) is set to com.rti.dds.infrastructure.true.

[default] com.rti.dds.infrastructure.true

Categories

Immutable (p. 292), **Durability** (p. 221), **Middleware Memory Management** (p. 244)

8.216.3.11 reader_checkpoint_frequency

```
int reader_checkpoint_frequency = 1
```

<<***extension***>> *(*p. *138)* Controls how often the reader state is stored into the database.

This field only applies to **com.rti.dds.subscription.DataReader** (p. 707) entities.

A value of N means store the state once every N received and processed samples.

The circumstances under which a data sample is considered "processed by the application" depends on the DataReader configuration.

For additional information on when a sample is considered "processed by the application" see `Durable Reader State`, in the Core Libraries User's Manual.

A high value will provide better performance. However, if the DataReader is restarted it may receive some duplicate samples.

[range] [1, 1000000] **[default]** 1

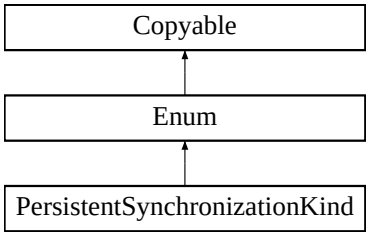
Immutable (p. 292), **Durability** (p. 221)

8.217 PersistentSynchronizationKind Class Reference

<<***extension***>> *(*p. *138)* Whether instance state consistency is enabled.

Inheritance diagram for PersistentSynchronizationKind:



Static Public Attributes

- static final **PersistentSynchronizationKind NORMAL_PERSISTENT_SYNCHRONIZATION**
  Data (e.g., new sample) is written to disk at critical moments.
- static final **PersistentSynchronizationKind FULL_PERSISTENT_SYNCHRONIZATION**
  Data (e.g., new sample) is written to physical disk immediately.
- static final **PersistentSynchronizationKind OFF_PERSISTENT_SYNCHRONIZATION**
  No synchronization is enforced. Data will be written to physical disk when the operating system flushes its buffers.

Additional Inherited Members

8.217.1 Detailed Description

<<***extension***>> *(*p. *138)* Whether instance state consistency is enabled.

QoS:

com.rti.dds.infrastructure.ReliabilityQosPolicy (p. 1829)

8.217.2 Member Data Documentation

8.217.2.1 NORMAL_PERSISTENT_SYNCHRONIZATION

```
final PersistentSynchronizationKind NORMAL_PERSISTENT_SYNCHRONIZATION [static]
```

Initial value:

```
=
            new PersistentSynchronizationKind("NORMAL_PERSISTENT_SYNCHRONIZATION", 0)
```

Data (e.g., new sample) is written to disk at critical moments.

8.217.2.2 FULL_PERSISTENT_SYNCHRONIZATION

```
final PersistentSynchronizationKind FULL_PERSISTENT_SYNCHRONIZATION [static]
```

Initial value:

```
=
            new PersistentSynchronizationKind("FULL_PERSISTENT_SYNCHRONIZATION", 1)
```

Data (e.g., new sample) is written to physical disk immediately.

8.217.2.3 OFF_PERSISTENT_SYNCHRONIZATION

```
final PersistentSynchronizationKind OFF_PERSISTENT_SYNCHRONIZATION [static]
```

Initial value:

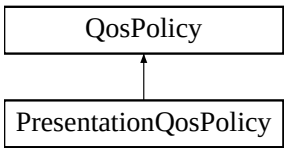
```
=
            new PersistentSynchronizationKind("OFF_PERSISTENT_SYNCHRONIZATION", 2)
```

No synchronization is enforced. Data will be written to physical disk when the operating system flushes its buffers.

8.218 PresentationQosPolicy Class Reference

<<***spec***>> *(*p. *132)* Specifies how the samples representing changes to data instances are presented to a subscribing application.

Inheritance diagram for PresentationQosPolicy:



Public Attributes

- **PresentationQosPolicyAccessScopeKind access_scope**

  <<***spec***>> *(*p. *132) Determines the largest scope spanning the entities for which the order and coherency of changes can be preserved.*
- boolean **coherent_access**

  <<***spec***>> *(*p. *132) Specifies support for coherent access. Controls whether coherent access is supported within the scope* `access_scope`*.*
- boolean **ordered_access**

  <<***spec***>> *(*p. *132) Specifies support for ordered access to the samples received at the subscription end. Controls whether ordered access is supported within the scope* `access_scope`*.*
- boolean **drop_incomplete_coherent_set**

  <<***extension***>> *(*p. *138) Indicates whether or not a* ***com.rti.dds.subscription.DataReader*** *(*p. *707) should drop samples from an incomplete coherent set (one for which not all the samples were received). Such samples are reported as lost in the SAMPLE_LOST Status.*

8.218.1 Detailed Description

<<***spec***>> *(*p. *132)* Specifies how the samples representing changes to data instances are presented to a subscribing application.

This QoS policy controls the extent to which changes to data instances can be made dependent on each other and also the kind of dependencies that can be propagated and maintained by RTI Connext. Specifically, this policy affects the application's ability to:

- specify and receive coherent changes to instances
- specify the relative order in which changes are presented

Entity:

com.rti.dds.publication.Publisher (p. 1767), **com.rti.dds.subscription.Subscriber** (p. 2039)

Status:

com.rti.dds.infrastructure.StatusKind.StatusKind.OFFERED_INCOMPATIBLE_QOS_STATUS, com.rti.dds.↩ infrastructure.StatusKind.StatusKind.REQUESTED_INCOMPATIBLE_QOS_STATUS

Properties:

RxO (p. 506) = YES
Changeable (p. 507) = **UNTIL ENABLE** (p. 507)

8.218.2 Usage

A **com.rti.dds.subscription.DataReader** (p. 707) will usually receive data in the order that it was sent by a **com.rti.↩ dds.publication.DataWriter** (p. 818), and the data is presented to the **com.rti.dds.subscription.DataReader** (p. 707) as soon as the application receives the next expected value. However, sometimes you may want a set of data for the same DataWriter or different DataWriters to be presented to the DataReader(s) only after *all* of the elements of the set have been received, but not before. Or you may want the data to be presented in a different order than that in which it was sent. Specifically for keyed data, you may want the middleware to present the data in keyed – or *instance* – order, such that samples pertaining to the same instance are presented together.

The Presentation QoS policy is a request-offered QoS policy that allows you to specify different *scopes* of presentation. It also controls whether or not a set of changes within the scope is delivered at the same time or can be delivered as soon as each element is received.

- `coherent_access` controls whether RTI Connext will preserve the groupings of changes made by a publishing application by means of the operations **com.rti.dds.publication.Publisher.begin_coherent_changes** (p. 1784) and **com.rti.dds.publication.Publisher.end_coherent_changes** (p. 1784).

- `ordered_access` controls whether RTI Connext will preserve the order of changes.

- access_scope controls the granularity of the other settings. See below:

If coherent_access is set, then the access_scope set on the **com.rti.dds.subscription.Subscriber** (p. 2039) controls the maximum extent of coherent changes. The behavior is as follows:

- If access_scope is set to com.rti.dds.infrastructure.PresentationQosPolicyAccessScopeKind.Presentation↩ QosPolicyAccessScopeKind.INSTANCE_PRESENTATION_QOS (the default), the behavior is the same as com.rti.dds.infrastructure.PresentationQosPolicyAccessScopeKind.PresentationQosPolicyAccessScopeKind.↩ TOPIC_PRESENTATION_QOS.

- If access_scope is set to com.rti.dds.infrastructure.PresentationQosPolicyAccessScopeKind.Presentation↩ QosPolicyAccessScopeKind.TOPIC_PRESENTATION_QOS, then coherent changes (indicated by their enclosure within calls to **com.rti.dds.publication.Publisher.begin_coherent_changes** (p. 1784) and **com.rti.dds.↩ publication.Publisher.end_coherent_changes** (p. 1784)) will be made available as a unit to each remote **com.rti.dds.subscription.DataReader** (p. 707) independently. That is, changes made to instances within each individual **com.rti.dds.publication.DataWriter** (p. 818) will be presented as a unit. They will not be grouped with changes made to instances belonging to a different **com.rti.dds.publication.DataWriter** (p. 818).

- If access_scope is set to com.rti.dds.infrastructure.PresentationQosPolicyAccessScopeKind.PresentationQos↩ PolicyAccessScopeKind.GROUP_PRESENTATION_QOS, then coherent changes made to instances through a set of **com.rti.dds.publication.DataWriter** (p. 818) entities attached to a common **com.rti.dds.publication.↩ Publisher** (p. 1767) will be made available as a unit to the **com.rti.dds.subscription.DataReader** (p. 707) entities within a **com.rti.dds.subscription.Subscriber** (p. 2039).

If ordered_access is set, then the access_scope set on the **com.rti.dds.subscription.Subscriber** (p. 2039) controls the maximum extent to which order will be preserved by RTI Connext.

- If access_scope is set to com.rti.dds.infrastructure.PresentationQosPolicyAccessScopeKind.Presentation↩ QosPolicyAccessScopeKind.INSTANCE_PRESENTATION_QOS (the lowest level), then the relative order of DDS samples sent by a **com.rti.dds.publication.DataWriter** (p. 818) is only preserved on a per-instance basis. If two DDS samples refer to the same instance (identified by Topic and a particular value for the key), then the order in which they are stored in the **com.rti.dds.subscription.DataReader** (p. 707) queue is consistent with the order in which the changes occurred. However, if the two DDS samples belong to different instances, the order in which they are presented may or may not match the order in which the changes occurred. This is the case even if it is the same application thread making the changes using the same **com.rti.dds.publication.DataWriter** (p. 818).

- If access_scope is set to com.rti.dds.infrastructure.PresentationQosPolicyAccessScopeKind.Presentation↩ QosPolicyAccessScopeKind.TOPIC_PRESENTATION_QOS, changes (creations, deletions, modifications) made by a single **com.rti.dds.publication.DataWriter** (p. 818) to one or more instances are presented to a **com.↩ rti.dds.subscription.DataReader** (p. 707) in the same order in which they occur. Changes made to instances though different **com.rti.dds.publication.DataWriter** (p. 818) entities are not required to be presented in the order in which they occur. This is the case even if the changes are made by a single application thread using **com.rti.dds.publication.DataWriter** (p. 818) objects attached to the same **com.rti.dds.publication.Publisher** (p. 1767).

- Finally, if access_scope is set to com.rti.dds.infrastructure.PresentationQosPolicyAccessScopeKind.↩ PresentationQosPolicyAccessScopeKind.GROUP_PRESENTATION_QOS, changes made to instances via **com.rti.dds.publication.DataWriter** (p. 818) entities attached to the same **com.rti.dds.publication.Publisher** (p. 1767) object are presented to the **com.rti.dds.subscription.DataReader** (p. 707) entities within a **com.rti.↩ dds.subscription.Subscriber** (p. 2039) in the same order in which they occur. For this to happen, the application must take the samples using the Subscriber's **com.rti.dds.subscription.Subscriber.begin_access** (p. 2058) and **com.rti.dds.subscription.Subscriber.end_access** (p. 2059) operations.

See the "Ordered Access" section in the "PRESENTATION **QosPolicy** (p. 1802)" section of the Core Libraries User's Manual for more information.

If access_scope is set to com.rti.dds.infrastructure.PresentationQosPolicyAccessScopeKind.PresentationQos↩ PolicyAccessScopeKind.HIGHEST_OFFERED_PRESENTATION_QOS on the **com.rti.dds.subscription.Subscriber** (p. 2039), then the **com.rti.dds.subscription.Subscriber** (p. 2039) will use the access_scope offered by the remote **com.rti.dds.publication.Publisher** (p. 1767).

Note that this QoS policy controls the scope at which related changes are made available to the subscriber. This means the subscriber **can** access the changes in a coherent manner and in the proper order; however, it does not necessarily imply that the **com.rti.dds.subscription.Subscriber** (p. 2039) **will** indeed access the changes in the correct order. For that to occur, the application at the subscriber end must use the proper logic in reading the **com.rti.dds.subscription.**↩ **DataReader** (p. 707) objects.

For com.rti.dds.infrastructure.PresentationQosPolicyAccessScopeKind.PresentationQosPolicyAccessScopeKind.↩ GROUP_PRESENTATION_QOS the subscribing application must use the APIs **com.rti.dds.subscription.**↩ **Subscriber.begin_access** (p. 2058), **com.rti.dds.subscription.Subscriber.end_access** (p. 2059) and **com.rti.**↩ **dds.subscription.Subscriber.get_datareaders** (p. 2050) to access the changes in the proper order. If you do not use these operations, the data may not be ordered across DataWriters that belong to the same **com.rti.dds.publication.**↩ **Publisher** (p. 1767).

The field **com.rti.dds.subscription.SampleInfo.coherent_set_info** (p. 1956) is set when a sample is part of a coherent set. This field provides information to identify the coherent set that a sample is part of. In addition, com.rti.dds.↩ infrastructure.CoherentSetInfo.incomplete_coherent_set indicates if a sample is part of an incomplete coherent set (one for which not all samples have been received). Coherent sets for which some of the samples are filtered out by content or time on the **com.rti.dds.publication.DataWriter** (p. 818) are considered incomplete.

By default, the samples that are received from an incomplete coherent set are dropped by the DataReader(s) and they are not provided to the application. Such samples are reported as lost in the SAMPLE_LOST Status. By setting **com.rti.dds.infrastructure.PresentationQosPolicy.drop_incomplete_coherent_set** (p. 1683) to com.rti.dds.↩ infrastructure.false, you can change this behavior and, in this case, samples from incomplete coherent sets will be provided to the application. These samples have com.rti.dds.infrastructure.CoherentSetInfo.incomplete_coherent_set set to com.rti.dds.infrastructure.true.

8.218.3 Compatibility

The value offered is considered compatible with the value requested if and only if the following conditions are met:

- the inequality *offered* `access_scope` >= *requested* `access_scope` evaluates to 'TRUE' or requested `access_scope` is com.rti.dds.infrastructure.PresentationQosPolicyAccessScopeKind.PresentationQos↩ PolicyAccessScopeKind.HIGHEST_OFFERED_PRESENTATION_QOS. For the purposes of this inequality, the values of `access_scope` are considered ordered such that com.rti.dds.infrastructure.PresentationQosPolicy↩ AccessScopeKind.PresentationQosPolicyAccessScopeKind.INSTANCE_PRESENTATION_QOS < com.rti.↩ dds.infrastructure.PresentationQosPolicyAccessScopeKind.PresentationQosPolicyAccessScopeKind.TOPIC↩ _PRESENTATION_QOS < com.rti.dds.infrastructure.PresentationQosPolicyAccessScopeKind.Presentation↩ QosPolicyAccessScopeKind.GROUP_PRESENTATION_QOS.

- requested `coherent_access` is com.rti.dds.infrastructure.false, or else both offered and requested `coherent_access` are com.rti.dds.infrastructure.true.

- requested `ordered_access` is com.rti.dds.infrastructure.false, or else both offered and requested `ordered_access` are com.rti.dds.infrastructure.true.

8.218.4 Member Data Documentation

8.218.4.1 access_scope

```
PresentationQosPolicyAccessScopeKind access_scope
```

<<***spec***>> *(p. 132)* Determines the largest scope spanning the entities for which the order and coherency of changes can be preserved.

[default] com.rti.dds.infrastructure.PresentationQosPolicyAccessScopeKind.PresentationQosPolicyAccessScope↩ Kind.INSTANCE_PRESENTATION_QOS

Categories

Immutable (p. 292), **Matching** (p. 355), **Discovery Metadata** (p. 348), **Applied Per-Instance** (p. 346), **Sample Ordering** (p. 280), **Data Availability** (p. 200)

8.218.4.2 coherent_access

```
boolean coherent_access
```

<<***spec***>> *(p. 132)* Specifies support for *coherent* access. Controls whether coherent access is supported within the scope `access_scope`.

That is, the ability to group a set of changes as a unit on the publishing end such that they are received as a unit at the subscribing end.

Note: To use this feature, the DataWriter must be configured for RELIABLE communication (see **com.rti.dds.↩ infrastructure.ReliabilityQosPolicyKind.RELIABLE_RELIABILITY_QOS** (p. 1836)).

[default] com.rti.dds.infrastructure.false

Categories

Immutable (p. 292), **Matching** (p. 355), **Discovery Metadata** (p. 348), **Sample Ordering** (p. 280), **Data Availability** (p. 200)

8.218.4.3 ordered_access

```
boolean ordered_access
```

<<***spec***>> *(*p. *132)* Specifies support for *ordered* access to the samples received at the subscription end. Controls whether ordered access is supported within the scope `access_scope`.

That is, the ability of the subscriber to see changes in the same order as they occurred on the publishing end.

[default] com.rti.dds.infrastructure.false

Categories

Immutable (p. 292), **Matching** (p. 355), **Discovery Metadata** (p. 348), **Applied Per-Instance** (p. 346), **Sample Ordering** (p. 280), **Data Availability** (p. 200)

8.218.4.4 drop_incomplete_coherent_set

```
boolean drop_incomplete_coherent_set
```

<<***extension***>> *(*p. *138)* Indicates whether or not a **com.rti.dds.subscription.DataReader** (p. 707) should drop samples from an incomplete coherent set (one for which not all the samples were received). Such samples are reported as lost in the SAMPLE_LOST Status.

Note that a coherent set will be considered incomplete if some of its samples are filtered by content or time on the DataWriter side.

By default, the samples that are received from an incomplete coherent set are dropped (and reported as lost) by the DataReader(s) and they are not provided to the application. By setting this parameter to com.rti.dds.infrastructure.false, you can change this behavior.

Samples from an incomplete coherent set have com.rti.dds.infrastructure.CoherentSetInfo.incomplete_coherent_set set to com.rti.dds.infrastructure.true in **com.rti.dds.subscription.SampleInfo.coherent_set_info** (p. 1956).

[default] com.rti.dds.infrastructure.true

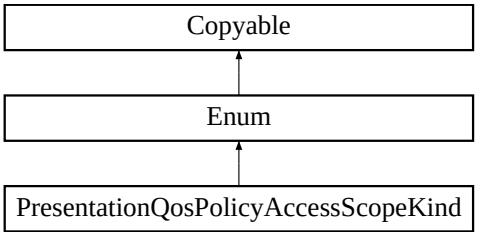
Categories

Immutable (p. 292), **Sample Ordering** (p. 280), **Data Availability** (p. 200)

8.219 PresentationQosPolicyAccessScopeKind Class Reference

Kinds of presentation "access scope".

Inheritance diagram for PresentationQosPolicyAccessScopeKind:



Static Public Attributes

- static final **PresentationQosPolicyAccessScopeKind INSTANCE_PRESENTATION_QOS**

  [default] *Scope spans only a single instance.*
- static final **PresentationQosPolicyAccessScopeKind TOPIC_PRESENTATION_QOS**

  Scope spans all instances within the same ***com.rti.dds.publication.DataWriter*** *(*p. *818), but not across instances in different* ***com.rti.dds.publication.DataWriter*** *(*p. *818) entities.*
- static final **PresentationQosPolicyAccessScopeKind GROUP_PRESENTATION_QOS**

  Scope spans all instances belonging to ***com.rti.dds.publication.DataWriter*** *(*p. *818) entities within the same* ***com.rti.dds.publication.Publisher*** *(*p. *1767).*
- static final **PresentationQosPolicyAccessScopeKind HIGHEST_OFFERED_PRESENTATION_QOS**

  This value only applies to a ***com.rti.dds.subscription.Subscriber*** *(*p. *2039). The* ***com.rti.dds.subscription.Subscriber*** *(*p. *2039) will use the access scope specified by each remote* ***com.rti.dds.publication.Publisher*** *(*p. *1767).*

Additional Inherited Members

8.219.1 Detailed Description

Kinds of presentation "access scope".

Access scope determines the largest scope spanning the entities for which the order and coherency of changes can be preserved.

QoS:

com.rti.dds.infrastructure.PresentationQosPolicy (p. 1678)

8.219.2 Member Data Documentation

8.219.2.1 INSTANCE_PRESENTATION_QOS

```
final PresentationQosPolicyAccessScopeKind INSTANCE_PRESENTATION_QOS [static]
```

[default] Scope spans only a single instance.

Indicates that changes to one instance need not be coherent nor ordered with respect to changes to any other instance. In other words, order and coherent changes apply to each instance separately.

8.219.2.2 TOPIC_PRESENTATION_QOS

```
final PresentationQosPolicyAccessScopeKind TOPIC_PRESENTATION_QOS [static]
```

Scope spans all instances within the same **com.rti.dds.publication.DataWriter** (p. 818), but not across instances in different **com.rti.dds.publication.DataWriter** (p. 818) entities.

8.219.2.3 GROUP_PRESENTATION_QOS

```
final PresentationQosPolicyAccessScopeKind GROUP_PRESENTATION_QOS [static]
```

Scope spans all instances belonging to **com.rti.dds.publication.DataWriter** (p. 818) entities within the same **com.rti.dds.publication.Publisher** (p. 1767).

8.219.2.4 HIGHEST_OFFERED_PRESENTATION_QOS

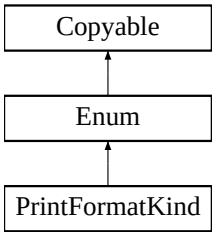
```
final PresentationQosPolicyAccessScopeKind HIGHEST_OFFERED_PRESENTATION_QOS [static]
```

This value only applies to a **com.rti.dds.subscription.Subscriber** (p. 2039). The **com.rti.dds.subscription.Subscriber** (p. 2039) will use the access scope specified by each remote **com.rti.dds.publication.Publisher** (p. 1767).

8.220 PrintFormatKind Class Reference

Format kinds available when converting data samples to string representations.

Inheritance diagram for PrintFormatKind:



Static Public Attributes

- static final **PrintFormatKind DEFAULT_PRINT_FORMAT**

  Use a default format specific to RTI Connext to represent the data when converting to a string.
- static final **PrintFormatKind XML_PRINT_FORMAT**

  Use an XML format to represent the data when converting to a string.
- static final **PrintFormatKind JSON_PRINT_FORMAT**

  Use a JSON format to represent the data when converting to a string.

Additional Inherited Members

8.220.1 Detailed Description

Format kinds available when converting data samples to string representations.

8.220.2 Member Data Documentation

8.220.2.1 DEFAULT_PRINT_FORMAT

```
final PrintFormatKind DEFAULT_PRINT_FORMAT [static]
```

Use a default format specific to RTI Connext to represent the data when converting to a string.

8.220.2.2 XML_PRINT_FORMAT

```
final PrintFormatKind XML_PRINT_FORMAT [static]
```

Use an XML format to represent the data when converting to a string.

8.220.2.3 JSON_PRINT_FORMAT

```
final PrintFormatKind JSON_PRINT_FORMAT [static]
```

Use a JSON format to represent the data when converting to a string.

Referenced by **DynamicData.from_string()**.

8.221 PrintFormatProperty Class Reference

A collection of attributes used to configure how data samples will be formatted when converted to a string.

Public Attributes

- **PrintFormatKind kind** = **PrintFormatKind.DEFAULT_PRINT_FORMAT**

  The kind of format to be used when converting a data sample to a string.
- boolean **pretty_print** = true

  Choose whether to print a data sample in a more readable format or to eliminate all white space.
- boolean **enum_as_int** = false

  Choose whether to print enum values as integers or as strings.
- boolean **include_root_elements** = true

  Choose whether or not to include the root elements of the print format in the output string.

8.221.1 Detailed Description

A collection of attributes used to configure how data samples will be formatted when converted to a string.

8.221.2 Member Data Documentation

8.221.2.1 kind

```
PrintFormatKind kind =  PrintFormatKind.DEFAULT_PRINT_FORMAT
```

The kind of format to be used when converting a data sample to a string.

Data samples can be represented in a default, XML, or JSON format.

See also

com.rti.dds.topic.PrintFormatKind (p. 1685)

[default] com.rti.dds.topic.PrintFormatKind.DEFAULT_PRINT_FORMAT (p. 1686)

Referenced by **DynamicData.to_string()**.

8.221.2.2 pretty_print

```
boolean pretty_print = true
```

Choose whether to print a data sample in a more readable format or to eliminate all white space.

A value of com.rti.dds.infrastructure.true will add indentation and newlines to the string representation of the data sample making it more readable. For example:

```
<FooType>
   <myLong>5</myLong>
</FooType>
```

A value of com.rti.dds.infrastructure.false will cause all white space in the string representation of the data sample to be eliminated. For example:

```
<FooType><myLong>5</myLong></FooType>
```

[default] com.rti.dds.infrastructure.true

Referenced by **DynamicData.to_string()**.

8.221.2.3 enum_as_int

```
boolean enum_as_int = false
```

Choose whether to print enum values as integers or as strings.

A value of com.rti.dds.infrastructure.true will cause enumeration literals to be printed using their integer value. For example:

```
<FooType>
   <myEnum>5</myEnum>
</FooType>
```

A value of com.rti.dds.infrastructure.false will cause enumeration literals to be printed as strings using their member names. For example:

```
<FooType>
   <myEnum>RED</myEnum>
</FooType>
```

[default] com.rti.dds.infrastructure.false

Referenced by **DynamicData.to_string()**.

8.221.2.4 include_root_elements

```
boolean include_root_elements = true
```

Choose whether or not to include the root elements of the print format in the output string.

This field only applies if the **com.rti.dds.topic.PrintFormatProperty.kind** (p. 1687) is **com.rti.dds.topic.PrintFormatKind.XML_PRINT_FORMAT** (p. 1686) or **com.rti.dds.topic.PrintFormatKind.JSON_PRINT_FORMAT** (p. 1686)

If the value is com.rti.dds.infrastructure.true and the kind is **com.rti.dds.topic.PrintFormatKind.XML_PRINT_FORMAT** (p. 1686) then a top-level tag with the type's name in it will be included in the output. For example:

```
<FooType>
   <myLong>5</myLong>
</FooType>
```

If the value is com.rti.dds.infrastructure.true and the kind is **com.rti.dds.topic.PrintFormatKind.JSON_PRINT_FORMAT** (p. 1686) then top-level opening and closing braces will be included in the output. For example:

```
{
   "myLong":5
}
```

If the value is com.rti.dds.infrastructure.false the elements described above will not be included in the output. For example:

```
<myLong>5</myLong>
"myLong":5
```

[default] com.rti.dds.infrastructure.true

Referenced by **DynamicData.to_string()**.

8.222 PRIVATE_MEMBER Class Reference

Constant used to indicate that a value type member is private.

Static Public Attributes

- static final short **VALUE**

8.222.1 Detailed Description

Constant used to indicate that a value type member is private.

See also

com.rti.dds.typecode.Visibility.PUBLIC_MEMBER

8.222.2 Member Data Documentation

8.222.2.1 VALUE

```
final short VALUE  [static]
```

Constant value.

8.223 ProductVersion_t Class Reference

<<***extension***>> *(*p. *403)* Type used to represent the current version of RTI Connext.

Inherits Struct, and Comparable< ProductVersion_t >.

Public Member Functions

- **ProductVersion_t** ()
  Constructor.
- String **toVersionString** ()
- String **toVersionString** (boolean isMicro)
- String **toString** ()

Public Attributes

- char **major**

  Major product version.
- char **minor**

  Minor product version.
- char **release**

  Release letter for product version.
- char **revision**

  Revision number of product.

Static Public Attributes

- static final **ProductVersion_t PRODUCTVERSION_UNKNOWN**

  The value used when the product version is unknown.

8.223.1 Detailed Description

<<***extension***>> *(*p. *403)* Type used to represent the current version of RTI Connext.

8.223.2 Constructor & Destructor Documentation

8.223.2.1 ProductVersion_t()

```
ProductVersion_t ( )
```

Constructor.

8.223.3 Member Function Documentation

8.223.3.1 toVersionString() [1/2]

```
String toVersionString ( )
```

A convenience method since most users of this API will not be using Micro.

Returns

Returns **toVersionString(boolean)** (p. 1690) with false as the argument.

References **ProductVersion_t.toVersionString()**.

Referenced by **ProductVersion_t.toVersionString()**.

8.223.3.2 toVersionString() [2/2]

```
String toVersionString (
            boolean isMicro )
```

Provide a simple string representation of an RTI version number. This method will drop revisions that are zero, following the RTI convention.

Parameters

isMicro	true if the string representation should be created for a Micro version, false otherwise.

Returns

The version as a string.

References **ProductVersion_t.major**, **ProductVersion_t.minor**, **ProductVersion_t.release**, and **ProductVersion_t.revision**.

8.223.3.3 toString()

```
String toString ( )
```

Provide a string representation for an instance of this type.

References **ProductVersion_t.major**, **ProductVersion_t.minor**, **ProductVersion_t.release**, and **ProductVersion_t.revision**.

8.223.4 Member Data Documentation

8.223.4.1 PRODUCTVERSION_UNKNOWN

```
final ProductVersion_t PRODUCTVERSION_UNKNOWN [static]
```

Initial value:

```
=
            new ProductVersion_t((char)0, (char)0, (char)0, (char)0)
```

The value used when the product version is unknown.

8.223.4.2 major

```
char major
```

Major product version.

Referenced by **ProductVersion_t.toString()**, and **ProductVersion_t.toVersionString()**.

8.223.4.3 minor

```
char minor
```

Minor product version.

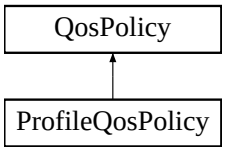
8.224 ProfileQosPolicy Class Reference

<<***extension***>> *(p. 138)* Configures the way that XML documents containing QoS profiles are loaded by RTI Connext.

Inheritance diagram for ProfileQosPolicy:



Public Attributes

- final **StringSeq string_profile**

  *<<**basic**>> (p. 123) <<**extension**>> (p. 138) Sequence of strings containing a XML document to load.*
- final **StringSeq url_profile**

  *<<**basic**>> (p. 123) <<**extension**>> (p. 138) Sequence of **URL groups** (p. 367) containing a set of XML documents to load.*
- boolean **ignore_user_profile**

  *<<**basic**>> (p. 123) <<**extension**>> (p. 138) Ignores the file USER_QOS_PROFILES.xml in the current working directory.*
- boolean **ignore_environment_profile**

  *<<**basic**>> (p. 123) <<**extension**>> (p. 138) Ignores the value of the **NDDS_QOS_PROFILES** (p. 367).*
- boolean **ignore_resource_profile**

  *<<**basic**>> (p. 123) <<**extension**>> (p. 138) Ignores the file NDDS_QOS_PROFILES.xml.*

8.224.1 Detailed Description

*<<**extension**>> (p. 138)* Configures the way that XML documents containing QoS profiles are loaded by RTI Connext.

All QoS values for Entities can be configured in QoS profiles defined in XML documents. XML documents can be passed to RTI Connext in string form or, more likely, through files found on a file system.

There are also default locations where DomainParticipants will look for files to load QoS profiles. These include the current working directory from where an application is started, a file in the distribution directory for RTI Connext, and the locations specified by an environment variable.

You may disable any or all of these default locations using the Profile QoS policy.

Entity:

com.rti.dds.domain.DomainParticipantFactory (p. 1039)

Properties:

RxO (p. 506) = NO
Changeable (p. 507) = **Changeable** (p. 507)

8.224.2 Member Data Documentation

8.224.2.1 string_profile

```
final StringSeq string_profile
```

<<***basic***>> *(*p. *123)* <<***extension***>> *(*p. *138)* Sequence of strings containing a XML document to load.

The concatenation of the strings in this sequence must be a valid XML document according to the XML QoS profile schema.

[default] Empty sequence (zero-length).

Categories

Immutable (p. 292), **QoS Profile Management** (p. 264)

8.224.2.2 url_profile

```
final StringSeq url_profile
```

<<***basic***>> *(*p. *123)* <<***extension***>> *(*p. *138)* Sequence of **URL groups** (p. 367) containing a set of XML documents to load.

Only one of the elements of each group will be loaded by RTI Connext, starting from the left.

[default] Empty sequence (zero-length).

Categories

Immutable (p. 292), **QoS Profile Management** (p. 264)

8.224.2.3 ignore_user_profile

```
boolean ignore_user_profile
```

<<***basic***>> *(*p. *123)* <<***extension***>> *(*p. *138)* Ignores the file USER_QOS_PROFILES.xml in the current working directory.

When this field is set to com.rti.dds.infrastructure.true, the QoS profiles contained in the file USER_QOS_PROFILES.↩ xml in the current working directory will be ignored.

[default] com.rti.dds.infrastructure.false

Categories

Immutable (p. 292), **QoS Profile Management** (p. 264)

8.224.2.4 ignore_environment_profile

```
boolean ignore_environment_profile
```

<<***basic***>> *(*p. *123)* <<***extension***>> *(*p. *138)* Ignores the value of the **NDDS_QOS_PROFILES** (p. 367).

When this field is set to com.rti.dds.infrastructure.true, the value of the environment variable NDDS_QOS_PROFILES will be ignored.

[default] com.rti.dds.infrastructure.false

Categories

Immutable (p. 292), **QoS Profile Management** (p. 264)

8.224.2.5 ignore_resource_profile

```
boolean ignore_resource_profile
```

<<***basic***>> *(*p. *123)* <<***extension***>> *(*p. *138)* Ignores the file NDDS_QOS_PROFILES.xml.

When this field is set to com.rti.dds.infrastructure.true, the QoS profiles contained in the file NDDS_QOS_PROFILES.↩ xml in $NDDSHOME/resource/xml will be ignored.

[default] com.rti.dds.infrastructure.false

8.226.3 Member Data Documentation

8.226.3.1 received_message_count_max

```
int received_message_count_max
```

Number of messages that can be buffered in the receive queue.

This does not guarantee that the Transport-Plugin will actually be able to buffer `received_message_count_max` messages of the maximum size set in **com.rti.ndds.transport.Transport.Property_t.message_size_max** (p. 1704). The total number of bytes that can be buffered for a transport plug-in is actually controlled by `receive_buffer_↩ size`.

See also

NDDS_Transport_Property_t, NDDS_TRANSPORT_SHMEM_RECEIVED_MESSAGE_COUNT_MAX_DEFAULT

Referenced by **ShmemTransport.Property_t.Property_t()**.

8.226.3.2 receive_buffer_size

```
int receive_buffer_size
```

The total number of bytes that can be buffered in the receive queue.

This number controls how much memory is allocated by the plugin for the receive queue. The actual number of bytes allocated is:

```
size = receive_buffer_size + message_size_max +
       received_message_count_max * fixedOverhead
```

where `fixedOverhead` is some small number of bytes used by the queue data structure. The following rules are noted:

- `receive_buffer_size` < `message_size_max` * `received_message_count_max`, then the transport plugin will not be able to store `received_message_count_max` messages of size `message_size_max`.
- `receive_buffer_size` > `message_size_max` * `received_message_count_max`, then there will be memory allocated that cannot be used by the plugin and thus wasted.

To optimize memory usage, the user is allowed to specify a size for the receive queue to be less than that required to hold the maximum number of messages which are all of the maximum size.

In most situations, the average message size may be far less than the maximum message size. So for example, if the maximum message size is 64 K bytes, and the user configures the plugin to buffer at least 10 messages, then 640 K bytes of memory would be needed if all messages were 64 K bytes. Should this be desired, then `receive_buffer_size` should be set to 640 K bytes.

However, if the average message size is only 10 K bytes, then the user could set the `receive_buffer_size` to 100 K bytes. This allows the user to optimize the memory usage of the plugin for the average case and yet allow the plugin to handle the extreme case.

NOTE, the queue will always be able to hold 1 message of `message_size_max` bytes, no matter what the value of receive_buffer_size is.

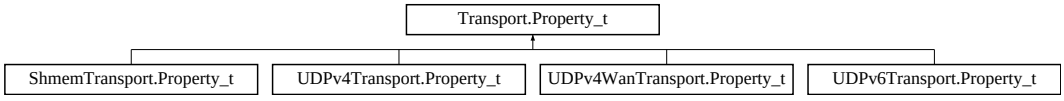
Referenced by **ShmemTransport.Property_t.Property_t()**.

8.227 Transport.Property_t Class Reference

Base configuration structure that must be inherited by derived **Transport** (p. 2150) Plugin classes.

Inheritance diagram for Transport.Property_t:



Public Attributes

- final int **classid**

  The Transport-Plugin Class ID.
- final int **address_bit_count**

  Number of bits in a 16-byte address that are used by the transport. Should be between -128 and 128.
- final int **properties_bitmap**

  A bitmap that defines various properties of the transport to the RTI Connext core.
- int **gather_send_buffer_count_max**

  Specifies the maximum number of buffers that RTI Connext can pass to the `send()` method of a transport plugin.
- int **message_size_max**

  The maximum size of an RTPS message in bytes that can be sent or received by the transport plugin.
- final **StringSeq allow_interfaces_list**

  A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `allow_interfaces_list_length` > 0), allow the use of only these interfaces. If the list is empty, allow the use of all interfaces.
- final **StringSeq deny_interfaces_list**

  A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `deny_interfaces_list_length` > 0), deny the use of these interfaces.
- final **StringSeq allow_multicast_interfaces_list**

  A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `allow_multicast_interfaces_list_length` > 0), allow the use of multicast only on these interfaces; otherwise allow the use of all the allowed interfaces.
- final **StringSeq deny_multicast_interfaces_list**

  A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `deny_multicast_interfaces_list_length` > 0), deny the use of those interfaces for multicast.
- byte[ ] **transport_uuid** = {0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0}

  Univocally identifies a transport plugin.
- int **max_interface_count**

  Maximum number of addresses from the `allow_interfaces_list` that will be announced.

Static Public Attributes

- static final int **NDDS_TRANSPORT_CLASSID_INVALID** = -1

  *Invalid **Transport** (p. 2150) Class ID.*
- static final int **NDDS_TRANSPORT_CLASSID_RESERVED_RANGE** = 1000

  Transport-Plugin class IDs below this are reserved by RTI.
- static final int **NDDS_TRANSPORT_PROPERTY_BIT_BUFFER_ALWAYS_LOANED** = 0x2

  Specified zero-copy behavior of transport.
- static final int **NDDS_TRANSPORT_PROPERTY_GATHER_SEND_BUFFER_COUNT_MIN** = 3

  *Minimum number of gather-send buffers that must be supported by a **Transport** (p. 2150) Plugin implementation.*

8.227.1 Detailed Description

Base configuration structure that must be inherited by derived **Transport** (p. 2150) Plugin classes.

This structure contains properties that must be set before registration of any transport plugin with RTI Connext. The RTI Connext core will configure itself to use the plugin based on the properties set within this structure.

A transport plugin may extend from this structure to add transport-specific properties.

WARNING: The transport properties of an instance of a **Transport** (p. 2150) Plugin should be considered immutable after the plugin has been created. That means the values contained in the property structure stored as a part of the transport plugin itself should not be changed. If those values are modified, the results are undefined.

8.227.2 Member Data Documentation

8.227.2.1 NDDS_TRANSPORT_CLASSID_INVALID

```
final int NDDS_TRANSPORT_CLASSID_INVALID = -1  [static]
```

Invalid **Transport** (p. 2150) Class ID.

Transport-Plugins implementations should set their class ID to a value different than this.

8.227.2.2 NDDS_TRANSPORT_CLASSID_RESERVED_RANGE

```
final int NDDS_TRANSPORT_CLASSID_RESERVED_RANGE = 1000  [static]
```

Transport-Plugin class IDs below this are reserved by RTI.

User-defined Transport-Plugins should use a class ID greater than this number.

8.227.2.3 NDDS_TRANSPORT_PROPERTY_BIT_BUFFER_ALWAYS_LOANED

```
final int NDDS_TRANSPORT_PROPERTY_BIT_BUFFER_ALWAYS_LOANED = 0x2  [static]
```

Specified zero-copy behavior of transport.

A **Transport** (p. 2150) Plugin may commit to one of three behaviors for zero copy receives:

1. Always does zero copy.
2. Sometimes does zero copy, up to the transport discretion.
3. Never does zero copy.

This bit should be set only if the **Transport** (p. 2150) Plugin commits to always doing a zero copy receive, or more specifically, always loaning a buffer through its `receive_rEA()` call.

In that case, the NDDS core will not need to allocate storage for a message that it retrieves with the `receive_rEA()` call.

8.227.2.4 NDDS_TRANSPORT_PROPERTY_GATHER_SEND_BUFFER_COUNT_MIN

```
final int NDDS_TRANSPORT_PROPERTY_GATHER_SEND_BUFFER_COUNT_MIN = 3  [static]
```

Minimum number of gather-send buffers that must be supported by a **Transport** (p. 2150) Plugin implementation.

For the NDDS_Transport_Property_t structure to be valid, the value of **Transport.Property_t.gather_send_buffer_↩ count_max** (p. 1704) must be greater than or equal to this value.

8.227.2.5 classid

```
final int classid
```

The Transport-Plugin Class ID.

The transport plugin sets the value for this field.

Class IDs below **NDDS_TRANSPORT_CLASSID_RESERVED_RANGE** (p. 1702) are reserved for RTI (Real-Time Innovations) usage.

User-defined transports should set an ID above this range.

The ID should be globally unique for each Transport-Plugin class. Transport-Plugin implementors should ensure that the class IDs do not conflict with each other amongst different Transport-Plugin classes.

Invariant

The `classid` is invariant for the lifecycle of a transport plugin.

8.227.2.6 address_bit_count

```
final int address_bit_count
```

Number of bits in a 16-byte address that are used by the transport. Should be between -128 and 128.

The transport plugin sets the value for this field.

A transport plugin should define the range of addresses that are meaningful to the plugin. It does this by setting the number of bits of an IPv6 address that will be used to designate an address in the network to which the transport plugin is connected. The sign of this field determines whether the count of bits starts on the most significant bit (negative sign) or on the least significant bit (positive sign).

For example, for an address range of 0-255, the address_bit_count should be set to 8. For the range of addresses used by IPv4 (4 bytes), it should be set to 32.

See also

Transport Class Attributes (p. 100)

8.227.2.7 properties_bitmap

```
final int properties_bitmap
```

A bitmap that defines various properties of the transport to the RTI Connext core.

Currently, the only property supported is whether or not the transport plugin will always loan a buffer when RTI Connext tries to receive a message using the plugin. This is in support of a zero-copy interface.

See also

NDDS_TRANSPORT_PROPERTY_BIT_BUFFER_ALWAYS_LOANED (p. 1702)

8.227.2.8 gather_send_buffer_count_max

```
int gather_send_buffer_count_max
```

Specifies the maximum number of buffers that RTI Connext can pass to the `send()` method of a transport plugin.

The transport plugin `send()` API supports a gather-send concept, where the `send()` call can take several discontiguous buffers, assemble and send them in a single message. This enables RTI Connext to send a message from parts obtained from different sources without first having to copy the parts into a single contiguous buffer.

However, most transports that support a gather-send concept have an upper limit on the number of buffers that can be gathered and sent. Setting this value will prevent RTI Connext from trying to gather too many buffers into a send call for the transport plugin.

RTI Connext requires all transport-plugin implementations to support a gather-send of least a minimum number of buffers. This minimum number is defined to be **NDDS_TRANSPORT_PROPERTY_GATHER_SEND_BUFFER_↩ COUNT_MIN** (p. 1702).

If the underlying transport does not support a gather-send concept directly, then the transport plugin itself must copy the separate buffers passed into the `send()` call into a single buffer for sending or otherwise send each buffer individually. However this is done by the transport plugin, the receive_rEA() call of the destination application should assemble, if needed, all of the pieces of the message into a single buffer before the message is passed to the RTI Connext layer.

8.227.2.9 message_size_max

```
int message_size_max
```

The maximum size of an RTPS message in bytes that can be sent or received by the transport plugin.

If the maximum size of a message that can be sent by a transport plugin is user configurable, the transport plugin should provide a default value for this property. In any case, this value must be set before the transport plugin is registered, so that RTI Connext can properly use the plugin.

For information about the default value for different transports, see the `Core Libraries User's Manual`.

8.227.2.10 allow_interfaces_list

`final` **StringSeq** `allow_interfaces_list`

A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `allow_interfaces_list_length` > 0), allow the use of only these interfaces. If the list is empty, allow the use of all interfaces.

The "white" list restricts *reception* to a particular set of interfaces for unicast UDP.

For UDPv4 and UDPv6 transports, the resulting list also controls the interfaces over which the DomainParticipant will send multicast traffic to the remote DomainParticipants (if multicast is supported on the platform).

Note: This property does not affect the interfaces that the transport uses to send unicast data from that Domain↩ Participant. That decision is made by the OS based on the destination address.

It is up to the transport plugin to interpret the list of strings passed in.

For example, the following are acceptable strings in IPv4 format: 192.168.1.1, 192.168.1.∗, 192.168.∗, 192.∗, ether0

The left-to-right order of this list matters if you are using the max_interface_count to limit the allowable interfaces further. See `max_interface_count`.

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

The caller (user) must manage the memory of the list. The memory may be freed after the **com.rti.dds.domain.↩ DomainParticipant** (p. 948) is deleted.

[default] empty list that represents all available interfaces.

See also

com.rti.ndds.transport.Transport.Property_t.max_interface_count (p. 1706)

8.227.2.11 deny_interfaces_list

`final` **StringSeq** `deny_interfaces_list`

A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `deny_interfaces_list_length` > 0), deny the use of these interfaces.

This "black" list is applied *after* the `allow_interfaces_list` and filters out the interfaces that should not be used.

The resulting list restricts *reception* to a particular set of interfaces for unicast UDP.

For UDPv4 and UDPv6 transports, the resulting list also controls the interfaces over which the DomainParticipant will send multicast traffic to the remote DomainParticipants (if multicast is supported on the platform).

Note: This property does not affect the interfaces that the transport uses to send unicast data from that Domain↩ Participant. That decision is made by the OS based on the destination address.

It is up to the transport plugin to interpret the list of strings passed in.

For example, the following are acceptable strings in IPv4 format: 192.168.1.1, 192.168.1.∗, 192.168.∗, 192.∗, ether0

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

The caller (user) must manage the memory of the list. The memory may be freed after the **com.rti.dds.domain.↩ DomainParticipant** (p. 948) is deleted.

[default] empty list that represents no denied interfaces.

8.227.2.12 allow_multicast_interfaces_list

```
final StringSeq allow_multicast_interfaces_list
```

A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.↩ e., allow_multicast_interfaces_list_length > 0), allow the use of multicast only on these interfaces; otherwise allow the use of all the allowed interfaces.

This "white" list sub-selects from the allowed interfaces obtained *after* applying the allow_interfaces_list "white" list *and* the deny_interfaces_list "black" list.

After allow_multicast_interfaces_list, the deny_multicast_interfaces_list is applied. Multicast output will be sent and may be received over the interfaces in the resulting list.

If this list is empty, all the allowed interfaces will be potentially used for multicast. It is up to the transport plugin to interpret the list of strings passed in.

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

The caller (user) must manage the memory of the list. The memory may be freed after the **com.rti.dds.domain.↩ DomainParticipant** (p. 948) is deleted.

[default] empty list that represents all available interfaces.

8.227.2.13 deny_multicast_interfaces_list

```
final StringSeq deny_multicast_interfaces_list
```

A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., deny_multicast_interfaces_list_length > 0), deny the use of those interfaces for multicast.

This "black" list is applied after allow_multicast_interfaces_list and filters out interfaces that should not be used for multicast.

Multicast output will be sent and may be received over the interfaces in the resulting list.

It is up to the transport plugin to interpret the list of strings passed in.

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

The caller (user) must manage the memory of the list. The memory may be freed after the **com.rti.dds.domain.↩ DomainParticipant** (p. 948) is deleted.

[default] empty list that represents no denied interfaces.

8.227.2.14 transport_uuid

```
byte [] transport_uuid = {0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0}
```

Univocally identifies a transport plugin.

It represents the prefix of the participant GUID.

8.227.2.15 max_interface_count

```
int max_interface_count
```

Maximum number of addresses from the allow_interfaces_list that will be announced.

By default, max_interface_count = LENGTH_UNLIMITED: all the interfaces are announced.

This feature is useful if you want to control the network interfaces on which your DomainParticipants receive data. For example, if you have one wired and one wireless interface both up and running, and max_interface_count is set to 1, the DomainParticipant will receive data over the interface you list first in the allow_interfaces_list -for example, the wired one.

RTI Connext selects the preferred interface(s) by iterating over the list of allowed interfaces until the first max_↩ interfaces_count of active interfaces encountered are announced. The order of iteration is left to right as specified in the allow_interfaces_list setting.

This setting applies only if the allow_interfaces_list is not empty.

The max_interface_count setting does not consider end-to-end connectivity to select interfaces. The decision is based purely on whether interfaces are up or down in a node. Therefore, this feature is not intended to be used in the following scenarios:

- A DomainParticipant is not reachable by other DomainParticipants in all the interfaces in the allow_↩ interfaces_list. This could occur if the DomainParticipant is in different subnets, and some of these subnets cannot be reached by other DomainParticipants.
- End-to-end connectivity issues lead to situations in which the interfaces selected after applying max_↩ interface_count cannot be reached by other DomainParticipants.

For UDPv4 and UDPv6 transports, this feature also affects multicast traffic by limiting the interfaces over which a DomainParticipant sends multicast traffic. The (allow/deny)_multicast_interfaces_list applies to the interfaces selected by using the max_interfaces_count property.

Note: If a pattern string in the allow_interfaces_list matches multiple interface addresses, and max_↩ interface_count is set to a finite value, the order for the matching allowed interfaces is decided based on the order in which the operating system provides these interfaces.

[default] LENGTH_UNLIMITED

- int **recv_socket_buffer_size**

  Size in bytes of the receive buffer of a socket used for receiving.
- int **unicast_enabled**

  Allows the transport plugin to use unicast for sending and receiving.
- int **multicast_enabled**

  Allows the transport plugin to use multicast for sending and receiving.
- int **multicast_ttl**

  Value for the time-to-live parameter for all multicast sends using this plugin.
- int **multicast_loopback_disabled**

  Prevents the transport plugin from putting multicast packets onto the loopback interface.
- int **ignore_loopback_interface**

  Prevents the transport plugin from using the IP loopback interface.
- int **ignore_nonup_interfaces**

  ***[DEPRECATED]** Prevents the transport plugin from using a network interface that is not reported as UP by the operating system.*
- int **ignore_nonrunning_interfaces**

  Prevents the transport plugin from using a network interface that is not reported as RUNNING by the operating system.
- int **no_zero_copy**

  ***[DEPRECATED]** Prevents the transport plugin from doing a zero copy.*
- int **send_blocking**

  Control blocking behavior of send sockets. CHANGING THIS FROM THE DEFAULT CAN CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.
- int **use_checksum**

  Configures whether to send UDP checksum.
- long **transport_priority_mask**

  Set mask for use of transport priority field.
- int **transport_priority_mapping_low**

  Set low value of output range to IPv4 TOS.
- int **transport_priority_mapping_high**

  Set high value of output range to IPv4 TOS.
- int **send_ping**

  Configures whether to send PING messages.
- int **force_interface_poll_detection**

  Forces the interface tracker to use a polling mechanism to detect changes on the UDPv4 interfaces.
- long **interface_poll_period**

  Specifies the period in milliseconds to query for changes in the state of all the interfaces.
- int **reuse_multicast_receive_resource**

  Controls whether or not to reuse multicast receive resources.
- int **protocol_overhead_max**

Maximum size in bytes of protocol overhead, including headers.

- int **disable_interface_tracking**

  Disables detection of network interface changes.

- long **join_multicast_group_timeout**

  [Windows only] Defines how much time (milliseconds) to wait to join a multicast group address when a new interface is detected.

- String **public_address**

  Public IP address associated with the transport instantiation.

- int **port_offset**

  Port offset to allow multiple instances of UDPv4 transports in the same ***com.rti.dds.domain.DomainParticipant*** *(*p. 948*).*

Additional Inherited Members

8.228.1 Detailed Description

Configurable IPv4/UDP Transport-Plugin properties.

You can modify the properties in this structure to configure the plugin. However, you must set the properties before the plugin is instantiated.

8.228.3 Member Data Documentation

8.228.3.1 send_socket_buffer_size

```
int send_socket_buffer_size
```

Size in bytes of the send buffer of a socket used for sending.

On most operating systems, `setsockopt()` will be called to set the SENDBUF to the value of this parameter.

This value must be greater than or equal to **com.rti.ndds.transport.Transport.Property_t.message_size_max** (p. 1704). Its maximum value is dependent on the operating system.

By default, it will be set to com.rti.ndds.transport.UDPv4Transport_SEND_SOCKET_BUFFER_SIZE_DEFAULT.

The maximum value for this property depends on the operating system.

Valid values are:

- com.rti.ndds.transport.UDPv4Transport_SEND_SOCKET_BUFFER_SIZE_DEFAULT: `setsockopt()` (or equivalent) will be called to size the send buffer of the socket with the default value.
- com.rti.ndds.transport.UDPv4Transport_SOCKET_BUFFER_SIZE_OS_DEFAULT: `setsockopt()` (or equivalent) will not be called to size the send buffer of the socket. RTI Connext will use the OS default.
- com.rti.ndds.transport.UDPv4Transport_SOCKET_BUFFER_SIZE_OS_MAX: RTI Connext will retrieve the maximum socket buffer size allowed by the operating system and use that value for the send buffer size of the socket.
- Positive integer: `setsockopt()` (or equivalent) will be called to size the send buffer of the socket with the provided value. If this value exceeds the maximum allowed by the operating system, the operating system's maximum value will be used instead.

Referenced by **UDPv4Transport.Property_t.Property_t()**.

8.228.3.2 recv_socket_buffer_size

```
int recv_socket_buffer_size
```

Size in bytes of the receive buffer of a socket used for receiving.

On most operating systems, `setsockopt()` will be called to set the RECVBUF to the value of this parameter.

This value must be greater than or equal to **com.rti.ndds.transport.Transport.Property_t.message_size_max** (p. 1704). Its maximum value is dependent on the operating system.

By default, it will be set to com.rti.ndds.transport.UDPv4Transport_RECV_SOCKET_BUFFER_SIZE_DEFAULT.

The maximum value for this property depends on the operating system.

Valid values are:

- com.rti.ndds.transport.UDPv4Transport_RECV_SOCKET_BUFFER_SIZE_DEFAULT: `setsockopt()` (or equivalent) will be called to size the receive buffer of the socket with the default value.
- com.rti.ndds.transport.UDPv4Transport_SOCKET_BUFFER_SIZE_OS_DEFAULT: `setsockopt()` (or equivalent) will not be called to size the receive buffer of the socket. RTI Connext will use the OS default.
- com.rti.ndds.transport.UDPv4Transport_SOCKET_BUFFER_SIZE_OS_MAX: RTI Connext will retrieve the maximum socket buffer size allowed by the operating system and use that value for the receive buffer size of the socket.
- Positive integer: `setsockopt()` (or equivalent) will be called to size the receive buffer of the socket with the provided value. If this value exceeds the maximum allowed by the operating system, the operating system's maximum value will be used instead.

Referenced by **UDPv4Transport.Property_t.Property_t()**.

8.228.3.3 unicast_enabled

```
int unicast_enabled
```

Allows the transport plugin to use unicast for sending and receiving.

This value turns unicast UDP on (if set to 1) or off (if set to 0) for this plugin. By default, it will be turned on (1). Also by default, the plugin will use all the allowed network interfaces that it finds up and running when the plugin is instantiated.

Referenced by **UDPv4Transport.Property_t.Property_t()**.

8.228.3.4 multicast_enabled

```
int multicast_enabled
```

Allows the transport plugin to use multicast for sending and receiving.

This value turns multicast UDP on (if set to 1) or off (if set to 0) for this plugin. By default, it will be turned on (1) for those platforms that support multicast. Also by default, the plugin will use all the network interfaces allowed for multicast that it finds up and running when the plugin is instantiated.

Referenced by **UDPv4Transport.Property_t.Property_t()**.

8.228.3.5 multicast_ttl

```
int multicast_ttl
```

Value for the time-to-live parameter for all multicast sends using this plugin.

This value is used to set the TTL of multicast packets sent by this transport plugin.

[default] 1

Referenced by **UDPv4Transport.Property_t.Property_t()**.

8.228.3.6 multicast_loopback_disabled

```
int multicast_loopback_disabled
```

Prevents the transport plugin from putting multicast packets onto the loopback interface.

If multicast loopback is disabled (this value is set to 1), then when sending multicast packets, RTI Connext will *not* put a copy of the packets on the loopback interface. This prevents applications on the same node (including itself) from receiving those packets.

This value is set to 0 by default, meaning multicast loopback is *enabled*.

Disabling multicast loopback (setting this value to 1) may result in minor performance gains when using multicast.

[NOTE: Windows CE systems do not support multicast loopback. This field is ignored for Windows CE targets.]

Referenced by **UDPv4Transport.Property_t.Property_t()**.

8.228.3.7 ignore_loopback_interface

```
int ignore_loopback_interface
```

Prevents the transport plugin from using the IP loopback interface.

Currently three values are allowed:

- **0**: Forces local traffic to be sent over loopback, even if a more efficient transport (such as shared memory) is installed (in which case traffic will be sent over both transports).
- **1**: Disables local traffic via this plugin. The IP loopback interface is not used, even if no NICs are discovered. This is useful when you want applications running on the same node to use a more efficient plugin (such as shared memory) instead of the IP loopback.
- **-1**: Automatic. Lets RTI Connext decide between the above two choices.

The current "automatic" (-1) RTI Connext policy is as follows:

- If a shared memory transport plugin is available for local traffic and there is a locator on the initial peers list that can use shared memory, the effective value is 1 (i.e., disable UPV4 local traffic).
- Otherwise, the effective value is 0 (i.e., use UDPv4 for local traffic also).

[default] -1 Automatic RTI Connext policy based on availability of the shared memory transport.

Referenced by **UDPv4Transport.Property_t.Property_t()**.

8.228.3.8 ignore_nonup_interfaces

```
int ignore_nonup_interfaces
```

[DEPRECATED] Prevents the transport plugin from using a network interface that is not reported as UP by the operating system.

DEPRECATED: this property has no effect. Non-UP interfaces are ignored until they change their status to UP, unless **com.rti.ndds.transport.UDPv4Transport.Property_t.disable_interface_tracking** (p. 1718) is set to 1, in which case interfaces are ignored even if they change their status at a later point.

The transport checks the flags reported by the operating system for each network interface upon initialization. An interface that is not reported as UP will not be used. This property allows you to configure the transport to start using even the interfaces that were not reported as UP.

Two values are allowed:

- **0**: Allow the use of interfaces that were not reported as UP.
- **1**: Do not use interfaces that were not reported as UP.

[default] 1

Referenced by **UDPv4Transport.Property_t.Property_t()**.

8.228.3.9 ignore_nonrunning_interfaces

```
int ignore_nonrunning_interfaces
```

Prevents the transport plugin from using a network interface that is not reported as RUNNING by the operating system.

The transport checks the flags reported by the operating system for each network interface upon initialization. An interface that is not reported as UP will not be used. This property allows the same check to be extended to the IFF_↩ RUNNING flag implemented by some operating systems. The RUNNING flag is defined to mean that "all resources are allocated," and may be off if there is no link detected, e.g., the network cable is unplugged.

Two values are allowed:

- **0**: Do not check the RUNNING flag when enumerating interfaces, just make sure the interface is UP.
- **1**: Check the flag when enumerating interfaces, and ignore those that are not reported as RUNNING. This can be used on some operating systems to cause the transport to ignore interfaces that are enabled but not connected to the network.

[default] 1 (i.e., check RUNNING flag)

Referenced by **UDPv4Transport.Property_t.Property_t()**.

8.228.3.10 no_zero_copy

```
int no_zero_copy
```

[DEPRECATED] Prevents the transport plugin from doing a zero copy.

DEPRECATED: This property has no effect. By default, this plugin will use the zero copy on OSes that offer it. While this is good for performance, it may sometimes tax the OS resources in a manner that cannot be overcome by the application.

The best example is if the hardware/device driver lends the buffer to the application itself. If the application does not return the loaned buffers soon enough, the node may err or malfunction. In case you cannot reconfigure the H/W, device driver, or the OS to allow the zero copy feature to work for your application, you may have no choice but to turn off zero copy use.

By default this is set to 0, so RTI Connext will use the zero-copy API if offered by the OS.

Referenced by **UDPv4Transport.Property_t.Property_t()**.

8.228.3.11 send_blocking

```
int send_blocking
```

Control blocking behavior of send sockets. CHANGING THIS FROM THE DEFAULT CAN CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

Currently two values are defined:

- **NDDS_TRANSPORT_UDPV4_BLOCKING_ALWAYS:** Sockets are blocking (default socket options for the operating system).
- **NDDS_TRANSPORT_UDPV4_BLOCKING_NEVER:** Sockets are modified to make them non-blocking. THIS MAY CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

[default] NDDS_TRANSPORT_UDPV4_BLOCKING_ALWAYS

Referenced by **UDPv4Transport.Property_t.Property_t()**.

8.228.3.12 use_checksum

```
int use_checksum
```

Configures whether to send UDP checksum.

This property specifies whether the UDP checksum will be computed. On Windows and Linux, the UDP protocol will not set the checksum when use_checksum is set to 0. This is useful when RTPS protocol statistics related to corrupted messages need to be collected through the API **com.rti.dds.domain.DomainParticipant.get_participant_protocol_status** (p. 1021).

[default] 1 (enabled)

Referenced by **UDPv4Transport.Property_t.Property_t()**.

8.228.3.13 transport_priority_mask

```
long transport_priority_mask
```

Set mask for use of transport priority field.

This is used in conjunction with **com.rti.ndds.transport.UDPv4Transport.Property_t.transport_priority_mapping_low** (p. 1715) and **com.rti.ndds.transport.UDPv4Transport.Property_t.transport_priority_mapping_high** (p. 1716) to define the mapping from the DDS transport priority (see **TRANSPORT_PRIORITY** (p. 526)) to the IPv4 TOS field. Defines a contiguous region of bits in the 32-bit transport priority value that is used to generate values for the IPv4 TOS field on an outgoing socket.

For example, the value 0x0000ff00 causes bits 9-16 (8 bits) to be used in the mapping. The value will be scaled from the mask range (0x0000 - 0xff00 in this case) to the range specified by low and high.

If the mask is set to zero, then the transport will not set IPv4 TOS for send sockets.

[default] 0.

Referenced by **UDPv4Transport.Property_t.Property_t()**.

8.228.3.14 transport_priority_mapping_low

```
int transport_priority_mapping_low
```

Set low value of output range to IPv4 TOS.

This is used in conjunction with **com.rti.ndds.transport.UDPv4Transport.Property_t.transport_priority_mask** (p. 1715) and **com.rti.ndds.transport.UDPv4Transport.Property_t.transport_priority_mapping_high** (p. 1716) to define the mapping from the DDS transport priority to the IPv4 TOS field. Defines the low value of the output range for scaling.

Note that IPv4 TOS is generally an 8-bit value.

[default] 0.

Referenced by **UDPv4Transport.Property_t.Property_t()**.

8.228.3.15 transport_priority_mapping_high

```
int transport_priority_mapping_high
```

Set high value of output range to IPv4 TOS.

This is used in conjunction with **com.rti.ndds.transport.UDPv4Transport.Property_t.transport_priority_mask** (p. 1715) and **com.rti.ndds.transport.UDPv4Transport.Property_t.transport_priority_mapping_low** (p. 1715) to define the mapping from the DDS transport priority to the IPv4 TOS field. Defines the high value of the output range for scaling.

Note that IPv4 TOS is generally an 8-bit value.

[default] 0xff.

Referenced by **UDPv4Transport.Property_t.Property_t()**.

8.228.3.16 send_ping

```
int send_ping
```

Configures whether to send PING messages.

This property specifies whether to send a PING message before commencing the discovery process. On certain operating systems or with certain switches the initial UDP packet, while configuring the ARP table, can unfortunately be dropped. To avoid dropping the initial RTPS discovery sample, a PING message is sent to preconfigure the ARP table in those environments.

[default] 1 (enabled)

Referenced by **UDPv4Transport.Property_t.Property_t()**.

8.228.3.17 force_interface_poll_detection

```
int force_interface_poll_detection
```

Forces the interface tracker to use a polling mechanism to detect changes on the UDPv4 interfaces.

When possible, the detection of an IP address change is done asynchronously using the APIs offered by the underlying OS. By setting this property on those OSes, the use of a polling mechanism to detect changes can be forced.

[default] 0 (disabled).

Referenced by **UDPv4Transport.Property_t.Property_t()**.

8.228.3.18 interface_poll_period

```
long interface_poll_period
```

Specifies the period in milliseconds to query for changes in the state of all the interfaces.

When possible, the detection of an IP address change is done asynchronously using the APIs offered by the underlying OS. If there is no mechanism to do that, the detection will use a polling strategy where the polling period can be configured by setting this property.

[default] 500 milliseconds.

Referenced by **UDPv4Transport.Property_t.Property_t()**.

8.228.3.19 reuse_multicast_receive_resource

```
int reuse_multicast_receive_resource
```

Controls whether or not to reuse multicast receive resources.

Setting this to 0 (FALSE) prevents multicast crosstalk by uniquely configuring a port and creating a receive thread for each multicast group address.

[default] 1.

Referenced by **UDPv4Transport.Property_t.Property_t()**.

8.228.3.20 protocol_overhead_max

```
int protocol_overhead_max
```

Maximum size in bytes of protocol overhead, including headers.

This value is the maximum size, in bytes, of protocol-related overhead. Normally, the overhead accounts for UDP and IP headers. The default value is set to accommodate the most common UDP/IP header size.

Note that when **com.rti.ndds.transport.Transport.Property_t.message_size_max** (p. 1704) plus this overhead is larger than the UDPv4 maximum message size (65535 bytes), the middleware will automatically reduce the effective message_size_max, to 65535 minus this overhead.

[default] 28.

See also

com.rti.ndds.transport.Transport.Property_t.message_size_max (p. 1704)

Referenced by **UDPv4Transport.Property_t.Property_t()**.

8.228.3.21 disable_interface_tracking

```
int disable_interface_tracking
```

Disables detection of network interface changes.

By default, network interface changes are propagated in the form of locators to other applications. This is done to support IP mobility scenarios.

For example, you could start a RTI Connext application with Wi-Fi and move to a wired connection. In order to continue communicating with other applications, this interface change has to be propagated.

In RTI Connext 5.2 (the initial release) and earlier versions of the product, IP mobility scenarios were not supported. 5.2 applications will report errors if they detect locator changes in a DataWriter or DataReader.

You can disable the notification and propagation of interface changes by setting this property to 1.

This way, an interface change in a newer application will not trigger errors in an application running 5.2 or earlier. Of course, this will prevent the new application from being able to detect network interface changes.

[default] 0

Referenced by **UDPv4Transport.Property_t.Property_t()**.

8.228.3.22 join_multicast_group_timeout

```
long join_multicast_group_timeout
```

[Windows only] Defines how much time (milliseconds) to wait to join a multicast group address when a new interface is detected.

On Windows, a network interface may be detected before it is allowed to join a multicast group address. This property adjusts how much time (milliseconds) to wait for the ADD_MEMBERSHIP multicast operation to succeed before withdrawing.

[default] 5000

Referenced by **UDPv4Transport.Property_t.Property_t()**.

8.228.3.23 public_address

```
String public_address
```

Public IP address associated with the transport instantiation.

Setting the public IP address is only necessary to support communication over WAN that involves Network Address Translation (NAT).

Typically, the address is the public address of the IP NAT router that provides access to the WAN.

By default, the **com.rti.dds.domain.DomainParticipant** (p. 948) creating the transport will announce the IP addresses obtained from the NICs to other DomainParticipants in the system.

When this property is set, the DomainParticipant will announce the IP address corresponding to the property value instead of the LAN IP addresses associated with the NICs.

Note 1: Setting this property is necessary, but is not a sufficient condition for sending and receiving data over the WAN. You must also configure the IP NAT router to allow UDP traffic and to map the public IP address specified by this property to the DomainParticipant's private LAN IP address. This is typically done with one of the following mechanisms:

- Port Forwarding: You must map the private ports used to receive discovery and user data traffic to the corresponding public ports (see **com.rti.dds.infrastructure.RtpsWellKnownPorts_t** (p. 1931)). Public and private ports must be the same since the transport does not allow you to change the mapping.
- 1:1 NAT: You must add a 1:1 NAT entry that maps the public IP address specified in this property to the private LAN IP address of the DomainParticipant.

Note 2: By setting this property, the **com.rti.dds.domain.DomainParticipant** (p. 948) only announces its public IP address to other DomainParticipants. Therefore, communication with DomainParticipants within the LAN that are running on different nodes will not work unless the NAT router is configured to enable NAT reflection (hairpin NAT).

There is another way to achieve simultaneous communication with DomainParticipants running in the LAN and WAN, that does not require hairpin NAT. This way uses a gateway application such as RTI Routing Service to provide access to the WAN.

[default] null (the transport uses the IP addresses obtained from the NICs)

Referenced by **UDPv4Transport.Property_t.Property_t()**.

8.228.3.24 port_offset

```
int port_offset
```

Port offset to allow multiple instances of UDPv4 transports in the same **com.rti.dds.domain.DomainParticipant** (p. 948).

By default, it is not possible to have multiple instances of the UDPv4 transport in the same **com.rti.dds.domain.↩ DomainParticipant** (p. 948). This is because all instances will try to bind to the same UDP port(s) for receiving data.

With this property, you can specify an offset that will be added to the RTPS port(s) to determine the UDP port(s) to bind to. This way, you can have multiple instances of the UDPv4 transport in the same **com.rti.dds.domain.Domain↩ Participant** (p. 948).

An RTPS port will be mapped to an UDP port as follows: UDP port = RTPS port + port_offset.

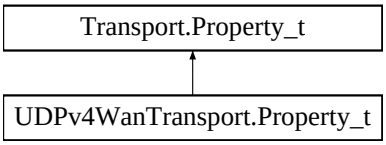
[default] 0

Referenced by **UDPv4Transport.Property_t.Property_t()**.

8.229 UDPv4WanTransport.Property_t Class Reference

Configurable IPv4/UDP WAN Transport-Plugin properties.

Inheritance diagram for UDPv4WanTransport.Property_t:



Public Member Functions

- **Property_t** ()

Public Attributes

- int **send_socket_buffer_size**

  Size in bytes of the send buffer of a socket used for sending.
- int **recv_socket_buffer_size**

  Size in bytes of the receive buffer of a socket used for receiving.
- int **ignore_loopback_interface**

  Prevents the transport plugin from using the IP loopback interface.
- int **ignore_nonup_interfaces**

  ***[DEPRECATED]** Prevents the transport plugin from using a network interface that is not reported as UP by the operating system.*
- int **ignore_nonrunning_interfaces**

  Prevents the transport plugin from using a network interface that is not reported as RUNNING by the operating system.
- int **no_zero_copy**

  ***[DEPRECATED]** Prevents the transport plugin from doing a zero copy.*
- int **send_blocking**

  Control blocking behavior of send sockets. CHANGING THIS FROM THE DEFAULT CAN CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.
- int **use_checksum**

  Configures whether to send UDP checksum.
- long **transport_priority_mask**

  Set mask for use of transport priority field.
- int **transport_priority_mapping_low**

  Set low value of output range to IPv4 TOS.
- int **transport_priority_mapping_high**

  Set high value of output range to IPv4 TOS.
- int **send_ping**

  Configures whether to send PING messages.
- int **force_interface_poll_detection**

  Forces the interface tracker to use a polling mechanism to detect changes on the UDPv4 interfaces.
- long **interface_poll_period**

  Specifies the period in milliseconds to query for changes in the state of all the interfaces.
- int **protocol_overhead_max**

  Maximum size in bytes of protocol overhead, including headers.
- int **disable_interface_tracking**

  Disables detection of network interface changes.
- String **public_address**

  Public IP address associated with the transport instantiation.
- **TransportUdpWanCommPortsMappingInfoSeq comm_ports**

  Configures the public and private UDP ports that a transport instance uses to receive/send RTPS data.
- int **port_offset**

  Port offset to allow coexistence with built-in UDPv4 transport.
- long **binding_ping_period**

  Specifies the period in milliseconds at which BINDING PINGS messages are sent to keep NAT mappings open.

Additional Inherited Members

8.229.1 Detailed Description

Configurable IPv4/UDP WAN Transport-Plugin properties.

You can modify the properties in this structure to configure the plugin. However, you must set the properties before the plugin is instantiated.

8.229.3 Member Data Documentation

8.229.3.1 send_socket_buffer_size

```
int send_socket_buffer_size
```

Size in bytes of the send buffer of a socket used for sending.

See also

com.rti.ndds.transport.UDPv4Transport.Property_t.send_socket_buffer_size (p. 1710)

Referenced by **UDPv4WanTransport.Property_t.Property_t()**.

8.229.3.2 recv_socket_buffer_size

```
int recv_socket_buffer_size
```

Size in bytes of the receive buffer of a socket used for receiving.

See also

com.rti.ndds.transport.UDPv4Transport.Property_t.recv_socket_buffer_size (p. 1710)

Referenced by **UDPv4WanTransport.Property_t.Property_t()**.

8.229.3.3 ignore_loopback_interface

```
int ignore_loopback_interface
```

Prevents the transport plugin from using the IP loopback interface.

Currently three values are allowed:

- **0**: Forces local traffic to be sent over loopback, even if a more efficient transport (such as shared memory) is installed (in which case traffic will be sent over both transports).
- **1**: Disables local traffic via this plugin. The IP loopback interface is not used, even if no NICs are discovered. This is useful when you want applications running on the same node to use a more efficient plugin (such as shared memory) instead of the IP loopback.
- **-1**: Automatic. Lets RTI Connext decide between the above two choices.

The current "automatic" (-1) RTI Connext policy is as follows:

- If a shared memory transport plugin is available for local traffic and there is a locator on the initial peers list that can use shared memory, the effective value is 1 (i.e., disable UPV4 local traffic).
- Otherwise, the effective value is 0 (i.e., use UDPv4 for local traffic also).

[default] -1 Automatic RTI Connext policy based on availability of the shared memory transport.

Referenced by **UDPv4WanTransport.Property_t.Property_t()**.

8.229.3.4 ignore_nonup_interfaces

```
int ignore_nonup_interfaces
```

[DEPRECATED] Prevents the transport plugin from using a network interface that is not reported as UP by the operating system.

DEPRECATED: this property has no effect. Non-UP interfaces are ignored until they change their status to UP, unless **com.rti.ndds.transport.UDPv4WanTransport.Property_t.disable_interface_tracking** (p. 1728) is set to 1, in which case interfaces are ignored even if they change their status at a later point.

The transport checks the flags reported by the operating system for each network interface upon initialization. An interface that is not reported as UP will not be used. This property allows you to configure the transport to start using even the interfaces that were not reported as UP.

Two values are allowed:

- **0**: Allow the use of interfaces that were not reported as UP.
- **1**: Do not use interfaces that were not reported as UP.

[default] 1

Referenced by **UDPv4WanTransport.Property_t.Property_t()**.

8.229.3.5 ignore_nonrunning_interfaces

```
int ignore_nonrunning_interfaces
```

Prevents the transport plugin from using a network interface that is not reported as RUNNING by the operating system.

The transport checks the flags reported by the operating system for each network interface upon initialization. An interface that is not reported as UP will not be used. This property allows the same check to be extended to the IFF_↩ RUNNING flag implemented by some operating systems. The RUNNING flag is defined to mean that "all resources are allocated," and may be off if there is no link detected, e.g., the network cable is unplugged.

Two values are allowed:

- **0**: Do not check the RUNNING flag when enumerating interfaces, just make sure the interface is UP.
- **1**: Check the flag when enumerating interfaces, and ignore those that are not reported as RUNNING. This can be used on some operating systems to cause the transport to ignore interfaces that are enabled but not connected to the network.

[default] 1 (i.e., check RUNNING flag)

Referenced by **UDPv4WanTransport.Property_t.Property_t()**.

8.229.3.6 no_zero_copy

```
int no_zero_copy
```

[DEPRECATED] Prevents the transport plugin from doing a zero copy.

DEPRECATED: This property has no effect. By default, this plugin will use the zero copy on OSes that offer it. While this is good for performance, it may sometimes tax the OS resources in a manner that cannot be overcome by the application.

The best example is if the hardware/device driver lends the buffer to the application itself. If the application does not return the loaned buffers soon enough, the node may err or malfunction. In case you cannot reconfigure the H/W, device driver, or the OS to allow the zero copy feature to work for your application, you may have no choice but to turn off zero copy use.

By default this is set to 0, so RTI Connext will use the zero-copy API if offered by the OS.

Referenced by **UDPv4WanTransport.Property_t.Property_t()**.

8.229.3.7 send_blocking

```
int send_blocking
```

Control blocking behavior of send sockets. CHANGING THIS FROM THE DEFAULT CAN CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

Currently two values are defined:

- **NDDS_TRANSPORT_UDPV4_BLOCKING_ALWAYS:** Sockets are blocking (default socket options for the operating system).
- **NDDS_TRANSPORT_UDPV4_BLOCKING_NEVER:** Sockets are modified to make them non-blocking. THIS MAY CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

[default] NDDS_TRANSPORT_UDPV4_BLOCKING_ALWAYS

This property is not supported on Windows when using the Real-Time WAN **Transport** (p. 2150). The send sockets cannot be configured to be non-blocking because Windows does not provide a way to configure a socket to only be non-blocking for send operations but not receive operations.

Referenced by **UDPv4WanTransport.Property_t.Property_t()**.

8.229.3.8 use_checksum

```
int use_checksum
```

Configures whether to send UDP checksum.

This property specifies whether the UDP checksum will be computed. On Windows and Linux, the UDP protocol will not set the checksum when use_checksum is set to 0. This is useful when RTPS protocol statistics related to corrupted messages need to be collected through the API **com.rti.dds.domain.DomainParticipant.get_participant_protocol↩ _status** (p. 1021).

[default] 1 (enabled)

Referenced by **UDPv4WanTransport.Property_t.Property_t()**.

8.229.3.9 transport_priority_mask

```
long transport_priority_mask
```

Set mask for use of transport priority field.

This is used in conjunction with **com.rti.ndds.transport.UDPv4WanTransport.Property_t.transport_priority↩ _mapping_low** (p. 1726) and **com.rti.ndds.transport.UDPv4WanTransport.Property_t.transport_priority_↩ mapping_high** (p. 1726) to define the mapping from the DDS transport priority (see **TRANSPORT_PRIORITY** (p. 526)) to the IPv4 TOS field. Defines a contiguous region of bits in the 32-bit transport priority value that is used to generate values for the IPv4 TOS field on an outgoing socket.

For example, the value 0x0000ff00 causes bits 9-16 (8 bits) to be used in the mapping. The value will be scaled from the mask range (0x0000 - 0xff00 in this case) to the range specified by low and high.

If the mask is set to zero, then the transport will not set IPv4 TOS for send sockets.

[default] 0.

Referenced by **UDPv4WanTransport.Property_t.Property_t()**.

8.229.3.10 transport_priority_mapping_low

```
int transport_priority_mapping_low
```

Set low value of output range to IPv4 TOS.

This is used in conjunction with **com.rti.ndds.transport.UDPv4WanTransport.Property_t.transport_priority_mask** (p. 1726) and **com.rti.ndds.transport.UDPv4WanTransport.Property_t.transport_priority_mapping_high** (p. 1726) to define the mapping from the DDS transport priority to the IPv4 TOS field. Defines the low value of the output range for scaling.

Note that IPv4 TOS is generally an 8-bit value.

[default] 0.

Referenced by **UDPv4WanTransport.Property_t.Property_t()**.

8.229.3.11 transport_priority_mapping_high

```
int transport_priority_mapping_high
```

Set high value of output range to IPv4 TOS.

This is used in conjunction with **com.rti.ndds.transport.UDPv4WanTransport.Property_t.transport_priority_mask** (p. 1726) and **com.rti.ndds.transport.UDPv4WanTransport.Property_t.transport_priority_mapping_low** (p. 1726) to define the mapping from the DDS transport priority to the IPv4 TOS field. Defines the high value of the output range for scaling.

Note that IPv4 TOS is generally an 8-bit value.

[default] 0xff.

Referenced by **UDPv4WanTransport.Property_t.Property_t()**.

8.229.3.12 send_ping

```
int send_ping
```

Configures whether to send PING messages.

This property specifies whether to send a PING message before commencing the discovery process. On certain operating systems or with certain switches the initial UDP packet, while configuring the ARP table, can unfortunately be dropped. To avoid dropping the initial RTPS discovery sample, a PING message is sent to preconfigure the ARP table in those environments.

[default] 1 (enabled)

Referenced by **UDPv4WanTransport.Property_t.Property_t()**.

8.229.3.13 force_interface_poll_detection

```
int force_interface_poll_detection
```

Forces the interface tracker to use a polling mechanism to detect changes on the UDPv4 interfaces.

When possible, the detection of an IP address change is done asynchronously using the APIs offered by the underlying OS. By setting this property on those OSes, the use of a polling mechanism to detect changes can be forced.

[default] 0 (disabled).

Referenced by **UDPv4WanTransport.Property_t.Property_t()**.

8.229.3.14 interface_poll_period

```
long interface_poll_period
```

Specifies the period in milliseconds to query for changes in the state of all the interfaces.

When possible, the detection of an IP address change is done asynchronously using the APIs offered by the underlying OS. If there is no mechanism to do that, the detection will use a polling strategy where the polling period can be configured by setting this property.

[default] 500 milliseconds.

Referenced by **UDPv4WanTransport.Property_t.Property_t()**.

8.229.3.15 protocol_overhead_max

```
int protocol_overhead_max
```

Maximum size in bytes of protocol overhead, including headers.

This value is the maximum size, in bytes, of protocol-related overhead. Normally, the overhead accounts for UDP and IP headers. The default value is set to accommodate the most common UDP/IP header size.

Note that when **com.rti.ndds.transport.Transport.Property_t.message_size_max** (p. 1704) plus this overhead is larger than the UDPv4 maximum message size (65535 bytes), the middleware will automatically reduce the effective message_size_max, to 65535 minus this overhead.

[default] 28.

See also

com.rti.ndds.transport.Transport.Property_t.message_size_max (p. 1704)

Referenced by **UDPv4WanTransport.Property_t.Property_t()**.

8.229.3.16 disable_interface_tracking

```
int disable_interface_tracking
```

Disables detection of network interface changes.

By default, network interface changes are propagated in the form of locators to other applications. This is done to support IP mobility scenarios.

For example, you could start a RTI Connext application with Wi-Fi and move to a wired connection. In order to continue communicating with other applications, this interface change has to be propagated.

In RTI Connext 5.2 (the initial release) and earlier versions of the product, IP mobility scenarios were not supported. 5.2 applications will report errors if they detect locator changes in a DataWriter or DataReader.

You can disable the notification and propagation of interface changes by setting this property to 1.

This way, an interface change in a newer application will not trigger errors in an application running 5.2 or earlier. Of course, this will prevent the new application from being able to detect network interface changes.

[default] 0

Referenced by **UDPv4WanTransport.Property_t.Property_t()**.

8.229.3.17 public_address

```
String public_address
```

Public IP address associated with the transport instantiation.

Setting the public IP address is only necessary for the Real-Time WAN **Transport** (p. 2150) associated with an external **com.rti.dds.domain.DomainParticipant** (p. 948) (publicly reachable) in order to support the two communication scenarios shown in the Figure below.

For an external **com.rti.dds.domain.DomainParticipant** (p. 948) behind a NAT-enabled router, this address is the public IP address of the router.

When this property is set, the DomainParticipant will announce PUBLIC+UUID locators to other DomainParticipants. These locators are reachable locators because they contain this public IP address.

For additional information on Real-Time WAN **Transport** (p. 2150) locators, see the `Core Libraries User's Manual`.

with a Participant that has a Public Address"

[default] null (the transport will announce UUID locators)

Referenced by **UDPv4WanTransport.Property_t.Property_t()**.

8.229.3.18 comm_ports

TransportUdpWanCommPortsMappingInfoSeq comm_ports

Configures the public and private UDP ports that a transport instance uses to receive/send RTPS data.

Array containing the mapping between "RTPS ports", "UDP receive host ports", and "UDP receive public ports".

When the transport is configured using properties, the port mapping array is provided using a JSON string.

For example:

```
{
    "default": {"host": 8192, "public": 9678},
    "mappings": [
        {"rtps": 1234, "host": 9999, "public": 5678},
        {"rtps": 1235, "host": 9990, "public": 5679},
    ]
}
```

It is also possible to configure the mapping with XML:

```
<transport_builtin>
    <udpv4_wan>
        <comm_ports>
```

```
            <default>
                <host>8192</host>
                <public>9678</public>
            </default>
            <mappings>
                <element>
                    <rtps>1234</rtps>
                    <host>9999</host>
                    <public>5678</public>
                </element>
                <element>
                    <rtps>1235</rtps>
                    <host>9990</host>
                    <public>5679</public>
                </element>
            </mappings>
        </comm_ports>
    </udpv4_wan>
<transport_builtin>
```

For additional information on how to set the value of this property, see the `Core Libraries User's Manual`.

[default] NULL (The UDP ports used for communications will be derived from the RTPS ports associated with the locators for the DomainParticipant and its Endpoints (DataWriters and DataReaders)).

Referenced by **UDPv4WanTransport.Property_t.Property_t()**.

8.229.3.19 port_offset

```
int port_offset
```

Port offset to allow coexistence with built-in UDPv4 transport.

This property allows using the built-in UDPv4 transport and the Real-Time WAN **Transport** (p. 2150) at the same time.

```
<transport_builtin>
    <mask>UDPv4_WAN|UDPv4</mask>
</transport_builtin>
```

When the UDP ports used by Real-Time WAN **Transport** (p. 2150) are not explicitly set, they are calculated as follows: RTPS port + port_offset.

[default] 125

Referenced by **UDPv4WanTransport.Property_t.Property_t()**.

8.229.3.20 binding_ping_period

```
long binding_ping_period
```

Specifies the period in milliseconds at which BINDING PINGS messages are sent to keep NAT mappings open.

Configures the period in milliseconds at which BINDING_PING messages are sent by a local transport instance to a remote transport instance. For example, 1000 means to send BINDING_PING messages every second.

BINDING_PING messages are used on the sending side to open NAT bindings from a local transport instance to a remote transport instance and they are sent periodically to keep the bindings open.

On the receiving side, BINDING_PINGS are used to calculate the public IP transport address of an UUID locator. This address will be used to send data to the locator.

For additional information on the role of BINDING_PING, see the `Core Libraries User's Manual`.

From a configuration point of view, and to avoid communication disruptions, the period at which a transport instance sends BINDING_PING messages should be smaller than the NAT binding session timeout. This timeout depends on the NAT router configuration.

[default] 1000 (1 sec)

Referenced by **UDPv4WanTransport.Property_t.Property_t()**.

8.230.3 Member Data Documentation

8.230.3.1 send_socket_buffer_size

```
int send_socket_buffer_size
```

Size in bytes of the send buffer of a socket used for sending.

On most operating systems, `setsockopt()` will be called to set the SENDBUF to the value of this parameter.

This value must be greater than or equal to **com.rti.ndds.transport.Transport.Property_t.message_size_max** (p. 1704). Its maximum value is dependent on the operating system.

By default, it will be set to com.rti.ndds.transport.UDPv6Transport_SEND_SOCKET_BUFFER_SIZE_DEFAULT.

The maximum value for this property depends on the operating system.

Valid values are:

- com.rti.ndds.transport.UDPv6Transport_SEND_SOCKET_BUFFER_SIZE_DEFAULT: `setsockopt()` (or equivalent) will be called to size the send buffer of the socket with the default value.
- com.rti.ndds.transport.UDPv6Transport_SOCKET_BUFFER_SIZE_OS_DEFAULT: `setsockopt()` (or equivalent) will not be called to size the send buffer of the socket. RTI Connext will use the OS default.
- com.rti.ndds.transport.UDPv6Transport_SOCKET_BUFFER_SIZE_OS_MAX: RTI Connext will retrieve the maximum socket buffer size allowed by the operating system and use that value for the send buffer size of the socket.
- Positive integer: `setsockopt()` (or equivalent) will be called to size the send buffer of the socket with the provided value. If this value exceeds the maximum allowed by the operating system, the operating system's maximum value will be used instead.

Referenced by **UDPv6Transport.Property_t.Property_t()**.

8.230.3.2 recv_socket_buffer_size

```
int recv_socket_buffer_size
```

Size in bytes of the receive buffer of a socket used for receiving.

On most operating systems, `setsockopt()` will be called to set the RECVBUF to the value of this parameter.

This value must be greater than or equal to **com.rti.ndds.transport.Transport.Property_t.message_size_max** (p. 1704). Its maximum value is dependent on the operating system.

By default, it will be set to com.rti.ndds.transport.UDPv6Transport_RECV_SOCKET_BUFFER_SIZE_DEFAULT.

The maximum value for this property depends on the operating system.

Valid values are:

- com.rti.ndds.transport.UDPv6Transport_RECV_SOCKET_BUFFER_SIZE_DEFAULT: `setsockopt()` (or equivalent) will be called to size the receive buffer of the socket with the default value.
- com.rti.ndds.transport.UDPv6Transport_SOCKET_BUFFER_SIZE_OS_DEFAULT: `setsockopt()` (or equivalent) will not be called to size the receive buffer of the socket. RTI Connext will use the OS default.
- com.rti.ndds.transport.UDPv6Transport_SOCKET_BUFFER_SIZE_OS_MAX: RTI Connext will retrieve the maximum socket buffer size allowed by the operating system and use that value for the receive buffer size of the socket.
- Positive integer: `setsockopt()` (or equivalent) will be called to size the receive buffer of the socket with the provided value. If this value exceeds the maximum allowed by the operating system, the operating system's maximum value will be used instead.

Referenced by **UDPv6Transport.Property_t.Property_t()**.

8.230.3.3 unicast_enabled

```
int unicast_enabled
```

Allows the transport plugin to use unicast for sending and receiving.

This value turns unicast UDP on (if set to 1) or off (if set to 0) for this plugin. By default, it will be turned on (1). Also by default, the plugin will use all the allowed network interfaces that it finds up and running when the plugin is instantiated.

Referenced by **UDPv6Transport.Property_t.Property_t()**.

8.230.3.4 multicast_enabled

```
int multicast_enabled
```

Allows the transport plugin to use multicast for sending and receiving.

This value turns multicast UDP on (if set to 1) or off (if set to 0) for this plugin. By default, it will be turned on (1) for those platforms that support multicast. Also by default, the plugin will use the all network interfaces allowed for multicast that it finds up and running when the plugin is instantiated.

Referenced by **UDPv6Transport.Property_t.Property_t()**.

8.230.3.5 multicast_ttl

```
int multicast_ttl
```

Value for the time-to-live parameter for all multicast sends using this plugin.

This is used to set the TTL of multicast packets sent by this transport plugin.

[default] 1

Referenced by **UDPv6Transport.Property_t.Property_t()**.

8.230.3.6 multicast_loopback_disabled

```
int multicast_loopback_disabled
```

Prevents the transport plugin from putting multicast packets onto the loopback interface.

If multicast loopback is disabled (this value is set to 1), then when sending multicast packets, RTI Connext will *not* put a copy of the packets on the loopback interface. This prevents applications on the same node (including itself) from receiving those packets.

This value is set to 0 by default, meaning multicast loopback is *enabled*.

Disabling multicast loopback (setting this value to 1) may result in minor performance gains when using multicast.

Referenced by **UDPv6Transport.Property_t.Property_t()**.

8.230.3.7 ignore_loopback_interface

```
int ignore_loopback_interface
```

Prevents the transport plugin from using the IP loopback interface.

Currently three values are allowed:

- **0**: Forces local traffic to be sent over loopback, even if a more efficient transport (such as shared memory) is installed (in which case traffic will be sent over both transports).
- **1**: Disables local traffic via this plugin. Do not use the IP loopback interface even if no NICs are discovered. This is useful when you want applications running on the same node to use a more efficient transport (such as shared memory) instead of the IP loopback.
- **-1**: Automatic. Lets RTI Connext decide between the above two choices.

The current "automatic" (-1) RTI Connext policy is as follows.

- If a shared memory transport plugin is available for local traffic and there is a locator on the initial peers list that can use shared memory, the effective value is 1 (i.e., disable UDPv6 local traffic).
- Otherwise, the effective value is 0 (i.e., use UDPv6 for local traffic also).

[default] -1 Automatic RTI Connext policy based on availability of the shared memory transport.

Referenced by **UDPv6Transport.Property_t.Property_t()**.

8.230.3.8 ignore_nonrunning_interfaces

```
int ignore_nonrunning_interfaces
```

Prevents the transport plugin from using a network interface that is not reported as RUNNING by the operating system.

The transport checks the flags reported by the operating system for each network interface upon initialization. An interface that is not reported as UP will not be used. This property allows the same check to be extended to the IFF_↩ RUNNING flag implemented by some operating systems. The RUNNING flag is defined to mean that "all resources are allocated," and may be off if there is no link detected, e.g., the network cable is unplugged.

Two values are allowed:

- **0**: Do not check the RUNNING flag when enumerating interfaces, just make sure interface is UP.
- **1**: Check flag when enumerating interfaces and ignore those that are not reported as RUNNING. This can be used on some operating systems to cause the transport to ignore interfaces that are enabled but not connected to the network.

[default] 1 (i.e., check RUNNING flag)

Referenced by **UDPv6Transport.Property_t.Property_t()**.

8.230.3.9 no_zero_copy

```
int no_zero_copy
```

[DEPRECATED] Prevents the transport plugin from doing zero copy.

DEPRECATED: This property has no effect. By default, this plugin will use the zero copy on OSes that offer it. While this is good for performance, it may sometimes tax the OS resources in a manner that cannot be overcome by the application.

The best example is if the hardware/device driver lends the buffer to the application itself. If the application does not return the loaned buffers soon enough, the node may error or malfunction. If you cannot reconfigure the H/W, device driver, or the OS to allow the zero copy feature to work for your application, you may have no choice but to turn off the use of zero copy.

By default this is set to 0, so RTI Connext will use the zero copy API if offered by the OS.

Referenced by **UDPv6Transport.Property_t.Property_t()**.

8.230.3.10 send_blocking

```
int send_blocking
```

Control blocking behavior of send sockets. CHANGING THIS FROM THE DEFAULT CAN CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

Currently two values are defined:

- **NDDS_TRANSPORT_UDPV6_BLOCKING_ALWAYS:** Sockets are blocking (default socket options for the operating system).
- **NDDS_TRANSPORT_UDPV6_BLOCKING_NEVER:** Sockets are modified to make them non-blocking. THIS MAY CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

[default] NDDS_TRANSPORT_UDPV6_BLOCKING_ALWAYS.

Referenced by **UDPv6Transport.Property_t.Property_t()**.

8.230.3.11 enable_v4mapped

```
int enable_v4mapped
```

Specify whether UDPv6 transport will process IPv4 addresses.

Set this to 1 to turn on processing of IPv4 addresses. Note that this may make it incompatible with use of the UDPv4 transport within the same domain participant.

[default] 0.

Referenced by **UDPv6Transport.Property_t.Property_t()**.

8.230.3.12 transport_priority_mask

```
long transport_priority_mask
```

Set mask for use of transport priority field.

If transport priority mapping is supported on the platform, this mask is used in conjunction with **com.rti.ndds.↩ transport.UDPv6Transport.Property_t.transport_priority_mapping_low** (p. 1738) and **com.rti.ndds.transport.↩ UDPv6Transport.Property_t.transport_priority_mapping_high** (p. 1738) to define the mapping from the DDS transport priority (see **TRANSPORT_PRIORITY** (p. 526)) to the IPv6 TCLASS field. Defines a contiguous region of bits in the 32-bit transport priority value that is used to generate values for the IPv6 TCLASS field on an outgoing socket.

For example, the value 0x0000ff00 causes bits 9-16 (8 bits) to be used in the mapping. The value will be scaled from the mask range (0x0000 - 0xff00 in this case) to the range specified by low and high.

If the mask is set to zero, then the transport will not set IPv6 TCLASS for send sockets.

[default] 0.

Referenced by **UDPv6Transport.Property_t.Property_t()**.

8.230.3.13 transport_priority_mapping_low

```
int transport_priority_mapping_low
```

Set low value of output range to IPv6 TCLASS.

This is used in conjunction with **com.rti.ndds.transport.UDPv6Transport.Property_t.transport_priority_mask** (p. 1737) and **com.rti.ndds.transport.UDPv6Transport.Property_t.transport_priority_mapping_high** (p. 1738) to define the mapping from the DDS transport priority to the IPv6 TCLASS field. Defines the low value of the output range for scaling.

Note that IPv6 TCLASS is generally an 8-bit value.

[default] 0.

Referenced by **UDPv6Transport.Property_t.Property_t()**.

8.230.3.14 transport_priority_mapping_high

```
int transport_priority_mapping_high
```

Set high value of output range to IPv6 TCLASS.

This is used in conjunction with **com.rti.ndds.transport.UDPv6Transport.Property_t.transport_priority_mask** (p. 1737) and **com.rti.ndds.transport.UDPv6Transport.Property_t.transport_priority_mapping_low** (p. 1738) to define the mapping from the DDS transport priority to the IPv6 TCLASS field. Defines the high value of the output range for scaling.

Note that IPv6 TCLASS is generally an 8-bit value.

[default] 0xff.

Referenced by **UDPv6Transport.Property_t.Property_t()**.

8.230.3.15 port_offset

```
int port_offset
```

Port offset to allow multiple instances of UDPv6 transports in the same **com.rti.dds.domain.DomainParticipant** (p. 948).

By default, it is not possible to have multiple instances of the UDPv6 transport in the same **com.rti.dds.domain.↩ DomainParticipant** (p. 948). This is because all instances will try to bind to the same UDP port(s) for receiving data.

With this property, you can specify an offset that will be added to the RTPS port(s) to determine the UDP port(s) to bind to. This way, you can have multiple instances of the UDPv6 transport in the same **com.rti.dds.domain.Domain↩ Participant** (p. 948).

An RTPS port will be mapped to an UDP port as follows: UDP port = RTPS port + port_offset.

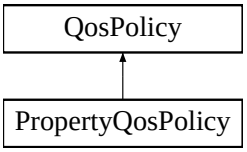
[default] 0

Referenced by **UDPv6Transport.Property_t.Property_t()**.

8.231 PropertyQosPolicy Class Reference

<<***extension***>> *(p. 138)* Stores name/value(string) pairs that can be used to configure certain parameters of RTI Connext that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.

Inheritance diagram for PropertyQosPolicy:



Public Attributes

- final **PropertySeq value**

  <<***basic***>> (p. *123)* <<***extension***>> (p. *138) Sequence of properties.*

8.231.1 Detailed Description

<<***extension***>> *(p. 138)* Stores name/value(string) pairs that can be used to configure certain parameters of RTI Connext that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.

Entity:

com.rti.dds.domain.DomainParticipant (p. 948) **com.rti.dds.subscription.DataReader** (p. 707) **com.rti.↩ dds.publication.DataWriter** (p. 818)

Properties:

RxO (p. 506) = N/A;
Changeable (p. 507) = **YES** (p. 507)

See also

com.rti.dds.domain.DomainParticipant.get_builtin_subscriber (p. 998)

8.231.2 Usage

The PROPERTY QoS policy can be used to associate a set of properties in the form of (name, value) pairs with a **com.↩ rti.dds.subscription.DataReader** (p. 707), **com.rti.dds.publication.DataWriter** (p. 818), or **com.rti.dds.domain.↩ DomainParticipant** (p. 948). This is similar to the **com.rti.dds.infrastructure.UserDataQosPolicy** (p. 2272), except this policy uses (name, value) pairs, and you can select whether or not a particular pair should be propagated (included in the builtin topic).

You can find a complete list of predefined properties in the `Property Reference Guide`.

This QoS policy may be used to configure:

- Durable Writer History, see **Configuring Durable Writer History** (p. 119)
- Durable Reader State, see **Configuring Durable Reader State** (p. 121)
- Builtin Transport Plugins, see **UDPv4 Transport Property Names in Property QoS Policy of Domain Participant** (p. 2257), **UDPv6 Transport Property Names in Property QoS Policy of Domain Participant** (p. 2266), and **Shared Memory Transport Property Names in Property QoS Policy of Domain Participant** (p. 1993)
- Extension Transport Plugins, see **Loading Transport Plugins through Property QoS Policy of Domain Participant** (p. 104)
- **Clock Selection** (p. 41)

In addition, you may add your own name/value pairs to the Property QoS policy of an **Entity** (p. 1320). Via this QoS policy, you can direct RTI Connext to propagate these name/value pairs with the discovery information for the **Entity** (p. 1320). Applications that discover the **Entity** (p. 1320) can then access the user-specific name/value pairs in the discovery information of the remote **Entity** (p. 1320). This allows you to add meta-information about an **Entity** (p. 1320) for application-specific use, for example, authentication/authorization certificates (which can also be done using the **com.↩ rti.dds.infrastructure.UserDataQosPolicy** (p. 2272) or **com.rti.dds.infrastructure.GroupDataQosPolicy** (p. 1419)).

8.231.2.1 Reasons for Using the PropertyQosPolicy

- Supports dynamic loading of extension transports
- Supports multiple instances of the builtin transports
- Allows full pluggable transport configuration for non-C/C++ language bindings (Java, .NET, etc.)
- Avoids the process of creating entities disabled, changing their QoS settings, then enabling them
- Allows selection of clock

Some of the RTI Connext capabilities configurable via the Property QoS policy can also be configured in code via APIs. However, the Property QoS policy allows you to configure those parameters via XML files. In addition, some of the configuration APIs will only work if the **Entity** (p. 1320) was created in a disabled state and then enabled after the configuration change was applied. By configuring those parameters using the Property QoS policy during entity creation, you avoid the additional work of first creating a disabled entity and then enabling it afterwards.

There are helper functions to facilitate working with properties, see the **PROPERTY** (p. 499) page.

8.231.3 Member Data Documentation

8.231.3.1 value

```
final  PropertySeq value
```

Initial value:

```
=
        new PropertySeq()
```

*<<**basic**>> (p. 123) <<**extension**>> (p. 138)* Sequence of properties.

[default] An empty list.

8.232 PropertyQosPolicyHelper Class Reference

Policy helpers that facilitate management of the properties in the input policy.

Static Public Member Functions

- static int **get_number_of_properties** (**PropertyQosPolicy** policy)
  Gets the number of properties in the input policy.
- static void **assert_property** (**PropertyQosPolicy** policy, String name, String value, boolean propagate)
  Asserts the property identified by name in the input policy.
- static void **add_property** (**PropertyQosPolicy** policy, String name, String value, boolean propagate)
  Adds a new property to the input policy.
- static **Property_t** **lookup_property** (**PropertyQosPolicy** policy, String name)
  Searches for a property in the input policy given its name.
- static void **remove_property** (**PropertyQosPolicy** policy, String name)
  Removes a property from the input policy.
- static void **get_properties** (**PropertyQosPolicy** policy, **PropertySeq** properties, String name_prefix)
  Retrieves a list of properties whose names match the input prefix.
- static void **configure_pki_secure_transport_properties** (**PropertyQosPolicy** policy, String transport_↩ plugin_prefix, java.security.cert.Certificate[ ] root_ca_certificates, java.security.cert.Certificate[ ] certificate_chain, java.security.PrivateKey private_key)
  Configures the public-key infrastructure elements required by a secure transport specified by its prefix.
- static int **get_qos_resource_limits_property_string_max_length** (**PropertyQosPolicy** policy)
  Returns the maximum cumulative string length of all the properties within the specified policy.
- static **PropertyQosPolicyMutability** **get_property_mutability** (String name, **PropertyQosPolicy** policy)
  Returns the mutability type of a property.

8.232.1 Detailed Description

Policy helpers that facilitate management of the properties in the input policy.

8.232.2 Member Function Documentation

8.232.2.1 get_number_of_properties()

```
static int get_number_of_properties (
            PropertyQosPolicy policy )  [static]
```

Gets the number of properties in the input policy.

Precondition

policy cannot be null.

Parameters

policy	<<***in***>> *(*p. *404)* Input policy.

Returns

Number of properties.

References **PropertyQosPolicy.value**.

8.232.2.2 assert_property()

```
static void assert_property (
              PropertyQosPolicy policy,
             String name,
             String value,
             boolean propagate )  [static]
```

Asserts the property identified by name in the input policy.

If the property already exists, this function replaces its current value with the new one.

If the property identified by name does not exist, this function adds it to the property set.

This function increases the maximum number of elements of the policy sequence when this number is not enough to store the new property.

Precondition

policy, name and value cannot be null.

Parameters

policy	<<***in***>> *(*p. *404)* Input policy.
name	<<***in***>> *(*p. *404)* Property name.
value	<<***in***>> *(*p. *404)* Property value.
propagate	<<***in***>> *(*p. *404)* Indicates if the property will be propagated on discovery.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903)

References **PropertyQosPolicyHelper.lookup_property()**, and **PropertyQosPolicy.value**.

Referenced by **PropertyQosPolicyHelper.configure_pki_secure_transport_properties()**.

8.232.2.3 add_property()

```
static void add_property (
              PropertyQosPolicy policy,
             String name,
             String value,
             boolean propagate )  [static]
```

Adds a new property to the input policy.

This function will allocate memory to store the (name, value) pair. The memory allocated is owned by RTI Connext.

If the maximum number of elements of the policy sequence is not enough to store the new property, this function will increase it.

If the property already exists the function fails with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_↩ MET** (p. 1903).

Precondition

policy, name and value cannot be null.

The property is not in the policy.

Parameters

policy	<<***in***>> *(p. 404)* Input policy.
name	<<***in***>> *(p. 404)* Property name.
value	<<***in***>> *(p. 404)* Property value.
propagate	<<***in***>> *(p. 404)* Indicates if the property will be propagated on discovery.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903), **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903)

References **PropertyQosPolicyHelper.lookup_property()**, and **PropertyQosPolicy.value**.

8.232.2.4 lookup_property()

```
static  Property_t lookup_property (
              PropertyQosPolicy policy,
             String name )  [static]
```

Searches for a property in the input policy given its name.

Precondition

policy, name and value cannot be null.

Parameters

policy	<<***in***>> *(*p. *404)* Input policy.
name	<<***in***>> *(*p. *404)* Property name.

Returns

The function returns the first property with the given name. If such a property does not exist, the function returns NULL.

References **Property_t.name**, and **PropertyQosPolicy.value**.

Referenced by **PropertyQosPolicyHelper.add_property()**, **PropertyQosPolicyHelper.assert_property()**, and **PropertyQosPolicyHelper.remove_property()**.

8.232.2.5 remove_property()

```
static void remove_property (
              PropertyQosPolicy policy,
             String name )  [static]
```

Removes a property from the input policy.

If the property does not exist, the function fails with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).

Precondition

policy and name cannot be null.

The property is in the policy.

Parameters

policy	<<***in***>> *(*p. *404)* Input policy.
name	<<***in***>> *(*p. *404)* Property name.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903)

References **PropertyQosPolicyHelper.lookup_property()**, and **PropertyQosPolicy.value**.

8.232.2.6 get_properties()

```
static void get_properties (
              PropertyQosPolicy policy,
              PropertySeq properties,
             String name_prefix )  [static]
```

Retrieves a list of properties whose names match the input prefix.

If the properties sequence doesn't own its buffer, and its maximum is less than the total number of properties matching the input prefix, it will be filled up to its maximum and fail with an error of **com.rti.dds.infrastructure.RETCODE_↩ OUT_OF_RESOURCES** (p. 1903).

Precondition

policy, properties and name_prefix cannot be null.

Parameters

policy	<<***in***>> *(p. 404)* Input policy.
properties	<<***inout***>> *(p. 404)* A **com.rti.dds.infrastructure.PropertySeq** (p. 1749) object where the set or list of properties will be returned.
name_prefix	Name prefix.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903)

References **Property_t.name**, **Property_t.propagate**, **Property_t.value**, and **PropertyQosPolicy.value**.

8.232.2.7 configure_pki_secure_transport_properties()

```
static void configure_pki_secure_transport_properties (
              PropertyQosPolicy policy,
```

```
String transport_plugin_prefix,
java.security.cert.Certificate[] root_ca_certificates,
java.security.cert.Certificate[] certificate_chain,
java.security.PrivateKey private_key )  [static]
```

Configures the public-key infrastructure elements required by a secure transport specified by its prefix.

This operation asserts the necessary set of properties that specify public-key elements required by a secure transport. These elements are the root CA certificates, the identifying certificate chain and the private key.

The operation sets the corresponding properties for each of these public-key elements, replacing an existing property if present in the policy. The set of properties contain both certificates and private key in PEM format.

These properties are:

- root_ca_certificates: <transport_plugin_prefix>.tls.verify.ca
- certificate_chain: <transport_plugin_prefix>.tls.identity.certificate_chain
- private_key <transport_plugin_prefix>.tls.identity.private_ky

The properties are asserted with the propagate option set to false;

The supported secure transport plugin is: RTI Secure TCP Transport (TCP + TLS). Library: nddstransporttcp

Parameters

policy	<<***inout***>> *(*p. *404)* Policy to be populated.
transport_plugin_prefix	<<***in***>> *(*p. *404)* Plugin prefix that is given to the transport plugin when the plugin is loaded. This is done by setting the property 'dds.transport.load_plugins'.
root_ca_certificates	<<***in***>> *(*p. *404)* List of CA certificates that will be used to verify the validity of the identifying certificate chain. At least one root CA certificate is required.
certificate_chain	<<***in***>> *(*p. *404)* Identifying certificate chain. At least one identifying certificate is required.
private_key	<<***in***>> *(*p. *404)* Private key associated with the public key of the identifying certificates and that is required for the authentication process. It must be unencrypted.

References **PropertyQosPolicyHelper.assert_property()**.

8.232.2.8 get_qos_resource_limits_property_string_max_length()

```
static int get_qos_resource_limits_property_string_max_length (
              PropertyQosPolicy policy )  [static]
```

Returns the maximum cumulative string length of all the properties within the specified policy.

This operation computes the total cumulative length of the properties. This represents the minimum value that must be set in the resource limits qos so that it is consistent.

References **PropertyQosPolicy.value**.

8.232.2.9 get_property_mutability()

```
static  PropertyQosPolicyMutability get_property_mutability (
             String name,
              PropertyQosPolicy policy )  [static]
```

Returns the mutability type of a property.

If the property does not exist, **com.rti.dds.infrastructure.PropertyQosPolicyMutability.PROPERTY_QOS_↩ MUTABLE** (p. 1749) is returned. Otherwise, it returns the mutability type of the specified property. See **com.↩ rti.dds.infrastructure.PropertyQosPolicyMutability** (p. 1748) for more information of the different mutability types.

Parameters

name	*<<**in**>> (p. 404)*. The name of the property for which we want to know the mutability type.
policy	*<<**in**>> (p. 404)*. These are the properties in which we are going to look for the property with the provided name.

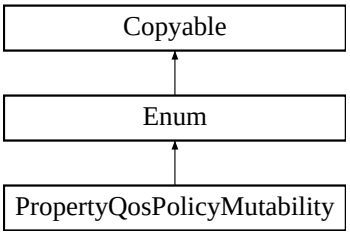
Returns

The mutability type of the input property.

8.233 PropertyQosPolicyMutability Class Reference

Determines if, and when, the value of a property can change.

Inheritance diagram for PropertyQosPolicyMutability:



Static Public Attributes

- static final **PropertyQosPolicyMutability PROPERTY_QOS_MUTABLE**

  The property is mutable: it can be changed at any time.
- static final **PropertyQosPolicyMutability PROPERTY_QOS_MUTABLE_UNTIL_ENABLE**

  The property can only be changed before enabling the entity.
- static final **PropertyQosPolicyMutability PROPERTY_QOS_IMMUTABLE**

  The property is immutable: it can only be specified when creating the entity.

  *Tags of the corresponding **DataWriter** (p. 818).*

8.237.1 Detailed Description

Entry created when a **com.rti.dds.publication.DataWriter** (p. 818) is discovered in association with its **Publisher** (p. 1767).

Data associated with the built-in topic **com.rti.dds.publication.builtin.PublicationBuiltinTopicDataTypeSupport.↩ PUBLICATION_TOPIC_NAME** (p. 411). It contains QoS policies and additional information that apply to the remote **com.rti.dds.publication.DataWriter** (p. 818) the related **com.rti.dds.publication.Publisher** (p. 1767).

8.237.2 Member Data Documentation

8.237.2.1 key

```
final BuiltinTopicKey_t key
```

DCPS key to distinguish entries.

8.237.2.2 participant_key

```
final BuiltinTopicKey_t participant_key
```

DCPS key of the participant to which the **DataWriter** (p. 818) belongs.

8.237.2.3 topic_name

```
String topic_name
```

Name of the related **com.rti.dds.topic.Topic** (p. 2116).

The length of this string is limited to 255 characters.

8.237.2.4 type_name

```
String type_name
```

Name of the type attached to the **com.rti.dds.topic.Topic** (p. 2116).

The length of this string is limited to 255 characters.

8.237.2.5 durability

```
final DurabilityQosPolicy durability
```

durability policy of the corresponding **DataWriter** (p. 818)

8.237.2.6 durability_service

```
final DurabilityServiceQosPolicy durability_service
```

durability_service policy of the corresponding **DataWriter** (p. 818)

8.237.2.7 deadline

```
final DeadlineQosPolicy deadline
```

Policy of the corresponding **DataWriter** (p. 818).

8.237.2.8 latency_budget

```
final LatencyBudgetQosPolicy latency_budget
```

Policy of the corresponding **DataWriter** (p. 818).

8.237.2.9 liveliness

```
final LivelinessQosPolicy liveliness
```

Policy of the corresponding **DataWriter** (p. 818).

8.237.2.10 reliability

```
final ReliabilityQosPolicy reliability
```

Policy of the corresponding **DataWriter** (p. 818).

8.237.2.11 lifespan

```
final LifespanQosPolicy lifespan
```

Policy of the corresponding **DataWriter** (p. 818).

8.237.2.12 user_data

```
final UserDataQosPolicy user_data
```

Policy of the corresponding **DataWriter** (p. 818).

8.237.2.13 ownership

```
final OwnershipQosPolicy ownership
```

Policy of the corresponding **DataWriter** (p. 818).

8.237.2.14 ownership_strength

```
final OwnershipStrengthQosPolicy ownership_strength
```

Policy of the corresponding **DataWriter** (p. 818).

8.237.2.15 destination_order

```
final DestinationOrderQosPolicy destination_order
```

Policy of the corresponding **DataWriter** (p. 818).

Warning

Only the field **com.rti.dds.infrastructure.DestinationOrderQosPolicy.kind** (p. 905) is propagated during discovery. The other fields always contain their default values.

8.237.2.16 presentation

```
final PresentationQosPolicy presentation
```

Policy of the **Publisher** (p. 1767) to which the **DataWriter** (p. 818) belongs.

8.237.2.17 partition

```
final PartitionQosPolicy partition
```

Policy of the **Publisher** (p. 1767) to which the **DataWriter** (p. 818) belongs.

8.237.2.18 topic_data

```
final TopicDataQosPolicy topic_data
```

Policy of the related Topic.

8.237.2.19 group_data

```
final GroupDataQosPolicy group_data
```

Policy of the **Publisher** (p. 1767) to which the **DataWriter** (p. 818) belongs.

8.237.2.20 type_code

```
TypeCode type_code
```

<<***extension***>> *(p. 403)* Type code information of the corresponding Topic.

If using TypeObject v2 (**com.rti.dds.infrastructure.DiscoveryConfigBuiltinChannelKind.TYPE_LOOKUP_SERVICE_CHANNEL** (p. 912)), which is the default, this is NULL if the type is not yet resolved. If the remote endpoint's topic name matches the **com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.request_types_filter** (p. 942), this will always contain the TypeCode converted from the complete TypeObject v2 representation (if non-NULL); the minimal TypeObject v2 will not be provided even if available. If the topic name does not match the **com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.request_types_filter** (p. 942) and the complete TypeObject v2 is resolved, this will contain the TypeCode converted from the complete TypeObject v2 representation. If the topic name does not match the **com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.request_types_filter** (p. 942), and only the minimal TypeObject v2 is resolved, this will contain the TypeCode converted from the minimal TypeObject v2 representation. As such, information that is not available in the minimal TypeObject v2 representation will be lost (such as default values) and member names will be the stringified version of the hashed member name, rather than the full member name. See `TypeLookup Service` for more information.

8.237.2.21 publisher_key

```
final BuiltinTopicKey_t publisher_key
```

<<***extension***>> *(p. 403)* DCPS key of the publisher to which the **DataWriter** (p. 818) belongs

8.237.2.22 property

```
final PropertyQosPolicy property
```

<<***extension***>> *(p. 403)* Properties of the corresponding **DataWriter** (p. 818).

8.237.2.23 unicast_locators

```
final LocatorSeq unicast_locators
```

<<***extension***>> *(p. 403)* Custom unicast locators that the endpoint can specify. The default locators will be used if this is not specified.

8.237.2.24 virtual_guid

```
final GUID_t virtual_guid
```

<<***extension***>> *(p. 403)* Virtual GUID associated to the **DataWriter** (p. 818).

See also

com.rti.dds.infrastructure.GUID_t (p. 1423)

8.237.2.25 service

```
final ServiceQosPolicy service
```

<<***extension***>> *(p. 403)* Policy of the corresponding **DataWriter** (p. 818).

8.237.2.26 rtps_protocol_version

```
final ProtocolVersion_t rtps_protocol_version
```

<<***extension***>> *(p. 403)* Version number of the RTPS wire protocol used.

8.237.2.27 rtps_vendor_id

```
final VendorId_t rtps_vendor_id
```

<<***extension***>> *(p. 403)* ID of vendor implementing the RTPS wire protocol.

8.237.2.28 product_version

```
final ProductVersion_t product_version
```

<<***extension***>> *(p. 403)* This is a vendor specific parameter. It gives the current version for rti-dds.

8.237.2.29 representation

```
final DataRepresentationQosPolicy representation
```

Data representation policy of the corresponding **DataWriter** (p. 818).

8.237.2.30 locator_filter

```
final LocatorFilterQosPolicy locator_filter
```

<<***extension***>> *(p. 403)* Policy of the corresponding **DataWriter** (p. 818)

Related to **com.rti.dds.infrastructure.MultiChannelQosPolicy** (p. 1616).

8.237.2.31 disable_positive_acks

```
boolean disable_positive_acks
```

<<***extension***>> *(p. 403)* This is a vendor specific parameter. Determines whether matching DataReaders send positive acknowledgements for reliability.

8.237.2.32 publication_name

```
final EntityNameQosPolicy publication_name
```

<<***extension***>> *(p. 403)* The publication name and role name.

This member contains the name and the role name of the discovered publication.

8.237.2.33 trust_protection_info

```
final  EndpointTrustProtectionInfo trust_protection_info
```

<<***extension***>> *(p. 403)* Trust Plugins protection information associated with the discovered **DataWriter** (p. 818).

Trust Plugins is a generic abstraction that represents any plugin intended to do transformation, interception, and validation of exchanged data and metadata.

trust_protection_info contains information about how RTPS wire serialization, discovery, and liveliness interact with the loaded Trust Plugins. Two endpoints will not match if their trust_protection_info is incompatible.

The meaning of the contents of this field may vary depending on what Trust Plugins the endpoint is using. For information about how this field interacts with the RTI Security Plugins, please refer to the `RTI Security Plugins User's Manual`.

8.237.2.34 trust_algorithm_info

```
final  EndpointTrustAlgorithmInfo trust_algorithm_info
```

<<***extension***>> *(p. 403)* Trust Plugins algorithms associated with the discovered **DataWriter** (p. 818).

Trust Plugins is a generic abstraction that represents any plugin intended to do transformation, interception, and validation of exchanged data and metadata.

trust_algorithm_info contains information about what algorithms the loaded Trust Plugins are running. Two endpoints will not match if their trust_algorithm_info are incompatible.

The meaning of the contents of this field may vary depending on what Trust Plugins the endpoint is using. For information about how this field interacts with the RTI Security Plugins, please refer to the `RTI Security Plugins User's Manual`.

8.237.2.35 data_tags

```
final  DataTagQosPolicy data_tags
```

Tags of the corresponding **DataWriter** (p. 818).

8.238 PublicationBuiltinTopicDataDataReader Class Reference

Instantiates `DataReader` < **com.rti.dds.publication.builtin.PublicationBuiltinTopicData** (p. 1753) > .

Inherits DataReaderImpl.

8.238.1 Detailed Description

Instantiates `DataReader` < **com.rti.dds.publication.builtin.PublicationBuiltinTopicData** (p. 1753) > .

com.rti.dds.subscription.DataReader (p. 707) of topic **com.rti.dds.publication.builtin.PublicationBuiltinTopic↩ DataTypeSupport.PUBLICATION_TOPIC_NAME** (p. 411) used for accessing **com.rti.dds.publication.builtin.↩ PublicationBuiltinTopicData** (p. 1753) of the remote **com.rti.dds.publication.DataWriter** (p. 818) and the associated **com.rti.dds.publication.Publisher** (p. 1767).

Instantiates:

8.241 PublicationMatchedStatus Class Reference

com.rti.dds.infrastructure.StatusKind.StatusKind.PUBLICATION_MATCHED_STATUS

Inherits Status.

Public Attributes

- int **total_count** = 0

  *The total cumulative number of times that this **com.rti.dds.publication.DataWriter** (p. 818) discovered a "match" with a **com.rti.dds.subscription.DataReader** (p. 707).*
- int **total_count_change** = 0

  The changes in total_count since the last time the listener was called or the status was read.
- int **current_count** = 0

  *The current number of DataReaders with which this **com.rti.dds.publication.DataWriter** (p. 818) is matched.*
- int **current_count_peak** = 0

  <<***extension***>> *(p. 403) Greatest number of DataReaders that matched this **com.rti.dds.publication.DataWriter** (p. 818) simultaneously.*
- int **current_count_change** = 0

  The change in current_count since the last time the listener was called or the status was read.
- final **InstanceHandle_t** **last_subscription_handle** = new **InstanceHandle_t**()

  *This InstanceHandle can be used to look up which remote **com.rti.dds.subscription.DataReader** (p. 707) was the last to cause this **DataWriter** (p. 818)'s status to change, using **com.rti.dds.publication.DataWriter.get_matched_↩ subscription_data** (p. 832).*

8.241.1 Detailed Description

com.rti.dds.infrastructure.StatusKind.StatusKind.PUBLICATION_MATCHED_STATUS

A "match" happens when the **com.rti.dds.publication.DataWriter** (p. 818) finds a **com.rti.dds.subscription.DataReader** (p. 707) with the same **com.rti.dds.topic.Topic** (p. 2116), same or compatible data type, and requested QoS that is compatible with that offered by the **com.rti.dds.publication.DataWriter** (p. 818). (For information on compatible data types, see the `Extensible Types Guide`.)

This status is also changed (and the listener, if any, called) when a match is ended. A local **com.rti.dds.publication.DataWriter** (p. 818) will become "unmatched" from a remote **com.rti.dds.subscription.DataReader** (p. 707) when that **com.rti.dds.subscription.DataReader** (p. 707) goes away for any of the following reasons:

- The matched **com.rti.dds.subscription.DataReader** (p. 707)'s **com.rti.dds.domain.DomainParticipant** (p. 948) has lost liveliness.
- This **DataWriter** (p. 818) or the matched DataReader has changed QoS such that the entities are now incompatible.
- The matched DataReader has been deleted.

This status may reflect changes from multiple match or unmatch events, and the **com.rti.dds.publication.PublicationMatchedStatus.current_count_change** (p. 1766) can be used to determine the number of changes since the listener was called back or the status was checked.

8.241.2 Member Data Documentation

8.241.2.1 total_count

```
int total_count = 0
```

The total cumulative number of times that this **com.rti.dds.publication.DataWriter** (p. 818) discovered a "match" with a **com.rti.dds.subscription.DataReader** (p. 707).

This number increases whenever a new match is discovered. It does not decrease when an existing match goes away for any of the reasons described in **com.rti.dds.publication.PublicationMatchedStatus** (p. 1764).

8.241.2.2 total_count_change

```
int total_count_change = 0
```

The changes in total_count since the last time the listener was called or the status was read.

Note that this number will never be negative (because it's the total number of times this **DataWriter** (p. 818) ever matched with a DataReader).

8.241.2.3 current_count

```
int current_count = 0
```

The current number of DataReaders with which this **com.rti.dds.publication.DataWriter** (p. 818) is matched.

This number increases when a new match is discovered and decreases when an existing match goes away for any of the reasons described in **com.rti.dds.publication.PublicationMatchedStatus** (p. 1764).

8.241.2.4 current_count_peak

```
int current_count_peak = 0
```

<<***extension***>> *(p. 403)* Greatest number of DataReaders that matched this **com.rti.dds.publication.DataWriter** (p. 818) simultaneously.

That is, there was no moment in time when more than this many DataReaders matched this **DataWriter** (p. 818). (As a result, total_count can be higher than current_count_peak.)

8.241.2.5 current_count_change

```
int current_count_change = 0
```

The change in current_count since the last time the listener was called or the status was read.

Note that a negative current_count_change means that one or more DataReaders have become unmatched for one or more of the reasons described in **com.rti.dds.publication.PublicationMatchedStatus** (p. 1764).

8.241.2.6 last_subscription_handle

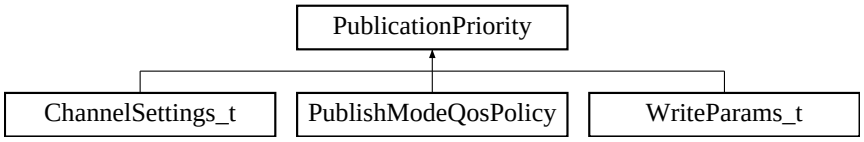
```
final InstanceHandle_t last_subscription_handle = new InstanceHandle_t()
```

This InstanceHandle can be used to look up which remote **com.rti.dds.subscription.DataReader** (p. 707) was the last to cause this **DataWriter** (p. 818)'s status to change, using **com.rti.dds.publication.DataWriter.get_matched_↩ subscription_data** (p. 832).

If the DataReader no longer matches this **DataWriter** (p. 818) due to any of the reasons in **com.rti.dds.publication.↩ PublicationMatchedStatus** (p. 1764) except incompatible QoS, then the DataReader has been purged from this **Data↩ Writer** (p. 818)'s DomainParticipant discovery database. (See the "Discovery Overview" section of the User's Manual.) In that case, the **com.rti.dds.publication.DataWriter.get_matched_subscription_data** (p. 832) method will not be able to return information about the DataReader. The only way to get information about the lost DataReader is if you cached the information previously.

8.242 PublicationPriority Interface Reference

Inheritance diagram for PublicationPriority:



Static Public Attributes

- static final int **UNDEFINED**

  *Initializer value for **com.rti.dds.infrastructure.PublishModeQosPolicy.priority** (p. 1799) and/or **com.rti.dds.infrastructure.ChannelSettings_t.priority** (p. 669).*
- static final int **AUTOMATIC**

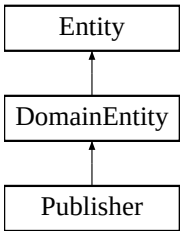
  *Constant value for **com.rti.dds.infrastructure.PublishModeQosPolicy.priority** (p. 1799) and/or **com.rti.dds.infrastructure.ChannelSettings_t.priority** (p. 669).*

8.242.1 Detailed Description

8.243 Publisher Interface Reference

<<***interface***>> *(p. 403)* A publisher is the object responsible for the actual dissemination of publications.

Inheritance diagram for Publisher:



Public Member Functions

- void **get_default_datawriter_qos** (**DataWriterQos** qos)

  *Copies the default **com.rti.dds.publication.DataWriterQos** (p. 878) values into the provided **com.rti.dds.publication.DataWriterQos** (p. 878) instance.*
- void **set_default_datawriter_qos** (**DataWriterQos** qos)

  *Sets the default **com.rti.dds.publication.DataWriterQos** (p. 878) values for this publisher.*
- void **set_default_datawriter_qos_with_profile** (String library_name, String profile_name)

*<<**extension**>> (*p. *403) Set the default **com.rti.dds.publication.DataWriterQos** (*p. *878) values for this publisher based on the input XML QoS profile.*

- **DataWriter create_datawriter** (**Topic** topic, **DataWriterQos** qos, **DataWriterListener** listener, int mask)

  *Creates a **com.rti.dds.publication.DataWriter** (*p. *818) that will be attached and belong to the **com.rti.dds.publication.Publisher** (*p. *1767).*
- **DataWriter create_datawriter_with_profile** (**Topic** topic, String library_name, String profile_name, **DataWriterListener** listener, int mask)

  *<<**extension**>> (*p. *403) Creates a **com.rti.dds.publication.DataWriter** (*p. *818) object using the **com.rti.dds.publication.DataWriterQos** (*p. *878) associated with the input XML QoS profile.*
- void **delete_datawriter** (**DataWriter** a_datawriter)

  *Deletes a **com.rti.dds.publication.DataWriter** (*p. *818) that belongs to the **com.rti.dds.publication.Publisher** (*p. *1767).*
- **DataWriter lookup_datawriter** (String topic_name)

  *Retrieves the **com.rti.dds.publication.DataWriter** (*p. *818) for a specific **com.rti.dds.topic.Topic** (*p. *2116).*
- void **set_qos** (**PublisherQos** qos)

  Sets the publisher QoS.
- void **set_qos_with_profile** (String library_name, String profile_name)

  *<<**extension**>> (*p. *403) Change the QoS of this publisher using the input XML QoS profile.*
- void **get_qos** (**PublisherQos** qos)

  Gets the publisher QoS.
- String **get_default_library** ()

  *<<**extension**>> (*p. *403) Gets the default XML library associated with a **com.rti.dds.publication.Publisher** (*p. *1767).*
- void **set_default_library** (String library_name)

  *<<**extension**>> (*p. *403) Sets the default XML library for a **com.rti.dds.publication.Publisher** (*p. *1767).*
- String **get_default_profile** ()

  *<<**extension**>> (*p. *403) Gets the default XML profile associated with a **com.rti.dds.publication.Publisher** (*p. *1767).*
- void **set_default_profile** (String library_name, String profile_name)

  *<<**extension**>> (*p. *403) Sets the default XML profile for a **com.rti.dds.publication.Publisher** (*p. *1767).*
- String **get_default_profile_library** ()

  *<<**extension**>> (*p. *403) Gets the library where the default XML QoS profile is contained for a **com.rti.dds.publication.Publisher** (*p. *1767).*
- void **set_listener** (**PublisherListener** l, int mask)

  Sets the publisher listener.
- **PublisherListener get_listener** ()

  Get the publisher listener.
- void **suspend_publications** ()

  *Indicates to RTI Connext that the application is about to make multiple modifications using **com.rti.dds.publication.DataWriter** (*p. *818) objects belonging to the **com.rti.dds.publication.Publisher** (*p. *1767).*
- void **resume_publications** ()

  *Indicates to RTI Connext that the application has completed the multiple changes initiated by the previous **com.rti.dds.publication.Publisher.suspend_publications** (*p. *1782).*
- void **begin_coherent_changes** ()

  *Indicates that the application will begin a coherent set of modifications using **com.rti.dds.publication.DataWriter** (*p. *818) objects attached to the **com.rti.dds.publication.Publisher** (*p. *1767).*
- void **end_coherent_changes** ()

  *Terminates the coherent set initiated by the matching call to **com.rti.dds.publication.Publisher.begin_coherent_changes** (*p. *1784).*
- void **copy_from_topic_qos** (**DataWriterQos** a_datawriter_qos, **TopicQos** a_topic_qos)

  *Copies the policies in the **com.rti.dds.topic.TopicQos** (*p. *2133) to the corresponding policies in the **com.rti.dds.publication.DataWriterQos** (*p. *878).*

- void **get_all_datawriters** (DataWriterSeq writers)

  *Retrieve all the DataWriters created from this **Publisher** (p. 1767).*
- **DomainParticipant get_participant** ()

  *Returns the **com.rti.dds.domain.DomainParticipant** (p. 948) to which the **com.rti.dds.publication.Publisher** (p. 1767) belongs.*
- void **delete_contained_entities** ()

  *Deletes all the entities that were created by means of the "create" operation on the **com.rti.dds.publication.Publisher** (p. 1767).*
- void **wait_for_acknowledgments** (**Duration_t** max_wait)

  *Blocks the calling thread until all data written by the **Publisher** (p. 1767)'s reliable DataWriters is acknowledged, or until timeout expires.*
- void **wait_for_asynchronous_publishing** (**Duration_t** max_wait)

  *<<**extension**>> (p. 403) Blocks the calling thread until asynchronous sending is complete.*
- **DataWriter lookup_datawriter_by_name** (String datawriter_name)

  *<<**extension**>> (p. 403) Retrieves a **com.rti.dds.publication.DataWriter** (p. 818) contained within the **com.rti.dds.publication.Publisher** (p. 1767) the **com.rti.dds.publication.DataWriter** (p. 818) entity name.*

Static Public Attributes

- static final **DataWriterQos DATAWRITER_QOS_DEFAULT**

  *Special value for creating **com.rti.dds.publication.DataWriter** (p. 818) with default QoS.*
- static final **DataWriterQos DATAWRITER_QOS_USE_TOPIC_QOS** = new **DataWriterQos**()

  *Special value for creating **com.rti.dds.publication.DataWriter** (p. 818) with a combination of the default **com.rti.dds.publication.DataWriterQos** (p. 878) and the **com.rti.dds.topic.TopicQos** (p. 2133).*
- static final **DataWriterQos DATAWRITER_QOS_PRINT_ALL** = new **DataWriterQos**()

  *Special value which can be supplied to **com.rti.dds.publication.DataWriterQos.toString(DataWriterQos baseQos, QosPrintFormat format)** (p. 881) indicating that all of the QoS should be printed.*

8.243.1 Detailed Description

*<<**interface**>> (p. 403)* A publisher is the object responsible for the actual dissemination of publications.

QoS:

com.rti.dds.publication.PublisherQos (p. 1791)

Listener:

com.rti.dds.publication.PublisherListener (p. 1789)

A publisher acts on the behalf of one or several **com.rti.dds.publication.DataWriter** (p. 818) objects that belong to it. When it is informed of a change to the data associated with one of its **com.rti.dds.publication.DataWriter** (p. 818) objects, it decides when it is appropriate to actually send the data-update message. In making this decision, it considers any extra information that goes with the data (timestamp, writer, etc.) as well as the QoS of the **com.rti.dds.publication.Publisher** (p. 1767) and the **com.rti.dds.publication.DataWriter** (p. 818).

The following operations may be called even if the **com.rti.dds.publication.Publisher** (p. 1767) is not enabled. Other operations will fail with the value **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902) if called on a disabled **com.rti.dds.publication.Publisher** (p. 1767):

- **com.rti.dds.infrastructure.Entity.enable** (p. 1323),
- **com.rti.dds.publication.Publisher.set_qos** (p. 1777), **com.rti.dds.publication.Publisher.get_qos** (p. 1778) , **com.rti.dds.publication.Publisher.set_qos_with_profile** (p. 1778)
- **com.rti.dds.publication.Publisher.set_listener** (p. 1781), **com.rti.dds.publication.Publisher.get_listener** (p. 1782),
- **com.rti.dds.infrastructure.Entity.get_statuscondition** (p. 1325), **com.rti.dds.infrastructure.Entity.get_↩ status_changes** (p. 1325)
- **com.rti.dds.publication.Publisher.create_datawriter** (p. 1773), **com.rti.dds.publication.Publisher.create↩ _datawriter_with_profile** (p. 1774), **com.rti.dds.publication.Publisher.delete_contained_entities** (p. 1786), **com.rti.dds.publication.Publisher.delete_datawriter** (p. 1775),
- **com.rti.dds.publication.Publisher.set_default_datawriter_qos** (p. 1771), **com.rti.dds.publication.↩ Publisher.set_default_datawriter_qos_with_profile** (p. 1772), **com.rti.dds.publication.Publisher.get_↩ default_datawriter_qos** (p. 1770), **com.rti.dds.publication.Publisher.wait_for_acknowledgments** (p. 1787), **com.rti.dds.publication.Publisher.set_default_library** (p. 1779), **com.rti.dds.publication.Publisher.set_↩ default_profile** (p. 1780),

Operations Allowed in Listener Callbacks (p. 1530)

8.243.2 Member Function Documentation

8.243.2.1 get_default_datawriter_qos()

```
void get_default_datawriter_qos (
               DataWriterQos qos )
```

Copies the default **com.rti.dds.publication.DataWriterQos** (p. 878) values into the provided **com.rti.dds.↩ publication.DataWriterQos** (p. 878) instance.

The retrieved `qos` will match the set of values specified on the last successful call to **com.rti.dds.publication.↩ Publisher.set_default_datawriter_qos** (p. 1771) or **com.rti.dds.publication.Publisher.set_default_datawriter_↩ qos_with_profile** (p. 1772), or else, if the call was never made, the default values from its owning **com.rti.dds.↩ domain.DomainParticipant** (p. 948).

This method may potentially allocate memory depending on the sequences contained in some QoS policies.

MT Safety:

UNSAFE. It is not safe to retrieve the default QoS value from a **com.rti.dds.publication.Publisher** (p. 1767) while another thread may be simultaneously calling **com.rti.dds.publication.Publisher.set_default_datawriter_qos** (p. 1771).

Parameters

qos	*<<**inout**>> (p. 404)* **com.rti.dds.publication.DataWriterQos** (p. 878) to be filled-up. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

com.rti.dds.publication.Publisher.DATAWRITER_QOS_DEFAULT (p. 72)

com.rti.dds.publication.Publisher.create_datawriter (p. 1773)

8.243.2.2 set_default_datawriter_qos()

```
void set_default_datawriter_qos (
               DataWriterQos qos )
```

Sets the default **com.rti.dds.publication.DataWriterQos** (p. 878) values for this publisher.

This call causes the default values inherited from the owning **com.rti.dds.domain.DomainParticipant** (p. 948) to be overridden.

This default value will be used for newly created **com.rti.dds.publication.DataWriter** (p. 818) if **com.rti.dds.↩ publication.Publisher.DATAWRITER_QOS_DEFAULT** (p. 72) is specified as the `qos` parameter when **com.rti.dds.↩ publication.Publisher.create_datawriter** (p. 1773) is called.

Precondition

The specified QoS policies must be consistent, or else the operation will have no effect and fail with **com.rti.↩ dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901)

MT Safety:

UNSAFE. It is not safe to set the default QoS value from a **com.rti.dds.publication.Publisher** (p. 1767) while another thread may be simultaneously calling **com.rti.dds.publication.Publisher.set_default_datawriter_qos** (p. 1771), **com.rti.dds.publication.Publisher.get_default_datawriter_qos** (p. 1770) or calling **com.rti.dds.↩ publication.Publisher.create_datawriter** (p. 1773) with **com.rti.dds.publication.Publisher.DATAWRITER_↩ QOS_DEFAULT** (p. 72) as the `qos` parameter.

Parameters

qos	<<***in***>> *(p. 404)* Default qos to be set. The special value **com.rti.dds.subscription.Subscriber.DATAREADER_QOS_DEFAULT** (p. 82) may be passed as `qos` to indicate that the default QoS should be reset back to the initial values the factory would used if **com.rti.dds.publication.Publisher.set_default_datawriter_qos** (p. 1771) had never been called. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), or **com.rti.dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901)

8.243.2.3 set_default_datawriter_qos_with_profile()

```
void set_default_datawriter_qos_with_profile (
             String library_name,
             String profile_name )
```

<<***extension***>> *(p. 403)* Set the default **com.rti.dds.publication.DataWriterQos** (p. 878) values for this publisher based on the input XML QoS profile.

This default value will be used for newly created **com.rti.dds.publication.DataWriter** (p. 818) if **com.rti.dds.↩ publication.Publisher.DATAWRITER_QOS_DEFAULT** (p. 72) is specified as the `qos` parameter when **com.rti.dds.↩ publication.Publisher.create_datawriter** (p. 1773) is called.

Precondition

The **com.rti.dds.publication.DataWriterQos** (p. 878) contained in the specified XML QoS profile must be consistent, or else the operation will have no effect and fail with **com.rti.dds.infrastructure.RETCODE_↩ INCONSISTENT_POLICY** (p. 1901)

MT Safety:

UNSAFE. It is not safe to set the default QoS value from a **com.rti.dds.publication.Publisher** (p. 1767) while another thread may be simultaneously calling **com.rti.dds.publication.Publisher.set_default_datawriter_qos** (p. 1771), **com.rti.dds.publication.Publisher.get_default_datawriter_qos** (p. 1770) or calling **com.rti.dds.↩ publication.Publisher.create_datawriter** (p. 1773) with **com.rti.dds.publication.Publisher.DATAWRITER_↩ QOS_DEFAULT** (p. 72) as the `qos` parameter.

Parameters

library_name	<<***in***>> *(p. 404)* Library name containing the XML QoS profile. If library_name is null RTI Connext will use the default library (see **com.rti.dds.publication.Publisher.set_default_library** (p. 1779)).
profile_name	<<***in***>> *(p. 404)* XML QoS Profile name. If profile_name is null RTI Connext will use the default profile (see **com.rti.dds.publication.Publisher.set_default_profile** (p. 1780)).

If the input profile cannot be found, the method fails with **com.rti.dds.infrastructure.RETCODE_ERROR** (p. 1900).

Exceptions

One	of the **Standard Return Codes** (p. 513), or **com.rti.dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901)

See also

com.rti.dds.publication.Publisher.DATAWRITER_QOS_DEFAULT (p. 72)

com.rti.dds.publication.Publisher.create_datawriter_with_profile (p. 1774)

8.243.2.4 create_datawriter()

```
DataWriter create_datawriter (
              Topic topic,
              DataWriterQos qos,
              DataWriterListener listener,
             int mask )
```

Creates a **com.rti.dds.publication.DataWriter** (p. 818) that will be attached and belong to the **com.rti.dds.↩ publication.Publisher** (p. 1767).

For each application-defined type, **com.rti.ndds.example.Foo** (p. 1358), there is an implied, auto-generated class **com.rti.ndds.example.FooDataWriter** (p. 1389) that extends **com.rti.dds.publication.DataWriter** (p. 818) and contains the operations to write data of type **com.rti.ndds.example.Foo** (p. 1358).

Note that a common application pattern to construct the QoS for the **com.rti.dds.publication.DataWriter** (p. 818) is to:

- Retrieve the QoS policies on the associated **com.rti.dds.topic.Topic** (p. 2116) by means of the **com.rti.dds.↩ topic.Topic.get_qos** (p. 2119) operation.
- Retrieve the default **com.rti.dds.publication.DataWriter** (p. 818) qos by means of the **com.rti.dds.↩ publication.Publisher.get_default_datawriter_qos** (p. 1770) operation.
- Combine those two QoS policies (for example, using **com.rti.dds.publication.Publisher.copy_from_topic_qos** (p. 1785)) and selectively modify policies as desired.

When a **com.rti.dds.publication.DataWriter** (p. 818) is created, only those transports already registered are available to the **com.rti.dds.publication.DataWriter** (p. 818). See **Built-in Transport Plugins** (p. 106) for details on when a builtin transport is registered.

Precondition

If publisher is enabled, topic must have been enabled. Otherwise, this operation will fail and no **com.rti.dds.↩ publication.DataWriter** (p. 818) will be created.

The given **com.rti.dds.topic.Topic** (p. 2116) must have been created from the same participant as this publisher. If it was created from a different participant, this method will fail.

MT Safety:

UNSAFE. If **com.rti.dds.publication.Publisher.DATAWRITER_QOS_DEFAULT** (p. 72) is used for the qos parameter, it is not safe to create the datawriter while another thread may be simultaneously calling **com.rti.dds.↩ publication.Publisher.set_default_datawriter_qos** (p. 1771).

Parameters

topic	<<***in***>> *(*p. *404)* The **com.rti.dds.topic.Topic** (p. 2116) that the **com.rti.dds.publication.DataWriter** (p. 818) will be associated with. Cannot be NULL.
qos	<<***in***>> *(*p. *404)* QoS to be used for creating the new **com.rti.dds.publication.DataWriter** (p. 818). The special value **com.rti.dds.publication.Publisher.DATAWRITER_QOS_DEFAULT** (p. 72) can be used to indicate that the **com.rti.dds.publication.DataWriter** (p. 818) should be created with the default **com.rti.dds.publication.DataWriterQos** (p. 878) set in the **com.rti.dds.publication.Publisher** (p. 1767). The special value **com.rti.dds.publication.Publisher.DATAWRITER_QOS_USE_TOPIC_QOS** (p. 73) can be used to indicate that the **com.rti.dds.publication.DataWriter** (p. 818) should be created with the combination of the default **com.rti.dds.publication.DataWriterQos** (p. 878) set on the **com.rti.dds.publication.Publisher** (p. 1767) and the **com.rti.dds.topic.TopicQos** (p. 2133) of the **com.rti.dds.topic.Topic** (p. 2116). Cannot be NULL.
listener	<<***in***>> *(*p. *404)* The listener of the **com.rti.dds.publication.DataWriter** (p. 818).
mask	<<***in***>> *(*p. *404)*. Changes of communication status to be invoked on the listener. See com.rti.dds.infrastructure.StatusMask.

Returns

A **com.rti.dds.publication.DataWriter** (p. 818) of a derived class specific to the data type associated with the **com.rti.dds.topic.Topic** (p. 2116) or NULL if an error occurred.

See also

com.rti.dds.publication.Publisher.create_datawriter_with_profile (p. 1774)

com.rti.dds.publication.Publisher.get_default_datawriter_qos (p. 1770)

com.rti.dds.topic.Topic.set_qos (p. 2118)

com.rti.dds.publication.Publisher.copy_from_topic_qos (p. 1785)

com.rti.dds.publication.DataWriter.set_listener (p. 824)

8.243.2.5 create_datawriter_with_profile()

```
DataWriter create_datawriter_with_profile (
             Topic topic,
            String library_name,
            String profile_name,
             DataWriterListener listener,
            int mask )
```

<<***extension***>> *(p. 403)* Creates a **com.rti.dds.publication.DataWriter** (p. 818) object using the **com.rti.dds.publication.DataWriterQos** (p. 878) associated with the input XML QoS profile.

The **com.rti.dds.publication.DataWriter** (p. 818) will be attached and belong to the **com.rti.dds.publication.Publisher** (p. 1767).

For each application-defined type, **com.rti.ndds.example.Foo** (p. 1358), there is an implied, auto-generated class **com.rti.ndds.example.FooDataWriter** (p. 1389) that extends **com.rti.dds.publication.DataWriter** (p. 818) and contains the operations to write data of type **com.rti.ndds.example.Foo** (p. 1358).

When a **com.rti.dds.publication.DataWriter** (p. 818) is created, only those transports already registered are available to the **com.rti.dds.publication.DataWriter** (p. 818). See **Built-in Transport Plugins** (p. 106) for details on when a builtin transport is registered.

Precondition

If publisher is enabled, topic must have been enabled. Otherwise, this operation will fail and no **com.rti.dds.publication.DataWriter** (p. 818) will be created.

The given **com.rti.dds.topic.Topic** (p. 2116) must have been created from the same participant as this publisher. If it was created from a different participant, this method will return NULL.

Parameters

topic	<<***in***>> *(p. 404)* The **com.rti.dds.topic.Topic** (p. 2116) that the **com.rti.dds.publication.DataWriter** (p. 818) will be associated with. Cannot be NULL.
library_name	<<***in***>> *(p. 404)* Library name containing the XML QoS profile. If library_name is null RTI Connext will use the default library (see **com.rti.dds.publication.Publisher.set_default_library** (p. 1779)).
profile_name	<<***in***>> *(p. 404)* XML QoS Profile name. If profile_name is null RTI Connext will use the default profile (see **com.rti.dds.publication.Publisher.set_default_profile** (p. 1780)).
listener	<<***in***>> *(p. 404)* The listener of the **com.rti.dds.publication.DataWriter** (p. 818).
mask	<<***in***>> *(p. 404)*. Changes of communication status to be invoked on the listener. See com.rti.dds.infrastructure.StatusMask.

Returns

A **com.rti.dds.publication.DataWriter** (p. 818) of a derived class specific to the data type associated with the **com.rti.dds.topic.Topic** (p. 2116) or NULL if an error occurred.

See also

com.rti.ndds.example.FooDataWriter (p. 1389)

Specifying QoS on entities (p. 505) for information on setting QoS before entity creation

com.rti.dds.publication.DataWriterQos (p. 878) for rules on consistency among QoS

com.rti.dds.publication.Publisher.create_datawriter (p. 1773)

com.rti.dds.publication.Publisher.get_default_datawriter_qos (p. 1770)

com.rti.dds.topic.Topic.set_qos (p. 2118)

com.rti.dds.publication.Publisher.copy_from_topic_qos (p. 1785)

com.rti.dds.publication.DataWriter.set_listener (p. 824)

8.243.2.6 delete_datawriter()

```
void delete_datawriter (
              DataWriter a_datawriter )
```

Deletes a **com.rti.dds.publication.DataWriter** (p. 818) that belongs to the **com.rti.dds.publication.Publisher** (p. 1767).

The deletion of the **com.rti.dds.publication.DataWriter** (p. 818) will automatically unregister all instances.

Precondition

If the **com.rti.dds.publication.DataWriter** (p. 818) does not belong to the **com.rti.dds.publication.Publisher** (p. 1767), the operation will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).

Postcondition

Listener installed on the **com.rti.dds.publication.DataWriter** (p. 818) will not be called after this method completes successfully.

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Parameters

a_datawriter	<<***in***>> *(p. 404)* The **com.rti.dds.publication.DataWriter** (p. 818) to be deleted.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).

8.243.2.7 lookup_datawriter()

```
DataWriter lookup_datawriter (
             String topic_name )
```

Retrieves the **com.rti.dds.publication.DataWriter** (p. 818) for a specific **com.rti.dds.topic.Topic** (p. 2116).

This returned **com.rti.dds.publication.DataWriter** (p. 818) is either enabled or disabled.

If more than one **com.rti.dds.publication.DataWriter** (p. 818) is attached to the **com.rti.dds.publication.Publisher** (p. 1767) with the same `topic_name`, then this operation may return any one of them.

MT Safety:

UNSAFE. It is not safe to lookup a **com.rti.dds.publication.DataWriter** (p. 818) in one thread while another thread is simultaneously creating or destroying that **com.rti.dds.publication.DataWriter** (p. 818).

Parameters

topic_name	<<***in***>> *(p. 404)* Name of the **com.rti.dds.topic.Topic** (p. 2116) associated with the **com.rti.dds.publication.DataWriter** (p. 818) that is to be looked up. Cannot be NULL.

Returns

A **com.rti.dds.publication.DataWriter** (p. 818) that belongs to the **com.rti.dds.publication.Publisher** (p. 1767) attached to the **com.rti.dds.topic.Topic** (p. 2116) with `topic_name`. If no such **com.rti.dds.publication.↩ DataWriter** (p. 818) exists, this operation returns NULL.

8.243.2.8 set_qos()

```
void set_qos (
              PublisherQos qos )
```

Sets the publisher QoS.

This operation modifies the QoS of the **com.rti.dds.publication.Publisher** (p. 1767).

The **com.rti.dds.publication.PublisherQos.group_data** (p. 1794), **com.rti.dds.publication.PublisherQos.partition** (p. 1794) and **com.rti.dds.publication.PublisherQos.entity_factory** (p. 1795) can be changed. The other policies are immutable.

Parameters

qos	<<***in***>> *(p. 404)* **com.rti.dds.publication.PublisherQos** (p. 1791) to be set to. Policies must be consistent. Immutable policies cannot be changed after **com.rti.dds.publication.Publisher** (p. 1767) is enabled. The special value **com.rti.dds.domain.DomainParticipant.PUBLISHER_QOS_DEFAULT** (p. 48) can be used to indicate that the QoS of the **com.rti.dds.publication.Publisher** (p. 1767) should be changed to match the current default **com.rti.dds.publication.PublisherQos** (p. 1791) set in the **com.rti.dds.domain.DomainParticipant** (p. 948). Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_IMMUTABLE_POLICY** (p. 1901), or **com.rti.dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901).

See also

com.rti.dds.publication.PublisherQos (p. 1791) for rules on consistency among QoS

set_qos (abstract) (p. 1321)

Operations Allowed in Listener Callbacks (p. 1530)

8.243.2.9 set_qos_with_profile()

```
void set_qos_with_profile (
            String library_name,
            String profile_name )
```

<<***extension***>> *(p. 403)* Change the QoS of this publisher using the input XML QoS profile.

This operation modifies the QoS of the **com.rti.dds.publication.Publisher** (p. 1767).

The **com.rti.dds.publication.PublisherQos.group_data** (p. 1794), **com.rti.dds.publication.PublisherQos.partition** (p. 1794) and **com.rti.dds.publication.PublisherQos.entity_factory** (p. 1795) can be changed. The other policies are immutable.

Parameters

library_name	<<***in***>> *(p. 404)* Library name containing the XML QoS profile. If library_name is null RTI Connext will use the default library (see **com.rti.dds.publication.Publisher.set_default_library** (p. 1779)).
profile_name	<<***in***>> *(p. 404)* XML QoS Profile name. If profile_name is null RTI Connext will use the default profile (see **com.rti.dds.publication.Publisher.set_default_profile** (p. 1780)).

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_IMMUTABLE_POLICY** (p. 1901), or **com.rti.dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901).

See also

com.rti.dds.publication.PublisherQos (p. 1791) for rules on consistency among QoS

Operations Allowed in Listener Callbacks (p. 1530)

8.243.2.10 get_qos()

```
void get_qos (
            PublisherQos qos )
```

Gets the publisher QoS.

This method may potentially allocate memory depending on the sequences contained in some QoS policies.

Parameters

qos	<<***in***>> *(p. 404)* **com.rti.dds.publication.PublisherQos** (p. 1791) to be filled in. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

get_qos (abstract) (p. 1322)

8.243.2.11 get_default_library()

```
String get_default_library ( )
```

<<***extension***>> *(p. 403)* Gets the default XML library associated with a **com.rti.dds.publication.Publisher** (p. 1767).

Returns

The default library or null if the default library was not set.

See also

com.rti.dds.publication.Publisher.set_default_library (p. 1779)

8.243.2.12 set_default_library()

```
void set_default_library (
             String library_name )
```

<<***extension***>> *(p. 403)* Sets the default XML library for a **com.rti.dds.publication.Publisher** (p. 1767).

This method specifies the library that will be used as the default the next time a default library is needed during a call to one of this **Publisher** (p. 1767)'s operations.

Any API requiring a library_name as a parameter can use null to refer to the default library.

If the default library is not set, the **com.rti.dds.publication.Publisher** (p. 1767) inherits the default from the **com.rti.dds.domain.DomainParticipant** (p. 948) (see **com.rti.dds.domain.DomainParticipant.set_default_library** (p. 994)).

Parameters

library_name	<<***in***>> *(p. 404)* Library name. If library_name is null any previous default is unset.

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

com.rti.dds.publication.Publisher.get_default_library (p. 1779)

8.243.2.13 get_default_profile()

```
String get_default_profile ( )
```

<<***extension***>> *(p. 403)* Gets the default XML profile associated with a **com.rti.dds.publication.Publisher** (p. 1767).

Returns

The default profile or null if the default profile was not set.

See also

com.rti.dds.publication.Publisher.set_default_profile (p. 1780)

8.243.2.14 set_default_profile()

```
void set_default_profile (
             String library_name,
             String profile_name )
```

<<***extension***>> *(p. 403)* Sets the default XML profile for a **com.rti.dds.publication.Publisher** (p. 1767).

This method specifies the profile that will be used as the default the next time a default **Publisher** (p. 1767) profile is needed during a call to one of this **Publisher** (p. 1767)'s operations. When calling a **com.rti.dds.publication.Publisher** (p. 1767) method that requires a `profile_name` parameter, you can use NULL to refer to the default profile. (This same information applies to setting a default library.)

If the default profile is not set, the **com.rti.dds.publication.Publisher** (p. 1767) inherits the default from the **com.rti.dds.domain.DomainParticipant** (p. 948) (see **com.rti.dds.domain.DomainParticipant.set_default_profile** (p. 995)).

This method does not set the default QoS for **com.rti.dds.publication.DataWriter** (p. 818) objects created by the **com.rti.dds.publication.Publisher** (p. 1767); for this functionality, use **com.rti.dds.publication.Publisher.set_default_datawriter_qos_with_profile** (p. 1772) (you may pass in NULL after having called **set_default_profile()** (p. 1780)).

This method does not set the default QoS for newly created Publishers; for this functionality, use **com.rti.dds.domain.DomainParticipant.set_default_publisher_qos_with_profile** (p. 961).

Parameters

library_name	<<***in***>> *(p. 404)* The library name containing the profile.
profile_name	<<***in***>> *(p. 404)* The profile name. If profile_name is null any previous default is unset.

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

com.rti.dds.publication.Publisher.get_default_profile (p. 1780)

com.rti.dds.publication.Publisher.get_default_profile_library (p. 1781)

8.243.2.15 get_default_profile_library()

```
String get_default_profile_library ( )
```

<<***extension***>> *(p. 403)* Gets the library where the default XML QoS profile is contained for a **com.rti.dds.publication.Publisher** (p. 1767).

The default profile library is automatically set when **com.rti.dds.publication.Publisher.set_default_profile** (p. 1780) is called.

This library can be different than the **com.rti.dds.publication.Publisher** (p. 1767) default library (see **com.rti.dds.publication.Publisher.get_default_library** (p. 1779)).

Returns

The default profile library or null if the default profile was not set.

See also

com.rti.dds.publication.Publisher.set_default_profile (p. 1780)

8.243.2.16 set_listener()

```
void set_listener (
             PublisherListener l,
            int mask )
```

Sets the publisher listener.

Parameters

l	<<***in***>> *(p. 404)* **com.rti.dds.publication.PublisherListener** (p. 1789) to set to.
mask	<<***in***>> *(p. 404)* com.rti.dds.infrastructure.StatusMask associated with the **com.rti.dds.publication.PublisherListener** (p. 1789).

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

set_listener (abstract) (p. 1322)

8.243.2.17 get_listener()

```
PublisherListener get_listener ( )
```

Get the publisher listener.

Returns

com.rti.dds.publication.PublisherListener (p. 1789) of the **com.rti.dds.publication.Publisher** (p. 1767).

See also

get_listener (abstract) (p. 1323)

8.243.2.18 suspend_publications()

```
void suspend_publications ( )
```

Indicates to RTI Connext that the application is about to make multiple modifications using **com.rti.dds.publication.DataWriter** (p. 818) objects belonging to the **com.rti.dds.publication.Publisher** (p. 1767).

It is a **hint** to RTI Connext so it can optimize its performance by e.g., holding the dissemination of the modifications and then batching them.

The use of this operation must be matched by a corresponding call to **com.rti.dds.publication.Publisher.resume_publications** (p. 1783) indicating that the set of modifications has completed.

If the **com.rti.dds.publication.Publisher** (p. 1767) is deleted before **com.rti.dds.publication.Publisher.resume_publications** (p. 1783) is called, any suspended updates yet to be published will be discarded.

RTI Connext is not required and does not currently make use of this hint in any way. However, similar results can be achieved by using *asynchronous publishing*. Combined with **com.rti.dds.publication.FlowController** (p. 1348), com.rti.dds.infrastructure.PublishModeQosPolicyKind.PublishModeQosPolicyKind.ASYNCHRONOUS_PUBLISH_MODE_QOS **com.rti.dds.publication.DataWriter** (p. 818) instances allow the user even finer control of traffic shaping and sample coalescing.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

See also

com.rti.dds.publication.FlowController (p. 1348)

com.rti.dds.publication.FlowController.trigger_flow (p. 1350)

com.rti.dds.publication.FlowController.ON_DEMAND_FLOW_CONTROLLER_NAME (p. 78)

com.rti.dds.infrastructure.PublishModeQosPolicy (p. 1797)

8.243.2.19 resume_publications()

```
void resume_publications ( )
```

Indicates to RTI Connext that the application has completed the multiple changes initiated by the previous **com.rti.dds.publication.Publisher.suspend_publications** (p. 1782).

This is a **hint** to RTI Connext that can be used for example, to batch all the modifications made since the **com.rti.dds.publication.Publisher.suspend_publications** (p. 1782).

RTI Connext is not required and does not currently make use of this hint in any way. However, similar results can be achieved by using *asynchronous publishing*. Combined with **com.rti.dds.publication.FlowController** (p. 1348), com.rti.dds.infrastructure.PublishModeQosPolicyKind.PublishModeQosPolicyKind.ASYNCHRONOUS_PUBLISH_MODE_QOS **com.rti.dds.publication.DataWriter** (p. 818) instances allow the user even finer control of traffic shaping and sample coalescing.

Precondition

A call to **com.rti.dds.publication.Publisher.resume_publications** (p. 1783) must match a previous call to **com.rti.dds.publication.Publisher.suspend_publications** (p. 1782). Otherwise the operation will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

See also

com.rti.dds.publication.FlowController (p. 1348)

com.rti.dds.publication.FlowController.trigger_flow (p. 1350)

com.rti.dds.publication.FlowController.ON_DEMAND_FLOW_CONTROLLER_NAME (p. 78)

com.rti.dds.infrastructure.PublishModeQosPolicy (p. 1797)

8.243.2.20 begin_coherent_changes()

```
void begin_coherent_changes ( )
```

Indicates that the application will begin a coherent set of modifications using **com.rti.dds.publication.DataWriter** (p. 818) objects attached to the **com.rti.dds.publication.Publisher** (p. 1767).

A 'coherent set' is a set of modifications that must be propagated in such a way that they are interpreted at the receiver's side as a consistent set of modifications; that is, the receiver will only be able to access the data after all the modifications in the set are available at the receiver end.

A connectivity change may occur in the middle of a set of coherent changes; for example, the set of partitions used by the **com.rti.dds.publication.Publisher** (p. 1767) or one of its subscribers (**com.rti.dds.subscription.Subscriber** (p. 2039)) may change, a late-joining **com.rti.dds.subscription.DataReader** (p. 707) may appear on the network, or a communication failure may occur. In the event that such a change prevents an entity from receiving the entire set of coherent changes, that entity must behave as if it had received none of the set.

These calls can be nested. In that case, the coherent set terminates only with the last call to **com.rti.dds.publication.↩ Publisher.end_coherent_changes** (p. 1784). **Publisher** (p. 1767)'s samples (samples published by any of the Data↩ Writers within the **Publisher** (p. 1767)) that are not published within a begin_coherent_changes/end_coherent_changes block will not be provided to the DataReaders as a set.

The support for coherent changes enables a publishing application to change the value of several data-instances that could belong to the same or different topics and have those changes be seen *atomically* by the readers. This is useful in cases where the values are inter-related (for example, if there are two data-instances representing the altitude and velocity vector of the same aircraft and both are changed, it may be useful to communicate those values in a way the reader can see both together; otherwise, it may, e.g., erroneously interpret that the aircraft is on a collision course).

Note

Coherent sets don't apply to Topic Queries. If a **com.rti.dds.subscription.TopicQuery** (p. 2139) selects only a subset of samples that was published as a coherent set, the subscribing application will receive them regardless of their membership to the coherent set.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

See also

com.rti.dds.infrastructure.PresentationQosPolicy (p. 1678)

8.243.2.21 end_coherent_changes()

```
void end_coherent_changes ( )
```

Terminates the coherent set initiated by the matching call to **com.rti.dds.publication.Publisher.begin_coherent_changes** (p. 1784).

Precondition

If there is no matching call to **com.rti.dds.publication.Publisher.begin_coherent_changes** (p. 1784) the operation will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

8.243.2.22 copy_from_topic_qos()

```
void copy_from_topic_qos (
              DataWriterQos a_datawriter_qos,
              TopicQos a_topic_qos )
```

Copies the policies in the **com.rti.dds.topic.TopicQos** (p. 2133) to the corresponding policies in the **com.rti.dds.publication.DataWriterQos** (p. 878).

Copies the policies in the **com.rti.dds.topic.TopicQos** (p. 2133) to the corresponding policies in the **com.rti.dds.publication.DataWriterQos** (p. 878) (replacing values in the **com.rti.dds.publication.DataWriterQos** (p. 878), if present).

This is a "convenience" operation most useful in combination with the operations **com.rti.dds.publication.Publisher.get_default_datawriter_qos** (p. 1770) and **com.rti.dds.topic.Topic.get_qos** (p. 2119). The operation **com.rti.dds.publication.Publisher.copy_from_topic_qos** (p. 1785) can be used to merge the **com.rti.dds.publication.DataWriter** (p. 818) default QoS policies with the corresponding ones on the **com.rti.dds.topic.Topic** (p. 2116). The resulting QoS can then be used to create a new **com.rti.dds.publication.DataWriter** (p. 818), or set its QoS.

This operation does not check the resulting **com.rti.dds.publication.DataWriterQos** (p. 878) for consistency. This is because the 'merged' **com.rti.dds.publication.DataWriterQos** (p. 878) may not be the final one, as the application can still modify some policies prior to applying the policies to the **com.rti.dds.publication.DataWriter** (p. 818).

Parameters

a_datawriter_qos	*<<**inout**>> (p. 404)* **com.rti.dds.publication.DataWriterQos** (p. 878) to be filled-up. Cannot be NULL.
a_topic_qos	*<<**in**>> (p. 404)* **com.rti.dds.topic.TopicQos** (p. 2133) to be merged with **com.rti.dds.publication.DataWriterQos** (p. 878). Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513)

8.243.2.23 get_all_datawriters()

```
void get_all_datawriters (
             DataWriterSeq writers )
```

Retrieve all the DataWriters created from this **Publisher** (p. 1767).

Parameters

writers	<<***inout***>> *(p. 404)* Sequence where the DataWriters will be added

Exceptions

One	of the **Standard Return Codes** (p. 513)

8.243.2.24 get_participant()

```
DomainParticipant get_participant ( )
```

Returns the **com.rti.dds.domain.DomainParticipant** (p. 948) to which the **com.rti.dds.publication.Publisher** (p. 1767) belongs.

Returns

the **com.rti.dds.domain.DomainParticipant** (p. 948) to which the **com.rti.dds.publication.Publisher** (p. 1767) belongs.

8.243.2.25 delete_contained_entities()

```
void delete_contained_entities ( )
```

Deletes all the entities that were created by means of the "create" operation on the **com.rti.dds.publication.Publisher** (p. 1767).

Deletes all contained **com.rti.dds.publication.DataWriter** (p. 818) objects. Once **com.rti.dds.publication.↩ Publisher.delete_contained_entities** (p. 1786) completes successfully, the application may delete the **com.rti.↩ dds.publication.Publisher** (p. 1767), knowing that it has no contained **com.rti.dds.publication.DataWriter** (p. 818) objects.

The operation will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903) if any of the contained entities is in a state where it cannot be deleted.

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).

8.243.2.26 wait_for_acknowledgments()

```
void wait_for_acknowledgments (
              Duration_t max_wait )
```

Blocks the calling thread until all data written by the **Publisher** (p. 1767)'s reliable DataWriters is acknowledged, or until timeout expires.

This operation blocks the calling thread until either all data written by the reliable DataWriters entities is acknowledged by (a) all reliable **com.rti.dds.subscription.DataReader** (p. 707) entities that are matched and alive and (b) by all required subscriptions, or until the duration specified by the `max_wait` parameter elapses, whichever happens first. A successful completion indicates that all the samples written have been acknowledged; a timeout indicates that max_wait elapsed before all the data was acknowledged.

Note that if a thread is blocked in the call to this operation on a **com.rti.dds.publication.Publisher** (p. 1767) and a different thread writes new samples on any of the reliable DataWriters that belong to this **Publisher** (p. 1767), the new samples must be acknowledged before unblocking the thread that is waiting on this operation.

If none of the **com.rti.dds.publication.DataWriter** (p. 818) instances have **com.rti.dds.infrastructure.Reliability↩ QosPolicy** (p. 1829) kind set to RELIABLE, the operation will complete successfully.

Parameters

max_wait	<<***in***>> *(*p. *404)* Specifies maximum time to wait for acknowledgements **com.rti.dds.infrastructure.Duration_t** (p. 1126) .

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902), **com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904)

8.243.2.27 wait_for_asynchronous_publishing()

```
void wait_for_asynchronous_publishing (
```

```
Duration_t max_wait )
```

<<***extension***>> *(*p. *403)* Blocks the calling thread until asynchronous sending is complete.

This operation blocks the calling thread (up to `max_wait`) until all data written by the asynchronous **com.rti.dds.publication.DataWriter** (p. 818) entities is sent and acknowledged (if reliable) by all matched **com.rti.dds.subscription.DataReader** (p. 707) entities. A successful completion indicates that all the samples written have been sent and acknowledged where applicable; if it times out, this indicates that `max_wait` elapsed before all the data was sent and/or acknowledged.

In other words, this guarantees that sending to best effort **com.rti.dds.subscription.DataReader** (p. 707) is complete in addition to what **com.rti.dds.publication.Publisher.wait_for_acknowledgments** (p. 1787) provides.

If none of the **com.rti.dds.publication.DataWriter** (p. 818) instances have **com.rti.dds.infrastructure.PublishMode↩ QosPolicy.kind** (p. 1798) set to com.rti.dds.infrastructure.PublishModeQosPolicyKind.PublishModeQosPolicyKind.↩ ASYNCHRONOUS_PUBLISH_MODE_QOS, the operation will complete immediately , with com.rti.dds.infrastructure.↩ RETCODE_OK.

Parameters

max_wait	<<***in***>> *(*p. *404)* Specifies maximum time to wait for acknowledgements **com.rti.dds.infrastructure.Duration_t** (p. 1126).

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902), **com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904)

8.243.2.28 lookup_datawriter_by_name()

```
DataWriter lookup_datawriter_by_name (
            String datawriter_name )
```

<<***extension***>> *(*p. *403)* Retrieves a **com.rti.dds.publication.DataWriter** (p. 818) contained within the **com.rti.dds.publication.Publisher** (p. 1767) the **com.rti.dds.publication.DataWriter** (p. 818) entity name.

Every **com.rti.dds.publication.DataWriter** (p. 818) in the system has an entity name which is configured and stored in the <<***extension***>> *(*p. *403)* EntityName policy, **ENTITY_NAME** (p. 485).

This operation retrieves the **com.rti.dds.publication.DataWriter** (p. 818) within the **com.rti.dds.publication.Publisher** (p. 1767) whose name matches the one specified. If there are several **com.rti.dds.publication.DataWriter** (p. 818) with the same name within the **com.rti.dds.publication.Publisher** (p. 1767), the operation returns the first matching occurrence.

Parameters

datawriter_name	<<***in***>> *(*p. *404)* Entity name of the **com.rti.dds.publication.DataWriter** (p. 818).

Returns

The first **com.rti.dds.publication.DataWriter** (p. 818) found with the specified name or NULL if it is not found.

8.246.1 Detailed Description

QoS policies supported by a **com.rti.dds.publication.Publisher** (p. 1767) entity.

You must set certain members in a consistent manner:

length of **com.rti.dds.infrastructure.GroupDataQosPolicy.value** (p. 1420) <= **com.rti.dds.infrastructure.Domain↩ ParticipantResourceLimitsQosPolicy.publisher_group_data_max_length** (p. 1097)

length of **com.rti.dds.infrastructure.PartitionQosPolicy.name** (p. 1666) <= **com.rti.dds.infrastructure.Domain↩ ParticipantResourceLimitsQosPolicy.max_partitions** (p. 1098)

combined number of characters (including terminating 0) in **com.rti.dds.infrastructure.PartitionQosPolicy.↩ name** (p. 1666) <= **com.rti.dds.infrastructure.DomainParticipantResourceLimitsQosPolicy.max_partition_↩ cumulative_characters** (p. 1098)

If any of the above are not true, **com.rti.dds.publication.Publisher.set_qos** (p. 1777) and **com.rti.dds.publication.↩ Publisher.set_qos_with_profile** (p. 1778) will fail with **com.rti.dds.infrastructure.RETCODE_INCONSISTENT_↩ POLICY** (p. 1901) and **com.rti.dds.domain.DomainParticipant.create_publisher** (p. 971) will\ return NULL.

8.246.2 Member Function Documentation

8.246.2.1 toString() [1/4]

```
String toString ( )
```

Overrides the builtin Object.toString method.

The various **toString()** (p. 1792) overloads allow formatting the output and printing only the differences with respect to another **PublisherQos** (p. 1791) object.

```
PublisherQos qos = new PublisherQos();
String theString = new String();
// The most basic version of the API simply overrides the builtin
// Object.toString method. Only the differences with respect to the
// documented default are printed to the string. The string is formatted
// according to the default values for QosPrintFormat.
theString = qos.toString();
// This overload allows us to specify a base profile. Only the differences
// with respect to this base profile are printed to the string. If the two
// Qos objects are equal, the resultant string will be empty.
PublisherQos baseQos = new PublisherQos(); // ...;
theString = qos.toString(baseQos);
// It is also possible to supply a custom format at this point
QosPrintFormat printFormat = new QosPrintFormat(); // ...;
theString = qos.toString(baseQos, format);
// The sentinel value PUBLISHER_QOS_PRINT_ALL can be used as
// the base in order to print the entire qos object
theString = qos.toString(PUBLISHER_QOS_PRINT_ALL);
```

This overload uses the default print format and only prints the differences between the supplied **PublisherQos** (p. 1791) and the documented default.

Returns

The string representation of the Qos.

References **PublisherQos.toString()**.

Referenced by **PublisherQos.toString()**.

8.246.2.2 toString() [2/4]

```
String toString (
              PublisherQos baseQos,
              QosPrintFormat format )
```

Obtains a string representation of a **PublisherQos** (p. 1791) object.

Parameters

format	The print format used to format the output.
baseQos	Only the differences between baseQos and the Qos object are included in the output string. If you want to print everything within the Qos, use the **com.rti.dds.domain.DomainParticipant.PUBLISHER_QOS_PRINT_ALL** (p. 48) sentinel value.

This overload prints the differences between the qos and the supplied baseQos. The output string is formatted using the supplied **com.rti.dds.infrastructure.QosPrintFormat** (p. 1809).

Returns

The string representation of the Qos.

References **DomainParticipant.PUBLISHER_QOS_PRINT_ALL**.

8.246.2.3 toString() [3/4]

```
String toString (
              QosPrintFormat format )
```

Obtains a string representation of a **PublisherQos** (p. 1791) object.

Parameters

format	The print format used to format the output.

This overload prints the differences between the qos and the documented. default. The output string is formatted using the supplied **com.rti.dds.infrastructure.QosPrintFormat** (p. 1809).

Returns

The string representation of the Qos.

References **PublisherQos.toString()**.

8.246.2.4 toString() [4/4]

```
String toString (
              PublisherQos baseQos )
```

Obtains a string representation of a **PublisherQos** (p. 1791) object.

Parameters

baseQos	Only the differences between baseQos and the Qos object are included in the output string. If you want to print everything within the Qos, use the **com.rti.dds.domain.DomainParticipant.PUBLISHER_QOS_PRINT_ALL** (p. 48) sentinel value.

This overload prints the differences between the qos and the supplied baseQos. The output string is formatted using the default value for **com.rti.dds.infrastructure.QosPrintFormat** (p. 1809).

Returns

The string representation of the Qos.

References **PublisherQos.toString()**.

8.246.3 Member Data Documentation

8.246.3.1 presentation

```
final PresentationQosPolicy presentation
```

Presentation policy, **PRESENTATION** (p. 497).

```
final  EntityNameQosPolicy publisher_name
```

<<***extension***>> *(p. 403)* EntityName policy, **ENTITY_NAME** (p. 485).

8.247 PublisherSeq Class Reference

Declares IDL `sequence` < **com.rti.dds.publication.Publisher** (p. 1767) > .

Inherits AbstractNativeSequence.

Public Member Functions

- **PublisherSeq** (Collection<?> publishers)
- int **getMaximum** ()

  Get the current maximum number of elements that can be stored in this sequence.

8.247.1 Detailed Description

Declares IDL `sequence` < **com.rti.dds.publication.Publisher** (p. 1767) > .

See also

com.rti.dds.infrastructure.com.rti.dds.util.Sequence

8.247.2 Constructor & Destructor Documentation

8.247.2.1 PublisherSeq()

```
PublisherSeq (
            Collection<?> publishers )
```

Exceptions

NullPointerException	if the given collection is null

8.247.3 Member Function Documentation

8.247.3.1 getMaximum()

```
int getMaximum ( )
```

Get the current maximum number of elements that can be stored in this sequence.

The `maximum` of the sequence represents the maximum number of elements that the underlying buffer can hold. It does not represent the current number of elements.

The `maximum` is a non-negative number. It is initialized when the sequence is first created.

The `maximum` can be changed implicitly by adding an element to the sequence with **add()** (p. 583), or explicitly by calling com.rti.dds.infrastructure.com.rti.dds.util.Sequence.Sequence.setMaximum.

Returns

the current maximum of the sequence.

See also

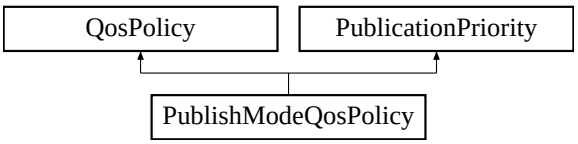
com.rti.dds.infrastructure.com.rti.dds.util.Sequence.Sequence.size()

Implements **Sequence** (p. 1974).

8.248 PublishModeQosPolicy Class Reference

<<***extension***>> *(*p. *138)* Specifies how RTI Connext sends application data on the network. This QoS policy can be used to tell RTI Connext to use its *own* thread to send data, instead of the user thread.

Inheritance diagram for PublishModeQosPolicy:



Public Attributes

- **PublishModeQosPolicyKind kind**

  <<***basic***>> *(*p. *123)* <<***extension***>> *(*p. *138) Publishing mode*
- String **flow_controller_name**

  <<***extension***>> *(*p. *138) Name of the associated flow controller*
- int **priority** = **UNDEFINED**

  <<***extension***>> *(*p. *138) Publication priority*

Additional Inherited Members

8.248.1 Detailed Description

<<***extension***>> *(*p. *138)* Specifies how RTI Connext sends application data on the network. This QoS policy can be used to tell RTI Connext to use its *own* thread to send data, instead of the user thread.

The publishing mode of a **com.rti.dds.publication.DataWriter** (p. 818) determines whether data is written synchronously in the context of the user thread when calling **com.rti.ndds.example.FooDataWriter.write** (p. 1397) or asynchronously in the context of a separate thread internal to the middleware.

Each **com.rti.dds.publication.Publisher** (p. 1767) spawns a single asynchronous publishing thread (**com.rti.dds.↩ infrastructure.AsynchronousPublisherQosPolicy.thread** (p. 594)) to serve all its asynchronous **com.rti.dds.↩ publication.DataWriter** (p. 818) instances.

See also

com.rti.dds.infrastructure.AsynchronousPublisherQosPolicy (p. 593)

com.rti.dds.infrastructure.HistoryQosPolicy (p. 1435)

com.rti.dds.publication.FlowController (p. 1348)

Entity:

com.rti.dds.publication.DataWriter (p. 818)

Properties:

RxO (p. 506) = N/A
Changeable (p. 507) = **NO** (p. 507)

8.248.2 Usage

The fastest way for RTI Connext to send data is for the user thread to execute the middleware code that actually sends the data itself. However, there are times when user applications may need or want an internal middleware thread to send the data instead.

When data is written asynchronously, a **com.rti.dds.publication.FlowController** (p. 1348), identified by `flow_controller_name`, can be used to shape the network traffic. Shaping a data flow usually means limiting the maximum data rates at which the middleware will send data for a **com.rti.dds.publication.DataWriter** (p. 818). The flow controller will buffer any excess data and only send it when the send rate drops below the maximum rate. The flow controller's properties determine when the asynchronous publishing thread is allowed to send data and how much.

Asynchronous publishing may increase latency, but offers the following advantages:

- The **com.rti.ndds.example.FooDataWriter.write** (p. 1397) call does not make any network calls and is therefore faster and more deterministic. This becomes important when the user thread is executing time-critical code.
- When data is written in bursts or when sending large data types as multiple fragments, a flow controller can throttle the send rate of the asynchronous publishing thread to avoid flooding the network.
- Asynchronously written samples for the same destination will be coalesced into a single network packet which reduces bandwidth consumption.

The maximum number of samples that will be coalesced depends on **com.rti.ndds.transport.Transport.Property_t.gather_send_buffer_count_max** (p. 1704) (each sample requires at least 2-4 gather-send buffers). Performance can be improved by increasing **com.rti.ndds.transport.Transport.Property_t.gather_send_buffer_count_max** (p. 1704). Note that the maximum value is operating system dependent.

The middleware must queue samples until they can be sent by the asynchronous publishing thread (as determined by the corresponding **com.rti.dds.publication.FlowController** (p. 1348)). The number of samples that will be queued is determined by the **com.rti.dds.infrastructure.HistoryQosPolicy** (p. 1435). When using com.rti.dds.infrastructure.HistoryQosPolicyKind.HistoryQosPolicyKind.KEEP_LAST_HISTORY_QOS, only the most recent **com.rti.dds.infrastructure.HistoryQosPolicy.depth** (p. 1438) samples are kept in the queue. Once unsent samples are removed from the queue, they are no longer available to the asynchronous publishing thread and will therefore never be sent.

8.248.3 Member Data Documentation

8.248.3.1 kind

PublishModeQosPolicyKind `kind`

<<***basic***>> *(p. 123)* <<***extension***>> *(p. 138)* Publishing mode

[default] com.rti.dds.infrastructure.PublishModeQosPolicyKind.PublishModeQosPolicyKind.SYNCHRONOUS_PUBLISH_MODE_QOS

Categories

Immutable (p. 292), **Flow Control** (p. 226)

8.248.3.2 flow_controller_name

```
String flow_controller_name
```

<<***extension***>> *(*p. *138)* Name of the associated flow controller

The following builitin values are supported:

- **com.rti.dds.publication.FlowController.DEFAULT_FLOW_CONTROLLER_NAME** (p. 76)
- **com.rti.dds.publication.FlowController.FIXED_RATE_FLOW_CONTROLLER_NAME** (p. 77)
- **com.rti.dds.publication.FlowController.ON_DEMAND_FLOW_CONTROLLER_NAME** (p. 78)

See also

com.rti.dds.domain.DomainParticipant.create_flowcontroller (p. 969)

[default] com.rti.dds.publication.FlowController.DEFAULT_FLOW_CONTROLLER_NAME (p. 76)

Categories

Immutable (p. 292), **Flow Control** (p. 226)

8.248.3.3 priority

```
int priority =  UNDEFINED
```

<<***extension***>> *(*p. *138)* Publication priority

A positive integer value designating the relative priority of the **com.rti.dds.publication.DataWriter** (p. 818), used to determine the transmission order of pending writes.

Use of publication priorities requires the asynchronous publisher (com.rti.dds.infrastructure.PublishModeQosPolicy↩ Kind.PublishModeQosPolicyKind.ASYNCHRONOUS_PUBLISH_MODE_QOS) with **com.rti.dds.publication.Flow↩ ControllerProperty_t.scheduling_policy** (p. 1352) set to com.rti.dds.publication.FlowControllerSchedulingPolicy.↩ FlowControllerSchedulingPolicy.HPF_FLOW_CONTROLLER_SCHED_POLICY.

Larger numbers have higher priority.

For multi-channel DataWriters, if the publication priority of any channel is set to any value other than com.rti.dds.↩ infrastructure.PUBLICATION_PRIORITY_UNDEFINED, then the channel's priority will take precedence over that of the DataWriter.

For multi-channel DataWriters, if the publication priority of any channel is com.rti.dds.infrastructure.PUBLICATION_↩ PRIORITY_UNDEFINED, then the channel will inherit the publication priority of the DataWriter.

If the publicaton priority of the DataWriter, and of any channel of a multi-channel DataWriter, are com.rti.dds.↩ infrastructure.PUBLICATION_PRIORITY_UNDEFINED, then the priority of the DataWriter or DataWriter channel will be assigned the lowest priority value.

If the publication priority of the DataWriter is com.rti.dds.infrastructure.PUBLICATION_PRIORITY_AUTOMATIC, then the DataWriter will be assigned the priority of the largest publication priority of all samples in the DataWriter.

The publication priority of each sample can be set in the **com.rti.dds.infrastructure.WriteParams_t** (p. 2308) of the **com.rti.ndds.example.FooDataWriter.write_w_params** (p. 1402) function.

For dispose and unregister samples, use the **com.rti.dds.infrastructure.WriteParams_t** (p. 2308) of **com.rti.ndds.↩ example.FooDataWriter.dispose_w_params** (p. 1406) and **com.rti.ndds.example.FooDataWriter.unregister_↩ instance_w_params** (p. 1396).

[default] com.rti.dds.infrastructure.PUBLICATION_PRIORITY_UNDEFINED

[range] [-1, MAX_INT]

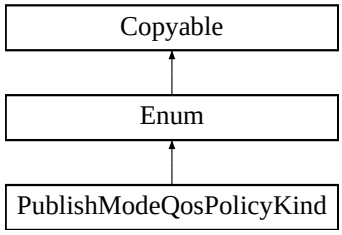
Categories

Immutable (p. 292), **Flow Control** (p. 226)

8.249 PublishModeQosPolicyKind Class Reference

Kinds of publishing mode.

Inheritance diagram for PublishModeQosPolicyKind:



Static Public Attributes

- static final **PublishModeQosPolicyKind SYNCHRONOUS_PUBLISH_MODE_QOS**

  Indicates to send data synchronously.
- static final **PublishModeQosPolicyKind ASYNCHRONOUS_PUBLISH_MODE_QOS**

  Indicates to send data asynchronously.

Additional Inherited Members

8.249.1 Detailed Description

Kinds of publishing mode.

QoS:

com.rti.dds.infrastructure.PublishModeQosPolicy (p. 1797)

8.249.2 Member Data Documentation

8.249.2.1 SYNCHRONOUS_PUBLISH_MODE_QOS

```
final PublishModeQosPolicyKind SYNCHRONOUS_PUBLISH_MODE_QOS [static]
```

Indicates to send data synchronously.

If **com.rti.dds.infrastructure.DataWriterProtocolQosPolicy.push_on_write** (p. 863) is com.rti.dds.infrastructure.true, data is sent immediately in the context of **com.rti.ndds.example.FooDataWriter.write** (p. 1397).

As data is sent immediately in the context of the user thread, no flow control is applied.

See also

com.rti.dds.infrastructure.DataWriterProtocolQosPolicy.push_on_write (p. 863)

[default] for **com.rti.dds.publication.DataWriter** (p. 818)

8.249.2.2 ASYNCHRONOUS_PUBLISH_MODE_QOS

```
final PublishModeQosPolicyKind ASYNCHRONOUS_PUBLISH_MODE_QOS [static]
```

Indicates to send data asynchronously.

Configures the **com.rti.dds.publication.DataWriter** (p. 818) to delegate the task of data transmission to a separate publishing thread. The **com.rti.ndds.example.FooDataWriter.write** (p. 1397) call does not send the data, but instead schedules the data to be sent later by its associated **com.rti.dds.publication.Publisher** (p. 1767).

Each **com.rti.dds.publication.Publisher** (p. 1767) uses its dedicated publishing thread (**com.rti.dds.publication.↩ PublisherQos.asynchronous_publisher** (p. 1795)) to send data for all its asynchronous DataWriters. For each asynchronous DataWriter, the associated **com.rti.dds.publication.FlowController** (p. 1348) determines when the publishing thread is allowed to send the data.

com.rti.dds.publication.DataWriter.wait_for_asynchronous_publishing (p. 835) and **com.rti.dds.publication.↩ Publisher.wait_for_asynchronous_publishing** (p. 1787) enable you to determine when the data has actually been sent.

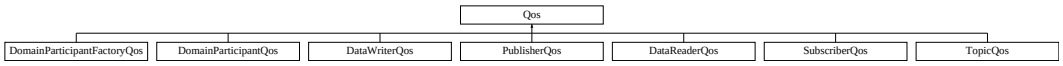
8.250 Qos Class Reference

An abstract base class for all QoS types.

Inheritance diagram for Qos:



Public Member Functions

- final boolean **equals** (Object other)

8.250.1 Detailed Description

An abstract base class for all QoS types.

8.250.2 Member Function Documentation

8.250.2.1 equals()

```
final boolean equals (
            Object other )
```

Parameters

other	<<***in***>> *(p. 404)* Other object to compare with this QoS.

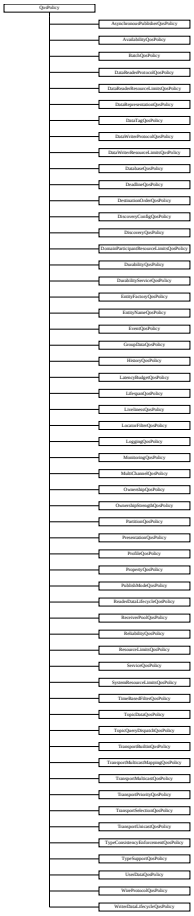
Returns

true if the given object is a QoS of the same concrete type as this QoS and all policies are equal, false otherwise

8.251 QosPolicy Class Reference

The base class for all QoS policies.

Inheritance diagram for QosPolicy:



Public Attributes

- final **QosPolicyId_t id**

  The ID of this QoS policy.
- final String **policy_name**

  The name of this QoS policy.

8.251.1 Detailed Description

The base class for all QoS policies.

8.251.2 Member Data Documentation

8.251.2.1 id

```
final  QosPolicyId_t id
```

The ID of this QoS policy.

This attribute is provided for more efficient comparisons of policy types that comparing strings.

8.251.2.2 policy_name

```
final String policy_name
```

The name of this QoS policy.

8.252 QosPolicyCount Class Reference

Type to hold a counter for a **com.rti.dds.infrastructure.QosPolicyId_t** (p. 1806).

Inherits Struct.

Public Member Functions

Additional Inherited Members

8.254.1 Detailed Description

Type to identify `QosPolicies`.

8.254.2 Member Data Documentation

8.254.2.1 INVALID_QOS_POLICY_ID

`final` **`QosPolicyId_t`** `INVALID_QOS_POLICY_ID` `[static]`

Identifier for an invalid QoS policy.

8.254.2.2 USEROBJECT_QOS_POLICY_ID

`final` **`QosPolicyId_t`** `USEROBJECT_QOS_POLICY_ID` `[static]`

<<***extension***>> *(p. 138)* Identifier for com.rti.dds.infrastructure.UserObjectQosPolicy

8.255 QosPrintFormat Class Reference

A collection of attributes used to configure how a QoS appears when printed.

Public Attributes

- int **indent** = 0

  Conifgures how much additional indent should be added to the string representation of a QoS.
- boolean **print_private** = false

  Configures how private QoS policies should be printed.
- boolean **is_standalone** = false

  Controls whether or not to print valid XML for this QoS policy (through the inclusion of a preamble).

8.255.1 Detailed Description

A collection of attributes used to configure how a QoS appears when printed.

8.255.2 Member Data Documentation

8.255.2.1 indent

```
int indent = 0
```

Conifgures how much additional indent should be added to the string representation of a QoS.

Configures how much additional indent is applied when converting a QoS to a string. This value acts as a total offset on the string, increasing the indent which is applied to all elements by the same amount. With indent set to 0, a string representation of a QoS may appear as:

```
<datareader_qos>
    <durability>
        <kind>TRANSIENT_LOCAL_DURABILITY_QOS</kind>
    </durability>
</datareader_qos>
```

Setting the indent property to 1, the same QoS would be printed as:

```
    <datareader_qos>
        <durability>
            <kind>TRANSIENT_LOCAL_DURABILITY_QOS</kind>
        </durability>
    </datareader_qos>
```

I.e., the entire structure is indented.

[default] 0

8.255.2.2 print_private

```
boolean print_private = false
```

Configures how private QoS policies should be printed.

There are some QoS policies which are not intended for external use. By default, these QoS policies are only printed if they are different to the default value for that policy. When true, private policies are treated like any other policy, and printed if they are different to the supplied base QoS. These private policies cannot be parsed from XML, and are always printed as XML comments.

[default] false

8.255.2.3 is_standalone

```
boolean is_standalone = false
```

Controls whether or not to print valid XML for this QoS policy (through the inclusion of a preamble).

The default value for this property (false) results in QoS being printed starting from the <ENTITY_qos> tag (where the <ENTITY_qos> tag is, e.g., <domain_participant_qos>, or, <datareader_qos>. This result cannot be directly parsed as valid XML (as it lacks <dds>, <qos_library>, and <qos_profile> tags). If is_standalone is set to true, these additional tags are printed, resulting in valid, parseable XML.

For example, with is_standalone set to false, a **Qos** (p. 1802) may appear as:

```
<datareader_qos>
    <durability>
        <kind>TRANSIENT_LOCAL_DURABILITY_QOS</kind>
    </durability>
</datareader_qos>
```

Setting is_standalone to true would result in the same **Qos** (p. 1802) being printed as:

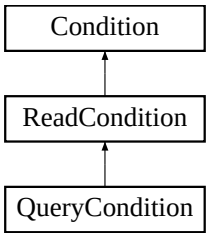
```
<?xml version="1.0"?>
<dds xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
    <qos_library name="QosLibrary">
        <qos_profile name="QosProfile">
            <datareader_qos>
                <durability>
                    <kind>TRANSIENT_LOCAL_DURABILITY_QOS</kind>
                </durability>
            </datareader_qos>
        </qos_profile>
    </qos_library>
</dds>
```

[default] false

8.256 QueryCondition Interface Reference

<<***interface***>> *(*p. *403)* These are specialised **com.rti.dds.subscription.ReadCondition** (p. 1816) objects that allow the application to also specify a filter on the locally available data.

Inheritance diagram for QueryCondition:



Public Member Functions

- String **get_query_expression** ()

  Retrieves the query expression.
- void **get_query_parameters** (**StringSeq** query_parameters)

  Retrieves the query parameters.
- void **set_query_parameters** (**StringSeq** query_parameters)

  Sets the query parameters.

8.256.1 Detailed Description

<<***interface***>> *(*p. *403)* These are specialised **com.rti.dds.subscription.ReadCondition** (p. 1816) objects that allow the application to also specify a filter on the locally available data.

Each query condition filter is composed of a **com.rti.dds.subscription.ReadCondition** (p. 1816) state filter and a content filter expressed as a `query_expression` and `query_parameters`.

The query (`query_expression`) is similar to an SQL WHERE clause and can be parameterised by arguments that are dynamically changeable by the **set_query_parameters()** (p. 1813) operation.

Two query conditions that have the same `query_expression` will require unique query condition content filters if their `query_paramters` differ. Query conditions that differ only in their state masks will share the same query condition content filter.

Queries and Filters Syntax (p. 108) describes the syntax of `query_expression` and `query_parameters`.

8.256.2 Member Function Documentation

8.256.2.1 get_query_expression()

```
String get_query_expression ( )
```

Retrieves the query expression.

8.256.2.2 get_query_parameters()

```
void get_query_parameters (
              StringSeq query_parameters )
```

Retrieves the query parameters.

Parameters

query_parameters	<<***inout***>> *(p. 404)* the query parameters are returned here.

8.256.2.3 set_query_parameters()

```
void set_query_parameters (
              StringSeq query_parameters )
```

Sets the query parameters.

Parameters

query_parameters	<<***in***>> *(p. 404)* the new query parameters

8.257 QueryConditionParams Class Reference

8.257.3 Member Function Documentation

8.257.3.1 copy_from()

```
Object copy_from (
            Object src )
```

Copy value of a data type from source.

Copy data into *this* object from another. This copy is intended to be a deep copy, so that all data members (recursively) are copied (not just resetting Object references).

This operation returns the object that is copied if copy is successful.

Parameters

src	<<***in***>> *(*p. *404)* The Object which contains the data to be copied.

Returns

Generally, return *this* but special cases (such as Enum) exist.

Exceptions

NullPointerException	If *src* is null.
ClassCastException	If *src* is not the same type as *this*.

Reimplemented from **ReadConditionParams** (p. 1820).

References **StringSeq.copy_from()**, **QueryConditionParams.query_expression**, **QueryConditionParams.↩ query_parameters**, and **QueryConditionParams.QueryConditionParams()**.

8.257.4 Member Data Documentation

8.257.4.1 query_expression

```
String query_expression = null
```

Expression for the query.

Cannot be NULL.

Referenced by **QueryConditionParams.copy_from()**, and **QueryConditionParams.QueryConditionParams()**.

8.257.4.2 query_parameters

```
StringSeq query_parameters = new StringSeq()
```

Parameters for the query expression.

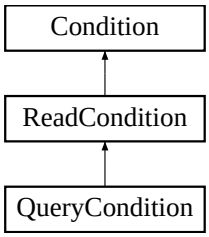
Cannot be NULL. .

Referenced by **QueryConditionParams.copy_from()**, and **QueryConditionParams.QueryConditionParams()**.

8.258 ReadCondition Interface Reference

<<***interface***>> *(*p. *403)* Conditions specifically dedicated to read operations and attached to one **com.rti.dds.↩ subscription.DataReader** (p. 707).

Inheritance diagram for ReadCondition:



Public Member Functions

- int **get_view_state_mask** ()

  Retrieves the set of `view_states` *for the condition.*
- int **get_instance_state_mask** ()

  Retrieves the set of `instance_states` *for the condition.*
- int **get_stream_kind_mask** ()

  Retrieves the set of stream kind mask for the condition.
- **DataReader get_datareader** ()

  Returns the ***com.rti.dds.subscription.DataReader*** *(p. 707) associated with the* ***com.rti.dds.subscription.ReadCondition*** *(p. 1816).*

8.258.1 Detailed Description

<<***interface***>> *(p. 403)* Conditions specifically dedicated to read operations and attached to one **com.rti.dds.subscription.DataReader** (p. 707).

com.rti.dds.subscription.ReadCondition (p. 1816) objects allow an application to specify the data samples it is interested in (by specifying the desired `sample_states`, `view_states` as well as `instance_states` in **com.rti.ndds.example.FooDataReader.read** (p. 1361) and **com.rti.ndds.example.FooDataReader.take** (p. 1363) variants.

This allows RTI Connext to enable the condition only when suitable information is available. They are to be used in conjunction with a WaitSet as normal conditions.

More than one **com.rti.dds.subscription.ReadCondition** (p. 1816) may be attached to the same **com.rti.dds.subscription.DataReader** (p. 707).

8.258.2 Member Function Documentation

8.258.2.1 get_sample_state_mask()

```
int get_sample_state_mask ( )
```

Retrieves the set of `sample_states` for the condition.

8.258.2.2 get_view_state_mask()

```
int get_view_state_mask ( )
```

Retrieves the set of `view_states` for the condition.

8.258.2.3 get_instance_state_mask()

```
int get_instance_state_mask ( )
```

Retrieves the set of `instance_states` for the condition.

8.258.2.4 get_stream_kind_mask()

```
int get_stream_kind_mask ( )
```

Retrieves the set of stream kind mask for the condition.

8.258.2.5 get_datareader()

```
DataReader get_datareader ( )
```

Returns the **com.rti.dds.subscription.DataReader** (p. 707) associated with the **com.rti.dds.subscription.ReadCondition** (p. 1816).

There is exactly one **com.rti.dds.subscription.DataReader** (p. 707) assicated with each **com.rti.dds.subscription.ReadCondition** (p. 1816).

Returns

com.rti.dds.subscription.DataReader (p. 707) associated with the **com.rti.dds.subscription.ReadCondition** (p. 1816).

8.259 ReadConditionParams Class Reference

- final **Duration_t autopurge_nowriter_instances_delay**

  <<***extension***>> *(*p. *138) Minimum duration for which the* ***com.rti.dds.subscription.DataReader*** *(*p. *707) will maintain information about a received instance once its* `instance_state` *becomes* ***com.rti.dds.subscription.InstanceStateKind.NOT_ALIVE_NO_WRITERS_INSTANCE_STATE*** *(*p. *1452) and there are no samples for the instance in the DataReader queue.*

8.260.1 Detailed Description

<<***spec***>> *(p. 132)* Controls how a DataReader manages the lifecycle of the data that it has received.

When a DataReader receives data, it is stored in a receive queue for the DataReader. The user application may either take the data from the queue or leave it there.

This QoS policy controls whether or not RTI Connext will automatically remove data from the receive queue (so that user applications cannot access it afterwards) when it detects that there are no more DataWriters alive for that data. It specifies how long a **com.rti.dds.subscription.DataReader** (p. 707) must retain information regarding instances that have the instance_state **com.rti.dds.subscription.InstanceStateKind.NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 1452).

Note: This policy is not concerned with keeping reliable reader state or discovery information.

The **com.rti.dds.subscription.DataReader** (p. 707) internally maintains the samples that have not been "taken" by the application, subject to the constraints imposed by other QoS policies such as **com.rti.dds.infrastructure.HistoryQosPolicy** (p. 1435) and **com.rti.dds.infrastructure.ResourceLimitsQosPolicy** (p. 1894).

The **com.rti.dds.subscription.DataReader** (p. 707) also maintains information regarding the identity, `view_state` and `instance_state` of data instances even after all samples have been taken. This is needed to properly compute the states when future samples arrive.

Under normal circumstances the **com.rti.dds.subscription.DataReader** (p. 707) can only reclaim all resources for instances for which there are no writers and for which all samples have been 'taken'. The last sample the **com.rti.dds.subscription.DataReader** (p. 707) will have taken for that instance will have an `instance_state` of either **com.rti.dds.subscription.InstanceStateKind.NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 1452) or **com.rti.dds.subscription.InstanceStateKind.NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 1452) depending on whether or not the last writer that had ownership of the instance disposed it.

In the absence of **READER_DATA_LIFECYCLE** (p. 508), this behavior could cause problems if the application forgets to take those samples. "Untaken" samples will prevent the **com.rti.dds.subscription.DataReader** (p. 707) from reclaiming the resources and they would remain in the **com.rti.dds.subscription.DataReader** (p. 707) indefinitely.

A DataReader can also reclaim all resources for instances that have an instance state of **com.rti.dds.subscription.InstanceStateKind.NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 1452) and for which all DDS samples have been 'taken'. DataReaders will only reclaim resources in this situation when the autopurge_disposed_instances_delay has been set to zero.

For keyed Topics, the consideration of removing data samples from the receive queue is done on a per instance (key) basis. Thus when RTI Connext detects that there are no longer DataWriters alive for a certain key value of a Topic (an instance of the Topic), it can be configured to remove all data samples for that instance (key).

Entity:

com.rti.dds.subscription.DataReader (p. 707)

Properties:

RxO (p. 506) = N/A
Changeable (p. 507) = **YES** (p. 507)

8.260.2 Member Data Documentation

8.260.2.1 autopurge_nowriter_samples_delay

```
final Duration_t autopurge_nowriter_samples_delay
```

<<***spec***>> *(p. 132)* Minimum duration for which the **com.rti.dds.subscription.DataReader** (p. 707) will maintain samples for an instance once its `instance_state` becomes **com.rti.dds.subscription.InstanceStateKind.NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 1452).

At some point after this time elapses, the **com.rti.dds.subscription.DataReader** (p. 707) will purge all samples for the instance; any "untaken" samples will also be dropped.

[default] com.rti.dds.infrastructure.Duration_t.DURATION_INFINITE (p. 1133)

[range] [1 nanosec, 1 year] or **com.rti.dds.infrastructure.Duration_t.DURATION_INFINITE** (p. 1133)

Categories

Immutable (p. 292), **Instance Lifecycle** (p. 232), **Sample Memory Management** (p. 276), **Data Availability** (p. 200)

8.260.2.2 autopurge_disposed_samples_delay

```
final Duration_t autopurge_disposed_samples_delay
```

<<***spec***>> *(p. 132)* Minimum duration for which the **com.rti.dds.subscription.DataReader** (p. 707) will maintain samples for an instance once its `instance_state` becomes **com.rti.dds.subscription.InstanceStateKind.NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 1452).

After this time elapses, the **com.rti.dds.subscription.DataReader** (p. 707) will purge all samples for the instance even if they have not been read by the application. This purge is done lazily when space is needed for other samples or instances.

[default] com.rti.dds.infrastructure.Duration_t.DURATION_INFINITE (p. 1133)

[range] [1 nanosec, 1 year] or **com.rti.dds.infrastructure.Duration_t.DURATION_INFINITE** (p. 1133)

  A special value indicating that the actual value will be automatically resolved.

8.261.1 Detailed Description

<<***extension***>> *(*p. *138)* Configures threads used by RTI Connext to receive and process data from transports (for example, UDP sockets).

This QoS policy is an extension to the DDS standard.

Entity:

com.rti.dds.domain.DomainParticipant (p. 948)

Properties:

RxO (p. 506) = N/A
Changeable (p. 507) = **NO** (p. 507)

See also

Controlling CPU Core Affinity for RTI Threads (p. 2104)

8.261.2 Usage

This QoS policy sets the thread properties such as priority level and stack size for the threads used by the middleware to receive and process data from transports.

RTI uses a separate receive thread per port per transport plug-in. To force RTI Connext to use a separate thread to process the data for a **com.rti.dds.subscription.DataReader** (p. 707), set a unique port for the **com.rti.dds.infrastructure.TransportUnicastQosPolicy** (p. 2177) or **com.rti.dds.infrastructure.TransportMulticastQosPolicy** (p. 2162) for the **com.rti.dds.subscription.DataReader** (p. 707).

This QoS policy also sets the size of the buffer used to store packets received from a transport. This buffer size will limit the largest single packet of data that a **com.rti.dds.domain.DomainParticipant** (p. 948) will accept from a transport. Users will often set this size to the largest packet that any of the transports used by their application will deliver. For many applications, the value 65,536 (64 K) is a good choice; this value is the largest packet that can be sent/received via UDP.

8.261.3 Member Data Documentation

8.261.3.1 thread

```
final ThreadSettings_t thread
```

<<***extension***>> *(*p. *138)* Receiver pool thread(s).

There is at least one receive thread, possibly more.

[default] priority above normal.
The actual value depends on your architecture:

For Windows: 2
For Linux: OS default priority
For a complete list of platform specific values, please refer to `Platform Notes`.

[default] The actual value depends on your architecture:

For Windows: OS default stack size
For Linux: OS default stack size

[default] mask **com.rti.dds.infrastructure.ThreadSettingsKind.THREAD_SETTINGS_FLOATING_POINT** (p. 2106) | **com.rti.dds.infrastructure.ThreadSettingsKind.THREAD_SETTINGS_STDIO** (p. 2106)

Categories

Immutable (p. 292), **Concurrency** (p. 195)

8.261.3.2 buffer_size

```
int buffer_size
```

<<***extension***>> *(*p. *138)* The receive buffer size in bytes.

The receive buffer is used by the receive thread to store the raw data that arrives over the transports in non-zero-copy transports.

Zero-copy transports do not copy their data into the buffer provided by the receive thread. Instead, they provide the receive thread data in buffers allocated by the transports themselves. Only the shared memory built-in transport (SHMEM) supports zero-copy.

buffer_size must always be at least as large as the maximum **com.rti.ndds.transport.Transport.Property_t.message_size_max** (p. 1704) across *all* of the transports being used that are not doing zero-copy.

By default (**com.rti.dds.infrastructure.ReceiverPoolQosPolicy.LENGTH_AUTO** (p. 509)): the size is equal to the maximum **com.rti.ndds.transport.Transport.Property_t.message_size_max** (p. 1704) across *all* of the non-zero-copy transports.

You may want the value to be greater than the default if you try to limit the largest data packet that can be sent through the transport(s) in one application, but you still want to receive data from other applications that have not made the same change.

For example, to avoid IP fragmentation, you may want to set **com.rti.ndds.transport.Transport.Property_t.message_size_max** (p. 1704) for IP-based transports to a small value, such as 1400 bytes. However, you may not be able to apply this change to all the applications at the same time. To receive data from these other applications the buffer_size should be equal to the original **com.rti.ndds.transport.Transport.Property_t.message_size_max** (p. 1704).

[default] com.rti.dds.infrastructure.ReceiverPoolQosPolicy.LENGTH_AUTO (p. 509)

[range] [1, 1 GB] or **com.rti.dds.infrastructure.ReceiverPoolQosPolicy.LENGTH_AUTO** (p. 509)

Categories

Immutable (p. 292), **Middleware Memory Management** (p. 244)

8.261.3.3 buffer_alignment

```
int buffer_alignment
```

[DEPRECATED] (p. **358)** <<***extension***>> *(*p. *138)* The receive buffer alignment.

Most users will not need to change this alignment.

[default] 16

[range] [1,1024] Value must be a power of 2.

8.262.1 Detailed Description

<<***extension***>> *(*p. *138)* <<***spec***>> *(*p. *132)* Indicates the level of reliability offered/requested by RTI Connext.

Entity:

com.rti.dds.topic.Topic (p. 2116), **com.rti.dds.subscription.DataReader** (p. 707), **com.rti.dds.publication.DataWriter** (p. 818)

Status:

com.rti.dds.infrastructure.StatusKind.StatusKind.OFFERED_INCOMPATIBLE_QOS_STATUS, com.rti.dds.infrastructure.StatusKind.StatusKind.REQUESTED_INCOMPATIBLE_QOS_STATUS

Properties:

RxO (p. 506) = YES
Changeable (p. 507) = **UNTIL ENABLE** (p. 507) (the instance_state_consistency_kind is **Changeable** (p. 507) = **NO** (p. 507))

8.262.2 Usage

This policy indicates the level of reliability requested by a **com.rti.dds.subscription.DataReader** (p. 707) or offered by a **com.rti.dds.publication.DataWriter** (p. 818).

The reliability of a connection between a DataWriter and DataReader is entirely user configurable. It can be done on a per DataWriter/DataReader connection. A connection may be configured to be "best effort" which means that RTI Connext will not use any resources to monitor or guarantee that the data sent by a DataWriter is received by a DataReader.

For some use cases, such as the periodic update of sensor values to a GUI displaying the value to a person, **com.↩ rti.dds.infrastructure.ReliabilityQosPolicyKind.BEST_EFFORT_RELIABILITY_QOS** (p. 1836) delivery is often good enough. It is certainly the fastest, most efficient, and least resource-intensive (CPU and network bandwidth) method of getting the newest/latest value for a topic from DataWriters to DataReaders. But there is no guarantee that the data sent will be received. It may be lost due to a variety of factors, including data loss by the physical transport such as wireless RF or even Ethernet.

However, there are data streams (topics) in which you want an absolute guarantee that all data sent by a DataWriter is received reliably by DataReaders. This means that RTI Connext must check whether or not data was received, and repair any data that was rejected by resending a copy of the data as many times as it takes for the DataReader to receive the data. RTI Connext uses a reliability protocol configured and tuned by these QoS policies: **com.rti.↩ dds.infrastructure.HistoryQosPolicy** (p. 1435), **com.rti.dds.infrastructure.DataWriterProtocolQosPolicy** (p. 860), **com.rti.dds.infrastructure.DataReaderProtocolQosPolicy** (p. 761), and **com.rti.dds.infrastructure.Resource↩ LimitsQosPolicy** (p. 1894).

The Reliability QoS policy is simply a switch to turn on the reliability protocol for a DataWriter/DataReader connection. The level of reliability provided by RTI Connext is determined by the configuration of the aforementioned QoS policies.

You can configure RTI Connext to deliver *all* data in the order they were sent (also known as absolute or strict reliability). Or, as a tradeoff for less memory, CPU, and network usage, you can choose a reduced level of reliability where only the last *N* values are guaranteed to be delivered reliably to DataReaders (where *N* is user-configurable). In the reduced level of reliability, there are no guarantees that the data sent before the last *N* are received. Only the last *N* data packets are monitored and repaired if necessary.

These levels are ordered, **com.rti.dds.infrastructure.ReliabilityQosPolicyKind.BEST_EFFORT_RELIABILITY_↩ QOS** (p. 1836) $<$ **com.rti.dds.infrastructure.ReliabilityQosPolicyKind.RELIABLE_RELIABILITY_QOS** (p. 1836). A **com.rti.dds.publication.DataWriter** (p. 818) offering one level is implicitly offering all levels below.

The setting of this policy has a dependency on the setting of the **RESOURCE_LIMITS** (p. 511) policy. In case the reliability kind is set to **com.rti.dds.infrastructure.ReliabilityQosPolicyKind.RELIABLE_RELIABILITY_QOS** (p. 1836) the write operation on the **com.rti.dds.publication.DataWriter** (p. 818) may block if the modification would cause data to be lost or else cause one of the limits in specified in the **RESOURCE_LIMITS** (p. 511) to be exceeded. Under these circumstances, the **RELIABILITY** (p. 510) `max_blocking_time` configures the maximum duration the write operation may block.

If the **com.rti.dds.infrastructure.ReliabilityQosPolicy.kind** (p. 1831) is set to **com.rti.dds.infrastructure.↩ ReliabilityQosPolicyKind.RELIABLE_RELIABILITY_QOS** (p. 1836), data samples originating from a single **com.↩ rti.dds.publication.DataWriter** (p. 818) cannot be made available to the **com.rti.dds.subscription.DataReader** (p. 707) if there are previous data samples that have not been received yet due to a communication error. In other words, RTI Connext will repair the error and resend data samples as needed in order to reconstruct a correct snapshot of the **com.rti.dds.publication.DataWriter** (p. 818) history before it is accessible by the **com.rti.dds.subscription.↩ DataReader** (p. 707).

If the **com.rti.dds.infrastructure.ReliabilityQosPolicy.kind** (p. 1831) is set to **com.rti.dds.infrastructure.↩ ReliabilityQosPolicyKind.BEST_EFFORT_RELIABILITY_QOS** (p. 1836), the service will not re-transmit missing data samples. However, for data samples originating from any one DataWriter the service will ensure they are stored in the **com.rti.dds.subscription.DataReader** (p. 707) history in the same order they originated in the **com.rti.dds.↩ publication.DataWriter** (p. 818). In other words, the **com.rti.dds.subscription.DataReader** (p. 707) may miss some data samples, but it will never see the value of a data object change from a newer value to an older value.

See also

com.rti.dds.infrastructure.HistoryQosPolicy (p. 1435)

com.rti.dds.infrastructure.ResourceLimitsQosPolicy (p. 1894)

8.262.3 Compatibility

The value offered is considered compatible with the value requested if and only if:

- The inequality *offered* `kind` >= *requested* `kind` evaluates to 'TRUE'. For the purposes of this inequality, the values of **com.rti.dds.infrastructure.ReliabilityQosPolicy.kind** (p. 1831) are considered ordered such that **com.rti.dds.infrastructure.ReliabilityQosPolicyKind.BEST_EFFORT_RELIABILITY_QOS** (p. 1836) < **com.rti.dds.infrastructure.ReliabilityQosPolicyKind.RELIABLE_RELIABILITY_QOS** (p. 1836). If **com.rti.dds.infrastructure.ReliabilityQosPolicy.exact_reliability_kind_match** (p. 1833) is set to true, then only exact kind matches, *offered* `kind` == *requested* `kind`, are considered compatible.

- The offered acknowledgment_kind = **com.rti.dds.infrastructure.ReliabilityQosPolicyAcknowledgmentModeKind.PROTOCOL_ACKNOWLEDGMENT_MODE** (p. 1834) and requested acknowledgment_kind = **com.rti.dds.infrastructure.ReliabilityQosPolicyAcknowledgmentModeKind.PROTOCOL_ACKNOWLEDGMENT_MODE** (p. 1834) OR offered acknowledgment_kind != **com.rti.dds.infrastructure.ReliabilityQosPolicyAcknowledgmentModeKind.PROTOCOL_ACKNOWLEDGMENT_MODE** (p. 1834).

- The inequality *offered* `instance_state_consistency_kind` >= *requested* `instance_state_consistency_kind` evaluates to 'TRUE'. For the purposes of this inequaility, the values of **com.rti.dds.infrastructure.ReliabilityQosPolicy.instance_state_consistency_kind** (p. 1832) are considered ordered such that **com.rti.dds.infrastructure.InstanceStateConsistencyKind.NO_RECOVER_INSTANCE_STATE_CONSISTENCY** (p. 1450) < **com.rti.dds.infrastructure.InstanceStateConsistencyKind.RECOVER_INSTANCE_STATE_CONSISTENCY** (p. 1450).

8.263.2 Member Data Documentation

8.263.2.1 PROTOCOL_ACKNOWLEDGMENT_MODE

```
final ReliabilityQosPolicyAcknowledgmentModeKind PROTOCOL_ACKNOWLEDGMENT_MODE [static]
```

Samples are acknowledged by RTPS protocol.

Samples are acknowledged according to the Real-Time Publish-Subscribe (RTPS) interoperability protocol.

8.263.2.2 APPLICATION_AUTO_ACKNOWLEDGMENT_MODE

```
final ReliabilityQosPolicyAcknowledgmentModeKind APPLICATION_AUTO_ACKNOWLEDGMENT_MODE [static]
```

Samples are acknowledged automatically after a subscribing application has accessed them.

A sample received by a **com.rti.ndds.example.FooDataReader** (p. 1359) is acknowledged after the subscribing application accesses it, either through calling **com.rti.ndds.example.FooDataReader.take** (p. 1363) or **com.rti.ndds.example.FooDataReader.read** (p. 1361) on the DDS sample. If the read or take operation loans the samples, the acknowledgment is done after **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386) is called. Otherwise, for read or take operations that make a copy, acknowledgment is done after the read or take operations are executed.

8.263.2.3 APPLICATION_EXPLICIT_ACKNOWLEDGMENT_MODE

```
final ReliabilityQosPolicyAcknowledgmentModeKind APPLICATION_EXPLICIT_ACKNOWLEDGMENT_MODE [static]
```

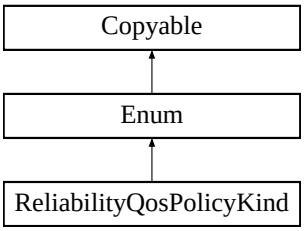
Samples are acknowledged after the subscribing application explicitly calls acknowledge on the samples.

Samples received by a **com.rti.dds.subscription.DataReader** (p. 707) are explicitly acknowledged by the subscribing application, after it calls either **com.rti.dds.subscription.DataReader.acknowledge_all** (p. 730) or **com.rti.dds.subscription.DataReader.acknowledge_sample** (p. 729).

8.264 ReliabilityQosPolicyKind Class Reference

Kinds of reliability.

Inheritance diagram for ReliabilityQosPolicyKind:



Static Public Attributes

- static final **ReliabilityQosPolicyKind BEST_EFFORT_RELIABILITY_QOS**

  Indicates that it is acceptable to not retry propagation of any samples.
- static final **ReliabilityQosPolicyKind RELIABLE_RELIABILITY_QOS**

  Specifies RTI Connext will attempt to deliver all samples in its history. Missed samples may be retried.

Additional Inherited Members

8.264.1 Detailed Description

Kinds of reliability.

QoS:

com.rti.dds.infrastructure.ReliabilityQosPolicy (p. 1829)

8.264.2 Member Data Documentation

8.264.2.1 BEST_EFFORT_RELIABILITY_QOS

```
final ReliabilityQosPolicyKind BEST_EFFORT_RELIABILITY_QOS [static]
```

Indicates that it is acceptable to not retry propagation of any samples.

Presumably new values for the samples are generated often enough that it is not necessary to re-send or acknowledge any samples.

[default] for **com.rti.dds.subscription.DataReader** (p. 707) and **com.rti.dds.topic.Topic** (p. 2116)

8.264.2.2 RELIABLE_RELIABILITY_QOS

```
final ReliabilityQosPolicyKind RELIABLE_RELIABILITY_QOS [static]
```

Specifies RTI Connext will attempt to deliver all samples in its history. Missed samples may be retried.

In steady-state (no modifications communicated via the **com.rti.dds.publication.DataWriter** (p. 818)), RTI Connext guarantees that all samples in the **com.rti.dds.publication.DataWriter** (p. 818) history will eventually be delivered to all the **com.rti.dds.subscription.DataReader** (p. 707) objects (subject to timeouts that indicate loss of communication with a particular **com.rti.dds.subscription.Subscriber** (p. 2039)).

Outside steady state, the **HISTORY** (p. 487) and **RESOURCE_LIMITS** (p. 511) policies will determine how samples become part of the history and whether samples can be discarded from it.

[default] for **com.rti.dds.publication.DataWriter** (p. 818)

  The number of reliable readers that have been dropped by this reliable writer because they failed to send acknowledgements in a timely fashion.
- int **active_count_change**

  The most recent change in the number of active remote reliable readers.
- int **inactive_count_change**

  The most recent change in the number of inactive remote reliable readers.
- final **InstanceHandle_t last_instance_handle**

  The instance handle of the last reliable remote reader to be determined inactive.

8.265.1 Detailed Description

<<***extension***>> *(*p. *403)* Describes the activity (i.e. are acknowledgements forthcoming) of reliable readers matched to a reliable writer.

Entity:

com.rti.dds.publication.DataWriter (p. 818)

Listener:

com.rti.dds.publication.DataWriterListener (p. 853)

This status is the reciprocal status to the **com.rti.dds.subscription.LivelinessChangedStatus** (p. 1531) on the reader. It is different than the **com.rti.dds.publication.LivelinessLostStatus** (p. 1534) on the writer in that the latter informs the writer about its own liveliness; this status informs the writer about the "liveliness" (activity) of its matched readers.

All counts in this status will remain at zero for best effort writers.

8.265.2 Constructor & Destructor Documentation

8.265.2.1 ReliableReaderActivityChangedStatus() [1/2]

```
ReliableReaderActivityChangedStatus ( )
```

Construct a new status object with default contents.

8.265.2.2 ReliableReaderActivityChangedStatus() [2/2]

```
ReliableReaderActivityChangedStatus (
            ReliableReaderActivityChangedStatus src )
```

Construct a new status identical to the given status.

Exceptions

NullPointerException	if the given status is null.

References **ReliableReaderActivityChangedStatus.active_count**, **ReliableReaderActivityChangedStatus.active_count_change**, **ReliableReaderActivityChangedStatus.inactive_count**, **ReliableReaderActivityChangedStatus.inactive_count_change**, and **ReliableReaderActivityChangedStatus.last_instance_handle**.

8.265.3 Member Data Documentation

8.265.3.1 active_count

```
int active_count
```

The current number of reliable readers currently matched with this reliable writer.

Referenced by **ReliableReaderActivityChangedStatus.ReliableReaderActivityChangedStatus()**.

8.265.3.2 inactive_count

```
int inactive_count
```

The number of reliable readers that have been dropped by this reliable writer because they failed to send acknowledgements in a timely fashion.

A reader is considered to be inactive after is has been sent heartbeats **com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t.max_heartbeat_retries** (p. 1917) times, each heartbeat having been separated from the previous by the current heartbeat period.

Referenced by **ReliableReaderActivityChangedStatus.ReliableReaderActivityChangedStatus()**.

8.265.3.3 active_count_change

```
int active_count_change
```

The most recent change in the number of active remote reliable readers.

Referenced by **ReliableReaderActivityChangedStatus.ReliableReaderActivityChangedStatus()**.

8.265.3.4 inactive_count_change

```
int inactive_count_change
```

The most recent change in the number of inactive remote reliable readers.

Referenced by **ReliableReaderActivityChangedStatus.ReliableReaderActivityChangedStatus()**.

8.265.3.5 last_instance_handle

```
final  InstanceHandle_t last_instance_handle
```

The instance handle of the last reliable remote reader to be determined inactive.

Referenced by **ReliableReaderActivityChangedStatus.ReliableReaderActivityChangedStatus()**.

8.266 ReliableWriterCacheChangedStatus Class Reference

<<***extension***>> *(*p. *403)* A summary of the state of a data writer's cache of unacknowledged samples written.

Inherits Status.

Public Member Functions

- **ReliableWriterCacheChangedStatus** ()

  Construct a new status object.
- **ReliableWriterCacheChangedStatus** (**ReliableWriterCacheChangedStatus** src)

  A copy constructor.

Public Attributes

- final **ReliableWriterCacheEventCount empty_reliable_writer_cache**

  The number of times the reliable writer's cache of unacknowledged samples has become empty.
- final **ReliableWriterCacheEventCount full_reliable_writer_cache** = new **ReliableWriterCacheEventCount**()

  The number of times the reliable writer's cache, or send window, of unacknowledged samples has become full.
- final **ReliableWriterCacheEventCount low_watermark_reliable_writer_cache**

  The number of times the reliable writer's cache of unacknowledged samples has fallen to the low watermark.
- final **ReliableWriterCacheEventCount high_watermark_reliable_writer_cache**

  The number of times the reliable writer's cache of unacknowledged samples has risen to the high watermark.
- int **unacknowledged_sample_count**

  The current number of unacknowledged samples in the writer's cache.
- int **unacknowledged_sample_count_peak**

  The highest value that unacknowledged_sample_count has reached until now.
- long **replaced_unacknowledged_sample_count**

  The number of unacknowledged samples that have been replaced in the writer's cache.

8.266.1 Detailed Description

<<***extension***>> *(*p. *403)* A summary of the state of a data writer's cache of unacknowledged samples written.

Entity:

com.rti.dds.publication.DataWriter (p. 818)

Listener:

com.rti.dds.publication.DataWriterListener (p. 853)

A written sample is unacknowledged (and therefore accounted for in this status) if the writer is reliable and one or more readers matched with the writer has not yet sent an acknowledgement to the writer declaring that it has received the sample.

If the low watermark is zero and the unacknowledged sample count decreases to zero, both the low watermark and cache empty events are considered to have taken place. A single callback will be dispatched (assuming the user has requested one) that contains both status changes. The same logic applies when the high watermark is set equal to the maximum number of samples and the cache becomes full.

8.266.2 Constructor & Destructor Documentation

8.266.2.1 ReliableWriterCacheChangedStatus() [1/2]

```
ReliableWriterCacheChangedStatus ( )
```

Construct a new status object.

8.266.2.2 ReliableWriterCacheChangedStatus() [2/2]

```
ReliableWriterCacheChangedStatus (
            ReliableWriterCacheChangedStatus src )
```

A copy constructor.

Parameters

src	Source to copy from.

Exceptions

NullPointerException	if the source object is null.

References **ReliableWriterCacheChangedStatus.empty_reliable_writer_cache**, **ReliableWriterCacheChanged↩ Status.full_reliable_writer_cache**, **ReliableWriterCacheChangedStatus.high_watermark_reliable_writer_cache**, **ReliableWriterCacheChangedStatus.low_watermark_reliable_writer_cache**, **ReliableWriterCacheChanged↩ Status.replaced_unacknowledged_sample_count**, **ReliableWriterCacheChangedStatus.unacknowledged_↩ sample_count**, and **ReliableWriterCacheChangedStatus.unacknowledged_sample_count_peak**.

8.266.3 Member Data Documentation

8.266.3.1 empty_reliable_writer_cache

```
final  ReliableWriterCacheEventCount empty_reliable_writer_cache
```

The number of times the reliable writer's cache of unacknowledged samples has become empty.

Referenced by **ReliableWriterCacheChangedStatus.ReliableWriterCacheChangedStatus()**.

8.266.3.2 full_reliable_writer_cache

```
final ReliableWriterCacheEventCount full_reliable_writer_cache = new ReliableWriterCacheEvent↩
Count()
```

The number of times the reliable writer's cache, or send window, of unacknowledged samples has become full.

Applies to writer's cache when the send window is enabled (when both **com.rti.dds.infrastructure.RtpsReliable↩ WriterProtocol_t.min_send_window_size** (p. 1924) and **com.rti.dds.infrastructure.RtpsReliableWriterProtocol↩ _t.max_send_window_size** (p. 1924) are not **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_↩ UNLIMITED** (p. 511)).

Otherwise, applies when the number of unacknowledged samples has reached the send window limit.

Referenced by **ReliableWriterCacheChangedStatus.ReliableWriterCacheChangedStatus()**.

8.266.3.3 low_watermark_reliable_writer_cache

```
final ReliableWriterCacheEventCount low_watermark_reliable_writer_cache
```

The number of times the reliable writer's cache of unacknowledged samples has fallen to the low watermark.

A low watermark event will only be considered to have taken place when the number of unacknowledged samples in the writer's cache *decreases* to this value. A sample count that increases to this value will not result in a callback or in a change to the total count of low watermark events.

When the writer's send window is enabled, the low watermark is scaled down, if necessary, to fit within the current send window.

Set the low watermark value using the **com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t.low_watermark** (p. 1913) field of the **com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t** (p. 1911) structure.

Referenced by **ReliableWriterCacheChangedStatus.ReliableWriterCacheChangedStatus()**.

8.266.3.4 high_watermark_reliable_writer_cache

```
final ReliableWriterCacheEventCount high_watermark_reliable_writer_cache
```

The number of times the reliable writer's cache of unacknowledged samples has risen to the high watermark.

A high watermark event will only be considered to have taken place when the number of unacknowledged sampled *increases* to this value. A sample count that was above this value and then decreases back to it will not trigger an event.

When the writer's send window is enabled, the high watermark is scaled down, if necessary, to fit within the current send window.

Set the high watermark value using the **com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t.high_watermark** (p. 1913) field of the **com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t** (p. 1911) structure.

Referenced by **ReliableWriterCacheChangedStatus.ReliableWriterCacheChangedStatus()**.

8.266.3.5 unacknowledged_sample_count

```
int unacknowledged_sample_count
```

The current number of unacknowledged samples in the writer's cache.

A sample is considered unacknowledged if the writer has failed to receive an acknowledgement from one or more reliable readers matched to it.

Referenced by **ReliableWriterCacheChangedStatus.ReliableWriterCacheChangedStatus()**.

8.266.3.6 unacknowledged_sample_count_peak

```
int unacknowledged_sample_count_peak
```

The highest value that unacknowledged_sample_count has reached until now.

Referenced by **ReliableWriterCacheChangedStatus.ReliableWriterCacheChangedStatus()**.

8.266.3.7 replaced_unacknowledged_sample_count

```
long replaced_unacknowledged_sample_count
```

The number of unacknowledged samples that have been replaced in the writer's cache.

Total number of unacknowledged samples that have been replaced by a **DataWriter** (p. 818) after applying com.rti.↩ dds.infrastructure.HistoryQosPolicyKind.HistoryQosPolicyKind.KEEP_LAST_HISTORY_QOS policy.

Referenced by **ReliableWriterCacheChangedStatus.ReliableWriterCacheChangedStatus()**.

8.267 ReliableWriterCacheEventCount Class Reference

<<***extension***>> *(p. 403)* The number of times the number of unacknowledged samples in the cache of a reliable writer hit a certain well-defined threshold.

Inherits Struct.

Public Attributes

- int **total_count**

  The total number of times the event has occurred.
- int **total_count_change**

  The incremental number of times the event has occurred since the listener was last invoked or the status read.

8.267.1 Detailed Description

<<***extension***>> *(p. 403)* The number of times the number of unacknowledged samples in the cache of a reliable writer hit a certain well-defined threshold.

The threshold interpretation depends on the usage of this data type in **com.rti.dds.publication.ReliableWriterCache↩ ChangedStatus** (p. 1839).

See also

com.rti.dds.publication.ReliableWriterCacheChangedStatus (p. 1839)

8.267.2 Member Data Documentation

8.267.2.1 total_count

```
int total_count
```

The total number of times the event has occurred.

8.267.2.2 total_count_change

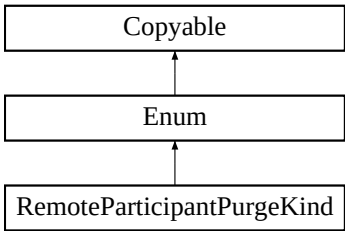
```
int total_count_change
```

The incremental number of times the event has occurred since the listener was last invoked or the status read.

8.268 RemoteParticipantPurgeKind Class Reference

Available behaviors for halting communication with remote participants (and their contained entities) with which discovery communication has been lost.

Inheritance diagram for RemoteParticipantPurgeKind:



Static Public Attributes

- static final **RemoteParticipantPurgeKind LIVELINESS_BASED_REMOTE_PARTICIPANT_PURGE**

  [default] *Maintain knowledge of the remote participant for as long as it maintains its liveliness contract.*
- static final **RemoteParticipantPurgeKind NO_REMOTE_PARTICIPANT_PURGE**

  Never "forget" a remote participant with which discovery communication has been lost.

Additional Inherited Members

8.268.1 Detailed Description

Available behaviors for halting communication with remote participants (and their contained entities) with which discovery communication has been lost.

When discovery communication with a remote participant has been lost, the local participant must make a decision about whether to continue attempting to communicate with that participant and its contained entities. This "kind" is used to select the desired behavior.

This "kind" does not pertain to the situation in which a remote participant has been gracefully deleted and notification of that deletion have been successfully received by its peers. In that case, the local participant will immediately stop attempting to communicate with those entities and will remove the associated remote entity records from its internal database.

See also

com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.remote_participant_purge_kind (p. 920)

8.268.2 Member Data Documentation

8.268.2.1 LIVELINESS_BASED_REMOTE_PARTICIPANT_PURGE

```
final  RemoteParticipantPurgeKind LIVELINESS_BASED_REMOTE_PARTICIPANT_PURGE  [static]
```

Initial value:

```
= new RemoteParticipantPurgeKind(
                "LIVELINESS_BASED_REMOTE_PARTICIPANT_PURGE", 0)
```

[default] Maintain knowledge of the remote participant for as long as it maintains its liveliness contract.

A participant will continue attempting communication with its peers, even if discovery communication with them is lost, as long as the remote participants maintain their liveliness. If both discovery communication and participant liveliness are lost, however, the local participant will remove all records of the remote participant and its contained endpoints, and no further data communication with them will occur until and unless they are rediscovered.

The liveliness contract a participant promises to its peers – its "liveliness lease duration" – is specified in its **com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.participant_liveliness_lease_duration** (p. 918) QoS field. It maintains that contract by writing data to those other participants with a writer that has a **com.rti.dds.infrastructure.LivelinessQosPolicyKind** (p. 1539) of com.rti.dds.infrastructure.LivelinessQosPolicyKind.LivelinessQosPolicyKind.AUTOMATIC_LIVELINESS_QOS or com.rti.dds.infrastructure.LivelinessQosPolicyKind.LivelinessQosPolicyKind.MANUAL_BY_PARTICIPANT_LIVELINESS_QOS and by asserting itself (at the **com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.participant_liveliness_assert_period** (p. 919)) over the Simple Discovery Protocol.

8.268.2.2 NO_REMOTE_PARTICIPANT_PURGE

```
final  RemoteParticipantPurgeKind NO_REMOTE_PARTICIPANT_PURGE  [static]
```

Initial value:

```
= new RemoteParticipantPurgeKind(
                "NO_REMOTE_PARTICIPANT_PURGE", 1)
```

Never "forget" a remote participant with which discovery communication has been lost.

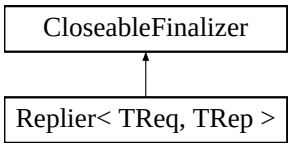
If a participant with this behavior loses discovery communication with a remote participant, it will nevertheless remember that remote participant and its endpoints and continue attempting to communicate with them indefinitely.

This value has consequences for a participant's resource usage. If discovery communication with a remote participant is lost, but the same participant is later rediscovered, any relevant records that remain in the database will be reused. However, if it is not rediscovered, the records will continue to take up space in the database for as long as the local participant remains in existence.

8.269 Replier< TReq, TRep > Class Template Reference

Allows receiving requests and sending replies.

Inheritance diagram for Replier< TReq, TRep >:



Public Member Functions

- **Replier** (**ReplierParams**< TReq, TRep > params)

  *Creates a **Replier** (p. 1846) with parameters.*
- **Replier** (**DomainParticipant** participant, String serviceName, **TypeSupport** requestTypeSupport, **Type↩ Support** replyTypeSupport)

  *Creates a **Replier** (p. 1846) with the minimum set of parameters.*
- void **close** ()

  *Releases the internal entities created by this **Replier** (p. 1846).*
- void **sendReply** (TRep reply, **SampleIdentity_t** relatedRequestId)

  Sends a reply for a previous request.
- void **sendReply** (**WriteSample**< TRep > reply, **SampleIdentity_t** relatedRequestId)

  Sends a reply for a previous request.
- boolean **receiveRequest** (**Sample**< TReq > request, **Duration_t** maxWait)

  Waits for a request and copies its contents into a Sample.
- List< **Sample**< TReq > > **receiveRequests** (List< **Sample**< TReq > > replies, int maxCount, **Duration_t** maxWait)

  Waits for multiple requests and copies them into a list.

- List< **Sample**< TReq > > **receiveRequests** (List< **Sample**< TReq > > replies, int minCount, int maxCount, **Duration_t** maxWait)

  Waits for multiple requests and copies them into a list.
- Sample.Iterator< TReq > **receiveRequests** (**Duration_t** maxWait)

  Waits for multiple requests and provides a loaned iterator to access them.
- Sample.Iterator< TReq > **receiveRequests** (int minCount, int maxCount, **Duration_t** maxWait)

  Waits for multiple requests and provides a loaned iterator to access them.
- boolean **takeRequest** (**Sample**< TReq > request)

  Copies the contents of a request into a Sample.
- Sample.Iterator< TReq > **takeRequests** ()

  Provides a loaned iterator to access the existing requests.
- Sample.Iterator< TReq > **takeRequests** (int maxCount)

  Provides a loaned iterator to access the existing requests.
- List< **Sample**< TReq > > **takeRequests** (List< **Sample**< TReq > > requests, int maxCount)

  Copies existing requests into a list.
- boolean **readRequest** (**Sample**< TReq > request)

  Copies the contents of a request into a Sample.
- Sample.Iterator< TReq > **readRequests** ()

  Provides a loaned iterator to access the existing requests.
- Sample.Iterator< TReq > **readRequests** (int maxCount)

  Provides a loaned iterator to access the existing requests.
- List< **Sample**< TReq > > **readRequests** (List< **Sample**< TReq > > requests, int maxCount)

  Copies existing requests into a list.
- boolean **waitForRequests** (**Duration_t** maxWait)

  Waits for requests.
- boolean **waitForRequests** (int minCount, **Duration_t** maxWait)

  Waits for requests.
- **DataWriter getReplyDataWriter** ()

  *Retrieves the underlying **com.rti.dds.publication.DataWriter** (p. 818).*
- **DataReader getRequestDataReader** ()

  *Retrieves the underlying **com.rti.dds.subscription.DataReader** (p. 707).*
- **WriteSample**< TRep > **createReplySample** ()

  Creates a WriteSample for sending replies.
- **WriteSample**< TRep > **createReplySample** (TRep data)

  Creates a WriteSample for sending replies.
- **Sample**< TReq > **createRequestSample** ()

  Creates a Sample for receiving replies.
- **Sample**< TReq > **createRequestSample** (TReq data)

  Creates a Sample for receiving replies.

8.269.1 Detailed Description

Allows receiving requests and sending replies.

A **Replier** (p. 1846) is an entity with two associated **topics** (p. 55): a request topic and a reply topic. It can receive requests by subscribing to the request topic and can send replies to those requests by publishing the reply topic.

Valid types for these topics (`TReq` and `TRep`) are: those generated by rtiddsgen, the **DDS built-in types** (p. 62), and **com.rti.dds.dynamicdata.DynamicData** (p. 1134). See **Creating a Replier** (p. 396).

A **Replier** (p. 1846) has four main types of operations:

- Waiting for requests to be received from the middleware
- Getting those requests
- Receiving requests (a convenience operation that is a combination of waiting and getting in a single operation)
- Sending a reply for a previously received request (i.e., publishing a reply sample on the reply topic with special meta-data so that the orignal **Requester** (p. 1867) can identify it)

For multi-reply scenarios in which a com.rti.connext.requestreply.Replier<TReq,TRep> generates more than one reply for a request, the com.rti.connext.requestreply.Replier<TReq,TRep> should mark all the intermediate replies (all but the last) using the **com.rti.dds.infrastructure.SampleFlagBits.INTERMEDIATE_REPLY_SEQUENCE_SAMPLE** (p. 1940) flag in **com.rti.dds.infrastructure.WriteParams_t.flag** (p. 2313).

Much like a **Requester** (p. 1867), a **Replier** (p. 1846) has an associated **com.rti.dds.domain.DomainParticipant** (p. 948), which can be shared with other Repliers or RTI Connext routines. All the other entities required for the request-reply interaction, including a **com.rti.dds.publication.DataWriter** (p. 818) for writing replies and a **com.rti.↩ dds.subscription.DataReader** (p. 707) for reading requests, are automatically created when the **Replier** (p. 1846) is constructed.

Quality of Service for the underlying DataWriter and DataReader can be configured (see **com.rti.connext.↩ requestreply.RequesterParams.setQosProfile(String,String)** (p. 1892)). By default, they are created with **com.rti.↩ dds.infrastructure.ReliabilityQosPolicyKind.RELIABLE_RELIABILITY_QOS** (p. 1836). The exact default configuration is described here: **Configuring Request-Reply QoS profiles** (p. 398)

There are several ways to use a **Replier** (p. 1846):

- A thread **receives** (p. 1853) requests and then dispatches them. If the computation of a reply is a simple operation, consider using a com.rti.connext.requestreply.SimpleReplier<TReq,TRep> instead of a **Replier** (p. 1846).
- Polling without waiting, using **takeRequests(int)** (p. 1854) directly.
- Using a com.rti.connext.requestreply.ReplierListener<TReq,TRep> to get notified and **get** (p. 1854) the requests within the callback.

Template Parameters

TReq	The data type for the request topic
TRep	The data type for the reply topic

See also

com.rti.connext.requestreply.Requester<TReq,TRep>

Request-Reply Examples (p. 391)

Basic Replier example (p. 397)

8.269.2 Constructor & Destructor Documentation

8.269.2.1 Replier() [1/2]

```
Replier (
            ReplierParams< TReq, TRep > params )
```

Creates a **Replier** (p. 1846) with parameters.

Parameters

params	All the parameters that configure this **Replier** (p. 1846)

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

com.rti.connext.requestreply.ReplierParams<TReq,TRep>

Creating a Replier (p. 396)

8.269.2.2 Replier() [2/2]

```
Replier (
             DomainParticipant participant,
            String serviceName,
             TypeSupport requestTypeSupport,
             TypeSupport replyTypeSupport )
```

Creates a **Replier** (p. 1846) with the minimum set of parameters.

Parameters

participant	The DomainParticipant that this **Replier** (p. 1846) uses to join a domain.
serviceName	The service name. See **com.rti.connext.requestreply.ReplierParams<TReq,TRep>.setServiceName(String)** (p. 1861)
requestTypeSupport	The type support for type TReq
replyTypeSupport	The type support for type TReq

Exceptions

One	of the **Standard Return Codes** (p. 513)

References **ReplierParams< TReq, TRep >.setServiceName()**.

8.269.3 Member Function Documentation

8.269.3.1 close()

```
void close ( )
```

Releases the internal entities created by this **Replier** (p. 1846).

Among other internal resources, it deletes the **Replier** (p. 1846)'s underlying DataReader and DataWriter.

See also

com.rti.dds.subscription.Subscriber.delete_datareader (p. 2048)

com.rti.dds.publication.Publisher.delete_datawriter (p. 1775)

Referenced by **SimpleReplier< TReq, TRep >.close()**.

8.269.3.2 sendReply() [1/2]

```
void sendReply (
             TRep reply,
              SampleIdentity_t relatedRequestId )
```

Sends a reply for a previous request.

The related request identity can be retrieved from an existing request sample (com.rti.connext.infrastructure.Sample< T>).

Parameters

reply	The reply to be sent.
relatedRequestId	The identity of a previously received request

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

com.rti.connext.infrastructure.SampleData<T>.getIdentity() (p. 1939)

receiveRequest(Sample<TReq>,Duration_t) (p. 1851)

receiveRequests(int,int,Duration_t) (p. 1853)

takeRequest(Sample<TReq>) (p. 1853)

takeRequests(int) (p. 1854)

Basic Replier example (p. 397)

8.269.3.3 sendReply() [2/2]

```
void sendReply (
            WriteSample< TRep > reply,
            SampleIdentity_t relatedRequestId )
```

Sends a reply for a previous request.

Allows you to set custom parameters for writing a reply.

Contrary to the com.rti.connext.requestreply.Requester<TReq,TRep>, where retrieving the sample identity for correlation is common, on the **Replier** (p. 1846) side using a WriteSample is only necessary when the default write parameters need to be overridden, and **sendReply(TRep, SampleIdentity_t)** (p. 1850) may be used if that is not necessary.

One reason to override the default write parameters is a multi-reply scenario in which a com.rti.connext.requestreply.↩ Replier<TReq,TRep> generates more than one reply for a request. In this case, all the intermediate replies (all but the last) should be marked with the **com.rti.dds.infrastructure.SampleFlagBits.INTERMEDIATE_REPLY_↩ SEQUENCE_SAMPLE** (p. 1940) flag in **com.rti.dds.infrastructure.WriteParams_t.flag** (p. 2313) within **com.rti.↩ connext.infrastructure.WriteSample<T>.getInfo()** (p. 2324).

A com.rti.connext.requestreply.Requester<TReq,TRep> can detect if a reply is the last reply of a sequence of replies by checking that the flag **com.rti.dds.infrastructure.SampleFlagBits.INTERMEDIATE_REPLY_SEQUENCE_SAMPLE** (p. 1940) is not set in **com.rti.dds.subscription.SampleInfo.flag** (p. 1954) within **com.rti.connext.infrastructure.↩ Sample<T>.getInfo()** (p. 1937).

See also

sendReply(TRep, SampleIdentity_t) (p. 1850)

com.rti.connext.infrastructure.WriteSample<T>

References **SampleData< T >.getData()**, and **WriteSample< T >.getInfo()**.

8.269.3.4 receiveRequest()

```
boolean receiveRequest (
              Sample< TReq > request,
              Duration_t maxWait )
```

Waits for a request and copies its contents into a Sample.

Equivalent to using **waitForRequests(int,Duration_t)** (p. 1856) and **takeRequest(Sample<TReq>)** (p. 1853)

See also

com.rti.connext.infrastructure.Sample<T>

waitForRequests(int,Duration_t) (p. 1856)

takeRequest(Sample<TReq>) (p. 1853)

Basic Replier example (p. 397)

8.269.3.5 receiveRequests() [1/4]

```
List<  Sample< TReq > > receiveRequests (
             List<  Sample< TReq > > replies,
             int maxCount,
              Duration_t maxWait )
```

Waits for multiple requests and copies them into a list.

Equivalent to **receiveRequests(List<Sample<TReq>>,int,int,Duration_t)** (p. 1852) with `min_count = 0`

See also

com.rti.connext.infrastructure.Sample<T>

receiveRequests(List<Sample<TReq>>,int,Duration_t) (p. 1852)

References **Replier< TReq, TRep >.receiveRequests()**.

Referenced by **Replier< TReq, TRep >.receiveRequests()**.

8.269.3.6 receiveRequests() [2/4]

```
List<  Sample< TReq > > receiveRequests (
            List<  Sample< TReq > > replies,
            int minCount,
            int maxCount,
             Duration_t maxWait )
```

Waits for multiple requests and copies them into a list.

Equivalent to using **waitForRequests(int,Duration_t)** (p. 1856) and **takeRequests(List<Sample<TReq>>,int)** (p. 1854)

8.269.3.11 takeRequests() [2/3]

```
Sample.Iterator< TReq > takeRequests (
             int maxCount )
```

Provides a loaned iterator to access the existing requests.

See also

com.rti.connext.requestreply.Requester<TReq,TRep>.takeReplies(int) (p. 1877)

8.269.3.12 takeRequests() [3/3]

```
List<  Sample< TReq > > takeRequests (
            List<  Sample< TReq > > requests,
            int maxCount )
```

Copies existing requests into a list.

See also

com.rti.connext.requestreply.Requester<TReq,TRep>.takeReplies(List<Sample<TRep>>,int) (p. 1878)

8.269.3.13 readRequest()

```
boolean readRequest (
             Sample< TReq > request )
```

Copies the contents of a request into a Sample.

This operation is equivalent to **com.rti.connext.requestreply.Replier<TReq,TRep>.takeRequest(Sample<TReq>)** (p. 1853) except the request remains in the **Replier** (p. 1846) and can be read or taken again.

8.269.3.14 readRequests() [1/3]

```
Sample.Iterator< TReq > readRequests ( )
```

Provides a loaned iterator to access the existing requests.

This operation is equivalent to **com.rti.connext.requestreply.Replier<TReq,TRep>.takeRequests()** (p. 1854) except the requests remain in the **Replier** (p. 1846) and can be read or taken again.

References **ResourceLimitsQosPolicy.LENGTH_UNLIMITED**.

8.269.3.15 readRequests() [2/3]

```
Sample.Iterator< TReq > readRequests (
            int maxCount )
```

Provides a loaned iterator to access the existing requests.

This operation is equivalent to **com.rti.connext.requestreply.Replier<TReq,TRep>.takeRequests(int)** (p. 1854) except the requests remain in the **Replier** (p. 1846) and can be read or taken again.

8.269.3.16 readRequests() [3/3]

```
List< Sample< TReq > > readRequests (
            List< Sample< TReq > > requests,
            int maxCount )
```

Copies existing requests into a list.

This operation is equivalent to **com.rti.connext.requestreply.Replier<TReq,TRep>.takeRequests(List<Sample<TReq>>,int)** (p. 1854) except the requests remain in the **Replier** (p. 1846) and can be read or taken again.

8.269.3.17 waitForRequests() [1/2]

```
boolean waitForRequests (
             Duration_t maxWait )
```

Waits for requests.

Equivalent to **waitForRequests(int,Duration_t)** (p. 1856) with `min_count=1`

See also

waitForRequests(int,Duration_t) (p. 1856)

References **Replier< TReq, TRep >.waitForRequests()**.

Referenced by **Replier< TReq, TRep >.waitForRequests()**.

8.269.3.18 waitForRequests() [2/2]

```
boolean waitForRequests (
            int minCount,
             Duration_t maxWait )
```

Waits for requests.

This operation waits for minCount requests to be available. It will wait up to maxWait .

This operation is similar to **com.rti.connext.requestreply.Requester<TReq,TRep>.waitForReplies(int,Duration_t)** (p. 1884).

Parameters

minCount	Minimum number of requests that need to be available for this operation to unblock.
maxWait	Maximum waiting time after which this operation unblocks regardless of how many requests are available.

Returns

true if at least minCount requests were available before maxWait elapsed, or false otherwise.

8.269.3.21 createReplySample() [1/2]

```
WriteSample< TRep > createReplySample ( )
```

Creates a WriteSample for sending replies.

Returns

A new WriteSample with data of type `TReq` initialized with default values and default write parameters.

See also

com.rti.connext.infrastructure.WriteSample<T>

sendReply(WriteSample<TRep>, SampleIdentity_t) (p. 1851)

8.269.3.22 createReplySample() [2/2]

```
WriteSample< TRep > createReplySample (
            TRep data )
```

Creates a WriteSample for sending replies.

Returns

A new WriteSample with the specified data and default write parameters.

See also

createReplySample() (p. 1857)

8.269.3.23 createRequestSample() [1/2]

```
Sample< TReq > createRequestSample ( )
```

Creates a Sample for receiving replies.

Returns

A new Sample with default data of type `TReq` and invalid SampleInfo.

See also

com.rti.connext.infrastructure.Sample<T>
receiveRequest(Sample<TReq>,Duration_t) (p. 1851)
takeRequest(Sample<TReq>) (p. 1853)

8.269.3.24 createRequestSample() [2/2]

```
Sample< TReq > createRequestSample (
            TReq data )
```

Creates a Sample for receiving replies.

Returns

A new Sample with default data of type `TReq` and invalid SampleInfo.

8.270 ReplierListener< TReq, TRep > Interface Template Reference

Called when a com.rti.connext.requestreply.Replier<TReq,TRep> has new available requests.

Inherits EventListener.

Public Member Functions

- void **onRequestAvailable** (**Replier**< TReq, TRep > replier)
  User callback.

8.270.1 Detailed Description

Called when a com.rti.connext.requestreply.Replier<TReq,TRep> has new available requests.

A replier listener is a way to implement a callback that will be invoked when requests are available. It is an optional com.rti.connext.requestreply.ReplierParams<TReq,TRep>.

This listener simply notifies when requests are available. The callback implementation can then use **com.rti.connext.requestreply.Replier<TReq,TRep>.takeRequests(int)** (p. 1854) to retrieve them.

A simpler callback mechanism, where one request sample is a parameter and the reply is the callback return value, is implemented by the com.rti.connext.requestreply.SimpleReplier<TReq,TRep>.

See also

com.rti.connext.requestreply.Replier<TReq,TRep>.Replier(ReplierParams)

8.270.2 Member Function Documentation

8.270.2.1 onRequestAvailable()

```
void onRequestAvailable (
              Replier< TReq, TRep > replier )
```

User callback.

See also

com.rti.dds.subscription.DataReaderListener.on_data_available (p. 760)

8.271 ReplierParams< TReq, TRep > Class Template Reference

Contains the parameters for creating a com.rti.connext.requestreply.Replier<TReq,TRep>.

Inherits EntityParams.

Public Member Functions

- **ReplierParams** (**DomainParticipant** participant, **TypeSupport** requestTypeSupport, **TypeSupport** reply↩ TypeSupport)

  *Creates a **ReplierParams** (p. 1860) with the parameters that a **Replier** (p. 1846) always needs.*
- **ReplierParams**< TReq, TRep > **setServiceName** (String serviceName)

  *The service name the **Replier** (p. 1846) offers and Requesters use to match.*
- **ReplierParams**< TReq, TRep > **setRequestTopicName** (String requestTopicName)

  Sets a specific request topic name.
- **ReplierParams**< TReq, TRep > **setReplyTopicName** (String replyTopicName)

  Sets a specific reply topic name.
- **ReplierParams**< TReq, TRep > **setDataWriterQos** (**DataWriterQos** dataWriterQos)

  Sets the quality of service of the reply DataWriter.
- **ReplierParams**< TReq, TRep > **setDataReaderQos** (**DataReaderQos** dataReaderQos)

  Sets the quality of service of the request DataReader.
- **ReplierParams**< TReq, TRep > **setQosProfile** (String qosLibraryName, String qosProfileName)

  Sets a QoS profile for the entities in this replier.
- **ReplierParams**< TReq, TRep > **setPublisher** (**Publisher** publisher)

  Sets a specific Publisher.
- **ReplierParams**< TReq, TRep > **setSubscriber** (**Subscriber** subscriber)

  Sets a specific Subscriber.
- **ReplierParams**< TReq, TRep > **setReplierListener** (**ReplierListener**< TReq, TRep > replierListener)

  Sets a listener that is called when requests are available.

8.271.1 Detailed Description

Contains the parameters for creating a com.rti.connext.requestreply.Replier<TReq,TRep>.

See also

com.rti.connext.requestreply.RequesterParams (p. 1890)

8.271.2 Constructor & Destructor Documentation

8.271.2.1 ReplierParams()

```
ReplierParams (
            DomainParticipant participant,
            TypeSupport requestTypeSupport,
            TypeSupport replyTypeSupport )
```

Creates a **ReplierParams** (p. 1860) with the parameters that a **Replier** (p. 1846) always needs.

In addition to the parameters this constructor takes , a **Replier** (p. 1846) needs either:

- A service name (**setServiceName(String)** (p. 1861)), or
- Custom topic names (**setReplyTopicName(String)** (p. 1862) and **setRequestTopicName(String)** (p. 1861)).

The other parameters are optional.

Parameters

participant	The DomainParticipant that this replier uses to join a domain.
requestTypeSupport	The type support for type `TReq`
replyTypeSupport	The type support for type `Trep`

8.271.3 Member Function Documentation

8.271.3.1 setServiceName()

```
ReplierParams< TReq, TRep > setServiceName (
            String serviceName )
```

The service name the **Replier** (p. 1846) offers and Requesters use to match.

See also

com.rti.connext.requestreply.RequesterParams.setServiceName(String) (p. 1891)

Referenced by **Replier< TReq, TRep >.Replier()**.

8.271.3.2 setRequestTopicName()

```
ReplierParams< TReq, TRep > setRequestTopicName (
            String requestTopicName )
```

Sets a specific request topic name.

The specified topic name will be used, instead of allowing a topic name to be generated based on the **setService↩ Name(String)** (p. 1861). If that topic already exists, it will be reused. This is useful to have the **Replier** (p. 1846) use a **com.rti.dds.topic.ContentFilteredTopic** (p. 692) to receive only certain requests.

8.271.3.3 setReplyTopicName()

```
ReplierParams< TReq, TRep > setReplyTopicName (
            String replyTopicName )
```

Sets a specific reply topic name.

The specified topic name will be used, instead of allowing a topic name to be generated based on c the **setService↩ Name(String)** (p. 1861). If that topic already exists, it will be reused.

8.271.3.4 setDataWriterQos()

```
ReplierParams< TReq, TRep > setDataWriterQos (
             DataWriterQos dataWriterQos )
```

Sets the quality of service of the reply DataWriter.

See also

setQosProfile(String,String) (p. 1862)

8.271.3.5 setDataReaderQos()

```
ReplierParams< TReq, TRep > setDataReaderQos (
             DataReaderQos dataReaderQos )
```

Sets the quality of service of the request DataReader.

See also

setQosProfile(String,String) (p. 1862)

8.271.3.6 setQosProfile()

```
ReplierParams< TReq, TRep > setQosProfile (
            String qosLibraryName,
            String qosProfileName )
```

Sets a QoS profile for the entities in this replier.

Specifies the XML QoS profile that will be used to configure the quality of service for the **Replier** (p. 1846)'s underlying reply DataWriter and request DataReader.

Parameters

qosLibraryName	The name of the QoS library
qosProfileName	The name of the QoS profile inside the QoS library

See also

com.rti.connext.requestreply.RequesterParams.setQosProfile(String,String) (p. 1892)

Configuring Request-Reply QoS profiles (p. 398)

Configuring QoS Profiles with XML (p. 365)

8.271.3.7 setPublisher()

```
ReplierParams< TReq, TRep > setPublisher (
            Publisher publisher )
```

Sets a specific Publisher.

See also

com.rti.connext.requestreply.RequesterParams.setPublisher(Publisher) (p. 1893)

8.271.3.8 setSubscriber()

```
ReplierParams< TReq, TRep > setSubscriber (
            Subscriber subscriber )
```

Sets a specific Subscriber.

See also

com.rti.connext.requestreply.RequesterParams.setSubscriber(Subscriber) (p. 1893)

8.271.3.9 setReplierListener()

```
ReplierParams< TReq, TRep > setReplierListener (
            ReplierListener< TReq, TRep > replierListener )
```

Sets a listener that is called when requests are available.

See also

com.rti.connext.requestreply.ReplierListener<TReq,TRep>

Referenced by **SimpleReplier< TReq, TRep >.SimpleReplier()**.

8.272 RequestedDeadlineMissedStatus Class Reference

com.rti.dds.infrastructure.StatusKind.StatusKind.REQUESTED_DEADLINE_MISSED_STATUS

Inherits Status.

Public Attributes

- int **total_count**

  *Total cumulative count of the missed deadlines detected for any instance read by the **com.rti.dds.subscription.DataReader** (p. 707).*
- int **total_count_change**

  The incremental number of missed deadlines detected since the last time the listener was called or the status was read.
- final **InstanceHandle_t last_instance_handle**

  *Handle to the last instance in the **com.rti.dds.subscription.DataReader** (p. 707) for which a requested deadline was missed.*

8.272.1 Detailed Description

com.rti.dds.infrastructure.StatusKind.StatusKind.REQUESTED_DEADLINE_MISSED_STATUS

8.272.2 Member Data Documentation

8.272.2.1 total_count

```
int total_count
```

Total cumulative count of the missed deadlines detected for any instance read by the **com.rti.dds.subscription.DataReader** (p. 707).

8.272.2.2 total_count_change

```
int total_count_change
```

The incremental number of missed deadlines detected since the last time the listener was called or the status was read.

8.272.2.3 last_instance_handle

```
final  InstanceHandle_t last_instance_handle
```

Handle to the last instance in the **com.rti.dds.subscription.DataReader** (p. 707) for which a requested deadline was missed.

8.273 RequestedIncompatibleQosStatus Class Reference

com.rti.dds.infrastructure.StatusKind.StatusKind.REQUESTED_INCOMPATIBLE_QOS_STATUS

Inherits Status.

Public Attributes

- int **total_count**

  *Total cumulative count of how many times the concerned **com.rti.dds.subscription.DataReader** (p. 707) discovered a **com.rti.dds.publication.DataWriter** (p. 818) for the same **com.rti.dds.topic.Topic** (p. 2116) with an offered QoS that is incompatible with that requested by the **com.rti.dds.subscription.DataReader** (p. 707).*
- int **total_count_change**

  The change in `total_count` since the last time the listener was called or the status was read.
- **QosPolicyId_t last_policy_id**

  *The **com.rti.dds.infrastructure.QosPolicyId_t** (p. 1806) of one of the policies that was found to be incompatible the last time an incompatibility was detected.*
- final **QosPolicyCountSeq policies**

  *A list containing, for each policy, the total number of times that the concerned **com.rti.dds.subscription.DataReader** (p. 707) discovered a **com.rti.dds.publication.DataWriter** (p. 818) for the same **com.rti.dds.topic.Topic** (p. 2116) with an offered QoS that is incompatible with that requested by the **com.rti.dds.subscription.DataReader** (p. 707).*

8.273.2 Member Data Documentation

8.273.2.1 total_count

```
int total_count
```

Total cumulative count of how many times the concerned **com.rti.dds.subscription.DataReader** (p. 707) discovered a **com.rti.dds.publication.DataWriter** (p. 818) for the same **com.rti.dds.topic.Topic** (p. 2116) with an offered QoS that is incompatible with that requested by the **com.rti.dds.subscription.DataReader** (p. 707).

8.273.2.2 total_count_change

```
int total_count_change
```

The change in `total_count` since the last time the listener was called or the status was read.

8.273.2.3 last_policy_id

```
QosPolicyId_t last_policy_id
```

The **com.rti.dds.infrastructure.QosPolicyId_t** (p. 1806) of one of the policies that was found to be incompatible the last time an incompatibility was detected.

8.273.2.4 policies

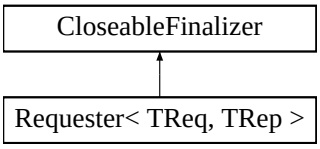
```
final  QosPolicyCountSeq policies
```

A list containing, for each policy, the total number of times that the concerned **com.rti.dds.subscription.DataReader** (p. 707) discovered a **com.rti.dds.publication.DataWriter** (p. 818) for the same **com.rti.dds.topic.Topic** (p. 2116) with an offered QoS that is incompatible with that requested by the **com.rti.dds.subscription.DataReader** (p. 707).

8.274 Requester< TReq, TRep > Class Template Reference

Allows sending requests and receiving replies.

Inheritance diagram for Requester< TReq, TRep >:



Public Member Functions

- **Requester** (**RequesterParams** params)

  *Creates a **Requester** (p. 1867) with parameters.*
- **Requester** (**DomainParticipant** participant, String serviceName, **TypeSupport** requestTypeSupport, **Type↩ Support** replyTypeSupport)

  *Creates a **Requester** (p. 1867) with the minimum set of parameters.*
- void **close** ()

  Releases the internal entities created by this object.
- void **sendRequest** (TReq request)

  Sends a request.
- void **sendRequest** (**WriteSample**< TReq > request)

  Sends a request and gets back information about it that allows correlation with future replies.
- boolean **receiveReply** (**Sample**< TRep > reply, **Duration_t** maxWait)

  Waits for a reply and copies its contents into a Sample.
- List< **Sample**< TRep > > **receiveReplies** (List< **Sample**< TRep > > replies, int maxCount, **Duration_t** maxWait)

  Waits for multiple replies and copies them into a list.
- List< **Sample**< TRep > > **receiveReplies** (List< **Sample**< TRep > > replies, int minCount, int maxCount, **Duration_t** maxWait)

  Waits for multiple replies and copies them into a list.
- Sample.Iterator< TRep > **receiveReplies** (**Duration_t** maxWait)

  Waits for multiple replies and provides a loaned iterator to access them.
- Sample.Iterator< TRep > **receiveReplies** (int minCount, int maxCount, **Duration_t** maxWait)

  Waits for multiple replies and provides a loaned iterator to access them.
- boolean **takeReply** (**Sample**< TRep > reply)

  Copies the contents of a reply into a Sample.
- Sample.Iterator< TRep > **takeReplies** ()

  Provides a loaned iterator to access the existing replies.
- Sample.Iterator< TRep > **takeReplies** (int maxCount)

  Provides a loaned iterator to access the existing replies.
- List< **Sample**< TRep > > **takeReplies** (List< **Sample**< TRep > > replies, int maxCount)

  Copies existing replies into a list.
- boolean **takeReply** (**Sample**< TRep > reply, **SampleIdentity_t** relatedRequestId)

  Copies the contents of a reply for a specific request.

- Sample.Iterator< TRep > **takeReplies** (**SampleIdentity_t** relatedRequestId)

  Provides a loaned iterator to access the existing replies for a specific request.
- Sample.Iterator< TRep > **takeReplies** (int maxCount, **SampleIdentity_t** relatedRequestId)

  Provides a loaned iterator to access the existing replies for a specific request.
- List< **Sample**< TRep > > **takeReplies** (List< **Sample**< TRep > > replies, int maxCount, **SampleIdentity_t** relatedRequestId)

  Copies existing replies for a specific request into a list.
- boolean **readReply** (**Sample**< TRep > reply)

  Copies the contents of a reply into a Sample.
- Sample.Iterator< TRep > **readReplies** ()

  Provides a loaned iterator to access the existing replies.
- Sample.Iterator< TRep > **readReplies** (int maxCount)

  Provides a loaned iterator to access the existing replies.
- List< **Sample**< TRep > > **readReplies** (List< **Sample**< TRep > > replies, int maxCount)

  Copies existing replies into a list.
- boolean **readReply** (**Sample**< TRep > reply, **SampleIdentity_t** relatedRequestId)

  Copies the contents of a reply for a specific request.
- Sample.Iterator< TRep > **readReplies** (**SampleIdentity_t** relatedRequestId)

  Provides a loaned iterator to access the existing replies for a specific request.
- Sample.Iterator< TRep > **readReplies** (int maxCount, **SampleIdentity_t** relatedRequestId)

  Provides a loaned iterator to access the existing replies for a specific request.
- List< **Sample**< TRep > > **readReplies** (List< **Sample**< TRep > > replies, int maxCount, **SampleIdentity_t** relatedRequestId)

  Copies existing replies for a specific request into a list.
- boolean **waitForReplies** (**Duration_t** maxWait)

  Waits for replies to any request.
- boolean **waitForReplies** (int minCount, **Duration_t** maxWait)

  Waits for replies to any request.
- boolean **waitForReplies** (int minCount, **Duration_t** maxWait, **SampleIdentity_t** relatedRequestId)

  Waits for replies to a specific request.
- **DataWriter getRequestDataWriter** ()

  *Retrieves the underlying **com.rti.dds.publication.DataWriter** (p. 818).*
- **DataReader getReplyDataReader** ()

  *Retrieves the underlying **com.rti.dds.subscription.DataReader** (p. 707).*
- **WriteSample**< TReq > **createRequestSample** ()

  Creates a WriteSample for sending requests.
- **WriteSample**< TReq > **createRequestSample** (TReq data)

  Creates a WriteSample for sending requests.
- **Sample**< TRep > **createReplySample** ()

  Creates a Sample for getting replies.
- **Sample**< TRep > **createReplySample** (TRep data)

  Creates a Sample for getting replies.

8.274.1 Detailed Description

Allows sending requests and receiving replies.

A requester is an entity with two associated **topics** (p. 55): a request topic and a reply topic. It can send requests by publishing samples of the request topic and receive replies to those requests by subscribing to the reply topic.

Valid types for these topics (`TReq` and `TRep`) are: those generated by rtiddsgen, the **DDS built-in types** (p. 62), and **com.rti.dds.dynamicdata.DynamicData** (p. 1134).

For example:
```
Requester<Foo, Bar> requester;

Requester<DynamicData, Bar> requester;

Requester<Foo, Octets> requester;
```

A **Replier** (p. 1846) and a **Requester** (p. 1867) communicate when they use the same topics for requests and replies (see **com.rti.connext.requestreply.RequesterParams.setServiceName(String)** (p. 1891)) on the same domain ID.

A **Requester** (p. 1867) can send requests and receive one or multiple replies. It does that using the following operations:

- Sending requests (i.e. publishing request samples on the request topic)
- Waiting for replies to be received by the middleware (for any request or for a specific request)
- Getting those replies from the middleware. There are two ways to do this: take (the data samples are removed from the middleware), read (the data samples remain in the middleware and can be read or taken again).
- A convenience operation, receive (which is a combination of wait and take).

In all cases, the middleware guarantees that a requester only receives reply samples that are associated with those requests that it sends.

For multi-reply scenarios, in which a **Requester** (p. 1867) receives multiple replies from a **Replier** (p. 1846) for a given request, the **Requester** (p. 1867) can check if a reply is the last reply of a sequence of replies. To do so, see if the bit **com.rti.dds.infrastructure.SampleFlagBits.INTERMEDIATE_REPLY_SEQUENCE_SAMPLE** (p. 1940) is set in **com.rti.dds.subscription.SampleInfo.flag** (p. 1954) after receiving each reply. This indicates it is NOT the last reply.

A requester has an associated **com.rti.dds.domain.DomainParticipant** (p. 948), which can be shared with other requesters or RTI Connext routines. All the other RTI Connext entities required for the request-reply interaction, including a **com.rti.dds.publication.DataWriter** (p. 818) for writing requests and a **com.rti.dds.subscription.DataReader** (p. 707) for reading replies, are automatically created when the requester is constructed.

Quality of Service for the underlying DataWriter and DataReader can be configured (see **com.rti.connext.↩ requestreply.RequesterParams.setQosProfile(String,String)** (p. 1892)). By default, they are created with **com.rti.↩ dds.infrastructure.ReliabilityQosPolicyKind.RELIABLE_RELIABILITY_QOS** (p. 1836). The exact default configuration is described here: **Configuring Request-Reply QoS profiles** (p. 398)

Template Parameters

TReq	The data type for the request topic
TRep	The data type for the reply topic

com.rti.connext.requestreply.Replier<TReq,TRep>

Request-Reply Examples (p. 391)

Basic Requester example (p. 393)

8.274.2 Constructor & Destructor Documentation

8.274.2.1 Requester() [1/2]

```
Requester (
            RequesterParams params )
```

Creates a **Requester** (p. 1867) with parameters.

Parameters

params	All the parameters that configure this requester. See **com.rti.connext.requestreply.RequesterParams** (p. 1890) for the list of mandatory parameters.

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

com.rti.connext.requestreply.RequesterParams (p. 1890)

Creating a Requester (p. 392)

8.274.2.2 Requester() [2/2]

```
Requester (
            DomainParticipant participant,
           String serviceName,
            TypeSupport requestTypeSupport,
            TypeSupport replyTypeSupport )
```

Creates a **Requester** (p. 1867) with the minimum set of parameters.

Parameters

participant	The DomainParticipant this requester uses to join a DDS domain
serviceName	The service name. See **com.rti.connext.requestreply.RequesterParams.setServiceName(String)** (p. 1891)
requestTypeSupport	The type support for type `TReq`
replyTypeSupport	The type support for type `TReq`

Exceptions

One	of the **Standard Return Codes** (p. 513)

References **RequesterParams.setServiceName()**.

8.274.3 Member Function Documentation

8.274.3.1 close()

```
void close ( )
```

Releases the internal entities created by this object.

Among other internal resources, it deletes the underlying DataReader and DataWriter.

See also

com.rti.dds.subscription.Subscriber.delete_datareader (p. 2048)

com.rti.dds.publication.Publisher.delete_datawriter (p. 1775)

8.274.3.2 sendRequest() [1/2]

```
void sendRequest (
            TReq request )
```

Sends a request.

If a future reply needs to be correlated to exactly this request, use **com.rti.connext.requestreply.Requester<TReq,↩ TRep>.sendRequest(WriteSample<TReq>)** (p. 1872).

Parameters

request	The request to be sent

Exceptions

One	of the **Standard Return Codes** (p. 513)

MT Safety:

SAFE

See also

sendRequest(WriteSample<TReq>) (p. 1872)

8.274.3.3 sendRequest() [2/2]

```
void sendRequest (
             WriteSample< TReq > request )
```

Sends a request and gets back information about it that allows correlation with future replies.

After calling this operation, the sample contains a valid identity that can be used for correlation with future replies.

See example code in **Correlating requests and replies** (p. 395).

Parameters

request	<<***inout***>> *(p. 404)* Contains the request and optional write parameters. When this call ends successfully, com.rti.connext.infrastructure.WriteSample<T> contains a valid identity that can be used for correlation with future replies.

Exceptions

One	of the **Standard Return Codes** (p. 513) ; **com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904) may be reported in the same conditions as in **com.rti.ndds.example.FooDataWriter.write** (p. 1397).

MT Safety:

SAFE

See also

com.rti.connext.infrastructure.SampleData<T>.getIdentity() (p. 1939)

createRequestSample() (p. 1887)

References **SampleIdentity_t.AUTO_SAMPLE_IDENTITY**, **SampleData< T >.getData()**, **WriteSample< T >.getInfo()**, and **WriteParams_t.identity**.

8.274.3.4 receiveReply()

```
boolean receiveReply (
              Sample< TRep > reply,
              Duration_t maxWait )
```

Waits for a reply and copies its contents into a Sample.

This operation is equivalent to using **waitForReplies(int,Duration_t)** (p. 1884) and **takeReply(Sample<TRep>)** (p. 1876).

MT Safety:

Same restrictions as **waitForReplies(int,Duration_t)** (p. 1884)

See also

com.rti.connext.infrastructure.Sample<T>

waitForReplies(int,Duration_t) (p. 1884)

takeReply(Sample<TRep>) (p. 1876)

Basic Requester example (p. 393)

8.274.3.5 receiveReplies() [1/4]

```
List<  Sample< TRep > > receiveReplies (
            List<  Sample< TRep > > replies,
            int maxCount,
             Duration_t maxWait )
```

Waits for multiple replies and copies them into a list.

This operation is equivalent to using **receiveReplies(List<Sample<TRep>>,int,int,Duration_t)** (p. 1874) with `min_count = 0`

MT Safety:

See **waitForReplies(int,Duration_t)** (p. 1884)

See also

com.rti.connext.infrastructure.Sample<T>

receiveReplies(List<Sample<TRep>>,int,Duration_t) (p. 1873)

References **Requester< TReq, TRep >.receiveReplies()**.

8.274.3.6 receiveReplies() [2/4]

```
List<  Sample< TRep > > receiveReplies (
            List<  Sample< TRep > > replies,
            int minCount,
            int maxCount,
             Duration_t maxWait )
```

Waits for multiple replies and copies them into a list.

This operation is equivalent to using **waitForReplies(int,Duration_t)** (p. 1884) and **takeReplies(List<Sample<TRep>>,int)** (p. 1878).

MT Safety:

See **waitForReplies(int,Duration_t)** (p. 1884)

com.rti.connext.infrastructure.Sample<T>

waitForReplies(int,Duration_t) (p. 1884)

takeReplies(List<Sample<TRep>>,int) (p. 1878)

8.274.3.7 receiveReplies() [3/4]

```
Sample.Iterator< TRep > receiveReplies (
            Duration_t maxWait )
```

Waits for multiple replies and provides a loaned iterator to access them.

This operation is equivalent to using **receiveReplies(int,int,Duration_t)** (p. 1875) with `min_count=1` and `max_count=`**`com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED`** (p. 511)

MT Safety:

See **waitForReplies(int,Duration_t)** (p. 1884)

See also

com.rti.connext.infrastructure.Sample<T>.Iterator<T>

receiveReplies(int,int,Duration_t) (p. 1875)

References **ResourceLimitsQosPolicy.LENGTH_UNLIMITED**, and **Requester< TReq, TRep >.receiveReplies()**.

8.274.3.8 receiveReplies() [4/4]

```
Sample.Iterator< TRep > receiveReplies (
            int minCount,
            int maxCount,
             Duration_t maxWait )
```

Waits for multiple replies and provides a loaned iterator to access them.

This operation is equivalent to using **waitForReplies(int,Duration_t)** (p. 1884) and **takeReplies(int)** (p. 1877).

MT Safety:

See **waitForReplies(int,Duration_t)** (p. 1884)

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

com.rti.connext.infrastructure.Sample<T>.Iterator<T>

waitForReplies(int,Duration_t) (p. 1884)

takeReplies(int) (p. 1877)

8.274.3.9 takeReply() [1/2]

```
boolean takeReply (
              Sample< TRep > reply )
```

Copies the contents of a reply into a Sample.

Takes a reply sample from the **Requester** (p. 1867) and makes a copy.

This operation may be used after a call to **waitForReplies(int,Duration_t)** (p. 1884).

To avoid copies, you can use **takeReplies(int)** (p. 1877).

Parameters

reply	The sample where the reply data and the related SampleInfo are copied

Returns

true if there was a reply to get. If this operation returns false, the contents of `reply` remain unchanged, except **com.rti.dds.subscription.SampleInfo.valid_data** (p. 1952) becomes false.

Exceptions

One	of the **Standard Return Codes** (p. 513)

MT Safety:

SAFE

com.rti.connext.infrastructure.Sample<T>

waitForReplies(int,Duration_t) (p. 1884)

8.274.3.10 takeReplies() [1/6]

```
Sample.Iterator< TRep > takeReplies ( )
```

Provides a loaned iterator to access the existing replies.

Equivalent to using **takeReplies(int)** (p. 1877) with max_count=**com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511).

MT Safety:

SAFE

See also

com.rti.connext.infrastructure.Sample<T>.Iterator<T>

takeReplies(int) (p. 1877)

References **ResourceLimitsQosPolicy.LENGTH_UNLIMITED**.

Referenced by **Requester< TReq, TRep >.takeReplies()**.

8.274.3.11 takeReplies() [2/6]

```
Sample.Iterator< TRep > takeReplies (
            int maxCount )
```

Provides a loaned iterator to access the existing replies.

Takes all the existing replies up to maxCount and provides a loaned iterator to access them.

This operation does not make a copy of the data.

The loan is returned with **com.rti.connext.infrastructure.Sample<T>.Iterator<T>.close()** (p. 1462)

Since Sample.Iterator<T> implements java.io.Closeable, the loan is automatically returned when the iterator is enclosed in a try-with-resources block (since Java 7)

This operation may be used after a call to **waitForReplies(int,Duration_t)** (p. 1884)

See an **example** here: **Taking loaned samples** (p. 394)

Parameters

maxCount	The maximum number of samples that are taken at a time. The special value **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511) may be used. This value will read up to the limit specified by **com.rti.dds.infrastructure.DataReaderResourceLimitsQosPolicy.max_samples_per_read** (p. 796)

Returns

A iterator with up to maxCount elements. May be empty if there were no replies to get.

Exceptions

One	of the **Standard Return Codes** (p. 513)

MT Safety:

SAFE

Taking loaned samples (p. 394)

Taking samples by copy (p. 395)

8.274.3.12 takeReplies() [3/6]

```
List<  Sample< TRep > > takeReplies (
            List<  Sample< TRep > > replies,
            int maxCount )
```

Copies existing replies into a list.

Takes all the existing replies up to `maxCount` and copies them into a list.

If the first argument is null, a new list containing the copies is created and returned.

If a non-null list is passed as the first argument, the copies are inserted into that list. The list may already contain some elements. Any existing elements are overwritten. If the list contains less elements, samples are inserted at the end; if it contains more elements, the excess samples are removed from the end.

This operation may be used after a call to **waitForReplies(int,Duration_t)** (p. 1884).

Parameters

replies	The list where the samples are copied or null to create a new list.
maxCount	The maximum number of samples that are taken at a time. The special value **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511) may be used.

Returns

Returns `replies` if it's not `null`. Otherwise it returns a new list.

Exceptions

One	of the **Standard Return Codes** (p. 513)

MT Safety:

SAFE

8.274.3.13 takeReply() [2/2]

```
boolean takeReply (
               Sample< TRep > reply,
               SampleIdentity_t relatedRequestId )
```

Copies the contents of a reply for a specific request.

This operation is analogous to **takeReply(Sample<TRep>)** (p. 1876) except the reply corresponds to a specific request.

Parameters

reply	The sample where a reply is copied into
relatedRequestId	The identity of a request previously sent by this **Requester** (p. 1867)

Returns

true if there was a reply to get. If this operation returns false, the contents of `reply` remain unchanged, except **com.rti.dds.subscription.SampleInfo.valid_data** (p. 1952) becomes false.

MT Safety:

SAFE

References **ResourceLimitsQosPolicy.LENGTH_UNLIMITED**, and **Requester< TReq, TRep >.takeReplies()**.

8.274.3.15 takeReplies() [5/6]

```
Sample.Iterator< TRep > takeReplies (
            int maxCount,
             SampleIdentity_t relatedRequestId )
```

Provides a loaned iterator to access the existing replies for a specific request.

This operation is analogous to **takeReplies(int)** (p. 1877) except the replies this operation provides correspond to a specific request.

Parameters

maxCount	The maximum number of samples that are taken at a time. The special value **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511) may be used.
relatedRequestId	The identity of a request previously sent by this **Requester** (p. 1867)

             List<  Sample< TRep > > replies,
             int maxCount,
              SampleIdentity_t relatedRequestId )
```

Copies existing replies for a specific request into a list.

This operation is analogous to **takeReplies(List<Sample<TRep>>,int)** (p. 1878) except the replies correspond to a specific request.

Parameters

replies	The list where the samples are copied or null to create a new List.
maxCount	The maximum number of samples that are taken at a time. The special value **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511) may be used.
relatedRequestId	The identity of a request previously sent by this **Requester** (p. 1867)

Returns

`replies` if it is not `null`. Otherwise it returns a new `List`.

MT Safety:

SAFE

8.274.3.17 readReply() [1/2]

```
boolean readReply (
              Sample< TRep > reply )
```

Copies the contents of a reply into a Sample.

This operation is equivalent to **com.rti.connext.requestreply.Requester<TReq,TRep>.takeReply(Sample<TRep>)** (p. 1876) except the reply remains in the **Requester** (p. 1867) and can be read or taken again.

8.274.3.18 readReplies() [1/6]

```
Sample.Iterator< TRep > readReplies ( )
```

Provides a loaned iterator to access the existing replies.

This operation is equivalent to **com.rti.connext.requestreply.Requester<TReq,TRep>.takeReplies()** (p. 1876) except the replies remain in the **Requester** (p. 1867) and can be read or taken again.

References **ResourceLimitsQosPolicy.LENGTH_UNLIMITED**.

Referenced by **Requester< TReq, TRep >.readReplies()**.

8.274.3.19 readReplies() [2/6]

```
Sample.Iterator< TRep > readReplies (
            int maxCount )
```

Provides a loaned iterator to access the existing replies.

This operation is equivalent to **com.rti.connext.requestreply.Requester<TReq,TRep>.takeReplies(int)** (p. 1877) except the replies remain in the **Requester** (p. 1867) and can be read or taken again.

8.274.3.20 readReplies() [3/6]

```
List<  Sample< TRep > > readReplies (
            List<  Sample< TRep > > replies,
            int maxCount )
```

Copies existing replies into a list.

This operation is equivalent to **com.rti.connext.requestreply.Requester<TReq,TRep>.takeReplies(List<↩ Sample<TRep>>,int)** (p. 1878) except the replies remain in the **Requester** (p. 1867) and can be read or taken again.

8.274.3.21 readReply() [2/2]

```
boolean readReply (
             Sample< TRep > reply,
             SampleIdentity_t relatedRequestId )
```

Copies the contents of a reply for a specific request.

This operation is equivalent to **com.rti.connext.requestreply.Requester<TReq,TRep>.takeReply(Sample<↩ TRep>,SampleIdentity_t)** (p. 1879) except the reply remains in the **Requester** (p. 1867) and can be read or taken again.

References **SampleStateKind.ANY_SAMPLE_STATE**, and **SampleIdentity_t.sequence_number**.

8.274.3.22 readReplies() [4/6]

```
Sample.Iterator< TRep > readReplies (
             SampleIdentity_t relatedRequestId )
```

Provides a loaned iterator to access the existing replies for a specific request.

This operation is equivalent to **com.rti.connext.requestreply.Requester<TReq,TRep>.takeReplies(Sample↩ Identity_t)** (p. 1880) except the replies remain in the **Requester** (p. 1867) and can be read or taken again.

References **ResourceLimitsQosPolicy.LENGTH_UNLIMITED**, and **Requester< TReq, TRep >.readReplies()**.

8.274.3.23 readReplies() [5/6]

```
Sample.Iterator< TRep > readReplies (
            int maxCount,
             SampleIdentity_t relatedRequestId )
```

Provides a loaned iterator to access the existing replies for a specific request.

This operation is equivalent to **com.rti.connext.requestreply.Requester<TReq,TRep>.takeReplies(int,SampleIdentity_t)** (p. 1880) except the replies remain in the **Requester** (p. 1867) and can be read or taken again.

References **SampleStateKind.ANY_SAMPLE_STATE**, and **SampleIdentity_t.sequence_number**.

8.274.3.24 readReplies() [6/6]

```
List< Sample< TRep > > readReplies (
            List< Sample< TRep > > replies,
            int maxCount,
             SampleIdentity_t relatedRequestId )
```

Copies existing replies for a specific request into a list.

This operation is equivalent to **com.rti.connext.requestreply.Requester<TReq,TRep>.takeReplies(List<Sample<TRep>>,int,SampleIdentity_t)** (p. 1881) except the replies remain in the **Requester** (p. 1867) and can be read or taken again.

References **SampleStateKind.ANY_SAMPLE_STATE**, and **SampleIdentity_t.sequence_number**.

8.274.3.25 waitForReplies() [1/3]

```
boolean waitForReplies (
             Duration_t maxWait )
```

Waits for replies to any request.

This operation is equivalent to using **waitForReplies(int,Duration_t)** (p. 1884) with `min_count=1`.

See also

waitForReplies(int,Duration_t) (p. 1884)

References **Requester< TReq, TRep >.waitForReplies()**.

Referenced by **Requester< TReq, TRep >.waitForReplies()**.

8.274.3.26 waitForReplies() [2/3]

```
boolean waitForReplies (
             int minCount,
              Duration_t maxWait )
```

Waits for replies to any request.

This operation waits for minCount requests to be available for up to maxWait .

If this operation is called several times but the available replies are not taken (with **takeReplies(int)** (p. 1877)), this operation may return immediately and will not wait for new replies. New replies may replace existing ones if they are not taken, depending on the **com.rti.dds.infrastructure.HistoryQosPolicy** (p. 1435) used to configure this **Requester** (p. 1867).

Parameters

minCount	Minimum number of replies that need to be available for this operation to unblock.
maxWait	Maximum waiting time after which this operation unblocks, regardless of how many replies are available.

Returns

true if at least minCount replies were available before maxWait elapsed, or false otherwise.

MT Safety:

Concurrent calls to this operation on the same object are not allowed. However, waiting for replies for specific requests in parallel is supported (see **waitForReplies(int,Duration_t,SampleIdentity_t)** (p. 1885)).

See also

takeReplies(int) (p. 1877)

8.274.3.27 waitForReplies() [3/3]

```
boolean waitForReplies (
             int minCount,
              Duration_t maxWait,
              SampleIdentity_t relatedRequestId )
```

Waits for replies to a specific request.

This operation is analogous to **waitForReplies(int,Duration_t)** (p. 1884) except this operation waits for replies for a specific request.

Parameters

minCount	Minimum number of replies for the related request that need to be available for this operation to unblock.
maxWait	Maximum wait time after which this operation unblocks, regardless of how many replies are available.
related↩ RequestId	The identity of a request previously sent by this **Requester** (p. 1867)

Returns

true if at least minCount replies for the related request were available before maxWait elapsed, or false otherwise.

Exceptions

One	of the **Standard Return Codes** (p. 513)

MT Safety:

8.275 RequesterParams Class Reference

Contains the parameters for creating a com.rti.connext.requestreply.Requester<TReq,TRep>

Inherits EntityParams.

Public Member Functions

- **RequesterParams** (**DomainParticipant** participant, **TypeSupport** requestTypeSupport, **TypeSupport** reply↩ TypeSupport)

  *Creates a **RequesterParams** (p. 1890) with the parameters a **Requester** (p. 1867) always needs.*
- **RequesterParams setServiceName** (String serviceName)

  *The service name that Repliers and **Requester** (p. 1867) use to match and communicate.*
- **RequesterParams setRequestTopicName** (String requestTopicName)

  Sets a specific request topic name.
- **RequesterParams setReplyTopicName** (String replyTopicName)

  Sets a specific reply topic name.
- **RequesterParams setQosProfile** (String qosLibraryName, String qosProfileName)

  Sets a QoS profile for the entities in this requester.
- **RequesterParams setDataWriterQos** (**DataWriterQos** dataWriterQos)

  Sets the quality of service of the request DataWriter.
- **RequesterParams setDataReaderQos** (**DataReaderQos** dataReaderQos)

  Sets the quality of service of the request DataReader.
- **RequesterParams setPublisher** (**Publisher** publisher)

  Sets a specific Publisher.
- **RequesterParams setSubscriber** (**Subscriber** subscriber)

  Sets a specific Subscriber.

8.275.1 Detailed Description

Contains the parameters for creating a com.rti.connext.requestreply.Requester<TReq,TRep>

See also

Creating a Requester with optional parameters (p. 393)

8.275.2 Constructor & Destructor Documentation

8.275.2.1 RequesterParams()

```
RequesterParams (
            DomainParticipant participant,
            TypeSupport requestTypeSupport,
            TypeSupport replyTypeSupport )
```

Creates a **RequesterParams** (p. 1890) with the parameters a **Requester** (p. 1867) always needs.

In addition to the parameters this constructor takes , a **Requester** (p. 1867) needs either:

- A service name (**setServiceName(String)** (p. 1891)),
- Or custom topic names (**setRequestTopicName(String)** (p. 1891) and **setReplyTopicName(String)** (p. 1892))

The rest of the parameters that can be set in a **RequesterParams** (p. 1890) object are optional.

Parameters

participant	The **com.rti.dds.domain.DomainParticipant** (p. 948) this requester uses to join a domain.
requestTypeSupport	The type support for type `TReq`
replyTypeSupport	The type support for type `TReq`

See also

Creating a Requester with optional parameters (p. 393)

8.275.3 Member Function Documentation

8.275.3.1 setServiceName()

```
RequesterParams setServiceName (
            String serviceName )
```

The service name that Repliers and **Requester** (p. 1867) use to match and communicate.

A **Requester** (p. 1867) and a **Replier** (p. 1846) need to be configured with the same topic names in order to match.

The service name is used to generate a request topic and a reply topic that the **Requester** (p. 1867) and **Replier** (p. 1846) will use to communicate. For example, the service name "MyService" will be used to create topics named "MyServiceRequest" and "MyServiceReply".

In some cases, the name of these topics is known beforehand or needs to be customized for another reason. The service name can be overridden by setting specific request and reply topic names using **setRequestTopicName(**↩ **String)** (p. 1891) and **setReplyTopicName(String)** (p. 1892).

Referenced by **Requester**< **TReq, TRep** >**.Requester()**.

8.275.3.2 setRequestTopicName()

```
RequesterParams setRequestTopicName (
            String requestTopicName )
```

Sets a specific request topic name.

The specified topic name will be used, instead of allowing a topic name to be generated based on the **setService↩ Name(String)** (p. 1891). If that topic already exists, it will be reused.

8.275.3.3 setReplyTopicName()

```
RequesterParams setReplyTopicName (
            String replyTopicName )
```

Sets a specific reply topic name.

The specified topic name will be used, instead of allowing a topic name to be generated based on the **setService↩ Name(String)** (p. 1891). If that topic already exists, it will be reused.

8.275.3.4 setQosProfile()

```
RequesterParams setQosProfile (
            String qosLibraryName,
            String qosProfileName )
```

Sets a QoS profile for the entities in this requester.

Specifies an XML QoS profile that will be used to configure the quality of service of a **Requester** (p. 1867)'s underlying request DataWriter and reply DataReader.

Within that profile, the DataWriter QoS in <datawriter_qos> will be used to configure the request DataWriter and the DataReader.

Alternatively, you can set the QoS using the DataWriterQos and DataReaderQos objects (**com.rti.connext.↩ requestreply.RequesterParams.setDataWriterQos(DataWriterQos)** (p. 1892), **com.rti.connext.requestreply.↩ RequesterParams.setDataReaderQos(DataReaderQos)** (p. 1893)).

Parameters

qosLibraryName	The name of the QoS library
qosProfileName	The name of the QoS profile inside the QoS library

See also

Configuring Request-Reply QoS profiles (p. 398)

Configuring QoS Profiles with XML (p. 365)

8.275.3.5 setDataWriterQos()

```
RequesterParams setDataWriterQos (
            DataWriterQos dataWriterQos )
```

Sets the quality of service of the request DataWriter.

See also

setQosProfile(String,String) (p. 1892)

8.275.3.6 setDataReaderQos()

```
RequesterParams setDataReaderQos (
            DataReaderQos dataReaderQos )
```

Sets the quality of service of the request DataReader.

See also

setQosProfile(String,String) (p. 1892)

8.275.3.7 setPublisher()

```
RequesterParams setPublisher (
            Publisher publisher )
```

Sets a specific Publisher.

By default, a **Requester** (p. 1867) uses the DomainParticipant's implicit Publisher. Sometimes a different Publisher may be needed, for example, to use non-default PublisherQos.

8.275.3.8 setSubscriber()

```
RequesterParams setSubscriber (
            Subscriber subscriber )
```

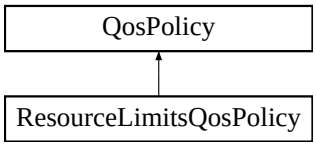
Sets a specific Subscriber.

By default, a **Requester** (p. 1867) uses the DomainParticipant's implicit Subscriber. Sometimes a different Subscriber may be needed, for example, to use non-default SubscriberQos.

8.276 ResourceLimitsQosPolicy Class Reference

*<<**spec**>> (p. 132)* Controls the amount of physical memory allocated for DDS entities, if dynamic allocations are allowed, and how they occur. Also controls memory usage among different instance values for keyed topics.

Inheritance diagram for ResourceLimitsQosPolicy:



Public Attributes

- int **max_samples**

  *<<**basic**>> (p. 123) <<**spec**>> (p. 132) Represents the maximum samples the middleware can store for any one **com.rti.dds.publication.DataWriter** (p. 818) (or **com.rti.dds.subscription.DataReader** (p. 707)).*
- int **max_instances**

  *<<**basic**>> (p. 123) <<**spec**>> (p. 132) Represents the maximum number of instances a **com.rti.dds.publication.DataWriter** (p. 818) (or **com.rti.dds.subscription.DataReader** (p. 707)) can manage.*
- int **max_samples_per_instance**

  *<<**spec**>> (p. 132) Represents the maximum number of samples of any one instance a **com.rti.dds.publication.DataWriter** (p. 818) (or **com.rti.dds.subscription.DataReader** (p. 707)) can manage.*
- int **initial_samples**

  *<<**basic**>> (p. 123) <<**extension**>> (p. 138) Represents the initial samples the middleware will store for any one **com.rti.dds.publication.DataWriter** (p. 818) (or **com.rti.dds.subscription.DataReader** (p. 707)).*
- int **initial_instances**

  *<<**basic**>> (p. 123) <<**extension**>> (p. 138) Represents the initial number of instances a **com.rti.dds.publication.DataWriter** (p. 818) (or **com.rti.dds.subscription.DataReader** (p. 707)) will manage.*
- int **instance_hash_buckets**

  ***[DEPRECATED]** (p. **358**) <<**extension**>> (p. 138) Number of hash buckets for instances.*

Static Public Attributes

- static final int **LENGTH_UNLIMITED**

  A special value indicating an unlimited quantity.
- static final int **LENGTH_AUTO**

  A special value indicating that the actual value will be automatically resolved.

8.276.1 Detailed Description

<<***spec***>> *(p. 132)* Controls the amount of physical memory allocated for DDS entities, if dynamic allocations are allowed, and how they occur. Also controls memory usage among different instance values for keyed topics.

Entity:

com.rti.dds.topic.Topic (p. 2116), **com.rti.dds.subscription.DataReader** (p. 707), **com.rti.dds.publication.DataWriter** (p. 818)

Status:

com.rti.dds.infrastructure.StatusKind.StatusKind.SAMPLE_REJECTED_STATUS, **com.rti.dds.subscription.SampleRejectedStatus** (p. 1966)

Properties:

RxO (p. 506) = NO
Changeable (p. 507) = **UNTIL ENABLE** (p. 507)

8.276.2 Usage

This policy controls the resources that RTI Connext can use to meet the requirements imposed by the application and other QoS settings.

For the reliability protocol (and **com.rti.dds.infrastructure.DurabilityQosPolicy** (p. 1116)), this QoS policy determines the actual maximum queue size when the **com.rti.dds.infrastructure.HistoryQosPolicy** (p. 1435) is set to com.rti.dds.infrastructure.HistoryQosPolicyKind.HistoryQosPolicyKind.KEEP_ALL_HISTORY_QOS.

In general, this QoS policy is used to limit the amount of system memory that RTI Connext can allocate. For embedded real-time systems and safety-critical systems, pre-determination of maximum memory usage is often required. In addition, dynamic memory allocation could introduce non-deterministic latencies in time-critical paths.

This QoS policy can be set such that an entity does not dynamically allocate any more memory after its initialization phase.

If **com.rti.dds.publication.DataWriter** (p. 818) objects are communicating samples faster than they are ultimately taken by the **com.rti.dds.subscription.DataReader** (p. 707) objects, the middleware will eventually hit against some of the QoS-imposed resource limits. Note that this may occur when just a single **com.rti.dds.subscription.DataReader** (p. 707) cannot keep up with its corresponding **com.rti.dds.publication.DataWriter** (p. 818). The behavior in this case depends on the setting for the **RELIABILITY** (p. 510). If reliability is **com.rti.dds.infrastructure.ReliabilityQosPolicyKind.BEST_EFFORT_RELIABILITY_QOS** (p. 1836), then RTI Connext is allowed to drop samples. If the reliability is **com.rti.dds.infrastructure.ReliabilityQosPolicyKind.RELIABLE_RELIABILITY_QOS** (p. 1836), RTI Connext will block the **com.rti.dds.publication.DataWriter** (p. 818) or discard the sample at the **com.rti.dds.subscription.DataReader** (p. 707) in order not to lose existing samples.

The constant **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511) may be used to indicate the absence of a particular limit. For example setting **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_samples_per_instance** (p. 1897) to **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511) will cause RTI Connext not to enforce this particular limit.

If these resource limits are not set sufficiently, under certain circumstances the **com.rti.dds.publication.DataWriter** (p. 818) may block on a write() call even though the **com.rti.dds.infrastructure.HistoryQosPolicy** (p. 1435) is com.rti.dds.infrastructure.HistoryQosPolicyKind.HistoryQosPolicyKind.KEEP_LAST_HISTORY_QOS. To guarantee the writer does not block for com.rti.dds.infrastructure.HistoryQosPolicyKind.HistoryQosPolicyKind.KEEP_LAST_HISTORY_QOS, make sure the resource limits are set such that:

```
max_samples >= max_instances * max_samples_per_instance
```

See also

com.rti.dds.infrastructure.ReliabilityQosPolicy (p. 1829)

com.rti.dds.infrastructure.HistoryQosPolicy (p. 1435)

8.276.3 Consistency

The setting of **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_samples** (p. 1896) must be consistent with **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_samples_per_instance** (p. 1897). For these two values to be consistent, it must be true that **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_samples** (p. 1896) >= **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_samples_per_instance** (p. 1897). As described above, this limit will not be enforced if **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_samples_per_instance** (p. 1897) is set to **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511).

The setting of **RESOURCE_LIMITS** (p. 511) `max_samples_per_instance` must be consistent with the **HISTORY** (p. 487) `depth`. For these two QoS to be consistent, it must be true that *depth* <= *max_samples_per_instance*.

com.rti.dds.infrastructure.HistoryQosPolicy (p. 1435)

8.276.4 Member Data Documentation

8.276.4.1 max_samples

```
int max_samples
```

<<***basic***>> *(p. 123)* <<***spec***>> *(p. 132)* Represents the maximum samples the middleware can store for any one **com.rti.dds.publication.DataWriter** (p. 818) (or **com.rti.dds.subscription.DataReader** (p. 707)).

Specifies the maximum number of data samples a **com.rti.dds.publication.DataWriter** (p. 818) (or **com.rti.dds.subscription.DataReader** (p. 707)) can manage across all the instances associated with it.

For unkeyed types, this value has to be equal to max_samples_per_instance if max_samples_per_instance is not equal to **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511).

When batching is enabled, the maximum number of data samples a **com.rti.dds.publication.DataWriter** (p. 818) can manage will also be limited by **com.rti.dds.infrastructure.DataWriterResourceLimitsQosPolicy.max_batches** (p. 895).

[default] com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED (p. 511)

[range] [1, 100 million] or **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511), >= initial_samples, >= max_samples_per_instance, >= **com.rti.dds.infrastructure.DataReaderResourceLimitsQosPolicy.max_samples_per_remote_writer** (p. 793) or >= **com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t.heartbeats_per_max_samples** (p. 1918)

For **com.rti.dds.publication.DataWriterQos** (p. 878) max_samples >= **com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t.heartbeats_per_max_samples** (p. 1918) in **com.rti.dds.infrastructure.DataWriterProtocolQosPolicy.rtps_reliable_writer** (p. 865) if batching is disabled.

Categories

Immutable (p. 292), **Durability** (p. 221), **Sample Memory Management** (p. 276), **Middleware Memory Management** (p. 244), **Data Availability** (p. 200)

8.276.4.2 max_instances

```
int max_instances
```

<<***basic***>> *(*p. *123)* <<***spec***>> *(*p. *132)* Represents the maximum number of instances a **com.rti.dds.publication.DataWriter** (p. 818) (or **com.rti.dds.subscription.DataReader** (p. 707)) can manage.

[default] com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED (p. 511)

[range] [1, 1 million] or **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511), >= initial_instances

Categories

Immutable (p. 292), **Durability** (p. 221), **Instance Lifecycle** (p. 232), **Sample Memory Management** (p. 276), **Middleware Memory Management** (p. 244), **Data Availability** (p. 200)

8.276.4.3 max_samples_per_instance

```
int max_samples_per_instance
```

<<***spec***>> *(*p. *132)* Represents the maximum number of samples of any one instance a **com.rti.dds.publication.DataWriter** (p. 818) (or **com.rti.dds.subscription.DataReader** (p. 707)) can manage.

While an unkeyed type is logically considered as a single instance, for unkeyed types this value has to be equal to max_samples or **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511).

[default] com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED (p. 511)

[range] [1, 100 million] or **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511), <= max_samples or **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511), >= **com.rti.dds.infrastructure.HistoryQosPolicy.depth** (p. 1438)

Categories

Immutable (p. 292), **Durability** (p. 221), **Instance Lifecycle** (p. 232), **Sample Memory Management** (p. 276), **Middleware Memory Management** (p. 244), **Data Availability** (p. 200)

8.276.4.4 initial_samples

```
int initial_samples
```

<<***basic***>> *(*p. *123)* <<***extension***>> *(*p. *138)* Represents the initial samples the middleware will store for any one **com.rti.dds.publication.DataWriter** (p. 818) (or **com.rti.dds.subscription.DataReader** (p. 707)).

Specifies the initial number of data samples a **com.rti.dds.publication.DataWriter** (p. 818) (or **com.rti.dds.subscription.DataReader** (p. 707)) will manage across all the instances associated with it.

[default] 32

[range] [1,100 million], <= max_samples

Categories

Immutable (p. 292), **Sample Memory Management** (p. 276), **Middleware Memory Management** (p. 244)

8.276.4.5 initial_instances

```
int initial_instances
```

<<***basic***>> *(*p. *123)* <<***extension***>> *(*p. *138)* Represents the initial number of instances a **com.rti.dds.publication.DataWriter** (p. 818) (or **com.rti.dds.subscription.DataReader** (p. 707)) will manage.

[default] 32

[range] [1,1 million], <= max_instances

Categories

Immutable (p. 292), **Instance Lifecycle** (p. 232), **Sample Memory Management** (p. 276), **Middleware Memory Management** (p. 244)

8.276.4.6 instance_hash_buckets

```
int instance_hash_buckets
```

[DEPRECATED] (p. **358)** <<***extension***>> *(*p. *138)* Number of hash buckets for instances.

The instance hash table facilitates instance lookup. A higher number of buckets decreases instance lookup time but increases the memory usage.

[default] 1 **[range]** [1,1 million]

8.290.3 Member Data Documentation

8.290.3.1 min_heartbeat_response_delay

```
final  Duration_t min_heartbeat_response_delay
```

<<***extension***>> *(*p. *138)* The minimum delay to respond to a heartbeat.

When a reliable reader receives a heartbeat from a remote writer and finds out that it needs to send back an ACK/NACK message, the reader can choose to delay a while. This sets the value of the minimum delay.

[default] 0 seconds

[range] [0, 1 year], <= max_heartbeat_response_delay

Categories

Immutable (p. 292), **Reliability** (p. 266)

Referenced by **RtpsReliableReaderProtocol_t.RtpsReliableReaderProtocol_t()**.

8.290.3.2 max_heartbeat_response_delay

```
final Duration_t max_heartbeat_response_delay
```

<<***extension***>> *(*p. *138)* The maximum delay to respond to a heartbeat.

When a reliable reader receives a heartbeat from a remote writer and finds out that it needs to send back an ACK/NACK message, the reader can choose to delay a while. This sets the value of maximum delay.

[default] The default value depends on the container policy:

- For **com.rti.dds.infrastructure.DataReaderProtocolQosPolicy.rtps_reliable_reader** (p. 765): 0.5 seconds
- For **com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.publication_reader** (p. 927): 0 seconds
- For **com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.subscription_reader** (p. 927): 0 seconds
- For **com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.participant_message_reader** (p. 929): 0 seconds

[range] [0, 1 year], >= min_heartbeat_response_delay

Categories

Immutable (p. 292), **Reliability** (p. 266)

Referenced by **RtpsReliableReaderProtocol_t.RtpsReliableReaderProtocol_t()**.

8.290.3.3 heartbeat_suppression_duration

```
final Duration_t heartbeat_suppression_duration
```

<<***extension***>> *(*p. *138)* The duration a reader ignores consecutively received heartbeats

When a reliable reader receives consecutive heartbeats within a short duration that will trigger redundant NACKs, the reader may ignore the latter heartbeat(s). This sets the duration during which additionally received heartbeats are suppressed.

[default] 0.0625 seconds

[range] [0, 1 year],

Categories

Immutable (p. 292), **Reliability** (p. 266)

Referenced by **RtpsReliableReaderProtocol_t.RtpsReliableReaderProtocol_t()**.

8.290.3.4 nack_period

```
final  Duration_t nack_period
```

<<***extension***>> *(*p. *138)* The period at which to send NACKs

A reliable reader will send periodic NACKs at this rate when it first matches with a reliable writer. The reader will stop sending NACKs when it has received all available historical data from the writer.

[default] 5 seconds

[range] [1 nanosec, 1 year]

Categories

Immutable (p. 292), **Reliability** (p. 266)

Referenced by **RtpsReliableReaderProtocol_t.RtpsReliableReaderProtocol_t()**.

8.290.3.5 receive_window_size

```
int receive_window_size = 256
```

<<***extension***>> *(*p. *138)* The number of received out-of-order samples a reader can keep at a time

A reliable reader stores the out-of-order samples it receives until it can present them to the application in-order. The receive window is the maximum number of out-of-order samples that a reliable reader keeps at a given time. When the receive window is full, subsequently received out-of-order samples are dropped.

[default] 256

[range] [>= 1]

Categories

Immutable (p. 292), **Reliability** (p. 266)

8.290.3.6 round_trip_time

```
final Duration_t round_trip_time
```

<<***extension***>> *(*p. *138)* The duration from sending a NACK to receiving a repair of a sample

This round-trip time is an estimate of the time starting from when the reader sends a NACK for a specific sample to when it receives that sample. For each sample, the reader will not send a subsequent NACK for it until the round-trip time has passed, thus preventing inefficient redundant requests.

[default] 0 seconds

[range] [0 nanosec, 1 year]

Categories

Immutable (p. 292), **Reliability** (p. 266)

Referenced by **RtpsReliableReaderProtocol_t.RtpsReliableReaderProtocol_t()**.

8.290.3.7 app_ack_period

```
final Duration_t app_ack_period
```

<<***extension***>> *(*p. *138)* The period at which application-level acknowledgment messages are sent

A **com.rti.dds.subscription.DataReader** (p. 707) sends application-level acknowledgment messages to a **com.rti.dds.publication.DataWriter** (p. 818) at this periodic rate, and will continue sending until it receives a message from the **com.rti.dds.publication.DataWriter** (p. 818) that it has received and processed the acknowledgment and an AppAckConfirmation has been received by the **com.rti.dds.subscription.DataReader** (p. 707). Note: application-level acknowledgment messages can also be sent non-periodically, as determined by **com.rti.dds.infrastructure.RtpsReliableReaderProtocol_t.samples_per_app_ack** (p. 1910).

[default] 5 seconds

[range] [1 nanosec, 1 year]

Categories

Immutable (p. 292), **Reliability** (p. 266), **Application Acknowledgement** (p. 190)

Referenced by **RtpsReliableReaderProtocol_t.RtpsReliableReaderProtocol_t()**.

8.290.3.8 min_app_ack_response_keep_duration

```
final Duration_t min_app_ack_response_keep_duration
```

<<***extension***>> *(*p. *138)* Minimum duration for which application-level acknowledgment response data is kept

The user-specified response data of an explicit application-level acknowledgment (called by **com.rti.dds.↩ subscription.DataReader.acknowledge_sample** (p. 729) or **com.rti.dds.subscription.DataReader.acknowledge↩ _all** (p. 730)) is cached by the **com.rti.dds.subscription.DataReader** (p. 707) for the purpose of reliably resending the data with the acknowledgment message. After this duration has passed from the time of the first acknowledgment, the response data is dropped from the cache and will not be resent with future acknowledgments for the corresponding sample(s).

[default] 0 sec

[range] [0 sec, 1 year]

Categories

Immutable (p. 292), **Reliability** (p. 266), **Application Acknowledgement** (p. 190)

Referenced by **RtpsReliableReaderProtocol_t.RtpsReliableReaderProtocol_t()**.

8.290.3.9 samples_per_app_ack

```
int samples_per_app_ack
```

<<***extension***>> *(*p. *138)* The minimum number of samples acknowledged by one application-level acknowledgment message

This setting applies only when **com.rti.dds.infrastructure.ReliabilityQosPolicy.acknowledgment_kind** (p. 1832) = **com.rti.dds.infrastructure.ReliabilityQosPolicyAcknowledgmentModeKind.APPLICATION_EXPLICIT_↩ ACKNOWLEDGMENT_MODE** (p. 1835) or **com.rti.dds.infrastructure.ReliabilityQosPolicyAcknowledgment↩ ModeKind.APPLICATION_AUTO_ACKNOWLEDGMENT_MODE** (p. 1834)

A **com.rti.dds.subscription.DataReader** (p. 707) will immediately send an application-level acknowledgment message when it has at least this many samples that have been acknowledged. It will not send an acknowledgment message until it has at least this many samples pending acknowledgment.

For example, calling **com.rti.dds.subscription.DataReader.acknowledge_sample** (p. 729) this many times consecutively will trigger the sending of an acknowledgment message. Calling **com.rti.dds.subscription.DataReader.↩ acknowledge_all** (p. 730) may trigger the sending of an acknowledgment message, if at least this many samples are being acknowledged at once.

This is independent of the **com.rti.dds.infrastructure.RtpsReliableReaderProtocol_t.app_ack_period** (p. 1909), where a **com.rti.dds.subscription.DataReader** (p. 707) will send acknowledgement messages at the periodic rate regardless.

When this is set to **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511), then acknowledgement messages are sent only periodically, at the rate set by **com.rti.dds.infrastructure.RtpsReliable↩ ReaderProtocol_t.app_ack_period** (p. 1909).

[default] 1

[range] [1, 1000000], or **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511)

Categories

Immutable (p. 292), **Reliability** (p. 266), **Application Acknowledgement** (p. 190)

8.291.1 Detailed Description

*<<**extension**>> (p. 138)* QoS related to the reliable writer protocol defined in RTPS.

It is used to configure a reliable writer according to RTPS protocol.

The reliability protocol settings are applied to batches instead of individual data samples when batching is enabled.

Properties:

RxO (p. 506) = N/A
Changeable (p. 507) = **NO** (p. 507)

QoS:

com.rti.dds.infrastructure.DataWriterProtocolQosPolicy (p. 860) **com.rti.dds.infrastructure.Discovery↩ ConfigQosPolicy** (p. 915)

8.291.2 Member Data Documentation

8.291.2.1 low_watermark

```
int low_watermark
```

<<***extension***>> *(p. 138)* When the number of unacknowledged samples in the current send window of a reliable writer meets or falls below this threshold, the com.rti.dds.infrastructure.StatusKind.StatusKind.RELIABLE_WRITER_↩ CACHE_CHANGED_STATUS is considered to have changed.

This value is measured in units of samples, except with batching configurations where it is measured in units of batches.

The value must be greater than or equal to zero and strictly less than high_watermark.

The high and low watermarks are used for switching between the regular and fast heartbeat rates (**com.rti.dds.↩ infrastructure.RtpsReliableWriterProtocol_t.heartbeat_period** (p. 1914) and **com.rti.dds.infrastructure.Rtps↩ ReliableWriterProtocol_t.fast_heartbeat_period** (p. 1914), respectively). When the number of unacknowledged samples in the queue of a reliable **com.rti.dds.publication.DataWriter** (p. 818) meets or exceeds high_watermark, the com.rti.dds.infrastructure.StatusKind.StatusKind.RELIABLE_WRITER_CACHE_CHANGED_STATUS is changed, and the DataWriter will start heartbeating at **com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t.fast_heartbeat_↩ period** (p. 1914). When the number of samples meets or falls below low_watermark, com.rti.dds.infrastructure.Status↩ Kind.StatusKind.RELIABLE_WRITER_CACHE_CHANGED_STATUS is changed, and the heartbeat rate will return to the "normal" rate (**com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t.heartbeat_period** (p. 1914)).

[default] 0

[range] [0, 100 million], < high_watermark

Categories

Immutable (p. 292), **Reliability** (p. 266)

8.291.2.2 high_watermark

```
int high_watermark
```

<<***extension***>> *(p. 138)* When the number of unacknowledged samples in the current send window of a reliable writer meets or exceeds this threshold, the com.rti.dds.infrastructure.StatusKind.StatusKind.RELIABLE_WRITER_CACHE↩ _CHANGED_STATUS is considered to have changed.

This value is measured in units of samples, except with batching configurations where it is measured in units of batches.

The value must be strictly greater than low_watermark and less than or equal to a maximum that depends on the container QoS policy:

In **com.rti.dds.domain.DomainParticipantQos.discovery_config** (p. 1079):

For **com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.publication_writer** (p. 924)
high_watermark<= **com.rti.dds.infrastructure.AllocationSettings_t.max_count** (p. 592) in **com.rti.dds.infrastructure.DomainParticipantResourceLimitsQosPolicy.local_writer_allocation** (p. 1085)

For **com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.subscription_writer** (p. 925)
high_watermark<= **com.rti.dds.infrastructure.AllocationSettings_t.max_count** (p. 592) in **com.rti.dds.infrastructure.DomainParticipantResourceLimitsQosPolicy.local_reader_allocation** (p. 1086)

In **com.rti.dds.publication.DataWriterQos.protocol** (p. 886):

For **com.rti.dds.infrastructure.DataWriterProtocolQosPolicy.rtps_reliable_writer** (p. 865),

high_watermark<=**com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_samples** (p. 1896) if batching is disabled. Otherwise,
high_watermark<=**com.rti.dds.infrastructure.DataWriterResourceLimitsQosPolicy.max_batches** (p. 895) high_watermark<=**com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t.max_send_window_size** (p. 1924)

[default] 1

[range] [1, 100 million] or **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511), > low_watermark <= *maximum* which depends on the container policy

Categories

Immutable (p. 292), **Reliability** (p. 266)

8.291.2.3 heartbeat_period

```
final Duration_t heartbeat_period
```

<<***basic***>> *(p. 123)* <<***extension***>> *(p. 138)* The period at which to send heartbeats.

A reliable writer will send periodic heartbeats at this rate.

[default] The default value depends on the container policy:

- For **com.rti.dds.infrastructure.DataWriterProtocolQosPolicy.rtps_reliable_writer** (p. 865): 200 ms
- For **com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.publication_writer** (p. 924): 3.0 seconds
- For **com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.subscription_writer** (p. 925): 3.0 seconds
- For **com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.participant_message_writer** (p. 929): 1.0 seconds

[range] [1 nanosec,1 year], >= **com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t.fast_heartbeat_period** (p. 1914), >= **com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t.late_joiner_heartbeat_period** (p. 1915)

Categories

Immutable (p. 292), **Reliability** (p. 266)

8.291.2.4 fast_heartbeat_period

```
final Duration_t fast_heartbeat_period
```

*<<**basic**>> (p. 123) <<**extension**>> (p. 138)* An alternative heartbeat period used when a reliable writer needs to flush its unacknowledged samples more quickly.

This heartbeat period will be used when the number of unacknowledged samples in the cache of a reliable writer meets or exceeds the writer's high watermark and has not subsequently dropped to the low watermark. The normal period will be used at all other times.

This period must not be slower (i.e. must be of the same or shorter duration) than the normal heartbeat period.

[default] The default value depends on the container policy:

- For **com.rti.dds.infrastructure.DataWriterProtocolQosPolicy.rtps_reliable_writer** (p. 865): 200 ms seconds
- For **com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.publication_writer** (p. 924): 3.0 seconds
- For **com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.subscription_writer** (p. 925): 3.0 seconds
- For **com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.participant_message_writer** (p. 929): 1.0 seconds

[range] [1 nanosec,1 year], <= **com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t.heartbeat_period** (p. 1914)

Categories

Immutable (p. 292), **Reliability** (p. 266)

8.291.2.5 late_joiner_heartbeat_period

```
final Duration_t late_joiner_heartbeat_period
```

*<<**basic**>> (p. 123) <<**extension**>> (p. 138)* An alternative heartbeat period used when a reliable reader joins late and needs to be caught up on cached samples of a reliable writer more quickly than the normal heartbeat rate.

This heartbeat period will be used when a reliable reader joins after a reliable writer with non-volatile durability has begun publishing samples. Once the reliable reader has received all cached samples, it will be serviced at the same rate as other reliable readers.

This period must not be slower (i.e., must be of the same or shorter duration) than the normal heartbeat period.

A reliable writer will use whichever heartbeat period is faster, the current heartbeat period being used for other reliable readers or the **com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t.late_joiner_heartbeat_period** (p. 1915), to service the late joining reader. This means that if the **com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t.↩ fast_heartbeat_period** (p. 1914) is currently being used and is faster than the late_joiner_heartbeat_period, then the fast_heartbeat_period will continue to be used for the late joiner as well.

[default] The default value depends on the container policy:

- For **com.rti.dds.infrastructure.DataWriterProtocolQosPolicy.rtps_reliable_writer** (p. 865): 200 seconds
- For **com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.publication_writer** (p. 924): 3.0 seconds
- For **com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.subscription_writer** (p. 925): 3.0 seconds
- For **com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.participant_message_writer** (p. 929): 1.0 seconds

[range] [1 nanosec,1 year], <= **com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t.heartbeat_period** (p. 1914)

Categories

Immutable (p. 292), **Reliability** (p. 266)

8.291.2.6 virtual_heartbeat_period

```
final Duration_t virtual_heartbeat_period
```

<<***extension***>> *(p. 138)* The period at which to send virtual heartbeats. Virtual heartbeats inform the reliable reader about the range of samples currently present, for each virtual GUID, in the reliable writer's queue.

A reliable writer will send periodic virtual heartbeats at this rate.

[default] The default value depends on the container policy:

- For **com.rti.dds.infrastructure.DataWriterProtocolQosPolicy.rtps_reliable_writer** (p. 865): com.rti.dds.↩ infrastructure.Duration_t.AUTO. If **com.rti.dds.infrastructure.PresentationQosPolicy.access_scope** (p. 1682) is set to com.rti.dds.infrastructure.PresentationQosPolicyAccessScopeKind.PresentationQosPolicyAccess↩ ScopeKind.GROUP_PRESENTATION_QOS on the DataWriter, this value is set to **com.rti.dds.infrastructure.**↩ **RtpsReliableWriterProtocol_t.heartbeat_period** (p. 1914). Otherwise, the value is set to **com.rti.dds.**↩ **infrastructure.Duration_t.DURATION_INFINITE** (p. 1133).

8.291.2.8 max_heartbeat_retries

```
int max_heartbeat_retries
```

<<***extension***>> *(*p. *138)* The maximum number of *periodic* heartbeat retries before marking a remote reader as inactive.

When a remote reader has not acked all the samples the reliable writer has in its queue, and max_heartbeat_retries number of periodic heartbeats has been sent without receiving any ack/nack back, the remote reader will be marked as inactive (not alive) and be ignored until it resumes sending ack/nack.

Note that piggyback heartbeats do NOT count towards this value.

[default] 150

[range] [1, 1 million] or **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511)

Categories

Immutable (p. 292), **Reliability** (p. 266), **Liveliness** (p. 239)

8.291.2.9 inactivate_nonprogressing_readers

```
boolean inactivate_nonprogressing_readers
```

<<***extension***>> *(p. 138)* Whether to treat remote readers as inactive when their NACKs do not progress

Nominally, a remote reader is marked inactive when a successive number of periodic heartbeats equal or greater than **com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t.max_heartbeat_retries** (p. 1917) have been sent without receiving any ack/nacks back.

By setting this com.rti.dds.infrastructure.true, it changes the conditions of inactivating a remote reader: a reader will be considered inactive when it either does not send any ack/nacks or keeps sending non-progressing nacks for **com.↩ rti.dds.infrastructure.RtpsReliableWriterProtocol_t.max_heartbeat_retries** (p. 1917) number of heartbeat periods, where a non-progressing nack is one whose oldest sample requested has not advanced from the oldest sample requested of the previous nack.

[default] com.rti.dds.infrastructure.false

Categories

Immutable (p. 292), **Reliability** (p. 266), **Liveliness** (p. 239)

8.291.2.10 heartbeats_per_max_samples

```
int heartbeats_per_max_samples
```

<<***extension***>> *(p. 138)* The number of piggyback heartbeats sent per max send window.

When a DataWriter is configured with a fixed send window size (**com.rti.dds.infrastructure.RtpsReliableWriter↩ Protocol_t.min_send_window_size** (p. 1924) is equal to effective max_send_window_size), a piggyback heartbeat is sent every [(effective max send window size/heartbeats_per_max_samples)] number of samples written.

Otherwise, the number of piggyback heartbeats sent is scaled according to the current size of the send window. For example, consider a **com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t.heartbeats_per_max_samples** (p. 1918) of 50. If the current send window size is 100, a piggyback heartbeat will be sent every 2 samples. If the send window size grows to 150, a piggyback heartbeat will be sent every 3 samples, and so on. Additionally, when the send window size grows, a piggyback heartbeat is sent with the next sample. (If it weren't, the sending of that heartbeat could be delayed, since the heartbeat rate scales with the increasing window size.)

The effective max send window is calculated as follows:

Without batching:

min (**com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_samples** (p. 1896), **com.rti.dds.infrastructure.↩ RtpsReliableWriterProtocol_t.max_send_window_size** (p. 1924))

With batching:

min (**com.rti.dds.infrastructure.DataWriterResourceLimitsQosPolicy.max_batches** (p. 895), **com.rti.dds.↩ infrastructure.RtpsReliableWriterProtocol_t.max_send_window_size** (p. 1924))

If heartbeats_per_max_samples is set to zero, no piggyback heartbeats will be sent.

If current send window size is **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.LENGTH_UNLIMITED** (p. 511), 100 million is assumed as the effective max send window.

[default] The default value depends on the container policy:

- For **com.rti.dds.infrastructure.DataWriterProtocolQosPolicy.rtps_reliable_writer** (p. 865): 8
- For **com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.publication_writer** (p. 924): 8
- For **com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.subscription_writer** (p. 925): 8
- For **com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.participant_message_writer** (p. 929): 1

[range] [0, 100 million]

- For **com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.publication_writer** (p. 924): heartbeats_per_max_samples<= **com.rti.dds.infrastructure.AllocationSettings_t.max_count** (p. 592) in **com.rti.dds.infrastructure.DomainParticipantResourceLimitsQosPolicy.local_writer_allocation** (p. 1085)
- For **com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.subscription_writer** (p. 925): heartbeats_per_max_samples<= **com.rti.dds.infrastructure.AllocationSettings_t.max_count** (p. 592) in **com.rti.dds.infrastructure.DomainParticipantResourceLimitsQosPolicy.local_reader_allocation** (p. 1086)
- For **com.rti.dds.infrastructure.DataWriterProtocolQosPolicy.rtps_reliable_writer** (p. 865):

heartbeats_per_max_samples<= **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_samples** (p. 1896) if batching is disabled. Otherwise:
heartbeats_per_max_samples<= **com.rti.dds.infrastructure.DataWriterResourceLimitsQosPolicy.max_batches** (p. 895)

heartbeats_per_max_samples<= **com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t.max_send_window_↩ size** (p. 1924)

Categories

Immutable (p. 292), **Reliability** (p. 266)

8.291.2.11 min_nack_response_delay

```
final Duration_t min_nack_response_delay = new Duration_t()
```

<<***extension***>> *(p. 138)* The minimum delay to respond to a NACK or NACK_FRAG.

When a reliable writer receives a NACK or a NACK_FRAG from a remote reader, the writer can choose to delay a while before it sends repair samples/fragments or a heartbeat. This sets the value of the minimum delay.

Delaying repairs can lower the amount of duplicate repair data sent to the remote reader. If the writer receives the same NACKs or NACK_FRAGs back-to-back within this wait time, it will combine them into one repair action.

[default] 0 seconds

[range] [0, 1 day], <= max_nack_response_delay

8.291.2.13 nack_suppression_duration

```
final Duration_t nack_suppression_duration
```

<<***extension***>> *(*p. *138)* The duration for ignoring consecutive NACKs/NACK_FRAGs that may trigger redundant repairs.

A reliable writer may receive consecutive NACKs/NACK_FRAGs within a short duration from a remote reader that will trigger the sending of redundant repair messages.

This specifies the duration during which consecutive NACKs/NACK_FRAGs are ignored to prevent redundant repairs from being sent.

A redundant NACK is a NACK that requests the same or lower first sequence number (SN) than the last NACK from the same reader.

A redundant NACK_FRAG is a NACK_FRAG that requests the same first fragment number for a sample as the last NACK_FRAG from the same reader.

The suppression duration applies separately to NACKs and NACK_FRAGS. For example, replying to a NACK_FRAG message in between receiving two NACK messages will not cause the second NACK message to be suppressed if the two NACK messages are received more than the suppression duration apart.

[default] 0 seconds

[range] [0, 1 day]

Categories

Immutable (p. 292), **Reliability** (p. 266), **Fragmentation** (p. 229)

8.291.2.14 max_bytes_per_nack_response

```
int max_bytes_per_nack_response
```

<<***extension***>> *(p. 138)* The maximum total message size when resending rejected samples or data fragments.

As part of the reliable communication protocol, DataWriters send heartbeat (HB) messages to their DataReaders. Each HB message contains the sequence number of the most recent sample sent by the DataWriter.

In response, a DataReader may send a negative acknowledgement (NACK) message, indicating what sequence numbers it did not receive, if any. If the samples were fragmented, it can also send a NACK_FRAG requesting the fragments of a sample that did not arrive. If the DataReader is missing some samples or fragments, the DataWriter will send them again.

max_bytes_per_nack_response determines the maximum size of the message sent by the DataWriter in response to a NACK or NACK_FRAG. This message may contain multiple samples or fragments. The DataWriter will always send at least one message, even if the size of that message exceeds the max_bytes_per_nack_response value.

If the total size of all samples or fragments that needs to be resent is larger than max_bytes_per_nack_response, the remaining samples or fragments will be resent the next time a NACK or NACK_FRAG arrives.

Note: If **com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t.min_nack_response_delay** (p. 1919) and **com.↩ rti.dds.infrastructure.RtpsReliableWriterProtocol_t.max_nack_response_delay** (p. 1919) are both com.rti.dds.↩ infrastructure.Duration_t.ZERO (which means repairs are processed immediately), this limit applies separately to NACKs and NACK_FRAGs: repairing a NACK in this case does not affect the maximum size of a NACK_FRAG response and vice versa. Otherwise, the limit applies to the total size of the response, including received NACKs and NACK_FRAGs.

[default] The default value depends on the container policy:

- For **com.rti.dds.infrastructure.DataWriterProtocolQosPolicy.rtps_reliable_writer** (p. 865): 131072 bytes
- For **com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.publication_writer** (p. 924): 131072 bytes
- For **com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.subscription_writer** (p. 925): 131072 bytes
- For **com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.participant_message_writer** (p. 929): 9216 bytes

```
boolean disable_positive_acks_enable_adaptive_sample_keep_duration
```

[DEPRECATED] (p. **358**) <<***extension***>> *(p. 138)* Enables dynamic adjustment of sample keep duration in response to congestion.

For dynamic networks where a static minimum sample keep duration may not provide sufficient performance or reliability, setting **com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t.disable_positive_acks_enable_adaptive_sample_keep_duration** (p. 1922) = com.rti.dds.infrastructure.true, enables the sample keep duration to be dynamically adjusted to adapt to network conditions. The keep duration changes according to the detected level of congestion, which is determined to be proportional to the rate of NACKs received. An adaptive algorithm automatically controls the keep duration to optimize throughput and reliability.

To relieve high congestion, the keep duration is increased to effectively decrease the send rate; this lengthening of the keep duration is controlled by **com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t.disable_positive_acks_increase_sample_keep_duration_factor** (p. 1923). Alternatively, when congestion is low, the keep duration is decreased to effectively increase send rate; this shortening of the keep duration is controlled by **com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t.disable_positive_acks_decrease_sample_keep_duration_factor** (p. 1923).

The lower and upper bounds of the dynamic sample keep duration are set by **com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t.disable_positive_acks_min_sample_keep_duration** (p. 1921) and **com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t.disable_positive_acks_max_sample_keep_duration** (p. 1922), respectively.

When **com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t.disable_positive_acks_enable_adaptive_sample_keep_duration** (p. 1922) = com.rti.dds.infrastructure.false, the sample keep duration is set to **com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t.disable_positive_acks_min_sample_keep_duration** (p. 1921) .

[default] com.rti.dds.infrastructure.true

  Assign to use well-known port mappings which are compliant with OMG's DDS Interoperability Wire Protocol.

8.293.1 Detailed Description

<<***extension***>> *(p. 138)* RTPS well-known port mapping configuration.

RTI Connext uses the RTPS wire protocol. The discovery protocols defined by RTPS rely on well-known ports to initiate discovery. These well-known ports define the multicast and unicast ports on which a Participant will listen for discovery **metatraffic** from other Participants. The discovery metatraffic contains all the information required to establish the presence of remote DDS entities in the network.

The well-known ports are defined by RTPS in terms of port mapping expressions with several tunable parameters, which allow you to customize what network ports are used by RTI Connext. These parameters are exposed in **com.rti.dds.infrastructure.RtpsWellKnownPorts_t** (p. 1931). In order for all Participants in a system to correctly discover each other, it is important that they all use the same port mapping expressions.

The actual port mapping expressions, as defined by the RTPS specification, can be found below. In addition to the parameters listed in **com.rti.dds.infrastructure.RtpsWellKnownPorts_t** (p. 1931), the port numbers depend on:

- `domain_id`, as specified in **com.rti.dds.domain.DomainParticipantFactory.create_participant** (p. 1043)
- `participant_id`, as specified using **com.rti.dds.infrastructure.WireProtocolQosPolicy.participant_id** (p. 2303)

The `domain_id` parameter ensures no port conflicts exist between Participants belonging to different domains. This also means that discovery metatraffic in one domain is not visible to Participants in a different domain. The `participant_id` parameter ensures that unique unicast port numbers are assigned to Participants belonging to the same domain on a given host.

The *metatraffic_unicast_port* is used to exchange discovery metatraffic using unicast.

```
metatraffic_unicast_port = port_base + (domain_id_gain * domain_id) + (participant_id_gain * participant_id) + b
```

The *metatraffic_multicast_port* is used to exchange discovery metatraffic using multicast. The corresponding multicast group addresses are specified via **com.rti.dds.infrastructure.DiscoveryQosPolicy.multicast_receive_addresses** (p. 944) on a **com.rti.dds.domain.DomainParticipant** (p. 948) entity.

```
metatraffic_multicast_port = port_base + (domain_id_gain * domain_id) + builtin_multicast_port_offset
```

RTPS also defines the *default* multicast and unicast ports on which DataReaders and DataWriters receive **usertraffic**. These default ports can be overridden using the **com.rti.dds.subscription.DataReaderQos.multicast** (p. 785), **com.rti.dds.subscription.DataReaderQos.unicast** (p. 784), or by the **com.rti.dds.publication.DataWriterQos.unicast** (p. 886) QoS policies.

The *usertraffic_unicast_port* is used to exchange user data using unicast.

```
usertraffic_unicast_port = port_base + (domain_id_gain * domain_id) + (participant_id_gain * participant_id) + u
```

The *usertraffic_multicast_port* is used to exchange user data using multicast. The corresponding multicast group addresses can be configured using **com.rti.dds.infrastructure.TransportMulticastQosPolicy** (p. 2162).

```
usertraffic_multicast_port = port_base + (domain_id_gain * domain_id) + user_multicast_port_offset
```

By default, the port mapping parameters are configured to compliant with OMG's DDS Interoperability Wire Protocol (see also **com.rti.dds.infrastructure.RtpsWellKnownPorts_t.INTEROPERABLE_RTPS_WELL_KNOWN_↩ PORTS** (p. 535)).

The OMG's DDS Interoperability Wire Protocol compliant port mapping parameters are *not* backwards compatible with previous versions of the RTI Connext middleware.

When modifying the port mapping parameters, care must be taken to avoid port aliasing. This would result in undefined discovery behavior. The chosen parameter values will also determine the maximum possible number of domains in the system and the maximum number of participants per domain. Additionally, any resulting mapped port number must be within the range imposed by the underlying transport. For example, for UDPv4, this range typically equals [1024 - 65535].

Note: On Windows, you should avoid using ports 49152 through 65535 for inbound traffic. RTI Connext's ephemeral ports (see "Ports Used for Communication" in the `User's Manual`) may be within that range (see `https↩ ://msdn.microsoft.com/en-us/library/windows/desktop/ms737550(v=vs.85).aspx`). With the default RtpsWellKnownPorts settings, port 49152 corresponds to domain ID 167, so using domain IDs 168 through 232 on Windows introduces the risk of a port collision and failure to create the Domain Participant when using multicast discovery. You may see this error:

RTIOsapiSocket_bindWithIP:OS bind() failure, error 0X271D: An attempt was made to access a socket in a way forbidden by its access permissions.

QoS:

com.rti.dds.infrastructure.WireProtocolQosPolicy (p. 2299)

8.293.2 Member Data Documentation

8.293.2.1 port_base

```
int port_base
```

<<***extension***>> *(p. 138)* The base port offset.

All mapped well-known ports are offset by this value.

[default] 7400

[range] [>= 1], but resulting ports must be within the range imposed by the underlying transport.

8.293.2.2 domain_id_gain

```
int domain_id_gain
```

<<***extension***>> *(*p. *138)* Tunable domain gain parameter.

Multiplier of the `domain_id`. Together with `participant_id_gain`, it determines the highest `domain_id` and `participant_id` allowed on this network.

In general, there are two ways to setup `domain_id_gain` and `participant_id_gain` parameters.

If `domain_id_gain` > `participant_id_gain`, it results in a port mapping layout where all **com.rti.dds.domain.DomainParticipant** (p. 948) instances within a single domain occupy a consecutive range of `domain_id_gain` ports. Precisely, all ports occupied by the domain fall within:

```
(port_base + (domain_id_gain * domain_id))
```

and:

```
(port_base + (domain_id_gain * (domain_id + 1)) - 1)
```

Under such a case, the highest `domain_id` is limited only by the underlying transport's maximum port. The highest `participant_id`, however, must satisfy:

```
max_participant_id < (domain_id_gain / participant_id_gain)
```

On the contrary, if `domain_id_gain` <= `participant_id_gain`, it results in a port mapping layout where a given domain's **com.rti.dds.domain.DomainParticipant** (p. 948) instances occupy ports spanned across the entire valid port range allowed by the underlying transport. For instance, it results in the following potential mapping:

Mapped Port	Domain Id	Participant ID
higher port number	Domain Id = 1	Participant ID = 2
	Domain Id = 0	Participant ID = 2
	Domain Id = 1	Participant ID = 1
	Domain Id = 0	Participant ID = 1
	Domain Id = 1	Participant ID = 0
lower port number	Domain Id = 0	Participant ID = 0

Under this case, the highest `participant_id` is limited only by the underlying transport's maximum port. The highest `domain_id`, however, must satisfy:

```
max_domain_id < (participant_id_gain / domain_id_gain)
```

Additionally, `domain_id_gain` also determines the range of the port-specific offsets.

```
domain_id_gain > abs(builtin_multicast_port_offset - user_multicast_port_offset)
```

```
domain_id_gain > abs(builtin_unicast_port_offset - user_unicast_port_offset)
```

Violating this may result in port aliasing and undefined discovery behavior.

[default] 250

[range] [> 0], but resulting ports must be within the range imposed by the underlying transport.

8.293.2.3 participant_id_gain

```
int participant_id_gain
```

<<***extension***>> *(*p. *138)* Tunable participant gain parameter.

Multiplier of the `participant_id`. See **com.rti.dds.infrastructure.RtpsWellKnownPorts_t.domain_id_gain** (p. 1933) for its implications on the highest `domain_id` and `participant_id` allowed on this network.

Additionally, `participant_id_gain` also determines the range of `builtin_unicast_port_offset` and `user_unicast_port_offset`.

```
participant_id_gain > abs(builtin_unicast_port_offset - user_unicast_port_offset)
```

[default] 2

[range] [> 0], but resulting ports must be within the range imposed by the underlying transport.

8.293.2.4 builtin_multicast_port_offset

```
int builtin_multicast_port_offset
```

<<***extension***>> *(*p. *138)* Additional offset for **metatraffic** multicast port.

It must be unique from other port-specific offsets.

[default] 0

[range] [>= 0], but resulting ports must be within the range imposed by the underlying transport.

8.293.2.5 builtin_unicast_port_offset

```
int builtin_unicast_port_offset
```

<<***extension***>> *(*p. *138)* Additional offset for **metatraffic** unicast port.

It must be unique from other port-specific offsets.

[default] 10

[range] [>= 0], but resulting ports must be within the range imposed by the underlying transport.

8.293.2.6 user_multicast_port_offset

```
int user_multicast_port_offset
```

<<***extension***>> *(*p. *138)* Additional offset for **usertraffic** multicast port.

It must be unique from other port-specific offsets.

[default] 1

[range] [>= 0], but resulting ports must be within the range imposed by the underlying transport.

8.293.2.7 user_unicast_port_offset

```
int user_unicast_port_offset
```

<<***extension***>> *(*p. *138)* Additional offset for **usertraffic** unicast port.

It must be unique from other port-specific offsets.

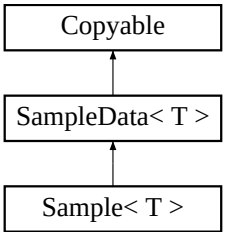
[default] 11

[range] [>= 0], but resulting ports must be within the range imposed by the underlying transport.

8.294 Sample< T > Interface Template Reference

A data sample and related info received from the middleware.

Inheritance diagram for Sample< T >:



Classes

- interface **Iterator**

  Provides access to a collection of middleware-loaned samples.

Public Member Functions

- **SampleInfo getInfo** ()

  Gets the sample information.
- **SampleIdentity_t getRelatedIdentity** ()

  Gets the identity of a sample that is related to this one.

8.294.1 Detailed Description

A data sample and related info received from the middleware.

Samples contain data received from the middleware and information associated to the data.

Template Parameters

T	The data type that this sample contains

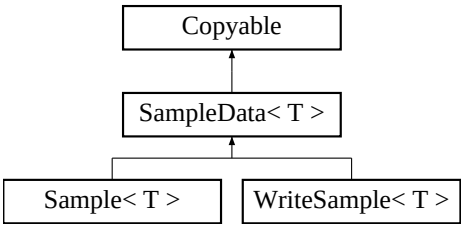
Sample (p. 1936) base type that contains data and has an identity.

Inheritance diagram for SampleData< T >:



Public Member Functions

- T **getData** ()

  Gets the data this sample contains.
- **SampleIdentity_t getIdentity** ()

  Gets the identity of this sample.

8.295.1 Detailed Description

Sample (p. 1936) base type that contains data and has an identity.

This is the base interface for samples received by the middleware (com.rti.connext.infrastructure.Sample<T>) and samples used to write (com.rti.connext.infrastructure.WriteSample<T>)

Template Parameters

T	The data type that this sample contains

8.295.2 Member Function Documentation

8.295.2.1 getData()

```
T getData ( )
```

Gets the data this sample contains.

See also

Basic Requester example (p. 393)

Referenced by **Replier< TReq, TRep >.sendReply()**, and **Requester< TReq, TRep >.sendRequest()**.

8.295.2.2 getIdentity()

```
SampleIdentity_t getIdentity ( )
```

Gets the identity of this sample.

The identity is assigned by the middleware upon reception.

8.296 SampleFlagBits Class Reference

Type to identify the sample flags reserved by RTI.

Static Public Attributes

- static final int **REDELIVERED_SAMPLE**

  Indicates that a sample has been redelivered by RTI Queuing Service.
- static final int **INTERMEDIATE_REPLY_SEQUENCE_SAMPLE**

  Indicates that a response sample is not the last response sample for a given request. This bit is usually set by Connext Repliers sending multiple responses for a request.
- static final int **REPLICATE_SAMPLE**

  Indicates if a sample must be broadcast by one RTI Queuing Service replica to other replicas.
- static final int **LAST_SHARED_READER_QUEUE_SAMPLE**

  Indicates that a sample is the last sample in a SharedReaderQueue for a QueueConsumer DataReader.
- static final int **INTERMEDIATE_TOPIC_QUERY_SAMPLE**

  Indicates that a sample for a TopicQuery will be followed by more samples.
- static final int **WRITER_REMOVED_BATCH_SAMPLE** = (0x00000001) << 5

  This flag will be set if the sample was accepted into the DataReader queue even though it was marked by the DataWriter as removed.
- static final int **DISCOVERY_SERVICE_SAMPLE** = (0x00000001) << 6

  This flag will be set if the sample was sent by Cloud Discovery Service.
- static final int **INCOMPLETE_SNAPSHOT_TOPIC_QUERY**

  Indicates that some of the samples that were published as part of a snapshot TopicQuery were lost.

8.296.1 Detailed Description

Type to identify the sample flags reserved by RTI.

8.296.2 Member Data Documentation

8.296.2.1 REDELIVERED_SAMPLE

```
final int REDELIVERED_SAMPLE  [static]
```

Indicates that a sample has been redelivered by RTI Queuing Service.

8.296.2.2 INTERMEDIATE_REPLY_SEQUENCE_SAMPLE

```
final int INTERMEDIATE_REPLY_SEQUENCE_SAMPLE  [static]
```

Indicates that a response sample is not the last response sample for a given request. This bit is usually set by Connext Repliers sending multiple responses for a request.

8.296.2.3 REPLICATE_SAMPLE

```
final int REPLICATE_SAMPLE  [static]
```

Indicates if a sample must be broadcast by one RTI Queuing Service replica to other replicas.

8.296.2.4 LAST_SHARED_READER_QUEUE_SAMPLE

```
final int LAST_SHARED_READER_QUEUE_SAMPLE  [static]
```

Indicates that a sample is the last sample in a SharedReaderQueue for a QueueConsumer DataReader.

8.296.2.5 INTERMEDIATE_TOPIC_QUERY_SAMPLE

```
final int INTERMEDIATE_TOPIC_QUERY_SAMPLE  [static]
```

Indicates that a sample for a TopicQuery will be followed by more samples.

This flag only applies to samples that have been published as a response to a **com.rti.dds.subscription.TopicQuery** (p. 2139).

When this bit is not set and **com.rti.dds.subscription.SampleInfo.topic_query_guid** (p. 1956) is different from **com.↩ rti.dds.infrastructure.GUID_t.GUID_UNKNOWN** (p. 1426), this sample is the last sample for that TopicQuery coming from the DataWriter identified by **com.rti.dds.subscription.SampleInfo.source_guid** (p. 1955).

8.296.2.6 WRITER_REMOVED_BATCH_SAMPLE

```
final int WRITER_REMOVED_BATCH_SAMPLE = (0x00000001) << 5  [static]
```

This flag will be set if the sample was accepted into the DataReader queue even though it was marked by the DataWriter as removed.

A sample can be marked as removed by the DataWriter in a batch when it is replaced due to the com.↩ rti.dds.infrastructure.HistoryQosPolicyKind.HistoryQosPolicyKind.KEEP_LAST_HISTORY_QOS **com.rti.dds.↩ infrastructure.HistoryQosPolicy** (p. 1435) QoS or because the duration in **com.rti.dds.infrastructure.Lifespan↩ QosPolicy** (p. 1526) was reached.

If the DataReader sets the property "dds.data_reader.accept_writer_removed_batch_samples" to true, the removed sample will be accepted into the DataReader queue and this flag will be set.

8.296.2.7 DISCOVERY_SERVICE_SAMPLE

```
final int DISCOVERY_SERVICE_SAMPLE = (0x00000001) << 6  [static]
```

This flag will be set if the sample was sent by Cloud Discovery Service.

The samples sent by Cloud Discovery Service are participant announcement samples on the ParticipantBuiltinTopic.

8.296.2.8 INCOMPLETE_SNAPSHOT_TOPIC_QUERY

```
final int INCOMPLETE_SNAPSHOT_TOPIC_QUERY  [static]
```

Indicates that some of the samples that were published as part of a snapshot TopicQuery were lost.

This flag is set in the last sample of the snapshot.

8.297 SampleIdentity_t Class Reference

Type definition for a Sample Identity.

Inherits Struct.

Public Member Functions

- **SampleIdentity_t** (**SampleIdentity_t** other)
  Copy constructor.

Public Attributes

- final **GUID_t writer_guid** = new **GUID_t**(**GUID_t.GUID_AUTO**)
  16-byte identifier identifying the virtual GUID.
- final **SequenceNumber_t sequence_number**
  monotonically increasing 64-bit integer that identifies the sample in the data source.

Static Public Attributes

- static final **SampleIdentity_t AUTO_SAMPLE_IDENTITY**
  The AUTO sample identity.
- static final **SampleIdentity_t UNKNOWN_SAMPLE_IDENTITY**
  An invalid or unknown sample identity.

8.297.1 Detailed Description

Type definition for a Sample Identity.

A SampleIdentity defines a pair (Virtual Writer GUID, Sequence Number) that uniquely identifies a sample within a DDS domain and a Topic.

8.297.2 Constructor & Destructor Documentation

8.297.2.1 SampleIdentity_t()

```
SampleIdentity_t (
            SampleIdentity_t other )
```

Copy constructor.

8.297.3 Member Data Documentation

8.297.3.1 AUTO_SAMPLE_IDENTITY

```
final SampleIdentity_t AUTO_SAMPLE_IDENTITY [static]
```

The AUTO sample identity.

Special com.rti.dds.infrastructure.SampleIdentity_t.SampleIdentity_t.AUTO_SAMPLE_IDENTITY value {**com.rti.dds.infrastructure.GUID_t.GUID_AUTO** (p. 1426), com.rti.dds.infrastructure.SequenceNumber_t.AUTO}

Referenced by **Requester< TReq, TRep >.sendRequest()**.

8.297.3.2 UNKNOWN_SAMPLE_IDENTITY

```
final SampleIdentity_t UNKNOWN_SAMPLE_IDENTITY [static]
```

An invalid or unknown sample identity.

Special com.rti.dds.infrastructure.SampleIdentity_t.SampleIdentity_t.UNKNOWN_SAMPLE_IDENTITY value {**com.rti.dds.infrastructure.GUID_t.GUID_UNKNOWN** (p. 1426), com.rti.dds.infrastructure.SequenceNumber_t.UNKNOWN}

8.297.3.3 writer_guid

```
final GUID_t writer_guid = new GUID_t( GUID_t.GUID_AUTO)
```

16-byte identifier identifying the virtual GUID.

8.297.3.4 sequence_number

```
final SequenceNumber_t sequence_number
```

Initial value:

```
=
        new SequenceNumber_t(SequenceNumber_t.AUTO_SEQUENCE_NUMBER)
```

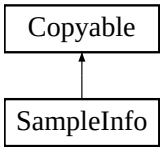
monotonically increasing 64-bit integer that identifies the sample in the data source.

Referenced by **Requester< TReq, TRep >.readReplies()**, **Requester< TReq, TRep >.readReply()**, **Requester< TReq, TRep >.takeReplies()**, **Requester< TReq, TRep >.takeReply()**, and **Requester< TReq, TRep >.waitForReplies()**.

8.298 SampleInfo Class Reference

Information that accompanies each sample that is `read` or `taken`.

Inheritance diagram for SampleInfo:



Public Member Functions

- Object **copy_from** (Object other)

Public Attributes

- int **sample_state**

  The sample state of the sample.
- int **view_state**

  The view state of the instance.
- int **instance_state**

  The instance state of the instance.
- final **Time_t source_timestamp**

  The timestamp when the sample was written by a DataWriter.
- final **InstanceHandle_t instance_handle**

  Identifies locally the corresponding instance.
- final **InstanceHandle_t publication_handle**

  Identifies locally the DataWriter that modified the instance.
- int **disposed_generation_count**

  The disposed generation count of the instance at the time of sample reception.
- int **no_writers_generation_count**

  The no writers generation count of the instance at the time of sample reception.
- int **sample_rank**

  The sample rank of the sample.
- int **generation_rank**

  The generation rank of the sample.
- int **absolute_generation_rank**

  The absolute generation rank of the sample.
- boolean **valid_data**

  Indicates whether the `DataSample` contains data or else it is only used to communicate a change in the `instance_state` of the instance.
- final **Time_t reception_timestamp**

  *<<**extension**>> (p. 403) The timestamp when the sample was committed by a **DataReader** (p. 707).*
- final **SequenceNumber_t publication_sequence_number**

8.298.1 Detailed Description

Information that accompanies each sample that is `read` or `taken`.

8.298.2 Interpretation of the SampleInfo

The **com.rti.dds.subscription.SampleInfo** (p. 1944) contains information pertaining to the associated `Data` instance sample including:

- the `sample_state` of the `Data` value (i.e., if it has already been read or not)
- the `view_state` of the related instance (i.e., if the instance is new or not)
- the `instance_state` of the related instance (i.e., if the instance is alive or not)
- **com.rti.dds.subscription.SampleInfo.valid_data** (p. 1952) flag. This flag indicates whether there is data associated with the sample. Some samples do not contain data indicating only a change on the `instance_state` of the corresponding instance.

- The values of `disposed_generation_count` and `no_writers_generation_count` for the related instance at the time the sample was received. These counters indicate the number of times the instance had become ALIVE (with `instance_state=` **com.rti.dds.subscription.InstanceStateKind.ALIVE_INSTANCE_STATE** (p. 1452)) at the time the sample was received.

- The `sample_rank` and `generation_rank` of the sample within the returned sequence. These ranks provide a preview of the samples that follow within the sequence returned by the `read` or `take` operations.

- The `absolute_generation_rank` of the sample within the **com.rti.dds.subscription.DataReader** (p. 707). This rank provides a preview of what is available within the **com.rti.dds.subscription.DataReader** (p. 707).

- The `source_timestamp` of the sample. This is the timestamp provided by the **com.rti.dds.publication.DataWriter** (p. 818) at the time the sample was produced.

8.298.3 Interpretation of the SampleInfo disposed_generation_count and no_writers_generation_count

For each instance, RTI Connext internally maintains two counts, the **com.rti.dds.subscription.SampleInfo.disposed_generation_count** (p. 1950) and **com.rti.dds.subscription.SampleInfo.no_writers_generation_count** (p. 1950), relative to each **DataReader** (p. 707):

- The **com.rti.dds.subscription.SampleInfo.disposed_generation_count** (p. 1950) and **com.rti.dds.subscription.SampleInfo.no_writers_generation_count** (p. 1950) are initialized to zero when the **com.rti.dds.subscription.DataReader** (p. 707) first detects the presence of a never-seen-before instance.

- The **com.rti.dds.subscription.SampleInfo.disposed_generation_count** (p. 1950) is incremented each time the instance_state of the corresponding instance changes from **com.rti.dds.subscription.InstanceStateKind.NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 1452) to **com.rti.dds.subscription.InstanceStateKind.ALIVE_INSTANCE_STATE** (p. 1452).

- The **com.rti.dds.subscription.SampleInfo.no_writers_generation_count** (p. 1950) is incremented each time the instance_state of the corresponding instance changes from **com.rti.dds.subscription.InstanceStateKind.NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 1452) to **com.rti.dds.subscription.InstanceStateKind.ALIVE_INSTANCE_STATE** (p. 1452).

- These 'generation counts' are reset to zero when the instance resource is reclaimed.

The **com.rti.dds.subscription.SampleInfo.disposed_generation_count** (p. 1950) and **com.rti.dds.subscription.SampleInfo.no_writers_generation_count** (p. 1950) available in the **com.rti.dds.subscription.SampleInfo** (p. 1944) capture a snapshot of the corresponding counters at the time the sample was received.

8.298.4 Interpretation of the SampleInfo sample_rank, generation_rank and absolute_generation_rank

The **com.rti.dds.subscription.SampleInfo.sample_rank** (p. 1951) and **com.rti.dds.subscription.SampleInfo.↩ generation_rank** (p. 1951) available in the **com.rti.dds.subscription.SampleInfo** (p. 1944) are computed based solely on the actual samples in the ordered collection returned by read or take.

- The **com.rti.dds.subscription.SampleInfo.sample_rank** (p. 1951) indicates the number of samples of the same instance that follow the current one in the collection.
- The **com.rti.dds.subscription.SampleInfo.generation_rank** (p. 1951) available in the **com.rti.dds.↩ subscription.SampleInfo** (p. 1944) indicates the difference in "generations" between the sample (S) and the Most Recent Sample of the same instance that appears in the returned Collection (MRSIC). That is, it counts the number of times the instance transitioned from not-alive to alive in the time from the reception of the S to the reception of MRSIC.
- These 'generation ranks' are reset to zero when the instance resource is reclaimed.

The **com.rti.dds.subscription.SampleInfo.generation_rank** (p. 1951) is computed using the formula:

```
generation_rank = (MRSIC.disposed_generation_count
                       + MRSIC.no_writers_generation_count)
                  - (S.disposed_generation_count
                       + S.no_writers_generation_count)
```

The **com.rti.dds.subscription.SampleInfo.absolute_generation_rank** (p. 1951) available in the **com.rti.dds.↩ subscription.SampleInfo** (p. 1944) indicates the difference in "generations" between the sample (S) and the Most Recent Sample of the same instance that the middleware has received (MRS). That is, it counts the number of times the instance transitioned from not-alive to alive in the time from the reception of the S to the time when the read or take was called.

```
absolute_generation_rank = (MRS.disposed_generation_count
                                 + MRS.no_writers_generation_count)
                           - (S.disposed_generation_count
                                 + S.no_writers_generation_count)
```

8.298.5 Interpretation of the SampleInfo counters and ranks

These counters and ranks allow the application to distinguish samples belonging to different "generations" of the instance. Note that it is possible for an instance to transition from not-alive to alive (and back) several times before the application accesses the data by means of read or take. In this case, the returned collection may contain samples that cross generations (i.e. some samples were received before the instance became not-alive, other after the instance re-appeared again). Using the information in the **com.rti.dds.subscription.SampleInfo** (p. 1944), the application can anticipate what other information regarding the same instance appears in the returned collection, as well as in the infrastructure and thus make appropriate decisions.

For example, an application desiring to only consider the most current sample for each instance would only look at samples with sample_rank == 0. Similarly, an application desiring to only consider samples that correspond to the latest generation in the collection will only look at samples with generation_rank == 0. An application desiring only samples pertaining to the latest generation available will ignore samples for which absolute_generation_rank != 0. Other application-defined criteria may also be used.

8.298.7 Member Data Documentation

8.298.7.1 sample_state

```
int sample_state
```

The sample state of the sample.

Indicates whether or not the corresponding data sample has already been read.

See also

com.rti.dds.subscription.SampleStateKind (p. 1972)

Referenced by **SampleInfo.copy_from()**.

8.298.7.2 view_state

```
int view_state
```

The view state of the instance.

Indicates whether the **com.rti.dds.subscription.DataReader** (p. 707) has already seen samples for the most-current generation of the related instance.

See also

com.rti.dds.subscription.ViewStateKind (p. 2283)

Referenced by **SampleInfo.copy_from()**.

8.298.7.3 instance_state

```
int instance_state
```

The instance state of the instance.

Indicates whether the instance is currently in existence or, if it has been disposed, the reason why it was disposed.

See also

com.rti.dds.subscription.InstanceStateKind (p. 1451)

Referenced by **SampleInfo.copy_from()**.

8.298.7.4 source_timestamp

```
final Time_t source_timestamp
```

The timestamp when the sample was written by a DataWriter.

Referenced by **SampleInfo.copy_from()**.

8.298.7.5 instance_handle

```
final InstanceHandle_t instance_handle
```

Identifies locally the corresponding instance.

The handle is equal to **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447) for unkeyed topics.

Referenced by **SampleInfo.copy_from()**.

8.298.7.6 publication_handle

```
final InstanceHandle_t publication_handle
```

Identifies locally the DataWriter that modified the instance.

The `publication_handle` is the same **com.rti.dds.infrastructure.InstanceHandle_t** (p. 1443) that is returned by the operation **com.rti.dds.subscription.DataReader.get_matched_publications** (p. 723) and can also be used as a parameter to the operation **com.rti.dds.subscription.DataReader.get_matched_publication_data** (p. 724).

Referenced by **SampleInfo.copy_from()**.

8.298.7.7 disposed_generation_count

```
int disposed_generation_count
```

The disposed generation count of the instance at the time of sample reception.

Indicates how many times the `instance_state` of the corresponding instance changed from **com.rti.↩ dds.subscription.InstanceStateKind.NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 1452) to **com.rti.dds.↩ subscription.InstanceStateKind.ALIVE_INSTANCE_STATE** (p. 1452). The counter is reset when the instance resource is reclaimed (removed from the **DataReader** (p. 707) cache).

See also

Interpretation of the SampleInfo disposed_generation_count and no_writers_generation_count (p. 1946)
Interpretation of the SampleInfo counters and ranks (p. 1947)

Referenced by **SampleInfo.copy_from()**.

8.298.7.8 no_writers_generation_count

```
int no_writers_generation_count
```

The no writers generation count of the instance at the time of sample reception.

Indicates how many times the `instance_state` of the corresponding instance changed from **com.rti.dds.subscription.InstanceStateKind.NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 1452) to **com.rti.dds.subscription.InstanceStateKind.ALIVE_INSTANCE_STATE** (p. 1452). The counter is reset when the instance resource is reclaimed (removed from the **DataReader** (p. 707) cache).

See also

Interpretation of the SampleInfo disposed_generation_count and no_writers_generation_count (p. 1946)
Interpretation of the SampleInfo counters and ranks (p. 1947)

Referenced by **SampleInfo.copy_from()**.

8.298.7.9 sample_rank

```
int sample_rank
```

The sample rank of the sample.

Indicates the number of samples related to the same instance that follow in the collection returned by `read` or `take`.

See also

Interpretation of the SampleInfo sample_rank, generation_rank and absolute_generation_rank (p. 1947)
Interpretation of the SampleInfo counters and ranks (p. 1947)

Referenced by **SampleInfo.copy_from()**.

8.298.7.10 generation_rank

```
int generation_rank
```

The generation rank of the sample.

Indicates the generation difference (number of times the instance was NOT_ALIVE and become alive again) between the time the sample was received and the time the most recent sample in the collection related to the same instance was received.

See also

Interpretation of the SampleInfo sample_rank, generation_rank and absolute_generation_rank (p. 1947)
Interpretation of the SampleInfo counters and ranks (p. 1947)

Referenced by **SampleInfo.copy_from()**.

8.298.7.11 absolute_generation_rank

```
int absolute_generation_rank
```

The absolute generation rank of the sample.

Indicates the generation difference (number of times the instance was disposed and become alive again) between the time the sample was received, and the time the most recent sample (which may not be in the returned collection) related to the same instance was received.

See also

Interpretation of the SampleInfo sample_rank, generation_rank and absolute_generation_rank (p. 1947)
Interpretation of the SampleInfo counters and ranks (p. 1947)

Referenced by **SampleInfo.copy_from()**.

8.298.7.12 valid_data

```
boolean valid_data
```

Indicates whether the `DataSample` contains data or else it is only used to communicate a change in the `instance_state` of the instance.

Normally each `DataSample` contains both a **com.rti.dds.subscription.SampleInfo** (p. 1944) and some Data. However there are situations where a `DataSample` contains only the **com.rti.dds.subscription.SampleInfo** (p. 1944) and does not have any associated data. This occurs when the RTI Connext notifies the application of a change of state for an instance that was caused by some internal mechanism (such as a timeout) for which there is no associated data. An example of this situation is when the RTI Connext detects that an instance has no writers and changes the corresponding instance_state to **com.rti.dds.subscription.InstanceStateKind.NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 1452).

The application can distinguish whether a particular `DataSample` has data by examining the value of the **`com.rti.dds.subscription.SampleInfo.valid_data`** (p. 1952). If this flag is set to com.rti.dds.infrastructure.true, then the `DataSample` contains valid Data. If the flag is set to com.rti.dds.infrastructure.false, the `DataSample` contains no Data.

To ensure correctness and portability, the `valid_data` flag must be examined by the application prior to accessing the Data associated with the `DataSample` and if the flag is set to com.rti.dds.infrastructure.false, the application should not access the Data associated with the `DataSample`, that is, the application should access only the **com.rti.dds.subscription.SampleInfo** (p. 1944).

Referenced by **SampleInfo.copy_from()**.

8.298.7.13 reception_timestamp

```
final Time_t reception_timestamp
```

<<***extension***>> *(*p. *403)* The timestamp when the sample was committed by a **DataReader** (p. 707).

Referenced by **SampleInfo.copy_from()**.

```

<<***extension***>> *(*p. *403)* The reception sequence number when sample was committed by a **DataReader** (p. 707)

Referenced by **SampleInfo.copy_from()**.

8.298.7.16 original_publication_virtual_guid

```
final GUID_t original_publication_virtual_guid
```

<<***extension***>> *(*p. *403)* The original publication virtual GUID.

If the **com.rti.dds.infrastructure.PresentationQosPolicy::access_scope** (p. 1682) of the **com.rti.dds.publication.↩ Publisher** (p. 1767) is com.rti.dds.infrastructure.PresentationQosPolicyAccessScopeKind.PresentationQosPolicy↩ AccessScopeKind.GROUP_PRESENTATION_QOS, this field contains the **com.rti.dds.publication.Publisher** (p. 1767) virtual GUID that uniquely identifies the DataWriter group.

See also

com.rti.connext.infrastructure.Sample<T>.getIdentity() (p. 1939)

Referenced by **SampleInfo.copy_from()**.

8.298.7.17 original_publication_virtual_sequence_number

```
final SequenceNumber_t original_publication_virtual_sequence_number
```

<<***extension***>> *(p. 403)* The original publication virtual sequence number.

If the **com.rti.dds.infrastructure.PresentationQosPolicy::access_scope** (p. 1682) of the **com.rti.dds.publication.Publisher** (p. 1767) is com.rti.dds.infrastructure.PresentationQosPolicyAccessScopeKind.PresentationQosPolicyAccessScopeKind.GROUP_PRESENTATION_QOS, this field contains the **com.rti.dds.publication.Publisher** (p. 1767) virtual sequence number that uniquely identifies a sample within the DataWriter group.

See also

com.rti.connext.infrastructure.Sample<T>.getIdentity() (p. 1939)

Referenced by **SampleInfo.copy_from()**.

8.298.7.18 related_original_publication_virtual_guid

```
final GUID_t related_original_publication_virtual_guid
```

<<***extension***>> *(p. 403)* The original publication virtual GUID of a related sample.

See also

com.rti.connext.infrastructure.Sample<T>.getRelatedIdentity() (p. 1937)

Referenced by **SampleInfo.copy_from()**.

8.298.7.19 related_original_publication_virtual_sequence_number

```
final SequenceNumber_t related_original_publication_virtual_sequence_number
```

<<***extension***>> *(p. 403)* The original publication virtual sequence number of a related sample.

See also

com.rti.connext.infrastructure.Sample<T>.getRelatedIdentity() (p. 1937)

Referenced by **SampleInfo.copy_from()**.

8.298.7.20 flag

```
int flag
```

<<***extension***>> *(*p. *403)* Flags associated with the sample.

The flags can be set by using the field **com.rti.dds.infrastructure.WriteParams_t.flag** (p. 2313) when writing a sample using the method **com.rti.ndds.example.FooDataWriter.write_w_params** (p. 1402).

Referenced by **SampleInfo.copy_from()**.

8.298.7.21 source_guid

```
GUID_t source_guid
```

<<***extension***>> *(*p. *403)* The application logical data source associated with the sample.

The source_guid can be set by using the field **com.rti.dds.infrastructure.WriteParams_t.source_guid** (p. 2314) when writing a sample using the method **com.rti.ndds.example.FooDataWriter.write_w_params** (p. 1402).

See also

com.rti.dds.infrastructure.WriteParams_t.source_guid (p. 2314) for additional information on **source_guid** (p. 1955) and when it is used.

Referenced by **SampleInfo.copy_from()**.

8.298.7.22 related_source_guid

```
GUID_t related_source_guid
```

<<***extension***>> *(*p. *403)* The application logical data source that is related to the sample.

The related_source_guid can be set by using the field **com.rti.dds.infrastructure.WriteParams_t.related_source↩ _guid** (p. 2314) when writing a sample using the method **com.rti.ndds.example.FooDataWriter.write_w_params** (p. 1402).

Referenced by **SampleInfo.copy_from()**.

8.298.7.23 related_subscription_guid

```
GUID_t related_subscription_guid
```

<<***extension***>> *(p. 403)* The related_reader_guid associated with the sample.

The related_reader_guid can be set by using the field **com.rti.dds.infrastructure.WriteParams_t.related_reader_guid** (p. 2315) when writing a sample using the method **com.rti.ndds.example.FooDataWriter.write_w_params** (p. 1402).

Referenced by **SampleInfo.copy_from()**.

8.298.7.24 topic_query_guid

```
final GUID_t topic_query_guid
```

<<***extension***>> *(p. 403)* The GUID of the **com.rti.dds.subscription.TopicQuery** (p. 2139) that is related to the sample.

This GUID indicates whether a sample is part of the response to a **com.rti.dds.subscription.TopicQuery** (p. 2139) or a regular ("live") sample:

- If the sample was written for the **TopicQuery** (p. 2139) stream, this field contains the GUID of the target **TopicQuery** (p. 2139).
- If the sample was written for the live stream, this field will be set to **com.rti.dds.infrastructure.GUID_t.GUID_UNKNOWN** (p. 1426).

Referenced by **SampleInfo.copy_from()**.

8.298.7.25 coherent_set_info

```
CoherentSetInfo_t coherent_set_info
```

<<***extension***>> *(p. 403)* The information about the coherent set that this sample is a part of.

This field is set for all samples that are part of a coherent set. Coherent sets are initiated using the operation **com.rti.dds.publication.Publisher.begin_coherent_changes** (p. 1784) and finalized using the operation **com.rti.dds.publication.Publisher.end_coherent_changes** (p. 1784).

See also

com.rti.dds.publication.Publisher.begin_coherent_changes (p. 1784) for additional information on coherent sets.

Additional Inherited Members

8.301.1 Detailed Description

<<***extension***>> *(*p. *403)* Kinds of reasons why a sample was lost.

8.301.2 Member Data Documentation

8.301.2.1 NOT_LOST

```
final  SampleLostStatusKind NOT_LOST  [static]
```

Initial value:

```
= new com.rti.dds.subscription.SampleLostStatusKind(
            "NOT_LOST", 0)
```

The sample was not lost.

This constant is an extension to the DDS standard. MONITOR-273 We assign an integer to the names in order to be compatible with the DDSMonitoring types. If new values are added, update DataReaderTest.testGetAndSetSample↩ LostStatus

8.301.2.2 LOST_BY_WRITER

```
final  SampleLostStatusKind LOST_BY_WRITER  [static]
```

Initial value:

```
= new com.rti.dds.subscription.SampleLostStatusKind(
            "LOST_BY_WRITER", 1)
```

A **com.rti.dds.publication.DataWriter** (p. 818) removed the sample before being received by the **com.rti.dds.↩ subscription.DataReader** (p. 707).

This constant is an extension to the DDS standard.

8.301.2.3 LOST_BY_INSTANCES_LIMIT

```
final  SampleLostStatusKind LOST_BY_INSTANCES_LIMIT  [static]
```

Initial value:

```
= new com.rti.dds.subscription.SampleLostStatusKind(
            "LOST_BY_INSTANCES_LIMIT", 2)
```

A resource limit on the number of instances (**com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_instances** (p. 1896)) was reached.

This constant is an extension to the DDS standard.

See also

com.rti.dds.infrastructure.ResourceLimitsQosPolicy (p. 1894)

8.301.2.4 LOST_BY_REMOTE_WRITERS_PER_INSTANCE_LIMIT

```
final SampleLostStatusKind LOST_BY_REMOTE_WRITERS_PER_INSTANCE_LIMIT [static]
```

Initial value:

```
= new SampleLostStatusKind(
                "LOST_BY_REMOTE_WRITERS_PER_INSTANCE_LIMIT", 3)
```

A resource limit on the number of remote writers for a single instance from which a **com.rti.dds.subscription.DataReader** (p. 707) may read (**com.rti.dds.infrastructure.DataReaderResourceLimitsQosPolicy.max_remote_writers_per_instance** (p. 792)) was reached.

This constant is an extension to the DDS standard.

See also

com.rti.dds.infrastructure.DataReaderResourceLimitsQosPolicy (p. 789)

8.301.2.5 LOST_BY_INCOMPLETE_COHERENT_SET

```
final SampleLostStatusKind LOST_BY_INCOMPLETE_COHERENT_SET [static]
```

Initial value:

```
= new SampleLostStatusKind(
                "LOST_BY_INCOMPLETE_COHERENT_SET", 4)
```

A sample is lost because it is part of an incomplete coherent set. An incomplete coherent set is a coherent set for which some of the samples are missing.

For example, consider a **com.rti.dds.publication.DataWriter** (p. 818) using com.rti.dds.infrastructure.HistoryQosPolicyKind.HistoryQosPolicyKind.KEEP_LAST_HISTORY_QOS with a depth of 1. The DataWriter publishes two samples of the same instance as part of a coherent set 'CS1'; the first sample of 'CS1' is replaced by a new sample before it can be successfully delivered to the **com.rti.dds.subscription.DataReader** (p. 707). In this case, the coherent set containing the two samples is considered incomplete. The new sample, by default, will not be provided to the application, and will be reported as LOST_BY_INCOMPLETE_COHERENT_SET. (You can change this default behavior by setting **com.rti.dds.infrastructure.PresentationQosPolicy.drop_incomplete_coherent_set** (p. 1683) to FALSE. If you do, the new sample will be provided to the application, but it will be marked as part of an incomplete coherent set in the **com.rti.dds.subscription.SampleInfo** (p. 1944) structure.)

This constant is an extension to the DDS standard.

8.301.2.6 LOST_BY_LARGE_COHERENT_SET

```
final SampleLostStatusKind LOST_BY_LARGE_COHERENT_SET [static]
```

Initial value:

```
= new SampleLostStatusKind(
                "LOST_BY_LARGE_COHERENT_SET", 5)
```

A sample is lost because it is part of a large coherent set. A large coherent set is a coherent set that cannot fit all at once into the **com.rti.dds.subscription.DataReader** (p. 707) queue because resource limits are exceeded.

For example, if **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_samples_per_instance** (p. 1897) on the **DataReader** (p. 707) is 10 and the coherent set has 15 samples for a given instance, the coherent set is a large coherent set that will be considered incomplete.

The resource limits that can lead to large coherent sets are: **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_samples** (p. 1896), **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_samples_per_instance** (p. 1897), **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_instances** (p. 1896), and **com.rti.dds.infrastructure.DataReaderResourceLimitsQosPolicy.max_samples_per_remote_writer** (p. 793).

This constant is an extension to the DDS standard.

8.301.2.7 LOST_BY_SAMPLES_PER_REMOTE_WRITER_LIMIT

```
final  SampleLostStatusKind LOST_BY_SAMPLES_PER_REMOTE_WRITER_LIMIT  [static]
```

Initial value:

```
= new SampleLostStatusKind(
                "LOST_BY_SAMPLES_PER_REMOTE_WRITER_LIMIT", 6)
```

When using **com.rti.dds.infrastructure.ReliabilityQosPolicyKind.BEST_EFFORT_RELIABILITY_QOS** (p. 1836)↩ : a resource limit on the number of samples from a given remote writer that a **com.rti.dds.subscription.**↩ **DataReader** (p. 707) may store (**com.rti.dds.infrastructure.DataReaderResourceLimitsQosPolicy.max_samples**↩ **_per_remote_writer** (p. 793)) was reached. When using **com.rti.dds.infrastructure.ReliabilityQosPolicyKind.**↩ **RELIABLE_RELIABILITY_QOS** (p. 1836), reaching **com.rti.dds.infrastructure.DataReaderResourceLimitsQos**↩ **Policy.max_samples_per_remote_writer** (p. 793) will trigger a rejection, not a loss, with reason **com.rti.dds.**↩ **subscription.SampleRejectedStatusKind.REJECTED_BY_SAMPLES_PER_REMOTE_WRITER_LIMIT** (p. 1970).

This constant is an extension to the DDS standard.

See also

com.rti.dds.infrastructure.DataReaderResourceLimitsQosPolicy (p. 789)

8.301.2.8 LOST_BY_VIRTUAL_WRITERS_LIMIT

```
final  SampleLostStatusKind LOST_BY_VIRTUAL_WRITERS_LIMIT  [static]
```

Initial value:

```
= new SampleLostStatusKind(
                "DDS_LOST_BY_VIRTUAL_WRITERS_LIMIT", 7)
```

A resource limit on the number of virtual writers from which a **com.rti.dds.subscription.DataReader** (p. 707) may read (**com.rti.dds.infrastructure.DataReaderResourceLimitsQosPolicy.max_remote_virtual_writers** (p. 800)) was reached.

This constant is an extension to the DDS standard.

See also

com.rti.dds.infrastructure.DataReaderResourceLimitsQosPolicy (p. 789)

8.301.2.9 LOST_BY_REMOTE_WRITERS_PER_SAMPLE_LIMIT

```
final  SampleLostStatusKind LOST_BY_REMOTE_WRITERS_PER_SAMPLE_LIMIT  [static]
```

Initial value:
```
= new SampleLostStatusKind(
                "LOST_BY_REMOTE_WRITERS_PER_SAMPLE_LIMIT", 8)
```

A resource limit on the number of remote writers per sample (**com.rti.dds.infrastructure.DataReaderResource↩ LimitsQosPolicy.max_remote_writers_per_sample** (p. 802)) was reached.

This constant is an extension to the DDS standard.

See also

com.rti.dds.infrastructure.DataReaderResourceLimitsQosPolicy (p. 789)

8.301.2.10 LOST_BY_AVAILABILITY_WAITING_TIME

```
final  SampleLostStatusKind LOST_BY_AVAILABILITY_WAITING_TIME  [static]
```

Initial value:
```
= new SampleLostStatusKind(
                "LOST_BY_AVAILABILITY_WAITING_TIME", 9)
```

com.rti.dds.infrastructure.AvailabilityQosPolicy.max_data_availability_waiting_time (p. 600) expired.

This constant is an extension to the DDS standard.

See also

com.rti.dds.infrastructure.AvailabilityQosPolicy (p. 597)

8.301.2.11 LOST_BY_REMOTE_WRITER_SAMPLES_PER_VIRTUAL_QUEUE_LIMIT

```
final  SampleLostStatusKind LOST_BY_REMOTE_WRITER_SAMPLES_PER_VIRTUAL_QUEUE_LIMIT  [static]
```

Initial value:
```
= new SampleLostStatusKind(
                "LOST_BY_REMOTE_WRITER_SAMPLES_PER_VIRTUAL_QUEUE_LIMIT", 10)
```

A resource limit on the number of samples published by a remote writer on behalf of a virtual writer that a **com.rti.↩ dds.subscription.DataReader** (p. 707) may store was reached. (This field is currently not used.)

This constant is an extension to the DDS standard.

See also

com.rti.dds.infrastructure.DataReaderResourceLimitsQosPolicy (p. 789)

8.301.2.12 LOST_BY_OUT_OF_MEMORY

```
final SampleLostStatusKind LOST_BY_OUT_OF_MEMORY [static]
```

Initial value:

```
= new SampleLostStatusKind(
                "LOST_BY_OUT_OF_MEMORY", 11)
```

A sample was lost because there was not enough memory to store the sample.

This constant is an extension to the DDS standard.

See also

com.rti.dds.infrastructure.DataReaderResourceLimitsQosPolicy (p. 789)

8.301.2.13 LOST_BY_UNKNOWN_INSTANCE

```
final SampleLostStatusKind LOST_BY_UNKNOWN_INSTANCE [static]
```

Initial value:

```
=
        new SampleLostStatusKind("LOST_BY_UNKNOWN_INSTANCE", 12)
```

A received sample was lost because it doesn't contain enough information for the reader to know what instance it is associated with.

This constant is an extension to the DDS standard.

8.301.2.14 LOST_BY_DESERIALIZATION_FAILURE

```
final SampleLostStatusKind LOST_BY_DESERIALIZATION_FAILURE [static]
```

Initial value:

```
=
        new SampleLostStatusKind("LOST_BY_DESERIALIZATION_FAILURE", 13)
```

A received sample was lost because it could not be deserialized.

This constant is an extension to the DDS standard.

8.301.2.15 LOST_BY_DECODE_FAILURE

```
final SampleLostStatusKind LOST_BY_DECODE_FAILURE [static]
```

Initial value:

```
=
        new SampleLostStatusKind("LOST_BY_DECODE_FAILURE", 14)
```

When using **com.rti.dds.infrastructure.ReliabilityQosPolicyKind.BEST_EFFORT_RELIABILITY_QOS** (p. 1836): A received sample was lost because it could not be decoded. When using **com.rti.dds.infrastructure.ReliabilityQos↩ PolicyKind.RELIABLE_RELIABILITY_QOS** (p. 1836), the sample will be rejected, not lost, with reason **com.rti.dds.↩ subscription.SampleRejectedStatusKind.REJECTED_BY_DECODE_FAILURE** (p. 1971).

This constant is an extension to the DDS standard.

8.301.2.16 LOST_BY_SAMPLES_PER_INSTANCE_LIMIT

```
final SampleLostStatusKind LOST_BY_SAMPLES_PER_INSTANCE_LIMIT [static]
```

Initial value:

```
=
        new SampleLostStatusKind("LOST_BY_SAMPLES_PER_INSTANCE_LIMIT", 15)
```

When using **com.rti.dds.infrastructure.ReliabilityQosPolicyKind.BEST_EFFORT_RELIABILITY_QOS** (p. 1836): A resource limit on the number of samples per instance (**com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_samples_per_instance** (p. 1897)) was reached. When using **com.rti.dds.infrastructure.ReliabilityQosPolicyKind.RELIABLE_RELIABILITY_QOS** (p. 1836), reaching **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_samples_per_instance** (p. 1897) will trigger a rejection, not a loss, with reason **com.rti.dds.subscription.SampleRejectedStatusKind.REJECTED_BY_SAMPLES_PER_INSTANCE_LIMIT** (p. 1970).

This constant is an extension to the DDS standard.

See also

com.rti.dds.infrastructure.ResourceLimitsQosPolicy (p. 1894)

8.301.2.17 LOST_BY_SAMPLES_LIMIT

```
final SampleLostStatusKind LOST_BY_SAMPLES_LIMIT [static]
```

Initial value:

```
=
        new SampleLostStatusKind("LOST_BY_SAMPLES_LIMIT", 16)
```

When using **com.rti.dds.infrastructure.ReliabilityQosPolicyKind.BEST_EFFORT_RELIABILITY_QOS** (p. 1836): A resource limit on the number of samples (**com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_samples** (p. 1896)) was reached. When using **com.rti.dds.infrastructure.ReliabilityQosPolicyKind.RELIABLE_RELIABILITY_QOS** (p. 1836), reaching **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_samples** (p. 1896) will trigger a rejection, not a loss, with reason **com.rti.dds.subscription.SampleRejectedStatusKind.REJECTED_BY_SAMPLES_LIMIT** (p. 1969).

This constant is an extension to the DDS standard.

8.302 SampleRejectedStatus Class Reference

com.rti.dds.infrastructure.StatusKind.StatusKind.SAMPLE_REJECTED_STATUS

Inherits Status.

Public Attributes

- int **total_count**

  *Total cumulative count of samples rejected by the **com.rti.dds.subscription.DataReader** (p. 707).*
- int **total_count_change**

  The incremental number of samples rejected since the last time the listener was called or the status was read.
- **SampleRejectedStatusKind last_reason**

  Reason for rejecting the last sample rejected.
- final **InstanceHandle_t last_instance_handle**

  Handle to the instance being updated by the last sample that was rejected.

8.302.1 Detailed Description

com.rti.dds.infrastructure.StatusKind.StatusKind.SAMPLE_REJECTED_STATUS

8.302.2 Member Data Documentation

8.302.2.1 total_count

```
int total_count
```

Total cumulative count of samples rejected by the **com.rti.dds.subscription.DataReader** (p. 707).

8.302.2.2 total_count_change

```
int total_count_change
```

The incremental number of samples rejected since the last time the listener was called or the status was read.

8.302.2.3 last_reason

```
SampleRejectedStatusKind last_reason
```

Reason for rejecting the last sample rejected.

See also

com.rti.dds.subscription.SampleRejectedStatusKind (p. 1968)

8.302.2.4 last_instance_handle

```
final InstanceHandle_t last_instance_handle
```

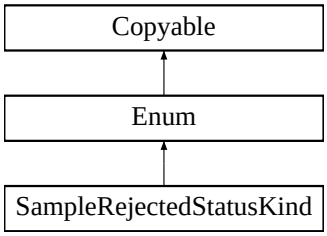
Handle to the instance being updated by the last sample that was rejected.

If the sample was rejected because of **com.rti.dds.subscription.SampleRejectedStatusKind.REJECTED_BY_↩ DECODE_FAILURE** (p. 1971) and the **com.rti.dds.publication.DataWriter** (p. 818) set **com.rti.dds.infrastructure.↩ DataWriterProtocolQosPolicy.disable_inline_keyhash** (p. 864) to com.rti.dds.infrastructure.true, then the last_↩ instance_handle may not be correct if the sample was encrypted.

8.303 SampleRejectedStatusKind Class Reference

Kinds of reasons for rejecting a sample.

Inheritance diagram for SampleRejectedStatusKind:



Static Public Attributes

- static final **SampleRejectedStatusKind NOT_REJECTED**

  The sample was not rejected.
- static final **SampleRejectedStatusKind REJECTED_BY_INSTANCES_LIMIT**

  *Connext DDS does not reject samples based on instance limits (**com.rti.dds.infrastructure.ResourceLimitsQos↩ Policy.max_instances** (p. 1896)), so this value will never be used.*
- static final **SampleRejectedStatusKind REJECTED_BY_SAMPLES_LIMIT**

  *When using **com.rti.dds.infrastructure.ReliabilityQosPolicyKind.RELIABLE_RELIABILITY_QOS** (p. 1836): A resource limit on the number of samples (**com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_samples** (p. 1896)) was reached. When using **com.rti.dds.infrastructure.ReliabilityQosPolicyKind.BEST_EFFORT_RELIABILITY_QOS** (p. 1836), reaching **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_samples** (p. 1896) will trigger a loss, not a rejection, with reason **com.rti.dds.subscription.SampleLostStatusKind.LOST_BY_SAMPLES_LIMIT** (p. 1966).*
- static final **SampleRejectedStatusKind REJECTED_BY_SAMPLES_PER_INSTANCE_LIMIT**

  *When using **com.rti.dds.infrastructure.ReliabilityQosPolicyKind.RELIABLE_RELIABILITY_QOS** (p. 1836): A resource limit on the number of samples per instance (**com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_↩ samples_per_instance** (p. 1897)) was reached. When using **com.rti.dds.infrastructure.ReliabilityQosPolicyKind.↩ BEST_EFFORT_RELIABILITY_QOS** (p. 1836), reaching **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.↩ max_samples_per_instance** (p. 1897) will trigger a loss, not a rejection, with reason **com.rti.dds.subscription.↩ SampleLostStatusKind.LOST_BY_SAMPLES_PER_INSTANCE_LIMIT** (p. 1965).*
- static final **SampleRejectedStatusKind REJECTED_BY_SAMPLES_PER_REMOTE_WRITER_LIMIT**

*When using **com.rti.dds.infrastructure.ReliabilityQosPolicyKind.RELIABLE_RELIABILITY_QOS** (p. 1836): a resource limit on the number of samples from a given remote writer that a **com.rti.dds.subscription.DataReader** (p. 707) may store (**com.rti.dds.infrastructure.DataReaderResourceLimitsQosPolicy.max_samples_per_remote_writer** (p. 793)) was reached. When using **com.rti.dds.infrastructure.ReliabilityQosPolicyKind.BEST_EFFORT_RELIABILITY_QOS** (p. 1836), reaching **com.rti.dds.infrastructure.DataReaderResourceLimitsQosPolicy.max_samples_per_remote_writer** (p. 793) will trigger a loss, not a rejection, with reason **com.rti.dds.subscription.SampleLostStatusKind.LOST_BY_SAMPLES_PER_REMOTE_WRITER_LIMIT** (p. 1962).*

- static final **SampleRejectedStatusKind REJECTED_BY_REMOTE_WRITER_SAMPLES_PER_VIRTUAL_QUEUE_LIMIT**

  *A resource limit on the number of samples published by a remote writer on behalf of a virtual writer that a **com.rti.dds.subscription.DataReader** (p. 707) may store was reached. (This field is currently not used.)*

- static final **SampleRejectedStatusKind REJECTED_BY_DECODE_FAILURE**

  *When using **com.rti.dds.infrastructure.ReliabilityQosPolicyKind.RELIABLE_RELIABILITY_QOS** (p. 1836): A received sample was rejected because it could not be decoded. When using **com.rti.dds.infrastructure.ReliabilityQosPolicyKind.BEST_EFFORT_RELIABILITY_QOS** (p. 1836), the sample will be lost, not rejected, with reason **com.rti.dds.subscription.SampleLostStatusKind.LOST_BY_DECODE_FAILURE** (p. 1965).*

Additional Inherited Members

8.303.1 Detailed Description

Kinds of reasons for rejecting a sample.

8.303.2 Member Data Documentation

8.303.2.1 NOT_REJECTED

```
final SampleRejectedStatusKind NOT_REJECTED [static]
```

Initial value:

```
= new com.rti.dds.subscription.SampleRejectedStatusKind(
            "NOT_REJECTED", 0)
```

The sample was not rejected.

MONITOR-273 We assign an integer to the names in order to be compatible with the DDSMonitoring types. If new values are added, update DataReaderTest.testGetAndSetSampleRejectedStatus

8.303.2.2 REJECTED_BY_INSTANCES_LIMIT

```
final SampleRejectedStatusKind REJECTED_BY_INSTANCES_LIMIT [static]
```

Initial value:

```
= new com.rti.dds.subscription.SampleRejectedStatusKind(
            "REJECTED_BY_INSTANCES_LIMIT", 1)
```

Connext DDS does not reject samples based on instance limits (**com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_instances** (p. 1896)), so this value will never be used.

final  SampleRejectedStatusKind REJECTED_BY_SAMPLES_PER_REMOTE_WRITER_LIMIT  [static]
```

Initial value:

```
= new SampleRejectedStatusKind(
                "REJECTED_BY_SAMPLES_PER_REMOTE_WRITER_LIMIT", 6)
```

When using **com.rti.dds.infrastructure.ReliabilityQosPolicyKind.RELIABLE_RELIABILITY_QOS** (p. 1836): a resource limit on the number of samples from a given remote writer that a **com.rti.dds.subscription.DataReader** (p. 707) may store (**com.rti.dds.infrastructure.DataReaderResourceLimitsQosPolicy.max_samples_per_remote_writer** (p. 793)) was reached. When using **com.rti.dds.infrastructure.ReliabilityQosPolicyKind.BEST_EFFORT_↩ RELIABILITY_QOS** (p. 1836), reaching **com.rti.dds.infrastructure.DataReaderResourceLimitsQosPolicy.max↩ _samples_per_remote_writer** (p. 793) will trigger a loss, not a rejection, with reason **com.rti.dds.subscription.↩ SampleLostStatusKind.LOST_BY_SAMPLES_PER_REMOTE_WRITER_LIMIT** (p. 1962).

This constant is an extension to the DDS standard.

See also

com.rti.dds.infrastructure.DataReaderResourceLimitsQosPolicy (p. 789)

8.303.2.6 REJECTED_BY_REMOTE_WRITER_SAMPLES_PER_VIRTUAL_QUEUE_LIMIT

```
final  SampleRejectedStatusKind REJECTED_BY_REMOTE_WRITER_SAMPLES_PER_VIRTUAL_QUEUE_LIMIT  [static]
```

Initial value:

```
= new SampleRejectedStatusKind(
                "REJECTED_BY_REMOTE_WRITER_SAMPLES_PER_VIRTUAL_QUEUE_LIMIT", 9)
```

A resource limit on the number of samples published by a remote writer on behalf of a virtual writer that a **com.rti.↩ dds.subscription.DataReader** (p. 707) may store was reached. (This field is currently not used.)

This constant is an extension to the DDS standard.

See also

com.rti.dds.infrastructure.DataReaderResourceLimitsQosPolicy (p. 789)

8.303.2.7 REJECTED_BY_DECODE_FAILURE

```
final SampleRejectedStatusKind REJECTED_BY_DECODE_FAILURE [static]
```

Initial value:

```
=
            new SampleRejectedStatusKind("REJECTED_BY_DECODE_FAILURE", 10)
```

When using **com.rti.dds.infrastructure.ReliabilityQosPolicyKind.RELIABLE_RELIABILITY_QOS** (p. 1836): A received sample was rejected because it could not be decoded. When using **com.rti.dds.infrastructure.Reliability↩ QosPolicyKind.BEST_EFFORT_RELIABILITY_QOS** (p. 1836), the sample will be lost, not rejected, with reason **com.rti.dds.subscription.SampleLostStatusKind.LOST_BY_DECODE_FAILURE** (p. 1965).

If a sample was rejected for this reason and the **com.rti.dds.publication.DataWriter** (p. 818) set **com.rti.dds.↩ infrastructure.DataWriterProtocolQosPolicy.disable_inline_keyhash** (p. 864) to com.rti.dds.infrastructure.true, then **com.rti.dds.subscription.SampleRejectedStatus.last_instance_handle** (p. 1967) may not be correct if the sample was encrypted.

This constant is an extension to the DDS standard.

8.304 SampleStateKind Class Reference

Indicates whether or not a sample has ever been read.

Static Public Attributes

- static final int **READ_SAMPLE_STATE** = 0x0001 << 0

  Sample has been read.
- static final int **NOT_READ_SAMPLE_STATE** = 0x0001 << 1

  Sample has not been read.
- static final int **ANY_SAMPLE_STATE** = 0xffff

  Any sample state com.rti.dds.subscription.SampleStateKind.SampleStateKind.READ_SAMPLE_STATE | com.rti.dds.↩ subscription.SampleStateKind.SampleStateKind.NOT_READ_SAMPLE_STATE.

8.304.1 Detailed Description

Indicates whether or not a sample has ever been read.

For each sample received, the middleware internally maintains a sample_state relative to each **com.rti.dds.↩ subscription.DataReader** (p. 707). The sample state can be either:

- com.rti.dds.subscription.SampleStateKind.SampleStateKind.READ_SAMPLE_STATE indicates that the **com.↩ rti.dds.subscription.DataReader** (p. 707) has already accessed that sample by means of a read or take operation.

- com.rti.dds.subscription.SampleStateKind.SampleStateKind.NOT_READ_SAMPLE_STATE indicates that the **com.rti.dds.subscription.DataReader** (p. 707) has not accessed that sample before.

The sample state will, in general, be different for each sample in the collection returned by read or take.

8.304.2 Member Data Documentation

8.304.2.1 READ_SAMPLE_STATE

```
final int READ_SAMPLE_STATE = 0x0001 << 0  [static]
```

Sample has been read.

8.304.2.2 NOT_READ_SAMPLE_STATE

```
final int NOT_READ_SAMPLE_STATE = 0x0001 << 1  [static]
```

Sample has not been read.

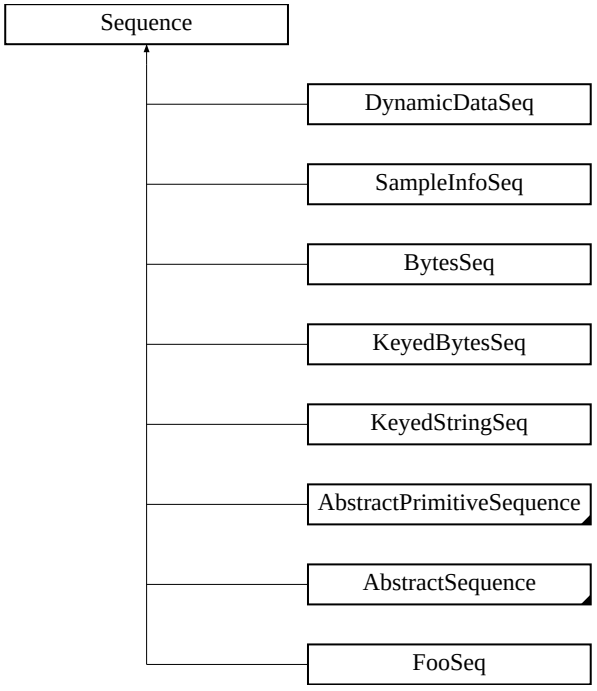
8.305 Sequence Interface Reference

*<<**interface**>> (p. 403) <<**generic**>> (p. 403)* A type-safe, ordered collection of elements. The type of these elements is referred to in this documentation as **com.rti.ndds.example.Foo** (p. 1358).

Inheritance diagram for Sequence:



Public Member Functions

- int **getMaximum** ()

  Get the current maximum number of elements that can be stored in this sequence.
- void **setMaximum** (int new_max)

  Resize this sequence to a new desired maximum.
- Class **getElementType** ()

8.305.1 Detailed Description

<<***interface***>> *(*p. *403)* <<***generic***>> *(*p. *403)* A type-safe, ordered collection of elements. The type of these elements is referred to in this documentation as **`com.rti.ndds.example.Foo`** (p. 1358).

For users who define data types in OMG IDL, this type corresponds to the IDL express `sequence<Foo>`.

For any user-data type `Foo` that an application defines for the purpose of data-distribution with RTI Connext, a `FooSeq` is generated. We refer to an IDL `sequence<Foo> as FooSeq`.

A sequence is a type-safe List that makes a distinction between its allocated size and its logical size (much like the ArrayList class). The Collection.size() method returns the logical size.

A new sequence is created for elements of a particular Class, which does not change throughout the lifetime of a sequence instance.

To add an element to a sequence, use the `add()` method inherited from the standard interface `java.util.List`; this will implicitly increase the sequence's size. Or, to pre-allocate space for several elements at once, use com.rti.↩ dds.infrastructure.com.rti.dds.util.Sequence.Sequence.setMaximum.

An attempt to add an element to a sequence that is not of the correct element type will result in a ClassCastException. (Note that null is considered to belong to any type.)

com.rti.ndds.example.FooDataWriter (p. 1389), **com.rti.ndds.example.FooDataReader** (p. 1359), **com.rti.↩ ndds.example.FooTypeSupport** (p. 1410), the `Code Generator User's Manual`

8.305.2 Member Function Documentation

8.305.2.1 getMaximum()

```
int getMaximum ( )
```

Get the current maximum number of elements that can be stored in this sequence.

The `maximum` of the sequence represents the maximum number of elements that the underlying buffer can hold. It does not represent the current number of elements.

The `maximum` is a non-negative number. It is initialized when the sequence is first created.

The `maximum` can be changed implicitly by adding an element to the sequence with `add()`, or explicitly by calling com.rti.dds.infrastructure.com.rti.dds.util.Sequence.Sequence.setMaximum.

Returns

the current maximum of the sequence.

See also

com.rti.dds.infrastructure.com.rti.dds.util.Sequence.Sequence.size()

Implemented in **BooleanSeq** (p. 617), **ByteSeq** (p. 654), **CharSeq** (p. 675), **ConditionSeq** (p. 689), **DoubleSeq** (p. 1114), **FloatSeq** (p. 1346), **IntSeq** (p. 1458), **LongSeq** (p. 1587), **ShortSeq** (p. 2000), **PublisherSeq** (p. 1796), **DataReaderSeq** (p. 809), **SubscriberSeq** (p. 2070), and **LoanableSequence** (p. 1543).

Referenced by **AbstractPrimitiveSequence.loan()**, and **AbstractPrimitiveSequence.setSize()**.

8.305.2.2 setMaximum()

```
void setMaximum (
            int new_max )
```

Resize this sequence to a new desired maximum.

This operation does nothing if the new desired maximum matches the current maximum.

Note: If you add an element with `add()`, the sequence's size is increased implicitly.

Postcondition

length == MINIMUM(original length, new_max)

Parameters

new_max	Must be >= 0.

Implemented in **AbstractSequence** (p. 582), and **LoanableSequence** (p. 1544).

8.305.2.3 getElementType()

```
Class getElementType ( )
```

Returns

a common supertype for all elements in this sequence.

Implemented in **AbstractPrimitiveSequence** (p. 577), and **AbstractSequence** (p. 583).

8.306 SequenceNumber_t Class Reference

Type for *sequence* number representation.

Inherits Struct.

Public Member Functions

- **SequenceNumber_t** ()
  Constructor.
- **SequenceNumber_t** (**SequenceNumber_t** sn)
  Copy constructor.
- **SequenceNumber_t** (int **high**, long **low**)
  Constructor.
- int **compare** (**SequenceNumber_t** sn)
  Compares two sequence numbers.
- void **plusplus** ()
  Increases the value of this by one
- void **minusminus** ()
  Decreases the value of this by one
- **SequenceNumber_t** **add** (**SequenceNumber_t** val)
  Returns a sequence number whose value is (this + val)
- **SequenceNumber_t** **subtract** (**SequenceNumber_t** val)
  Returns a sequence number whose value is (this - val)

Public Attributes

- int **high**
  The most significant part of the sequence number.
- long **low**
  The least significant part of the sequence number.

Static Public Attributes

- static final **SequenceNumber_t SEQUENCE_NUMBER_UNKNOWN**

  Unknown sequence number.
- static final **SequenceNumber_t AUTO_SEQUENCE_NUMBER**

  The sequence number is internally determined by RTI Connext.
- static final **SequenceNumber_t SEQUENCE_NUMBER_ZERO**

  Zero value for the sequence number.
- static final **SequenceNumber_t SEQUENCE_NUMBER_MAX**

  Highest, most positive value for the sequence number.

8.306.1 Detailed Description

Type for *sequence* number representation.

Represents a 64-bit sequence number.

8.306.2 Constructor & Destructor Documentation

8.306.2.1 SequenceNumber_t() [1/3]

```
SequenceNumber_t ( )
```

Constructor.

References **SequenceNumber_t.SEQUENCE_NUMBER_UNKNOWN**.

Referenced by **SequenceNumber_t.add()**, and **SequenceNumber_t.subtract()**.

8.306.2.2 SequenceNumber_t() [2/3]

```
SequenceNumber_t (
            SequenceNumber_t sn )
```

Copy constructor.

Parameters

sn	The sequence number instance to copy. It must not be null.

References **SequenceNumber_t.high**, and **SequenceNumber_t.low**.

8.306.2.3 SequenceNumber_t() [3/3]

```
SequenceNumber_t (
            int high,
            long low )
```

Constructor.

Parameters

high	must be in the interval [0,0xffffffff]
low	must be in the interval [0,0x00000000ffffffff]

Exceptions

RETCODE_BAD_PARAMETER *(p. 1899)*	

References **SequenceNumber_t.high**, and **SequenceNumber_t.low**.

8.306.3 Member Function Documentation

8.306.3.1 compare()

```
int compare (
             SequenceNumber_t sn )
```

Compares two sequence numbers.

Parameters

sn	<<***in***>> *(p. 404)* Sequence number to compare. Cannot be null.

Returns

If the two sequence numbers are equal, the function returns 0. If sn1 is greater than sn2 the function returns a positive number; otherwise, it returns a negative number.

References **SequenceNumber_t.high**, and **SequenceNumber_t.low**.

8.306.3.2 plusplus()

```
void plusplus ( )
```

Increases the value of this by one

References **SequenceNumber_t.high**, and **SequenceNumber_t.low**.

8.306.3.3 minusminus()

```
void minusminus ( )
```

Decreases the value of this by one

References **SequenceNumber_t.high**, and **SequenceNumber_t.low**.

8.306.3.4 add()

```
SequenceNumber_t add (
            SequenceNumber_t val )
```

Returns a sequence number whose value is (this + val)

Returns

(this+val)

References **SequenceNumber_t.high**, **SequenceNumber_t.low**, and **SequenceNumber_t.SequenceNumber_t()**.

8.306.3.5 subtract()

```
SequenceNumber_t subtract (
            SequenceNumber_t val )
```

Returns a sequence number whose value is (this - val)

Returns

(this-val)

References **SequenceNumber_t.high**, **SequenceNumber_t.low**, and **SequenceNumber_t.SequenceNumber_t()**.

8.306.4 Member Data Documentation

8.306.4.1 SEQUENCE_NUMBER_UNKNOWN

```
final SequenceNumber_t SEQUENCE_NUMBER_UNKNOWN [static]
```

Unknown sequence number.

Referenced by **SequenceNumber_t.SequenceNumber_t()**.

8.306.4.2 AUTO_SEQUENCE_NUMBER

```
final SequenceNumber_t AUTO_SEQUENCE_NUMBER [static]
```

The sequence number is internally determined by RTI Connext.

8.306.4.3 SEQUENCE_NUMBER_ZERO

```
final SequenceNumber_t SEQUENCE_NUMBER_ZERO [static]
```

Zero value for the sequence number.

8.306.4.4 SEQUENCE_NUMBER_MAX

```
final SequenceNumber_t SEQUENCE_NUMBER_MAX [static]
```

Highest, most positive value for the sequence number.

8.306.4.5 high

```
int high
```

The most significant part of the sequence number.

Referenced by **SequenceNumber_t.add()**, **SequenceNumber_t.compare()**, **SequenceNumber_t.minusminus()**, **SequenceNumber_t.plusplus()**, **SequenceNumber_t.SequenceNumber_t()**, and **SequenceNumber_t.subtract()**.

8.306.4.6 low

```
long low
```

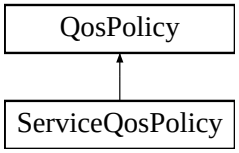
The least significant part of the sequence number.

Referenced by **SequenceNumber_t.add()**, **SequenceNumber_t.compare()**, **SequenceNumber_t.minusminus()**, **SequenceNumber_t.plusplus()**, **SequenceNumber_t.SequenceNumber_t()**, and **SequenceNumber_t.subtract()**.

8.307 ServiceQosPolicy Class Reference

<<***extension***>> *(*p. *138)* Service or tool associated with a DDS entity.

Inheritance diagram for ServiceQosPolicy:



Public Attributes

- **ServiceQosPolicyKind kind**
  <<***extension***>> *(*p. *138) The kind of service.*

8.307.1 Detailed Description

<<***extension***>> *(*p. *138)* Service or tool associated with a DDS entity.

This QoS policy is intended to be used by RTI infrastructure services and RTI tools.

User applications should not modify its value.

Entity:

com.rti.dds.domain.DomainParticipant (p. 948), **com.rti.dds.subscription.DataReader** (p. 707), **com.rti.dds.publication.DataWriter** (p. 818)

Properties:

RxO (p. 506) = NO
Changeable (p. 507) = **UNTIL ENABLE** (p. 507)

The entity is an entity created by RTI Observability Collector Service.

8.308.2.10 ADMIN_CONSOLE_SERVICE_QOS

```
final ServiceQosPolicyKind ADMIN_CONSOLE_SERVICE_QOS [static]
```

The entity is an entity created by RTI Admin Console.

8.309 ServiceRequest Class Reference

A request coming from one of the built-in services.

Inherits AbstractBuiltinTopicData.

Public Attributes

- int **service_id**

  The id of the service that the request was sent on.
- final **GUID_t instance_id**

  *Each **ServiceRequest** (p. 1985) is keyed on the instance_id.*
- final **ByteSeq request_body**

  Service-specific information.

Static Public Attributes

- static final int **UNKNOWN_SERVICE_ID**

  An invalid Service Id.
- static final int **TOPIC_QUERY_SERVICE_ID**

  *Service Id for the **com.rti.dds.subscription.TopicQuery** (p. 2139) Service.*
- static final int **LOCATOR_REACHABILITY_SERVICE_ID**

  Service Id for the Locator Reachability Service.
- static final int **INSTANCE_STATE_SERVICE_ID**

  Service Id for the Instance State Request service.
- static final int **MONITORING_LIBRARY_COMMAND_SERVICE_REQUEST_ID**

  Service Id for RTI Monitoring Library 2.0 Command Service Request.
- static final int **MONITORING_LIBRARY_REPLY_SERVICE_REQUEST_ID**

  Service Id for RTI Monitoring Library 2.0 Reply Service Requests.

8.309.1 Detailed Description

A request coming from one of the built-in services.

Data associated with the built-in topic **com.rti.dds.topic.builtin.ServiceRequestTypeSupport.SERVICE_↩ REQUEST_TOPIC_NAME** (p. 415). It contains service-specific information.

See also

com.rti.dds.topic.builtin.ServiceRequestTypeSupport.SERVICE_REQUEST_TOPIC_NAME (p. 415)

builtin.ParticipantBuiltinTopicDataDataReader

8.309.2 Member Data Documentation

8.309.2.1 service_id

```
int service_id
```

The id of the service that the request was sent on.

There can be multiple services that use the built-in **ServiceRequest** (p. 1985) topic. The service_id identifies which service a specific request was sent from.

See also

com.rti.dds.topic.builtin.ServiceRequest.UNKNOWN_SERVICE_ID (p. 414)

com.rti.dds.topic.builtin.ServiceRequest.TOPIC_QUERY_SERVICE_ID (p. 414)

8.309.2.2 instance_id

```
final GUID_t instance_id
```

Each **ServiceRequest** (p. 1985) is keyed on the instance_id.

The instance_id provides a way for users to differentiate between different requests coming from the same service.

8.309.2.3 request_body

```
final ByteSeq request_body
```

Service-specific information.

Each service uses the request_body field to send information specific to that service in the form of an opaque sequence of bytes. Each service provides a helper function that will deserialize the information from the request body.

See also

com.rti.dds.subscription.TopicQueryHelper.topic_query_data_from_service_request (p. 2145)

Referenced by **TopicQueryHelper.topic_query_data_from_service_request()**.

8.310 ServiceRequestAcceptedStatus Class Reference

com.rti.dds.infrastructure.StatusKind.SERVICE_REQUEST_ACCEPTED_STATUS (p. 2018)

Inherits Status.

Public Attributes

- int **total_count**

  *The total cumulative number of ServiceRequests that have been accepted by a **com.rti.dds.publication.DataWriter** (p. 818).*
- int **total_count_change**

  The incremental changes in total_count since the last time the listener was called or the status was read.
- int **current_count**

  *The current number of ServiceRequests that have been accepted by this **com.rti.dds.publication.DataWriter** (p. 818).*
- int **current_count_change**

  The change in current_count since the last time the listener was called or the status was read.
- final **InstanceHandle_t last_request_handle**

  *A handle to the last **com.rti.dds.topic.builtin.ServiceRequest** (p. 1985) that caused the **com.rti.dds.publication.↩ DataWriter** (p. 818)'s status to change.*
- int **service_id**

  ID of the service to which the accepted Request belongs.

8.310.1 Detailed Description

com.rti.dds.infrastructure.StatusKind.SERVICE_REQUEST_ACCEPTED_STATUS (p. 2018)

Currently, the only service that causes the **ServiceRequestAcceptedStatus** (p. 1986) to be triggered is the **com.rti.↩ dds.subscription.TopicQuery** (p. 2139) service. A **com.rti.dds.topic.builtin.ServiceRequest** (p. 1985) is accepted when a **com.rti.dds.publication.DataWriter** (p. 818) matches with a **com.rti.dds.subscription.DataReader** (p. 707) that has created a **com.rti.dds.subscription.TopicQuery** (p. 2139).

This status is also changed (and the listener, if any, called) when a ServiceRequest has been cancelled, or deleted. This will happen when a **com.rti.dds.subscription.DataReader** (p. 707) deletes a TopicQuery using **com.rti.dds.↩ subscription.DataReader.delete_topic_query** (p. 733).

8.310.2 Member Data Documentation

8.310.2.1 total_count

```
int total_count
```

The total cumulative number of ServiceRequests that have been accepted by a **com.rti.dds.publication.DataWriter** (p. 818).

This number increases whenever a new request is accepted. It does not change when a request is cancelled.

8.310.2.2 total_count_change

```
int total_count_change
```

The incremental changes in total_count since the last time the listener was called or the status was read.

8.310.2.3 current_count

```
int current_count
```

The current number of ServiceRequests that have been accepted by this **com.rti.dds.publication.DataWriter** (p. 818).

This number increases when a new request is accepted and decreases when an existing request is cancelled.

8.310.2.4 current_count_change

```
int current_count_change
```

The change in current_count since the last time the listener was called or the status was read.

8.310.2.5 last_request_handle

```
final InstanceHandle_t last_request_handle
```

A handle to the last **com.rti.dds.topic.builtin.ServiceRequest** (p. 1985) that caused the **com.rti.dds.publication.↩ DataWriter** (p. 818)'s status to change.

8.310.2.6 service_id

```
int service_id
```

ID of the service to which the accepted Request belongs.

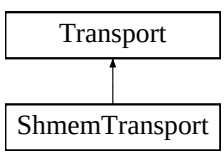
8.314 ShmemTransport Interface Reference

Built-in transport plug-in for inter-process communications using shared memory.

Inheritance diagram for ShmemTransport:



Classes

- class **Property_t**

  *Subclass of **com.rti.ndds.transport.Transport.Property_t*** (p. *1700*) *allowing specification of parameters that are specific to the shared-memory transport.*

Static Public Attributes

- static final int **CLASSID** = 0x01000000
- static final int **MESSAGE_SIZE_MAX_DEFAULT**

  [default]** Value for **com.rti.ndds.transport.Transport.Property_t.message_size_max (p. *1704*).
- static final int **RECEIVED_MESSAGE_COUNT_MAX_DEFAULT**

  [default]** Value for **com.rti.ndds.transport.ShmemTransport.Property_t.received_message_count_max (p. *1699*).
- static final int **RECEIVE_BUFFER_SIZE_DEFAULT**

  [default]** Value for **com.rti.ndds.transport.ShmemTransport.Property_t.receive_buffer_size (p. *1699*).

8.314.1 Detailed Description

Built-in transport plug-in for inter-process communications using shared memory.

This transport plugin uses System Shared Memory to send messages between processes on the same node. This transport is installed as a built-in transport plugin with the alias **com.rti.dds.infrastructure.TransportBuiltinKind.↩ SHMEM_ALIAS** (p. 522).

8.314.2 Compatibility of Sender and Receiver Transports

Opening a receiver "port" on shared memory corresponds to creating a shared memory segment using a name based on the port number. The transport plugin's properties are embedded in the shared memory segment.

When a sender tries to send to the shared memory port, it verifies that properties of the receiver's shared memory transport are compatible with those specified in its transport plugin. If not, the sender will fail to attach to the port and will output messages such as below (with numbers appropriate to the properties of the transport plugins involved).

```
NDDS_Transport_Shmem_attachShmem:failed to initialize incompatible properties

NDDS_Transport_Shmem_attachShmem:countMax 0 > -19417345 or max size -19416188 > 2147482624
```

In this scenario, the properties of the sender or receiver transport plugin instances should be adjusted, so that they are compatible.

8.314.3 Crashing and Restarting Programs

If a process using shared memory crashes (say because the user typed in ^C), resources associated with its shared memory ports may not be properly cleaned up. Later, if another RTI Connext process needs to open the same ports (say, the crashed program is restarted), it will attempt to reuse the shared memory segment left behind by the crashed process.

The reuse is allowed iff the properties of transport plugin are compatible with those embedded in the shared memory segment (i.e., of the original creator). Otherwise, the process will fail to open the ports, and will output messages such as below (with numbers appropriate to the properties of the transport plugins involved).

```
NDDS_Transport_Shmem_create_recvresource_rrEA:failed to initialize shared

    memory resource Cannot recycle existing shmem: size not compatible for key 0x1234
```

In this scenario, the shared memory segments must be cleaned up using appropriate platform specific commands. For details, please refer to the `Platform Notes`.

8.314.4 Shared Resource Keys

The transport uses the **shared memory segment keys**, given by the formula below.
`0x400000 + port`

The transport also uses signaling **shared semaphore** keys given by the formula below.
`0x800000 + port`

The transport also uses mutex **shared semaphore keys** given by the formula below.
`0xb00000 + port`

wher the `port` is a function of the `domain_id` and the `participant_id`, as described in **com.rti.dds.↩ infrastructure.WireProtocolQosPolicy.participant_id** (p. 2303)

See also

com.rti.dds.infrastructure.WireProtocolQosPolicy.participant_id (p. 2303)

com.rti.ndds.transport.TransportSupport.set_builtin_transport_property() (p. 2173)

8.314.5 Creating and Registering Shared Memory Transport Plugin

RTI Connext can implicitly create this plugin and register with the **com.rti.dds.domain.DomainParticipant** (p. 948) if this transport is specified in **com.rti.dds.infrastructure.TransportBuiltinQosPolicy** (p. 2152).

To specify the properties of the builtin shared memory transport that is implicitly registered, you can either:

- call **com.rti.ndds.transport.TransportSupport.set_builtin_transport_property** (p. 2173) or
- specify the pre-defined property names in **com.rti.dds.infrastructure.PropertyQosPolicy** (p. 1739) associated with the **com.rti.dds.domain.DomainParticipant** (p. 948). (see **Shared Memory Transport Property Names in Property QoS Policy of Domain Participant** (p. 1993)).

Builtin transport plugin properties specified in **com.rti.dds.infrastructure.PropertyQosPolicy** (p. 1739) always overwrite the ones specified through **com.rti.ndds.transport.TransportSupport.set_builtin_transport_property()** (p. 2173). The default value is assumed on any unspecified property. Note that all properties should be set before the transport is implicitly created and registered by RTI Connext. See **Built-in Transport Plugins** (p. 106) for details on when a builtin transport is registered.

8.314.6 Shared Memory Transport Property Names in Property QoS Policy of Domain Participant

The following table lists the predefined property names that can be set in the **com.rti.dds.domain.DomainParticipantQos.property** (p. 1079) to to configure the builtin shared memory transport plugin.

Table 8.1011 ***Property Strings for Shared Memory Transport (*** p. ***2150)***

Name	Descriptions
dds.transport.shmem.builtin.parent.address_bit_count	See **com.rti.ndds.transport.Transport.Property_t.address_bit_count** (p. 1703)
dds.transport.shmem.builtin.parent.properties_bitmap	See **com.rti.ndds.transport.Transport.Property_t.properties_bitmap** (p. 1703)
dds.transport.shmem.builtin.parent.gather_send_buffer_count_max	See **com.rti.ndds.transport.Transport.Property_t.gather_send_buffer_count_max** (p. 1704)
dds.transport.shmem.builtin.parent.message_size_max	See **com.rti.ndds.transport.Transport.Property_t.message_size_max** (p. 1704)
dds.transport.shmem.builtin.parent.allow_interfaces	See **com.rti.ndds.transport.Transport.Property_t.allow_interfaces_list** (p. 1704) and com.rti.ndds.transport.Transport.Property_t.allow_interfaces_list_length. Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.shmem.builtin.parent.deny_interfaces	See **com.rti.ndds.transport.Transport.Property_t.deny_interfaces_list** (p. 1705) and com.rti.ndds.transport.Transport.Property_t.deny_interfaces_list_length. Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.shmem.builtin.parent.allow_multicast_interfaces	See **com.rti.ndds.transport.Transport.Property_t.allow_multicast_interfaces_list** (p. 1705) and com.rti.ndds.transport.Transport.Property_t.allow_multicast_interfaces_list_length. Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.shmem.builtin.parent.deny_multicast_interfaces	See **com.rti.ndds.transport.Transport.Property_t.deny_multicast_interfaces_list** (p. 1706) and com.rti.ndds.transport.Transport.Property_t.deny_multicast_interfaces_list_length. Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.shmem.builtin.parent.max_interface_count	See **com.rti.ndds.transport.Transport.Property_t.max_interface_count** (p. 1706)
dds.transport.shmem.builtin.parent.thread_name_prefix	See com.rti.ndds.transport.Transport.Property_t.thread_name_prefix

Name	Descriptions
dds.transport.shmem.builtin.received_message_↩ count_max	See **com.rti.ndds.transport.ShmemTransport.↩ Property_t.received_message_count_max** (p. 1699)

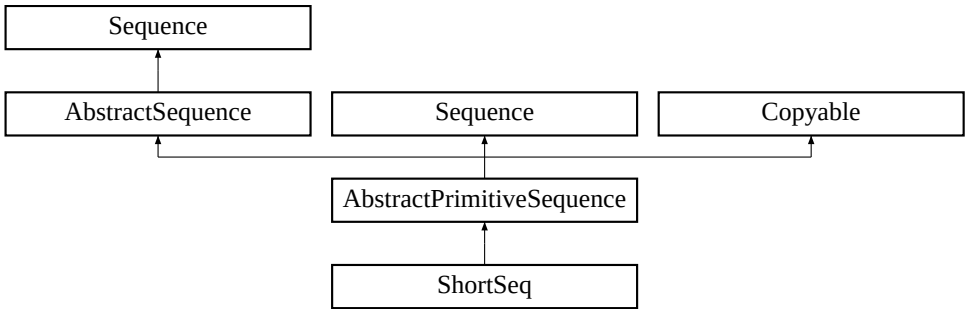
8.315 ShortSeq Class Reference

Instantiates `com.rti.dds.infrastructure.com.rti.dds.util.Sequence` < short >

Inheritance diagram for ShortSeq:



Public Member Functions

- **ShortSeq** ()

  Constructs an empty sequence of short integers with an initial maximum of zero.
- **ShortSeq** (int initialMaximum)

  Constructs an empty sequence of short integers with the given initial maximum.
- **ShortSeq** (short[ ] shorts)

  Constructs a new sequence containing the given shorts.
- boolean **addAllShort** (short[ ] elements, int offset, int length)

  Append `length` elements from the given array to this sequence, starting at index `offset` in that array.
- boolean **addAllShort** (short[ ] elements)
- void **addShort** (short element)

  Append the element to the end of the sequence.
- void **addShort** (int index, short element)

  Shift all elements in the sequence starting from the given index and add the element to the given index.
- short **getShort** (int index)

  Returns the short at the given index.
- short **setShort** (int index, short element)

  Set the new short at the given index and return the old short.
- void **setShort** (int dstIndex, short[ ] elements, int srcIndex, int length)

  Copy a portion of the given array into this sequence.

- short[ ] **toArrayShort** (short[ ] array)

  Return an array containing copy of the contents of this sequence.
- int **getMaximum** ()

  Get the current maximum number of elements that can be stored in this sequence.
- Object **get** (int index)

  *A wrapper for **getShort(int)** (p. 1998) that returns a java.lang.Short.*
- Object **set** (int index, Object element)

  *A wrapper for **setShort()** (p. 1998).*
- void **add** (int index, Object element)

  A wrapper for addShort(int, int).

8.315.1 Detailed Description

Instantiates `com.rti.dds.infrastructure.com.rti.dds.util.Sequence` < short >

Instantiates:

8.315.2 Constructor & Destructor Documentation

8.315.2.1 ShortSeq() [1/3]

```
ShortSeq ( )
```

Constructs an empty sequence of short integers with an initial maximum of zero.

8.315.2.2 ShortSeq() [2/3]

```
ShortSeq (
            int initialMaximum )
```

Constructs an empty sequence of short integers with the given initial maximum.

8.315.2.3 ShortSeq() [3/3]

```
ShortSeq (
            short[] shorts )
```

Constructs a new sequence containing the given shorts.

Parameters

shorts	the initial contents of this sequence

Exceptions

NullPointerException	if the input array is null

References **ShortSeq.addAllShort()**.

8.315.3 Member Function Documentation

8.315.3.1 addAllShort() [1/2]

```
boolean addAllShort (
            short[] elements,
            int offset,
            int length )
```

Append `length` elements from the given array to this sequence, starting at index `offset` in that array.

Exceptions

NullPointerException	if the given array is null.

Referenced by **ShortSeq.addAllShort()**, and **ShortSeq.ShortSeq()**.

8.315.3.2 addAllShort() [2/2]

```
boolean addAllShort (
            short[] elements )
```

Exceptions

NullPointerException	if the given array is null

References **ShortSeq.addAllShort()**.

8.315.3.3 addShort() [1/2]

```
void addShort (
            short element )
```

Append the element to the end of the sequence.

Referenced by **ShortSeq.add()**.

8.315.3.4 addShort() [2/2]

```
void addShort (
            int index,
            short element )
```

Shift all elements in the sequence starting from the given index and add the element to the given index.

8.315.3.5 getShort()

```
short getShort (
            int index )
```

Returns the short at the given index.

Exceptions

IndexOutOfBoundsException	if the index is out of bounds.

Referenced by **ShortSeq.get()**, **DynamicData.get_ushort_seq()**, and **DynamicData.set_uint8_seq()**.

8.315.3.6 setShort() [1/2]

```
short setShort (
            int index,
            short element )
```

Set the new short at the given index and return the old short.

Exceptions

IndexOutOfBoundsException	if the index is out of bounds.

Referenced by **ShortSeq.set()**.

8.315.3.7 setShort() [2/2]

```
void setShort (
             int dstIndex,
             short[] elements,
             int srcIndex,
             int length )
```

Copy a portion of the given array into this sequence.

Parameters

dstIndex	the index at which to start copying into this sequence.
elements	an array of primitive elements.
srcIndex	the index at which to start copying from the given array.
length	the number of elements to copy.

Exceptions

IndexOutOfBoundsException	if copying would cause access of data outside array bounds.

8.315.3.8 toArrayShort()

```
short[] toArrayShort (
             short[] array )
```

Return an array containing copy of the contents of this sequence.

Parameters

array	The array into which this sequence should be copied. It may be null. If it is, or if array length is too small, the array will be ignored, and a new array of the necessary length will be created and copied into instead.

Returns

A non-null array containing a copy of the contents of this sequence.

8.315.3.9 getMaximum()

```
int getMaximum ( )
```

Get the current maximum number of elements that can be stored in this sequence.

The `maximum` of the sequence represents the maximum number of elements that the underlying buffer can hold. It does not represent the current number of elements.

The `maximum` is a non-negative number. It is initialized when the sequence is first created.

The `maximum` can be changed implicitly by adding an element to the sequence with **`add()`** (p. 2001), or explicitly by calling com.rti.dds.infrastructure.com.rti.dds.util.Sequence.Sequence.setMaximum.

Returns

the current maximum of the sequence.

See also

com.rti.dds.infrastructure.com.rti.dds.util.Sequence.Sequence.size()

Implements **Sequence** (p. 1974).

Referenced by **DynamicData.get_short_seq()**, **DynamicData.get_uint8_seq()**, **DynamicData.get_ushort_seq()**, **DynamicData.set_short_seq()**, and **DynamicData.set_uint8_seq()**.

8.315.3.10 get()

```
Object get (
             int index )
```

A wrapper for **getShort(int)** (p. 1998) that returns a java.lang.Short.

See also

java.util.List::get(int)

Reimplemented from **AbstractPrimitiveSequence** (p. 576).

References **ShortSeq.getShort()**.

8.315.3.11 set()

```
Object set (
             int index,
             Object element )
```

A wrapper for **setShort()** (p. 1998).

Exceptions

ClassCastException	if the element is not of type Short.

See also

java.util.List::set(int, java.lang.Object)

Reimplemented from **AbstractPrimitiveSequence** (p. 576).

References **ShortSeq.setShort()**.

Referenced by **DynamicData.get_uint8_seq()**, and **DynamicData.set_ushort_seq()**.

8.315.3.12 add()

```
void add (
            int index,
            Object element )
```

A wrapper for addShort(int, int).

Exceptions

ClassCastException	if the element is not of type Short.

See also

java.util.List::add(int, java.lang.Object)

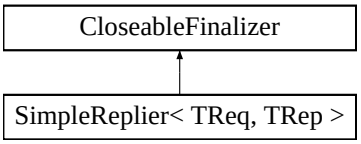
Reimplemented from **AbstractPrimitiveSequence** (p. 577).

References **ShortSeq.addShort()**.

8.316 SimpleReplier< TReq, TRep > Class Template Reference

A callback-based replier.

Inheritance diagram for SimpleReplier< TReq, TRep >:



Public Member Functions

- **SimpleReplier** (**DomainParticipant** participant, String serviceName, **SimpleReplierListener**< TReq, TRep > listener, **TypeSupport** requestTypeSupport, **TypeSupport** replyTypeSupport)

  *Creates a new **SimpleReplier** (p. 2001).*
- **SimpleReplier** (**SimpleReplierParams**< TReq, TRep > params)

  *Creates a new **SimpleReplier** (p. 2001).*
- void **close** ()

  *Releases the resources created by this **SimpleReplier** (p. 2001).*

8.316.1 Detailed Description

A callback-based replier.

A **SimpleReplier** (p. 2001) is based on a com.rti.connext.requestreply.SimpleReplierListener<TReq,TRep> that users provide . Requests are passed to the callback, which returns a reply. The reply is directed only to the **Requester** (p. 1867) that sent the request.

SimpleRepliers are useful for simple use cases where a single reply for a request can be generated quickly, for example, looking up a table.

When more than one reply for a request can be generated or the processing is complex or needs to happen asynchronously, use a com.rti.connext.requestreply.Replier<TReq,TRep> instead.

See also

com.rti.connext.requestreply.Replier<TReq,TRep>

com.rti.connext.requestreply.SimpleReplierListener<TReq,TRep>

SimpleReplier example (p. 397)

8.316.2 Constructor & Destructor Documentation

8.316.2.1 SimpleReplier() [1/2]

```
SimpleReplier (
             DomainParticipant participant,
            String serviceName,
             SimpleReplierListener< TReq, TRep > listener,
             TypeSupport requestTypeSupport,
             TypeSupport replyTypeSupport )
```

Creates a new **SimpleReplier** (p. 2001).

See also

com.rti.connext.requestreply.SimpleReplierParams<TReq,TRep>

com.rti.connext.requestreply.SimpleReplierListener<TReq,TRep>

References **SimpleReplierParams< TReq, TRep >.setServiceName()**.

8.316.2.2 SimpleReplier() [2/2]

```
SimpleReplier (
            SimpleReplierParams< TReq, TRep > params )
```

Creates a new **SimpleReplier** (p. 2001).

See also

com.rti.connext.requestreply.SimpleReplierParams<TReq,TRep>

com.rti.connext.requestreply.SimpleReplierListener<TReq,TRep>

References **ReplierParams< TReq, TRep >.setReplierListener()**.

8.316.3 Member Function Documentation

8.316.3.1 close()

```
void close ( )
```

Releases the resources created by this **SimpleReplier** (p. 2001).

See also

com.rti.connext.requestreply.Replier<TReq,TRep>.close() (p. 1850)

References **Replier< TReq, TRep >.close()**.

8.317 SimpleReplierListener< TReq, TRep > Interface Template Reference

The listener called by a **SimpleReplier** (p. 2001).

Inherits EventListener.

Inherited by RequestReplyHowTo.MySimpleReplierListener.

Public Member Functions

- TRep **onRequestAvailable** (**Sample**< TReq > request)

  User callback that receives a request and provides a reply.
- void **returnLoan** (TRep reply)

  Returns a previously generated reply to the user.

8.317.1 Detailed Description

The listener called by a **SimpleReplier** (p. 2001).

See also

com.rti.connext.requestreply.SimpleReplier<TReq,TRep>

SimpleReplier example (p. 397)

8.317.2 Member Function Documentation

8.317.2.1 onRequestAvailable()

```
TRep onRequestAvailable (
              Sample< TReq > request )
```

User callback that receives a request and provides a reply.

This operation gets called when a request is available and expects a reply that is automatically sent. Immediately after that, **returnLoan** (p. 2004) is called.

Parameters

request	The received request

Returns

A reply for that request

8.317.2.2 returnLoan()

```
void returnLoan (
             TRep reply )
```

Returns a previously generated reply to the user.

This operation is always called right after sending the reply created by **onRequestAvailable** (p. 2004). It can be used to release any resources from the reply creation. If there are no resources to release, the implementation body can be empty.

Parameters

reply	The reply previously provided in **onRequestAvailable** (p. 2004)

8.318 SimpleReplierParams< TReq, TRep > Class Template Reference

Contains the parameters for creating a com.rti.connext.requestreply.SimpleReplier<TReq,TRep>

Inherits EntityParams.

Public Member Functions

- **SimpleReplierParams** (**DomainParticipant** participant, **SimpleReplierListener**< TReq, TRep > listener, **TypeSupport** requestTypeSupport, **TypeSupport** replyTypeSupport)

  *Creates **SimpleReplierParams** (p. 2005) with the parameters that a **SimpleReplier** (p. 2001) always needs.*
- **SimpleReplierParams**< TReq, TRep > **setServiceName** (String serviceName)

  *The service name the **Replier** (p. 1846) offers and Requesters use to match.*
- **SimpleReplierParams**< TReq, TRep > **setRequestTopicName** (String requestTopicName)

  Sets a specific request topic name.
- **SimpleReplierParams**< TReq, TRep > **setReplyTopicName** (String replyTopicName)

  Sets a specific reply topic name.
- **SimpleReplierParams**< TReq, TRep > **setDatawriterQos** (**DataWriterQos** dataWriterQos)

  Sets the quality of service of the reply DataWriter.
- **SimpleReplierParams**< TReq, TRep > **setDatareaderQos** (**DataReaderQos** dataReaderQos)

  Sets the quality of service of the request DataReader.
- **SimpleReplierParams**< TReq, TRep > **setQosProfile** (String qosLibraryName, String qosProfileName)

  Sets a QoS profile for the entities in this replier.
- **SimpleReplierParams**< TReq, TRep > **setPublisher** (**Publisher** publisher)

  Sets a specific Publisher.
- **SimpleReplierParams**< TReq, TRep > **setSubscriber** (**Subscriber** subscriber)

  Sets a specific Subscriber.

8.318.1 Detailed Description

Contains the parameters for creating a com.rti.connext.requestreply.SimpleReplier<TReq,TRep>

The parameters for a **SimpleReplier** (p. 2001) are identical to those of the **Replier** (p. 1846), except for the **SimpleReplierListener** (p. 2003), which is required and has a different user callback.

See also

com.rti.connext.requestreply.ReplierParams<TReq,TRep>

8.318.2 Constructor & Destructor Documentation

8.318.2.1 SimpleReplierParams()

```
SimpleReplierParams (
            DomainParticipant participant,
            SimpleReplierListener< TReq, TRep > listener,
            TypeSupport requestTypeSupport,
            TypeSupport replyTypeSupport )
```

Creates **SimpleReplierParams** (p. 2005) with the parameters that a **SimpleReplier** (p. 2001) always needs.

In addition to these parameters, a **SimpleReplier** (p. 2001) needs either:

- A service name (**setServiceName(String)** (p. 2006)), or
- Custom topic names (**setReplyTopicName(String)** (p. 2007) and **setRequestTopicName(String)** (p. 2006)).

The other parameters are optional.

Parameters

participant	The DomainParticipant that this **SimpleReplier** (p. 2001) uses to join a domain.
listener	The listener where the user callback that a **SimpleReplier** (p. 2001) calls is implemented.
requestTypeSupport	The type support for type `TReq`
replyTypeSupport	The type support for type `Trep`

8.318.3 Member Function Documentation

8.318.3.1 setServiceName()

```
SimpleReplierParams< TReq, TRep > setServiceName (
            String serviceName )
```

The service name the **Replier** (p. 1846) offers and Requesters use to match.

See also

com.rti.connext.requestreply.RequesterParams.setServiceName(String) (p. 1891)

Referenced by **SimpleReplier< TReq, TRep >.SimpleReplier()**.

8.318.3.2 setRequestTopicName()

```
SimpleReplierParams< TReq, TRep > setRequestTopicName (
            String requestTopicName )
```

Sets a specific request topic name.

This is an alternative to **setServiceName(String)** (p. 2006)

8.318.3.3 setReplyTopicName()

```
SimpleReplierParams< TReq, TRep > setReplyTopicName (
            String replyTopicName )
```

Sets a specific reply topic name.

This is an alternative to **setServiceName(String)** (p. 2006)

8.318.3.4 setDatawriterQos()

```
SimpleReplierParams< TReq, TRep > setDatawriterQos (
             DataWriterQos dataWriterQos )
```

Sets the quality of service of the reply DataWriter.

See also

setQosProfile(String,String) (p. 2007)

8.318.3.5 setDatareaderQos()

```
SimpleReplierParams< TReq, TRep > setDatareaderQos (
             DataReaderQos dataReaderQos )
```

Sets the quality of service of the request DataReader.

See also

setQosProfile(String,String) (p. 2007)

8.318.3.6 setQosProfile()

```
SimpleReplierParams< TReq, TRep > setQosProfile (
            String qosLibraryName,
            String qosProfileName )
```

Sets a QoS profile for the entities in this replier.

See also

com.rti.connext.requestreply.ReplierParams<TReq,TRep>.setQosProfile(String,String) (p. 1862)

8.318.3.7 setPublisher()

```
SimpleReplierParams< TReq, TRep > setPublisher (
             Publisher publisher )
```

Sets a specific Publisher.

See also

com.rti.connext.requestreply.RequesterParams.setPublisher(Publisher) (p. 1893)

8.318.3.8 setSubscriber()

```
SimpleReplierParams< TReq, TRep > setSubscriber (
             Subscriber subscriber )
```

Sets a specific Subscriber.

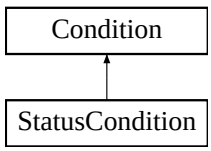
See also

com.rti.connext.requestreply.RequesterParams.setSubscriber(Subscriber) (p. 1893)

8.319 StatusCondition Interface Reference

<<***interface***>> *(p. 403)* A specific **com.rti.dds.infrastructure.Condition** (p. 686) that is associated with each **com.↩ rti.dds.infrastructure.Entity** (p. 1320).

Inheritance diagram for StatusCondition:



Public Member Functions

- int **get_enabled_statuses** ()

  *Get the list of statuses enabled on an **com.rti.dds.infrastructure.Entity** (p. 1320).*
- void **set_enabled_statuses** (int mask)

  This operation defines the list of communication statuses that determine the `trigger_value` *of the **com.rti.dds.↩ infrastructure.StatusCondition** (p. 2008).*
- **Entity get_entity** ()

  *Get the **com.rti.dds.infrastructure.Entity** (p. 1320) associated with the **com.rti.dds.infrastructure.StatusCondition** (p. 2008).*

8.319.1 Detailed Description

<<***interface***>> *(p. 403)* A specific **com.rti.dds.infrastructure.Condition** (p. 686) that is associated with each **com.↩ rti.dds.infrastructure.Entity** (p. 1320).

The `trigger_value` of the **com.rti.dds.infrastructure.StatusCondition** (p. 2008) depends on the communication status of that entity (e.g., arrival of data, loss of information, etc.), 'filtered' by the set of `enabled_statuses` on the **com.rti.dds.infrastructure.StatusCondition** (p. 2008).

See also

Status Kinds (p. 514)

com.rti.dds.infrastructure.WaitSet (p. 2287), **com.rti.dds.infrastructure.Condition** (p. 686)

com.rti.dds.infrastructure.Listener (p. 1528)

8.319.2 Member Function Documentation

8.319.2.1 get_enabled_statuses()

```
int get_enabled_statuses ( )
```

Get the list of statuses enabled on an **com.rti.dds.infrastructure.Entity** (p. 1320).

Returns

list of enabled statuses.

8.319.2.2 set_enabled_statuses()

```
void set_enabled_statuses (
            int mask )
```

This operation defines the list of communication statuses that determine the `trigger_value` of the **com.rti.dds.↩ infrastructure.StatusCondition** (p. 2008).

This operation may change the `trigger_value` of the **com.rti.dds.infrastructure.StatusCondition** (p. 2008).

com.rti.dds.infrastructure.WaitSet (p. 2287) objects' behavior depends on the changes of the `trigger_value` of their attached conditions. Therefore, any **com.rti.dds.infrastructure.WaitSet** (p. 2287) to which the **com.rti.dds.↩ infrastructure.StatusCondition** (p. 2008) is attached is potentially affected by this operation.

If this function is not invoked, the default list of enabled statuses includes all the statuses.

Parameters

mask	<<***in***>> *(*p. *404)* the list of enables statuses (see **Status Kinds** (p. 514))

Exceptions

One	of the **Standard Return Codes** (p. 513)

8.319.2.3 get_entity()

```
Entity get_entity ( )
```

Get the **com.rti.dds.infrastructure.Entity** (p. 1320) associated with the **com.rti.dds.infrastructure.StatusCondition** (p. 2008).

There is exactly one **com.rti.dds.infrastructure.Entity** (p. 1320) assocated with each **com.rti.dds.infrastructure.↩ StatusCondition** (p. 2008).

Returns

com.rti.dds.infrastructure.Entity (p. 1320) associated with the **com.rti.dds.infrastructure.StatusCondition** (p. 2008).

8.320 StatusKind Class Reference

Type for *status* kinds.

Static Public Attributes

- static final int **INCONSISTENT_TOPIC_STATUS**

  Another topic exists with the same name but different characteristics.
- static final int **OFFERED_DEADLINE_MISSED_STATUS**

  *The deadline that the **com.rti.dds.publication.DataWriter** (*p. *818) has committed through its **com.rti.dds.↩ infrastructure.DeadlineQosPolicy** (*p. *900) was not respected for a specific instance.*
- static final int **REQUESTED_DEADLINE_MISSED_STATUS**

  *The deadline that the **com.rti.dds.subscription.DataReader** (*p. *707) was expecting through its **com.rti.dds.↩ infrastructure.DeadlineQosPolicy** (*p. *900) was not respected for a specific instance.*

- static final int **STATUS_MASK_NONE**

  No bits are set.

- static final int **STATUS_MASK_ALL**

  All bits are set.

8.320.1 Detailed Description

Type for *status* kinds.

Each concrete **com.rti.dds.infrastructure.Entity** (p. 1320) is associated with a set of `*Status` objects whose values represent the communication status of that **com.rti.dds.infrastructure.Entity** (p. 1320).

The communication statuses whose changes can be communicated to the application depend on the **com.rti.dds.↩ infrastructure.Entity** (p. 1320).

Each status value can be accessed with a corresponding method on the **com.rti.dds.infrastructure.Entity** (p. 1320). The changes on these status values cause activation of the corresponding **com.rti.dds.infrastructure.Status↩ Condition** (p. 2008) objects and trigger invocation of the proper **com.rti.dds.infrastructure.Listener** (p. 1528) objects to asynchronously inform the application. Note that not all statuses will activate the **com.rti.dds.infrastructure.↩ StatusCondition** (p. 2008) or have a corresponding listener callback. Refer to the documentation of the individual statuses for that information.

8.320.2 Member Data Documentation

8.320.2.1 INCONSISTENT_TOPIC_STATUS

```
final int INCONSISTENT_TOPIC_STATUS  [static]
```

Another topic exists with the same name but different characteristics.

Entity:

com.rti.dds.topic.Topic (p. 2116)

Status:

com.rti.dds.topic.InconsistentTopicStatus (p. 1440)

Listener:

com.rti.dds.topic.TopicListener (p. 2131)

8.320.2.2 OFFERED_DEADLINE_MISSED_STATUS

```
final int OFFERED_DEADLINE_MISSED_STATUS  [static]
```

The deadline that the **com.rti.dds.publication.DataWriter** (p. 818) has committed through its **com.rti.dds.infrastructure.DeadlineQosPolicy** (p. 900) was not respected for a specific instance.

Entity:

com.rti.dds.publication.DataWriter (p. 818)

QoS:

DEADLINE (p. 467)

Status:

com.rti.dds.publication.OfferedDeadlineMissedStatus (p. 1637)

Listener:

com.rti.dds.publication.DataWriterListener (p. 853)

8.320.2.3 REQUESTED_DEADLINE_MISSED_STATUS

```
final int REQUESTED_DEADLINE_MISSED_STATUS  [static]
```

The deadline that the **com.rti.dds.subscription.DataReader** (p. 707) was expecting through its **com.rti.dds.infrastructure.DeadlineQosPolicy** (p. 900) was not respected for a specific instance.

Entity:

com.rti.dds.subscription.DataReader (p. 707)

QoS:

DEADLINE (p. 467)

Status:

com.rti.dds.subscription.RequestedDeadlineMissedStatus (p. 1864)

Listener:

com.rti.dds.subscription.DataReaderListener (p. 757)

8.320.2.4 OFFERED_INCOMPATIBLE_QOS_STATUS

```
final int OFFERED_INCOMPATIBLE_QOS_STATUS  [static]
```

A **QosPolicy** (p. 1802) value was incompatible with what was requested.

Entity:

com.rti.dds.publication.DataWriter (p. 818)

Status:

com.rti.dds.publication.OfferedIncompatibleQosStatus (p. 1638)

Listener:

com.rti.dds.publication.DataWriterListener (p. 853)

8.320.2.5 REQUESTED_INCOMPATIBLE_QOS_STATUS

```
final int REQUESTED_INCOMPATIBLE_QOS_STATUS  [static]
```

A **QosPolicy** (p. 1802) value was incompatible with what is offered.

Entity:

com.rti.dds.subscription.DataReader (p. 707)

Status:

com.rti.dds.subscription.RequestedIncompatibleQosStatus (p. 1865)

Listener:

com.rti.dds.subscription.DataReaderListener (p. 757)

8.320.2.6 SAMPLE_LOST_STATUS

```
final int SAMPLE_LOST_STATUS  [static]
```

A sample has been lost (i.e., was never received).

Entity:

com.rti.dds.subscription.DataReader (p. 707)

Status:

com.rti.dds.subscription.SampleLostStatus (p. 1958)

Listener:

com.rti.dds.subscription.DataReaderListener (p. 757)

8.320.2.7 SAMPLE_REJECTED_STATUS

```
final int SAMPLE_REJECTED_STATUS  [static]
```

A (received) sample has been rejected.

Entity:

com.rti.dds.subscription.DataReader (p. 707)

QoS:

RESOURCE_LIMITS (p. 511)

Status:

com.rti.dds.subscription.SampleRejectedStatus (p. 1966)

Listener:

com.rti.dds.subscription.DataReaderListener (p. 757)

8.320.2.8 DATA_ON_READERS_STATUS

```
final int DATA_ON_READERS_STATUS [static]
```

New data is available.

Entity:

com.rti.dds.subscription.Subscriber (p. 2039)

Listener:

com.rti.dds.subscription.SubscriberListener (p. 2063)

8.320.2.9 DATA_AVAILABLE_STATUS

```
final int DATA_AVAILABLE_STATUS [static]
```

One or more new data samples have been received.

Entity:

com.rti.dds.subscription.DataReader (p. 707)

Listener:

com.rti.dds.subscription.DataReaderListener (p. 757)

8.320.2.10 LIVELINESS_LOST_STATUS

```
final int LIVELINESS_LOST_STATUS [static]
```

The liveliness that the **com.rti.dds.publication.DataWriter** (p. 818) has committed to through its **com.rti.dds.infrastructure.LivelinessQosPolicy** (p. 1535) was not respected, thus **com.rti.dds.subscription.DataReader** (p. 707) entities will consider the **com.rti.dds.publication.DataWriter** (p. 818) as no longer alive.

Entity:

com.rti.dds.publication.DataWriter (p. 818)

QoS:

LIVELINESS (p. 489)

Status:

com.rti.dds.publication.LivelinessLostStatus (p. 1534)

Listener:

com.rti.dds.publication.DataWriterListener (p. 853)

8.320.2.11 LIVELINESS_CHANGED_STATUS

```
final int LIVELINESS_CHANGED_STATUS  [static]
```

The liveliness of one or more **com.rti.dds.publication.DataWriter** (p. 818) that were writing instances read through the **com.rti.dds.subscription.DataReader** (p. 707) has changed. Some **com.rti.dds.publication.DataWriter** (p. 818) have become alive or not_alive.

Entity:

com.rti.dds.subscription.DataReader (p. 707)

QoS:

LIVELINESS (p. 489)

Status:

com.rti.dds.subscription.LivelinessChangedStatus (p. 1531)

Listener:

com.rti.dds.subscription.DataReaderListener (p. 757)

8.320.2.12 PUBLICATION_MATCHED_STATUS

```
final int PUBLICATION_MATCHED_STATUS  [static]
```

The **com.rti.dds.publication.DataWriter** (p. 818) has found **com.rti.dds.subscription.DataReader** (p. 707) that matches the **com.rti.dds.topic.Topic** (p. 2116) and has compatible QoS.

Entity:

com.rti.dds.publication.DataWriter (p. 818)

Status:

com.rti.dds.publication.PublicationMatchedStatus (p. 1764)

Listener:

com.rti.dds.publication.DataWriterListener (p. 853)

8.320.2.13 SUBSCRIPTION_MATCHED_STATUS

```
final int SUBSCRIPTION_MATCHED_STATUS [static]
```

The **com.rti.dds.subscription.DataReader** (p. 707) has found **com.rti.dds.publication.DataWriter** (p. 818) that matches the **com.rti.dds.topic.Topic** (p. 2116) and has compatible QoS.

Entity:

com.rti.dds.subscription.DataReader (p. 707)

Status:

com.rti.dds.subscription.SubscriptionMatchedStatus (p. 2081)

Listener:

com.rti.dds.subscription.DataReaderListener (p. 757)

8.320.2.14 INVALID_LOCAL_ADVANCE_NOTICE_STATUS

```
final int INVALID_LOCAL_ADVANCE_NOTICE_STATUS [static]
```

<<***extension***>> *(p. 403)* The local **com.rti.dds.domain.DomainParticipant** (p. 948) has or is about to have an invalid identity or permissions credential.

Enables a **com.rti.dds.domain.DomainParticipant** (p. 948) callback that is called when the local **com.rti.dds.domain.DomainParticipant** (p. 948) has or is about to have an invalid identity or permissions credential. Currently, this status is only triggered when enabling the RTI Security Plugins. Please refer to the `RTI Security Plugins User's Manual` for more information.

Entity:

com.rti.dds.domain.DomainParticipant (p. 948)

Listener:

com.rti.dds.domain.DomainParticipantListener (p. 1070)

8.320.2.15 SERVICE_REQUEST_ACCEPTED_STATUS

```
final int SERVICE_REQUEST_ACCEPTED_STATUS  [static]
```

<<***extension***>> *(p. 403)* A **com.rti.dds.publication.DataWriter** (p. 818) has been issued a **com.rti.dds.topic.builtin.ServiceRequest** (p. 1985)

Enables a **com.rti.dds.publication.DataWriter** (p. 818) callback that is called when a **com.rti.dds.topic.builtin.ServiceRequest** (p. 1985) has been accepted and dispatched to the DataWriter.

Entity:

com.rti.dds.publication.DataWriter (p. 818)

Listener:

com.rti.dds.publication.DataWriterListener (p. 853)

8.320.2.16 DATA_WRITER_APPLICATION_ACKNOWLEDGMENT_STATUS

```
final int DATA_WRITER_APPLICATION_ACKNOWLEDGMENT_STATUS  [static]
```

<<***extension***>> *(p. 403)* A **com.rti.dds.publication.DataWriter** (p. 818) has received an application-level acknowledgment for a sample

Enables a **com.rti.dds.publication.DataWriter** (p. 818) callback that is called when an application-level acknowledgment from a **com.rti.dds.subscription.DataReader** (p. 707) is received. The callback is called for each sample that is application-level acknowledged. Changes to this status do not trigger a **com.rti.dds.infrastructure.StatusCondition** (p. 2008).

Entity:

com.rti.dds.publication.DataWriter (p. 818)

Listener:

com.rti.dds.publication.DataWriterListener (p. 853)

8.320.2.17 DATA_WRITER_INSTANCE_REPLACED_STATUS

```
final int DATA_WRITER_INSTANCE_REPLACED_STATUS  [static]
```

<<***extension***>> *(*p. *403)* A **com.rti.dds.publication.DataWriter** (p. 818) instance has been replaced

Enables a **com.rti.dds.publication.DataWriter** (p. 818) callback that is called when an instance in the writer queue is replaced.

Entity:

com.rti.dds.publication.DataWriter (p. 818)

Listener:

com.rti.dds.publication.DataWriterListener (p. 853)

8.320.2.18 RELIABLE_WRITER_CACHE_CHANGED_STATUS

```
final int RELIABLE_WRITER_CACHE_CHANGED_STATUS  [static]
```

<<***extension***>> *(*p. *403)* The number of unacknowledged samples in a reliable writer's cache has changed such that it has reached a pre-defined trigger point.

This status is considered changed at the following times: the cache is empty (i.e., contains no unacknowledged samples), the cache is full (i.e., the sample count has reached the value specified in **com.rti.dds.infrastructure.Resource↩ LimitsQosPolicy.max_samples** (p. 1896)), or the number of samples has reached a high (see **com.rti.dds.↩ infrastructure.RtpsReliableWriterProtocol_t.high_watermark** (p. 1913)) or low (see **com.rti.dds.infrastructure.↩ RtpsReliableWriterProtocol_t.low_watermark** (p. 1913)) watermark.

Entity:

com.rti.dds.publication.DataWriter (p. 818)

Status:

com.rti.dds.publication.ReliableWriterCacheChangedStatus (p. 1839)

Listener:

com.rti.dds.publication.DataWriterListener (p. 853)

8.320.2.19 RELIABLE_READER_ACTIVITY_CHANGED_STATUS

```
final int RELIABLE_READER_ACTIVITY_CHANGED_STATUS  [static]
```

<<***extension***>> *(*p. *403)* One or more reliable readers has become active or inactive.

A reliable reader is considered active by a reliable writer with which it is matched if that reader acknowledges the samples it has been sent in a timely fashion. For the definition of "timely" in this case, see **com.rti.dds.infrastructure.Rtps↩ ReliableWriterProtocol_t** (p. 1911) and **com.rti.dds.publication.ReliableReaderActivityChangedStatus** (p. 1836).

See also

com.rti.dds.infrastructure.RtpsReliableWriterProtocol_t (p. 1911)

com.rti.dds.publication.ReliableReaderActivityChangedStatus (p. 1836)

8.320.2.20 DDS_DATA_WRITER_CACHE_STATUS

```
final int DDS_DATA_WRITER_CACHE_STATUS  [static]
```

<<***extension***>> *(*p. *403)* The status of the writer's cache.

Changes to this status do not trigger a **com.rti.dds.infrastructure.StatusCondition** (p. 2008).

8.320.2.21 DDS_DATA_WRITER_PROTOCOL_STATUS

```
final int DDS_DATA_WRITER_PROTOCOL_STATUS  [static]
```

<<***extension***>> *(*p. *403)* The status of a writer's internal protocol related metrics

The status of a writer's internal protocol-related metrics, such as the number of samples pushed, pulled, and filtered and the status of wire protocol traffic. Changes to this status information do not trigger a **com.rti.dds.infrastructure.↩ StatusCondition** (p. 2008).

8.320.2.22 DDS_DATA_READER_CACHE_STATUS

```
final int DDS_DATA_READER_CACHE_STATUS  [static]
```

<<***extension***>> *(*p. *403)* The status of the reader's cache.

Changes to this status do not trigger a **com.rti.dds.infrastructure.StatusCondition** (p. 2008).

8.320.2.23 DATA_READER_PROTOCOL_STATUS

```
final int DATA_READER_PROTOCOL_STATUS  [static]
```

<<***extension***>> *(*p. *403)* The status of a reader's internal protocol related metrics

The status of a reader's internal protocol related metrics, like the number of samples received, filtered, rejected; and status of wire protocol traffic. Changes to this status do not trigger a **com.rti.dds.infrastructure.StatusCondition** (p. 2008).

8.321 StreamKind Class Reference

Indicates if the samples are **TopicQuery** (p. 2139) samples or not.

Static Public Attributes

- static final int **LIVE_STREAM** = 0x0001 << 0
  Sample is a live data sample.
- static final int **TOPIC_QUERY_STREAM** = 0x0001 << 1
  *Sample is a **TopicQuery** (*p. *2139) sample.*
- static final int **ANY_STREAM** = 0xffff
  Any stream kind LIVE_STREAM | TOPIC_QUERY_STREAM.

8.321.1 Detailed Description

Indicates if the samples are **TopicQuery** (p. 2139) samples or not.

8.321.2 Member Data Documentation

8.321.2.1 LIVE_STREAM

```
final int LIVE_STREAM = 0x0001 << 0  [static]
```

Sample is a live data sample.

8.321.2.2 TOPIC_QUERY_STREAM

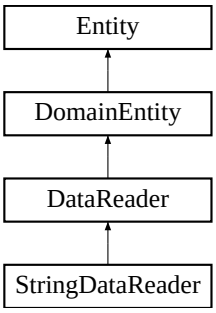
```
final int TOPIC_QUERY_STREAM = 0x0001 << 1  [static]
```

Sample is a **TopicQuery** (p. 2139) sample.

8.322 StringDataReader Class Reference

<<***interface***>> *(*p. *403)* Instantiates `DataReader` < com.rti.dds.infrastructure.String >.

Inheritance diagram for StringDataReader:



Public Member Functions

- void **read** (**StringSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, int sample_states, int view↩ _states, int instance_states)

  *Access a collection of data samples from the **com.rti.dds.subscription.DataReader** (*p. *707).*
- void **take** (**StringSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, int sample_states, int view↩ _states, int instance_states)

  *Access a collection of data-samples from the **com.rti.dds.subscription.DataReader** (*p. *707).*
- void **read_w_condition** (**StringSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, **Read**↩ **Condition** condition)

  *Accesses via **com.rti.dds.type.builtin.StringDataReader.read** (*p. *2024) the samples that match the criteria specified in the **com.rti.dds.subscription.ReadCondition** (*p. *1816).*
- void **take_w_condition** (**StringSeq** received_data, **SampleInfoSeq** info_seq, int max_samples, **Read**↩ **Condition** condition)

  *Analogous to **com.rti.dds.type.builtin.StringDataReader.read_w_condition** (*p. *2024) except it accesses samples via the **com.rti.dds.type.builtin.StringDataReader.take** (*p. *2024) operation.*
- String **read_next_sample** (**SampleInfo** sample_info)

  *Copies the next not-previously-accessed data value from the **com.rti.dds.subscription.DataReader** (*p. *707).*
- String **take_next_sample** (**SampleInfo** sample_info)

  *Copies the next not-previously-accessed data value from the **com.rti.dds.subscription.DataReader** (*p. *707).*

Additional Inherited Members

8.322.1 Detailed Description

<<***interface***>> *(*p. *403)* Instantiates `DataReader` < com.rti.dds.infrastructure.String >.

com.rti.dds.subscription.DataReader (p. 707)

8.322.2 Member Function Documentation

8.322.2.1 read()

```
void read (
              StringSeq received_data,
              SampleInfoSeq info_seq,
             int max_samples,
             int sample_states,
             int view_states,
             int instance_states )
```

Access a collection of data samples from the **com.rti.dds.subscription.DataReader** (p. 707).

See also

com.rti.ndds.example.FooDataReader.read (p. 1361)

References **DataReader.read_untyped()**.

8.322.2.2 take()

```
void take (
              StringSeq received_data,
              SampleInfoSeq info_seq,
             int max_samples,
             int sample_states,
             int view_states,
             int instance_states )
```

Access a collection of data-samples from the **com.rti.dds.subscription.DataReader** (p. 707).

See also

com.rti.ndds.example.FooDataReader.take (p. 1363)

References **DataReader.take_untyped()**.

8.322.2.3 read_w_condition()

```
void read_w_condition (
              StringSeq received_data,
              SampleInfoSeq info_seq,
             int max_samples,
              ReadCondition condition )
```

Accesses via **com.rti.dds.type.builtin.StringDataReader.read** (p. 2024) the samples that match the criteria specified in the **com.rti.dds.subscription.ReadCondition** (p. 1816).

See also

com.rti.ndds.example.FooDataReader.read_w_condition (p. 1368)

References **DataReader.read_w_condition_untyped()**.

8.322.2.4 take_w_condition()

```
void take_w_condition (
              StringSeq received_data,
              SampleInfoSeq info_seq,
             int max_samples,
              ReadCondition condition )
```

Analogous to **com.rti.dds.type.builtin.StringDataReader.read_w_condition** (p. 2024) except it accesses samples via the **com.rti.dds.type.builtin.StringDataReader.take** (p. 2024) operation.

See also

com.rti.ndds.example.FooDataReader.take_w_condition (p. 1369)

References **DataReader.take_w_condition_untyped()**.

8.322.2.5 read_next_sample()

```
String read_next_sample (
              SampleInfo sample_info )
```

Copies the next not-previously-accessed data value from the **com.rti.dds.subscription.DataReader** (p. 707).

See also

com.rti.ndds.example.FooDataReader.read_next_sample (p. 1370)

References **DataReader.read_next_sample_untyped()**.

8.322.2.6 take_next_sample()

```
String take_next_sample (
            SampleInfo sample_info )
```

Copies the next not-previously-accessed data value from the **com.rti.dds.subscription.DataReader** (p. 707).

See also

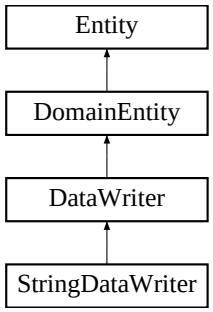
com.rti.ndds.example.FooDataReader.take_next_sample (p. 1371)

References **DataReader.take_next_sample_untyped()**.

8.323 StringDataWriter Class Reference

<<***interface***>> *(p. 403)* Instantiates `DataWriter` < com.rti.dds.infrastructure.String >.

Inheritance diagram for StringDataWriter:



Public Member Functions

- void **write** (String instance_data, **InstanceHandle_t** handle)

  Modifies the value of a string data instance.
- void **write_w_timestamp** (String instance_data, **InstanceHandle_t** handle, **Time_t** source_timestamp)

  *Performs the same function as **com.rti.dds.type.builtin.StringDataWriter.write** (p. 2027) except that it also provides the value for the `source_timestamp`.*

8.323.1 Detailed Description

<<***interface***>> *(p. 403)* Instantiates `DataWriter` < com.rti.dds.infrastructure.String >.

See also

com.rti.ndds.example.FooDataWriter (p. 1389)

com.rti.dds.publication.DataWriter (p. 818)

8.323.2 Member Function Documentation

8.323.2.1 write()

```
void write (
             String instance_data,
              InstanceHandle_t handle )
```

Modifies the value of a string data instance.

See also

com.rti.ndds.example.FooDataWriter.write (p. 1397)

References **DataWriter.write_untyped()**.

8.323.2.2 write_w_timestamp()

```
void write_w_timestamp (
             String instance_data,
              InstanceHandle_t handle,
              Time_t source_timestamp )
```

Performs the same function as **com.rti.dds.type.builtin.StringDataWriter.write** (p. 2027) except that it also provides the value for the `source_timestamp`.

See also

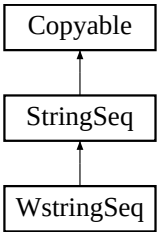
com.rti.ndds.example.FooDataWriter.write_w_timestamp (p. 1401)

References **DataWriter.write_w_timestamp_untyped()**.

8.324 StringSeq Class Reference

Declares IDL `sequence` < com.rti.dds.infrastructure.String > .

Inheritance diagram for StringSeq:



Public Member Functions

- **StringSeq** ()

  Constructs an empty sequence of strings with an initial maximum of zero.
- **StringSeq** (int initialMaximum)

  Constructs an empty sequence of strings with the given initial maximum.
- **StringSeq** (Collection<?> strings)

  Constructs a new sequence containing the given strings.
- final Object **copy_from** (Object src)

Static Public Member Functions

- static void **readStringArray** (String[ ] value, CdrObjectInput in, int length) throws IOException
- static void **writeStringArray** (String[ ] value, CdrObjectOutput out, int length, int maxStringLength) throws IOException

8.324.1 Detailed Description

Declares IDL `sequence` < com.rti.dds.infrastructure.String > .

See also

com.rti.dds.infrastructure.com.rti.dds.util.Sequence

Instantiates `com.rti.dds.infrastructure.com.rti.dds.util.Sequence` < com.rti.dds.infrastructure.↩ String > with value type semantics.

StringSeq (p. 2027) is a sequence that contains strings.

Instantiates:

<<***generic***>> *(*p. *403)* com.rti.dds.infrastructure.com.rti.dds.util.Sequence

See also

com.rti.dds.infrastructure.com.rti.dds.util.Sequence

8.324.2 Constructor & Destructor Documentation

8.324.2.1 StringSeq() [1/3]

```
StringSeq ( )
```

Constructs an empty sequence of strings with an initial maximum of zero.

Referenced by **StringSeq.copy_from()**.

8.324.2.2 StringSeq() [2/3]

```
StringSeq (
            int initialMaximum )
```

Constructs an empty sequence of strings with the given initial maximum.

8.324.2.3 StringSeq() [3/3]

```
StringSeq (
            Collection<?> strings )
```

Constructs a new sequence containing the given strings.

Parameters

strings	the initial contents of this sequence

Exceptions

NullPointerException	if the input collection is null

8.324.3 Member Function Documentation

8.324.3.1 copy_from()

```
final Object copy_from (
            Object src )
```

Copy data into `this` object from another. The result of this method is that both `this` and `src` will be the same size and contain the same data.

Parameters

src	The Object which contains the data to be copied

Returns

Generally, return `this` but special cases (such as `Enum`) exist.

Exceptions

NullPointerException	If `src` is null OR if there are null objects contained in this sequence.
ClassCastException	If `src` is not the same type as `this`.

See also

com.rti.dds.infrastructure.Copyable::copy_from (p. 701)(java.lang.Object)

Implements **Copyable** (p. 701).

References **StringSeq.StringSeq()**.

Referenced by **QueryConditionParams.copy_from()**, **TopicQuerySelection.copy_from()**, **MonitoringMetric↩ Selection.MonitoringMetricSelection()**, and **QueryConditionParams.QueryConditionParams()**.

8.324.3.2 readStringArray()

```
static void readStringArray (
             String[] value,
             CdrObjectInput in,
             int length ) throws IOException  [static]
```

Read array of strings. The length specified **must** match the expected length of array. Otherwise, the stream will be positioned incorrectly, leading to corrupt reads. The length of array must be at least the value of length parameter (otherwise, ArrayOutOfBoundException will be thrown).

Parameters

value	array to read into
in	Interface for reading object in CDR encoding.
length	the length of array (<= value.length)

8.324.3.3 writeStringArray()

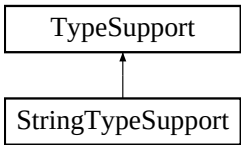
```
static void writeStringArray (
            String[] value,
            CdrObjectOutput out,
            int length,
            int maxStringLength ) throws IOException  [static]
```

Write array of string up to the specified length

8.325 StringTypeSupport Class Reference

<<***interface***>> *(*p. *403)* String type support.

Inheritance diagram for StringTypeSupport:



Public Member Functions

- long **get_serialized_sample_max_size** (Object endpoint_data, boolean include_encapsulation, short final_↩ encapsulation_id, long currentAlignment)
- long **serialize_to_cdr_buffer** (byte[ ] buffer, long length, String src)

  <<***extension***>> *(*p. *403) Serializes the input sample into a CDR buffer of octets.*
- long **serialize_to_cdr_buffer** (byte[ ] buffer, long length, String src, short representation)

  <<***extension***>> *(*p. *403) Serializes the input sample into a buffer of octets.*
- String **data_to_string** (String src, **PrintFormatProperty** property)

  <<***extension***>> *(*p. *403) Get the string representation of an input sample.*
- String **data_to_string** (String src)

  <<***extension***>> *(*p. *403) Get the string representation of an input sample.*
- String **deserialize_from_cdr_buffer** (byte[ ] buffer, long length)

  <<***extension***>> *(*p. *403) Deserializes a sample from a buffer of octets.*

Static Public Member Functions

- static void **register_type** (**DomainParticipant** participant, String type_name)

  Allows an application to communicate to RTI Connext the existence of the com.rti.dds.infrastructure.String data type.
- static void **unregister_type** (**DomainParticipant** participant, String type_name)

  Allows an application to unregister the com.rti.dds.infrastructure.String data type from RTI Connext. After calling unregister_type, no further communication using this type is possible.
- static String **get_type_name** ()

  Get the default name for the com.rti.dds.infrastructure.String type.

8.325.1 Detailed Description

<<***interface***>> *(*p. *403)* String type support.

8.325.2 Member Function Documentation

8.325.2.1 register_type()

```
static void register_type (
              DomainParticipant participant,
             String type_name )  [static]
```

Allows an application to communicate to RTI Connext the existence of the com.rti.dds.infrastructure.String data type.

By default, The com.rti.dds.infrastructure.String built-in type is automatically registered when a DomainParticipant is created using the type_name returned by com.rti.dds.type.builtin.com.rti.dds.type.builtin.StringTypeSupport.get_type↩ _name. Therefore, the usage of this function is optional and it is only required when the automatic built-in type registration is disabled using the participant property "dds.builtin_type.auto_register".

This method can also be used to register the same com.rti.dds.type.builtin.com.rti.dds.type.builtin.StringTypeSupport with a **com.rti.dds.domain.DomainParticipant** (p. 948) using different values for the type_name.

If `register_type` is called multiple times with the same **com.rti.dds.domain.DomainParticipant** (p. 948) and `type_name`, the second (and subsequent) registrations are ignored by the operation.

Parameters

participant	<<***in***>> *(*p. *404)* the **com.rti.dds.domain.DomainParticipant** (p. 948) to register the data type com.rti.dds.infrastructure.String with. Cannot be null.
type_name	<<***in***>> *(*p. *404)* the type name under with the data type com.rti.dds.infrastructure.String is registered with the participant; this type name is used when creating a new **com.rti.dds.topic.Topic** (p. 2116). (See **com.rti.dds.domain.DomainParticipant.create_topic** (p. 984).) The name may not be null or longer than 255 characters.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903) or **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903).

MT Safety:

UNSAFE on the FIRST call. It is not safe for two threads to simultaneously make the first call to register a type. Subsequent calls are thread safe.

See also

com.rti.dds.domain.DomainParticipant.create_topic (p. 984)

8.325.2.2 unregister_type()

```
static void unregister_type (
              DomainParticipant participant,
             String type_name )  [static]
```

Allows an application to unregister the com.rti.dds.infrastructure.String data type from RTI Connext. After calling unregister_type, no further communication using this type is possible.

Precondition

The com.rti.dds.infrastructure.String type with `type_name` is registered with the participant and all **com.rti.dds.topic.Topic** (p. 2116) objects referencing the type have been destroyed. If the type is not registered with the participant, or if any **com.rti.dds.topic.Topic** (p. 2116) is associated with the type, the operation will fail with **com.rti.dds.infrastructure.RETCODE_ERROR** (p. 1900).

Postcondition

All information about the type is removed from RTI Connext. No further communication using this type is possible.

Parameters

participant	<<***in***>> *(p. 404)* the **com.rti.dds.domain.DomainParticipant** (p. 948) to unregister the data type com.rti.dds.infrastructure.String from. Cannot be null.
type_name	<<***in***>> *(p. 404)* the type name under with the data type com.rti.dds.infrastructure.String is registered with the participant. The name should match a name that has been previously used to register a type with the participant. Cannot be null.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_BAD_PARAMETER** (p. 1899) or **com.rti.dds.infrastructure.RETCODE_ERROR** (p. 1900)

MT Safety:

SAFE.

See also

com.rti.dds.type.builtin.com.rti.dds.type.builtin.StringTypeSupport.register_type

8.325.2.3 get_type_name()

```
static String get_type_name ( )  [static]
```

Get the default name for the com.rti.dds.infrastructure.String type.

Can be used for calling com.rti.dds.type.builtin.com.rti.dds.type.builtin.StringTypeSupport.register_type or creating **com.rti.dds.topic.Topic** (p. 2116).

Returns

default name for the com.rti.dds.infrastructure.String type.

See also

com.rti.dds.type.builtin.com.rti.dds.type.builtin.StringTypeSupport.register_type

com.rti.dds.domain.DomainParticipant.create_topic (p. 984)

8.325.2.4 get_serialized_sample_max_size()

```
long get_serialized_sample_max_size (
             Object endpoint_data,
             boolean include_encapsulation,
             short final_encapsulation_id,
             long currentAlignment )
```

Coverity is complaining about endpoint_data being null, because it is called from create_native_bufferI which is a performance test method. This method is just used against two types in our testers.

Coverity is complaining about a possible null dereference, but it is not possible. Adding a null check to avoid the report.

References **ExtensibilityKind.EXTENSIBLE_EXTENSIBILITY**.

8.325.2.5 serialize_to_cdr_buffer() [1/2]

```
long serialize_to_cdr_buffer (
             byte[] buffer,
             long length,
             String src )
```

<<***extension***>> *(p. 403)* Serializes the input sample into a CDR buffer of octets.

See also

com.rti.ndds.example.FooTypeSupport.serialize_to_cdr_buffer (p. 1413)

Referenced by **StringTypeSupport.data_to_string()**.

8.325.2.6 serialize_to_cdr_buffer() [2/2]

```
long serialize_to_cdr_buffer (
            byte[] buffer,
            long length,
            String src,
            short representation )
```

<<***extension***>> *(*p. *403)* Serializes the input sample into a buffer of octets.

See also

com.rti.ndds.example.FooTypeSupport.serialize_to_cdr_buffer (p. 1413)

8.325.2.7 data_to_string() [1/2]

```
String data_to_string (
            String src,
             PrintFormatProperty property )
```

<<***extension***>> *(*p. *403)* Get the string representation of an input sample.

See also

com.rti.ndds.example.FooTypeSupport.data_to_string (p. 1416)

References **DynamicData.from_cdr_buffer()**, **DynamicData.PROPERTY_DEFAULT**, **StringTypeSupport.↩ serialize_to_cdr_buffer()**, and **DynamicData.to_string()**.

Referenced by **StringTypeSupport.data_to_string()**.

8.325.2.8 data_to_string() [2/2]

```
String data_to_string (
            String src )
```

<<***extension***>> *(*p. *403)* Get the string representation of an input sample.

Use the default values for **com.rti.dds.topic.PrintFormatProperty** (p. 1686) to create the output string.

See also

com.rti.ndds.example.FooTypeSupport.data_to_string (p. 1416)

References **StringTypeSupport.data_to_string()**.

8.325.2.9 deserialize_from_cdr_buffer()

```
String deserialize_from_cdr_buffer (
            byte[] buffer,
            long length )
```

<<***extension***>> *(*p. *403)* Deserializes a sample from a buffer of octets.

See also

com.rti.ndds.example.FooTypeSupport.deserialize_from_cdr_buffer (p. 1415)

8.326 StructMember Class Reference

A description of a member of a struct.

Inherits Serializable.

Public Member Functions

- **StructMember** (String **name**, boolean **is_pointer**, short **bits**, boolean **is_key**, **TypeCode type**)

Public Attributes

- String **name**

  The name of the struct member.
- **TypeCode type**

  The type of the struct member.
- boolean **is_pointer**

  Indicates whether the struct member is a pointer or not.
- short **bits**

  Number of bits of a bitfield member.
- boolean **is_key**

  Indicates if the struct member is a key member or not.
- int **id**

  The member ID.
- boolean **is_optional**

  Indicates if the struct member is optional or required.
- boolean **is_must_understand**

  Indicates if the struct member is annotated as "must understand".

8.326.1 Detailed Description

A description of a member of a struct.

See also

com.rti.dds.typecode.TypeCodeFactory.create_struct_tc (p. 2235)

8.326.2 Constructor & Destructor Documentation

8.326.2.1 StructMember()

```
StructMember (
            String name,
            boolean is_pointer,
            short bits,
            boolean is_key,
             TypeCode type )
```

Constructs a **StructMember** (p. 2036) object initialized with the given values.

References **StructMember.bits**, **StructMember.is_key**, **StructMember.is_pointer**, **TypeCode.MEMBER_ID_INVALID**, **StructMember.name**, and **StructMember.type**.

8.326.3 Member Data Documentation

8.326.3.1 name

```
String name
```

The name of the struct member.

Cannot be null.

Referenced by **TypeCode.member_name()**, and **StructMember.StructMember()**.

8.326.3.2 type

```
TypeCode type
```

The type of the struct member.

Cannot be null.

Referenced by **TypeCode.member_type()**, and **StructMember.StructMember()**.

8.326.3.3 is_pointer

```
boolean is_pointer
```

Indicates whether the struct member is a pointer or not.

Referenced by **TypeCode.is_member_pointer()**, and **StructMember.StructMember()**.

8.326.3.4 bits

```
short bits
```

Number of bits of a bitfield member.

If the struct member is a bitfield, this field contains the number of bits of the bitfield. Otherwise, bits should contain **com.rti.dds.typecode.TypeCode.NOT_BITFIELD** (p. 2232).

Referenced by **TypeCode.member_bitfield_bits()**, and **StructMember.StructMember()**.

8.326.3.5 is_key

```
boolean is_key
```

Indicates if the struct member is a key member or not.

Referenced by **TypeCode.is_member_key()**, **TypeCode.is_member_must_understand()**, and **StructMember.↩ StructMember()**.

8.326.3.6 id

```
int id
```

The member ID.

Use **com.rti.dds.typecode.TypeCode.MEMBER_ID_INVALID** (p. 2230) to have the member ID automatically assigned.

Referenced by **TypeCode.member_id()**.

8.326.3.7 is_optional

```
boolean is_optional
```

Indicates if the struct member is optional or required.

Referenced by **TypeCode.is_member_required()**.

8.326.3.8 is_must_understand

```
boolean is_must_understand
```

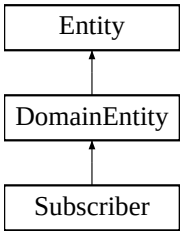
Indicates if the struct member is annotated as "must understand".

Referenced by **TypeCode.is_member_must_understand()**.

8.327 Subscriber Interface Reference

<<***interface***>> *(p. 403)* A subscriber is the object responsible for actually receiving data from a subscription.

Inheritance diagram for Subscriber:



Public Member Functions

- void **get_default_datareader_qos** (**DataReaderQos** qos)

  *Copies the default **com.rti.dds.subscription.DataReaderQos** (p. 777) values into the provided **com.rti.dds.subscription.DataReaderQos** (p. 777) instance.*
- void **set_default_datareader_qos** (**DataReaderQos** qos)

  *Sets the default **com.rti.dds.subscription.DataReaderQos** (p. 777) values for this subscriber.*
- void **set_default_datareader_qos_with_profile** (String library_name, String profile_name)

  *<<**extension**>> (p. 403) Set the default **com.rti.dds.subscription.DataReaderQos** (p. 777) values for this subscriber based on the input XML QoS profile.*
- **DataReader create_datareader** (**TopicDescription** topic, **DataReaderQos** qos, **DataReaderListener** listener, int mask)

  *Creates a **com.rti.dds.subscription.DataReader** (p. 707) that will be attached and belong to the **com.rti.dds.subscription.Subscriber** (p. 2039).*
- **DataReader create_datareader_with_profile** (**TopicDescription** topic, String library_name, String profile_name, **DataReaderListener** listener, int mask)

  *<<**extension**>> (p. 403) Creates a **com.rti.dds.subscription.DataReader** (p. 707) object using the **com.rti.dds.subscription.DataReaderQos** (p. 777) associated with the input XML QoS profile.*
- void **delete_datareader** (**DataReader** a_datareader)

  *Deletes a **com.rti.dds.subscription.DataReader** (p. 707) that belongs to the **com.rti.dds.subscription.Subscriber** (p. 2039).*
- **DataReader lookup_datareader** (String topic_name)

  *Retrieves an existing **com.rti.dds.subscription.DataReader** (p. 707).*
- void **get_datareaders** (**DataReaderSeq** readers, int sample_states, int view_states, int instance_states)

  *Allows the application to access the **com.rti.dds.subscription.DataReader** (p. 707) objects that contain samples with the specified `sample_states`, `view_states` and `instance_states`.*
- void **get_all_datareaders** (**DataReaderSeq** readers)

  *Retrieve all the DataReaders created from this **Subscriber** (p. 2039).*
- void **notify_datareaders** ()

  *Invokes the operation **com.rti.dds.subscription.DataReaderListener::on_data_available()** (p. 760) on the **com.rti.dds.subscription.DataReaderListener** (p. 757) objects attached to contained **com.rti.dds.subscription.DataReader** (p. 707) entities with com.rti.dds.infrastructure.StatusKind.StatusKind.DATA_AVAILABLE_STATUS that is considered changed as described in **Changes in read communication status** (p. 516).*
- void **set_qos** (**SubscriberQos** qos)

  Sets the subscriber QoS.
- void **set_qos_with_profile** (String library_name, String profile_name)

  *<<**extension**>> (p. 403) Change the QoS of this subscriber using the input XML QoS profile.*
- void **get_qos** (**SubscriberQos** qos)

  Gets the subscriber QoS.
- String **get_default_library** ()

  *<<**extension**>> (p. 403) Gets the default XML library associated with a **com.rti.dds.subscription.Subscriber** (p. 2039).*
- void **set_default_library** (String library_name)

  *<<**extension**>> (p. 403) Sets the default XML library for a **com.rti.dds.subscription.Subscriber** (p. 2039).*
- String **get_default_profile** ()

  *<<**extension**>> (p. 403) Gets the default XML profile associated with a **com.rti.dds.subscription.Subscriber** (p. 2039).*
- void **set_default_profile** (String library_name, String profile_name)

  *<<**extension**>> (p. 403) Sets the default XML profile for a **com.rti.dds.subscription.Subscriber** (p. 2039).*
- String **get_default_profile_library** ()

*<<**extension**>> (p. 403) Gets the library where the default XML QoS profile is contained for a **com.rti.dds.subscription.Subscriber** (p. 2039).*

- void **set_listener** (**SubscriberListener** l, int mask)

  Sets the subscriber listener.
- **SubscriberListener get_listener** ()

  Get the subscriber listener.
- void **call_listenerT** (int mask)

  Call the subscriber listener.
- void **begin_access** ()

  *Indicates that the application is about to access the data samples in any of the **com.rti.dds.subscription.DataReader** (p. 707) objects attached to the **com.rti.dds.subscription.Subscriber** (p. 2039).*
- void **end_access** ()

  *Indicates that the application has finished accessing the data samples in **com.rti.dds.subscription.DataReader** (p. 707) objects managed by the **com.rti.dds.subscription.Subscriber** (p. 2039).*
- void **copy_from_topic_qos** (**DataReaderQos** datareader_qos, **TopicQos** topic_qos)

  *Copies the policies in the **com.rti.dds.topic.TopicQos** (p. 2133) to the corresponding policies in the **com.rti.dds.subscription.DataReaderQos** (p. 777).*
- **DomainParticipant get_participant** ()

  *Returns the **com.rti.dds.domain.DomainParticipant** (p. 948) to which the **com.rti.dds.subscription.Subscriber** (p. 2039) belongs.*
- void **delete_contained_entities** ()

  *Deletes all the entities that were created by means of the "create" operation on the **com.rti.dds.subscription.Subscriber** (p. 2039).*
- **DataReader lookup_datareader_by_name** (String datareader_name)

  *<<**extension**>> (p. 403) Retrieves a **com.rti.dds.subscription.DataReader** (p. 707) contained within the **com.rti.dds.subscription.Subscriber** (p. 2039) the **com.rti.dds.subscription.DataReader** (p. 707) entity name.*

Static Public Attributes

- static final **DataReaderQos DATAREADER_QOS_DEFAULT**

  Special value for creating data reader with default QoS.
- static final **DataReaderQos DATAREADER_QOS_USE_TOPIC_QOS** = new **DataReaderQos**()

  *Special value for creating **com.rti.dds.subscription.DataReader** (p. 707) with a combination of the default **com.rti.dds.subscription.DataReaderQos** (p. 777) and the **com.rti.dds.topic.TopicQos** (p. 2133).*
- static final **DataReaderQos DATAREADER_QOS_PRINT_ALL** = new **DataReaderQos**()

  *Special value which can be supplied to **com.rti.dds.subscription.DataReaderQos.toString(DataReaderQos baseQos, QosPrintFormat format)** (p. 780) indicating that all of the QoS should be printed.*

8.327.1 Detailed Description

*<<**interface**>> (p. 403)* A subscriber is the object responsible for actually receiving data from a subscription.

QoS:

com.rti.dds.subscription.SubscriberQos (p. 2065)

Status:

com.rti.dds.infrastructure.StatusKind.StatusKind.DATA_ON_READERS_STATUS

Listener:

com.rti.dds.subscription.SubscriberListener (p. 2063)

A subscriber acts on the behalf of one or several **com.rti.dds.subscription.DataReader** (p. 707) objects that are related to it. When it receives data (from the other parts of the system), it builds the list of concerned **com.rti.dds.↩ subscription.DataReader** (p. 707) objects and then indicates to the application that data is available through its listener or by enabling related conditions.

The application can access the list of concerned **com.rti.dds.subscription.DataReader** (p. 707) objects through the operation **com.rti.dds.subscription.Subscriber.get_datareaders** (p. 2050) and then access the data available through operations on the **com.rti.dds.subscription.DataReader** (p. 707).

The following operations may be called even if the **com.rti.dds.subscription.Subscriber** (p. 2039) is not enabled. Other operations will the value **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902) if called on a disabled **com.rti.dds.subscription.Subscriber** (p. 2039):

- **com.rti.dds.infrastructure.Entity.enable** (p. 1323),
- **com.rti.dds.subscription.Subscriber.set_qos** (p. 2052), **com.rti.dds.subscription.Subscriber.get_qos** (p. 2054) , idref_Subscriber_set_qos_with_profile
- **com.rti.dds.subscription.Subscriber.set_listener** (p. 2057), **com.rti.dds.subscription.Subscriber.get_↩ listener** (p. 2058),
- **com.rti.dds.infrastructure.Entity.get_statuscondition** (p. 1325), **com.rti.dds.infrastructure.Entity.get_↩ status_changes** (p. 1325)
- **com.rti.dds.subscription.Subscriber.create_datareader** (p. 2045), **com.rti.dds.subscription.Subscriber.↩ create_datareader_with_profile** (p. 2047), **com.rti.dds.subscription.Subscriber.delete_contained_entities** (p. 2061), **com.rti.dds.subscription.Subscriber.delete_datareader** (p. 2048),
- **com.rti.dds.subscription.Subscriber.set_default_datareader_qos** (p. 2043), **com.rti.dds.subscription.↩ Subscriber.set_default_datareader_qos_with_profile** (p. 2044), **com.rti.dds.subscription.Subscriber.↩ get_default_datareader_qos** (p. 2042), **com.rti.dds.subscription.Subscriber.set_default_library** (p. 2055), **com.rti.dds.subscription.Subscriber.set_default_profile** (p. 2056)

All operations except for **com.rti.dds.subscription.Subscriber.set_qos** (p. 2052), **com.rti.dds.subscription.↩ Subscriber.set_qos_with_profile** (p. 2053), **com.rti.dds.subscription.Subscriber.get_qos** (p. 2054), **com.rti.↩ dds.subscription.Subscriber.set_listener** (p. 2057), **com.rti.dds.subscription.Subscriber.get_listener** (p. 2058), **com.rti.dds.infrastructure.Entity.enable** (p. 1323) and **com.rti.dds.subscription.Subscriber.create_datareader** (p. 2045) may fail with **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

See also

Operations Allowed in Listener Callbacks (p. 1530)

8.327.2 Member Function Documentation

8.327.2.1 get_default_datareader_qos()

```
void get_default_datareader_qos (
              DataReaderQos qos )
```

Copies the default **com.rti.dds.subscription.DataReaderQos** (p. 777) values into the provided **com.rti.dds.↩ subscription.DataReaderQos** (p. 777) instance.

The retrieved qos will match the set of values specified on the last successful call to **com.rti.dds.subscription.↩ Subscriber.set_default_datareader_qos** (p. 2043), or **com.rti.dds.subscription.Subscriber.set_default_↩ datareader_qos_with_profile** (p. 2044), or else, if the call was never made, the default values from is owning **com.rti.dds.domain.DomainParticipant** (p. 948).

This method may potentially allocate memory depending on the sequences contained in some QoS policies.

MT Safety:

UNSAFE. It is not safe to retrieve the default QoS value from a subscriber while another thread may be simultaneously calling **com.rti.dds.subscription.Subscriber.set_default_datareader_qos** (p. 2043)

Parameters

qos	<<***inout***>> *(p. 404)* **com.rti.dds.subscription.DataReaderQos** (p. 777) to be filled-up. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

com.rti.dds.subscription.Subscriber.DATAREADER_QOS_DEFAULT (p. 82)

com.rti.dds.subscription.Subscriber.create_datareader (p. 2045)

8.327.2.2 set_default_datareader_qos()

```
void set_default_datareader_qos (
              DataReaderQos qos )
```

Sets the default **com.rti.dds.subscription.DataReaderQos** (p. 777) values for this subscriber.

This call causes the default values inherited from the owning **com.rti.dds.domain.DomainParticipant** (p. 948) to be overridden.

This default value will be used for newly created **com.rti.dds.subscription.DataReader** (p. 707) if **com.rti.dds.↩ subscription.Subscriber.DATAREADER_QOS_DEFAULT** (p. 82) is specified as the qos parameter when **com.rti.↩ dds.subscription.Subscriber.create_datareader** (p. 2045) is called.

Precondition

The specified QoS policies must be consistent, or else the operation will have no effect and fail with **com.rti.↩ dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901)

MT Safety:

UNSAFE. It is not safe to set the default QoS value from a subscriber while another thread may be simultaneously calling **com.rti.dds.subscription.Subscriber.set_default_datareader_qos** (p. 2043), **com.rti.↩ dds.subscription.Subscriber.get_default_datareader_qos** (p. 2042) or calling **com.rti.dds.subscription.↩ Subscriber.create_datareader** (p. 2045) with **com.rti.dds.subscription.Subscriber.DATAREADER_QOS_↩ DEFAULT** (p. 82) as the `qos` parameter.

Parameters

qos	<<***in***>> *(p. 404)* The default **com.rti.dds.subscription.DataReaderQos** (p. 777) to be set to. The special value **com.rti.dds.subscription.Subscriber.DATAREADER_QOS_DEFAULT** (p. 82) may be passed as `qos` to indicate that the default QoS should be reset back to the initial values the factory would used if **com.rti.dds.subscription.Subscriber.set_default_datareader_qos** (p. 2043) had never been called. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), or or **com.rti.dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901)

8.327.2.3 set_default_datareader_qos_with_profile()

```
void set_default_datareader_qos_with_profile (
             String library_name,
             String profile_name )
```

<<***extension***>> *(p. 403)* Set the default **com.rti.dds.subscription.DataReaderQos** (p. 777) values for this subscriber based on the input XML QoS profile.

This default value will be used for newly created **com.rti.dds.subscription.DataReader** (p. 707) if **com.rti.dds.↩ subscription.Subscriber.DATAREADER_QOS_DEFAULT** (p. 82) is specified as the `qos` parameter when **com.rti.↩ dds.subscription.Subscriber.create_datareader** (p. 2045) is called.

Precondition

The **com.rti.dds.subscription.DataReaderQos** (p. 777) contained in the specified XML QoS profile must be consistent, or else the operation will have no effect and fail with **com.rti.dds.infrastructure.RETCODE_↩ INCONSISTENT_POLICY** (p. 1901)

MT Safety:

UNSAFE. It is not safe to set the default QoS value from a **com.rti.dds.subscription.Subscriber** (p. 2039) while another thread may be simultaneously calling **com.rti.dds.subscription.Subscriber.set_default_datareader_qos** (p. 2043), **com.rti.dds.subscription.Subscriber.get_default_datareader_qos** (p. 2042) or calling **com.rti.dds.subscription.Subscriber.create_datareader** (p. 2045) with **com.rti.dds.subscription.Subscriber.DATAREADER_QOS_DEFAULT** (p. 82) as the `qos` parameter.

Parameters

library_name	<<***in***>> *(p. 404)* Library name containing the XML QoS profile. If library_name is null RTI Connext will use the default library (see **com.rti.dds.subscription.Subscriber.set_default_library** (p. 2055)).
profile_name	<<***in***>> *(p. 404)* XML QoS Profile name. If profile_name is null RTI Connext will use the default profile (see **com.rti.dds.subscription.Subscriber.set_default_profile** (p. 2056)).

If the input profile cannot be found the method fails with **com.rti.dds.infrastructure.RETCODE_ERROR** (p. 1900).

Exceptions

One	of the **Standard Return Codes** (p. 513), or **com.rti.dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901)

See also

com.rti.dds.subscription.Subscriber.DATAREADER_QOS_DEFAULT (p. 82)

com.rti.dds.subscription.Subscriber.create_datareader_with_profile (p. 2047)

8.327.2.4 create_datareader()

```
DataReader create_datareader (
              TopicDescription topic,
              DataReaderQos qos,
              DataReaderListener listener,
             int mask )
```

Creates a **com.rti.dds.subscription.DataReader** (p. 707) that will be attached and belong to the **com.rti.dds.subscription.Subscriber** (p. 2039).

For each application-defined type **com.rti.ndds.example.Foo** (p. 1358), there is an implied, auto-generated class **com.rti.ndds.example.FooDataReader** (p. 1359) (an incarnation of FooDataReader) that extends **com.rti.dds.subscription.DataReader** (p. 707) and contains the operations to read data of type **com.rti.ndds.example.Foo** (p. 1358).

Note that a common application pattern to construct the QoS for the **com.rti.dds.subscription.DataReader** (p. 707) is to:

- Retrieve the QoS policies on the associated **com.rti.dds.topic.Topic** (p. 2116) by means of the **com.rti.dds.topic.Topic.get_qos** (p. 2119) operation.
- Retrieve the default **com.rti.dds.subscription.DataReader** (p. 707) qos by means of the **com.rti.dds.subscription.Subscriber.get_default_datareader_qos** (p. 2042) operation.
- Combine those two QoS policies (for example, using **com.rti.dds.subscription.Subscriber.copy_from_topic_qos** (p. 2060)) and selectively modify policies as desired
- Use the resulting QoS policies to construct the **com.rti.dds.subscription.DataReader** (p. 707).

When a **com.rti.dds.subscription.DataReader** (p. 707) is created, only those transports already registered are available to the **com.rti.dds.subscription.DataReader** (p. 707). See **Built-in Transport Plugins** (p. 106) for details on when a builtin transport is registered.

MT Safety:

UNSAFE. If **com.rti.dds.subscription.Subscriber.DATAREADER_QOS_DEFAULT** (p. 82) is used for the `qos` parameter, it is not safe to create the datareader while another thread may be simultaneously calling **com.rti.dds.subscription.Subscriber.set_default_datareader_qos** (p. 2043).

Precondition

If subscriber is enabled, the topic must be enabled. If it is not, this operation will fail and no **com.rti.dds.subscription.DataReader** (p. 707) will be created.

The given **com.rti.dds.topic.TopicDescription** (p. 2129) must have been created from the same participant as this subscriber. If it was created from a different participant, this method will return NULL.

If `qos` is **com.rti.dds.subscription.Subscriber.DATAREADER_QOS_USE_TOPIC_QOS** (p. 82), `topic` cannot be **com.rti.dds.topic.MultiTopic** (p. 1618), or else this method will return NULL.

Parameters

topic	<<***in***>> *(*p. *404)* The **com.rti.dds.topic.TopicDescription** (p. 2129) that the **com.rti.dds.subscription.DataReader** (p. 707) will be associated with. Cannot be NULL.
qos	<<***in***>> *(*p. *404)* The qos of the **com.rti.dds.subscription.DataReader** (p. 707). The special value **com.rti.dds.subscription.Subscriber.DATAREADER_QOS_DEFAULT** (p. 82) can be used to indicate that the **com.rti.dds.subscription.DataReader** (p. 707) should be created with the default **com.rti.dds.subscription.DataReaderQos** (p. 777) set in the **com.rti.dds.subscription.Subscriber** (p. 2039). If **com.rti.dds.topic.TopicDescription** (p. 2129) is of type **com.rti.dds.topic.Topic** (p. 2116) or **com.rti.dds.topic.ContentFilteredTopic** (p. 692), the special value **com.rti.dds.subscription.Subscriber.DATAREADER_QOS_USE_TOPIC_QOS** (p. 82) can be used to indicate that the **com.rti.dds.subscription.DataReader** (p. 707) should be created with the combination of the default **com.rti.dds.subscription.DataReaderQos** (p. 777) set on the **com.rti.dds.subscription.Subscriber** (p. 2039) and the **com.rti.dds.topic.TopicQos** (p. 2133) (in the case of a **com.rti.dds.topic.ContentFilteredTopic** (p. 692), the **com.rti.dds.topic.TopicQos** (p. 2133) of the related **com.rti.dds.topic.Topic** (p. 2116)). if **com.rti.dds.subscription.Subscriber.DATAREADER_QOS_USE_TOPIC_QOS** (p. 82) is used, `topic` cannot be a **com.rti.dds.topic.MultiTopic** (p. 1618). Cannot be NULL.
listener	<<***in***>> *(*p. *404)* The listener of the **com.rti.dds.subscription.DataReader** (p. 707).
mask	<<***in***>> *(*p. *404)*. Changes of communication status to be invoked on the listener. See com.rti.dds.infrastructure.StatusMask.

Returns

A **com.rti.dds.subscription.DataReader** (p. 707) of a derived class specific to the data-type associated with the **com.rti.dds.topic.Topic** (p. 2116) or NULL if an error occurred.

See also

com.rti.ndds.example.FooDataReader (p. 1359)

Specifying QoS on entities (p. 505) for information on setting QoS before entity creation

com.rti.dds.subscription.DataReaderQos (p. 777) for rules on consistency among QoS

com.rti.dds.subscription.Subscriber.create_datareader_with_profile (p. 2047)

com.rti.dds.subscription.Subscriber.get_default_datareader_qos (p. 2042)

com.rti.dds.topic.Topic.set_qos (p. 2118)

com.rti.dds.subscription.Subscriber.copy_from_topic_qos (p. 2060)

com.rti.dds.subscription.DataReader.set_listener (p. 717)

8.327.2.5 create_datareader_with_profile()

```
DataReader create_datareader_with_profile (
             TopicDescription topic,
            String library_name,
            String profile_name,
             DataReaderListener listener,
            int mask )
```

<<***extension***>> *(*p. *403)* Creates a **com.rti.dds.subscription.DataReader** (p. 707) object using the **com.rti.dds.subscription.DataReaderQos** (p. 777) associated with the input XML QoS profile.

The **com.rti.dds.subscription.DataReader** (p. 707) will be attached and belong to the **com.rti.dds.subscription.Subscriber** (p. 2039).

For each application-defined type **com.rti.ndds.example.Foo** (p. 1358), there is an implied, auto-generated class **com.rti.ndds.example.FooDataReader** (p. 1359) (an incarnation of FooDataReader) that extends **com.rti.dds.subscription.DataReader** (p. 707) and contains the operations to read data of type **com.rti.ndds.example.Foo** (p. 1358).

When a **com.rti.dds.subscription.DataReader** (p. 707) is created, only those transports already registered are available to the **com.rti.dds.subscription.DataReader** (p. 707). See **Built-in Transport Plugins** (p. 106) for details on when a builtin transport is registered.

Precondition

If subscriber is enabled, the topic must be enabled. If it is not, this operation will fail and no **com.rti.dds.subscription.DataReader** (p. 707) will be created.

The given **com.rti.dds.topic.TopicDescription** (p. 2129) must have been created from the same participant as this subscriber. If it was created from a different participant, this method will return NULL.

Parameters

topic	<<***in***>> *(*p. *404)* The **com.rti.dds.topic.TopicDescription** (p. 2129) that the **com.rti.dds.subscription.DataReader** (p. 707) will be associated with. Cannot be NULL.
library_name	<<***in***>> *(*p. *404)* Library name containing the XML QoS profile. If library_name is null RTI Connext will use the default library (see **com.rti.dds.subscription.Subscriber.set_default_library** (p. 2055)).
profile_name	<<***in***>> (p. *404)* XML QoS Profile name. If profile_name is null RTI Connext will use the default profile (see **com.rti.dds.subscription.Subscriber.set_default_profile** (p. 2056)).
listener	<<***in***>> *(*p. *404)* The listener of the **com.rti.dds.subscription.DataReader** (p. 707).
mask	<<***in***>> (p. *404).* Changes of communication status to be invoked on the listener. See com.rti.dds.infrastructure.StatusMask.

Returns

A **com.rti.dds.subscription.DataReader** (p. 707) of a derived class specific to the data-type associated with the **com.rti.dds.topic.Topic** (p. 2116) or NULL if an error occurred.

See also

com.rti.ndds.example.FooDataReader (p. 1359)

Specifying QoS on entities (p. 505) for information on setting QoS before entity creation

com.rti.dds.subscription.DataReaderQos (p. 777) for rules on consistency among QoS

com.rti.dds.subscription.Subscriber.DATAREADER_QOS_DEFAULT (p. 82)

com.rti.dds.subscription.Subscriber.DATAREADER_QOS_USE_TOPIC_QOS (p. 82)

com.rti.dds.subscription.Subscriber.create_datareader (p. 2045)

com.rti.dds.subscription.Subscriber.get_default_datareader_qos (p. 2042)

com.rti.dds.topic.Topic.set_qos (p. 2118)

com.rti.dds.subscription.Subscriber.copy_from_topic_qos (p. 2060)

com.rti.dds.subscription.DataReader.set_listener (p. 717)

8.327.2.6 delete_datareader()

```
void delete_datareader (
               DataReader a_datareader )
```

Deletes a **com.rti.dds.subscription.DataReader** (p. 707) that belongs to the **com.rti.dds.subscription.Subscriber** (p. 2039).

Precondition

If the **com.rti.dds.subscription.DataReader** (p. 707) does not belong to the **com.rti.dds.subscription.Subscriber** (p. 2039), or if ther are any existing **com.rti.dds.subscription.ReadCondition** (p. 1816) or **com.rti.dds.subscription.QueryCondition** (p. 1812) objects that are attached to the **com.rti.dds.subscription.DataReader** (p. 707), or if there are outstanding loans on samples (as a result of a call to read(), take(), or one of the variants thereof), the operation fails with the error **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).

Postcondition

Listener installed on the **com.rti.dds.subscription.DataReader** (p. 707) will not be called after this method completes successfully.

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Parameters

a_datareader	<<***in***>> *(p. 404)* The **com.rti.dds.subscription.DataReader** (p. 707) to be deleted.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).

8.327.2.7 lookup_datareader()

```
DataReader lookup_datareader (
            String topic_name )
```

Retrieves an existing **com.rti.dds.subscription.DataReader** (p. 707).

Use this operation on the built-in **com.rti.dds.subscription.Subscriber** (p. 2039) (**Built-in Topics** (p. 53)) to access the built-in **com.rti.dds.subscription.DataReader** (p. 707) entities for the built-in topics.

The built-in **com.rti.dds.subscription.DataReader** (p. 707) is created when this operation is called on a built-in topic for the first time. The built-in **com.rti.dds.subscription.DataReader** (p. 707) is deleted automatically when the **com.rti.dds.domain.DomainParticipant** (p. 948) is deleted.

To ensure that builtin **com.rti.dds.subscription.DataReader** (p. 707) entities receive all the discovery traffic, it is suggested that you lookup the builtin **com.rti.dds.subscription.DataReader** (p. 707) before the **com.rti.dds.domain.DomainParticipant** (p. 948) is enabled. Looking up builtin **com.rti.dds.subscription.DataReader** (p. 707) may implicitly register builtin transports due to creation of **com.rti.dds.subscription.DataReader** (p. 707) (see **Built-in Transport Plugins** (p. 106) for details on when a builtin transport is registered). Therefore, if you are want to modify builtin transport properties, do so *before* using this operation.

Therefore the suggested sequence when looking up builtin DataReaders is:

- Create a disabled **com.rti.dds.domain.DomainParticipant** (p. 948).
- (optional) Modify builtin transport properties
- Call **com.rti.dds.domain.DomainParticipant.get_builtin_subscriber()** (p. 998).
- Call **com.rti.dds.subscription.Subscriber.lookup_datareader()** (p. 2049).
- Call **enable()** (p. 1323) on the DomainParticipant.

Parameters

topic_name	<<***in***>> *(p. 404)* Name of the **com.rti.dds.topic.TopicDescription** (p. 2129) that the retrieved **com.rti.dds.subscription.DataReader** (p. 707) is attached to. Cannot be NULL.

Returns

A **com.rti.dds.subscription.DataReader** (p. 707) that belongs to the **com.rti.dds.subscription.Subscriber** (p. 2039) attached to the **com.rti.dds.topic.TopicDescription** (p. 2129) with `topic_name`. If no such **com.↩ rti.dds.subscription.DataReader** (p. 707) exists, this operation returns NULL.

The returned **com.rti.dds.subscription.DataReader** (p. 707) may be enabled or disabled.

If more than one **com.rti.dds.subscription.DataReader** (p. 707) is attached to the **com.rti.dds.subscription.↩ Subscriber** (p. 2039), this operation may return any one of them.

MT Safety:

UNSAFE. It is not safe to lookup a **com.rti.dds.subscription.DataReader** (p. 707) in one thread while another thread is simultaneously creating or destroying that **com.rti.dds.subscription.DataReader** (p. 707).

8.327.2.8 get_datareaders()

```
void get_datareaders (
               DataReaderSeq readers,
              int sample_states,
              int view_states,
              int instance_states )
```

Allows the application to access the **com.rti.dds.subscription.DataReader** (p. 707) objects that contain samples with the specified `sample_states`, `view_states` and `instance_states`.

If the application is outside a **begin_access()** (p. 2058)/end_access() block, or if the **com.rti.dds.infrastructure.↩ PresentationQosPolicy::access_scope** (p. 1682) of the **com.rti.dds.subscription.Subscriber** (p. 2039) is com.↩ rti.dds.infrastructure.PresentationQosPolicyAccessScopeKind.PresentationQosPolicyAccessScopeKind.INSTANCE_↩ PRESENTATION_QOS or com.rti.dds.infrastructure.PresentationQosPolicyAccessScopeKind.PresentationQosPolicy↩ AccessScopeKind.TOPIC_PRESENTATION_QOS, or if the **com.rti.dds.infrastructure.PresentationQosPolicy.↩ ordered_access** (p. 1682) of the **com.rti.dds.subscription.Subscriber** (p. 2039) is com.rti.dds.infrastructure.false,

the returned collection is a 'set' containing each **com.rti.dds.subscription.DataReader** (p. 707) at most once, in no specified order.

If the application is within a **begin_access()** (p. 2058)/end_access() block, and the **PRESENTATION** (p. 497) policy of the **com.rti.dds.subscription.Subscriber** (p. 2039) is com.rti.dds.infrastructure.PresentationQos↩ PolicyAccessScopeKind.PresentationQosPolicyAccessScopeKind.GROUP_PRESENTATION_QOS or com.rti.↩ dds.infrastructure.PresentationQosPolicyAccessScopeKind.PresentationQosPolicyAccessScopeKind.HIGHEST↩ _OFFERED_PRESENTATION_QOS, and **com.rti.dds.infrastructure.PresentationQosPolicy.ordered_access** (p. 1682) in the **com.rti.dds.subscription.Subscriber** (p. 2039) is com.rti.dds.infrastructure.true, the returned collection is a 'list' of DataReaders where a **DataReader** (p. 707) may appear more than one time.

To retrieve the samples in the order they were published across DataWriters of the same group (**com.rti.dds.↩ publication.Publisher** (p. 1767) configured with com.rti.dds.infrastructure.PresentationQosPolicyAccessScopeKind.↩ PresentationQosPolicyAccessScopeKind.GROUP_PRESENTATION_QOS), the application should read()/take() from each **DataReader** (p. 707) in the same order as it appears in the output sequence. The application will move to the next **DataReader** (p. 707) when the read()/take() operation fails with **com.rti.dds.infrastructure.RETCODE_NO_DATA** (p. 1902).

Parameters

readers	<<***inout***>> *(p. 404)* a **com.rti.dds.subscription.DataReaderSeq** (p. 808) object where the set or list of readers will be returned. Cannot be NULL.
sample_states	<<***in***>> *(p. 404)* the returned **DataReader** (p. 707) must contain samples that have one of these `sample_states`.
view_states	<<***in***>> *(p. 404)* the returned **DataReader** (p. 707) must contain samples that have one of these `view_states`.
instance_states	<<***in***>> *(p. 404)* the returned **DataReader** (p. 707) must contain samples that have one of these `instance_states`.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

Access to data samples (p. 80)

com.rti.dds.subscription.Subscriber.begin_access (p. 2058)

com.rti.dds.subscription.Subscriber.end_access (p. 2059)

PRESENTATION (p. 497)

8.327.2.9 get_all_datareaders()

```
void get_all_datareaders (
              DataReaderSeq readers )
```

Retrieve all the DataReaders created from this **Subscriber** (p. 2039).

Parameters

readers	<<***inout***>> *(*p. *404)* Sequence where the DataReaders will be added

Exceptions

One	of the **Standard Return Codes** (p. 513)

8.327.2.10 notify_datareaders()

```
void notify_datareaders ( )
```

Invokes the operation **com.rti.dds.subscription.DataReaderListener::on_data_available()** (p. 760) on the **com.rti.dds.subscription.DataReaderListener** (p. 757) objects attached to contained **com.rti.dds.subscription.DataReader** (p. 707) entities with com.rti.dds.infrastructure.StatusKind.StatusKind.DATA_AVAILABLE_STATUS that is considered changed as described in **Changes in read communication status** (p. 516).

This operation is typically invoked from the **com.rti.dds.subscription.SubscriberListener.on_data_on_readers** (p. 2064) operation in the **com.rti.dds.subscription.SubscriberListener** (p. 2063). That way the **com.rti.dds.subscription.SubscriberListener** (p. 2063) can delegate to the **com.rti.dds.subscription.DataReaderListener** (p. 757) objects the handling of the data.

The operation will notify the data readers that have a `sample_state` of com.rti.dds.subscription.SampleStateKind.SampleStateKind.NOT_READ_SAMPLE_STATE, `view_state` of **com.rti.dds.subscription.SampleStateKind.ANY_SAMPLE_STATE** (p. 91) and `instance_state` of **com.rti.dds.subscription.InstanceStateKind.ANY_INSTANCE_STATE** (p. 93).

Exceptions

One	of the **Standard Return Codes** (p. 513), or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

8.327.2.11 set_qos()

```
void set_qos (
                SubscriberQos qos )
```

Sets the subscriber QoS.

This operation modifies the QoS of the **com.rti.dds.subscription.Subscriber** (p. 2039).

The **com.rti.dds.subscription.SubscriberQos.group_data** (p. 2068), **com.rti.dds.subscription.SubscriberQos.partition** (p. 2068) and **com.rti.dds.subscription.SubscriberQos.entity_factory** (p. 2068) can be changed. The other policies are immutable.

Parameters

qos	<<***in***>> *(*p. *404)* **com.rti.dds.subscription.SubscriberQos** (p. 2065) to be set to. Policies must be consistent. Immutable policies cannot be changed after **com.rti.dds.subscription.Subscriber** (p. 2039) is enabled. The special value **com.rti.dds.domain.DomainParticipant.SUBSCRIBER_QOS_DEFAULT** (p. 49) can be used to indicate that the QoS of the **com.rti.dds.subscription.Subscriber** (p. 2039) should be changed to match the current default **com.rti.dds.subscription.SubscriberQos** (p. 2065) set in the **com.rti.dds.domain.DomainParticipant** (p. 948). Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_IMMUTABLE_POLICY** (p. 1901), or **com.rti.dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901).

See also

com.rti.dds.subscription.SubscriberQos (p. 2065) for rules on consistency among QoS

set_qos (abstract) (p. 1321)

Operations Allowed in Listener Callbacks (p. 1530)

8.327.2.12 set_qos_with_profile()

```
void set_qos_with_profile (
            String library_name,
            String profile_name )
```

<<***extension***>> *(*p. *403)* Change the QoS of this subscriber using the input XML QoS profile.

This operation modifies the QoS of the **com.rti.dds.subscription.Subscriber** (p. 2039).

The **com.rti.dds.subscription.SubscriberQos.group_data** (p. 2068), **com.rti.dds.subscription.SubscriberQos.↩ partition** (p. 2068) and **com.rti.dds.subscription.SubscriberQos.entity_factory** (p. 2068) can be changed. The other policies are immutable.

Parameters

library_name	<<***in***>> *(*p. *404)* Library name containing the XML QoS profile. If library_name is null RTI Connext will use the default library (see **com.rti.dds.subscription.Subscriber.set_default_library** (p. 2055)).
profile_name	<<***in***>> *(*p. *404)* XML QoS Profile name. If profile_name is null RTI Connext will use the default profile (see **com.rti.dds.subscription.Subscriber.set_default_profile** (p. 2056)).

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_IMMUTABLE_POLICY** (p. 1901), or **com.rti.dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901).

See also

com.rti.dds.subscription.SubscriberQos (p. 2065) for rules on consistency among QoS

Operations Allowed in Listener Callbacks (p. 1530)

8.327.2.13 get_qos()

```
void get_qos (
              SubscriberQos qos )
```

Gets the subscriber QoS.

This method may potentially allocate memory depending on the sequences contained in some QoS policies.

Parameters

qos	<<***in***>> *(p. 404)* **com.rti.dds.subscription.SubscriberQos** (p. 2065) to be filled in. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

get_qos (abstract) (p. 1322)

8.327.2.14 get_default_library()

```
String get_default_library ( )
```

<<***extension***>> *(p. 403)* Gets the default XML library associated with a **com.rti.dds.subscription.Subscriber** (p. 2039).

Returns

The default library or null if the default library was not set.

See also

com.rti.dds.subscription.Subscriber.set_default_library (p. 2055)

8.327.2.15 set_default_library()

```
void set_default_library (
            String library_name )
```

<<***extension***>> *(p. 403)* Sets the default XML library for a **com.rti.dds.subscription.Subscriber** (p. 2039).

This method specifies the library that will be used as the default the next time a default library is needed during a call to one of this **Subscriber** (p. 2039)'s operations.

Any API requiring a library_name as a parameter can use null to refer to the default library.

If the default library is not set, the **com.rti.dds.subscription.Subscriber** (p. 2039) inherits the default from the **com.rti.dds.domain.DomainParticipant** (p. 948) (see **com.rti.dds.domain.DomainParticipant.set_default_library** (p. 994)).

Parameters

library_name	<<***in***>> *(p. 404)* Library name. If library_name is null any previous default is unset.

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

com.rti.dds.subscription.Subscriber.get_default_library (p. 2054)

8.327.2.16 get_default_profile()

```
String get_default_profile ( )
```

<<***extension***>> *(p. 403)* Gets the default XML profile associated with a **com.rti.dds.subscription.Subscriber** (p. 2039).

Returns

The default profile or null if the default profile was not set.

See also

com.rti.dds.subscription.Subscriber.set_default_profile (p. 2056)

8.327.2.17 set_default_profile()

```
void set_default_profile (
            String library_name,
            String profile_name )
```

<<***extension***>> *(p. 403)* Sets the default XML profile for a **com.rti.dds.subscription.Subscriber** (p. 2039).

This method specifies the profile that will be used as the default the next time a default **Subscriber** (p. 2039) profile is needed during a call to one of this **Subscriber** (p. 2039)'s operations. When calling a **com.rti.dds.subscription.Subscriber** (p. 2039) method that requires a `profile_name` parameter, you can use NULL to refer to the default profile. (This same information applies to setting a default library.)

If the default profile is not set, the **com.rti.dds.subscription.Subscriber** (p. 2039) inherits the default from the **com.rti.dds.domain.DomainParticipant** (p. 948) (see **com.rti.dds.domain.DomainParticipant.set_default_profile** (p. 995)).

This method does not set the default QoS for **com.rti.dds.subscription.DataReader** (p. 707) objects created by this **com.rti.dds.subscription.Subscriber** (p. 2039); for this functionality, use **com.rti.dds.subscription.Subscriber.set_default_datareader_qos_with_profile** (p. 2044) (you may pass in NULL after having called **set_default_profile()** (p. 2056)).

This method does not set the default QoS for newly created Subscribers; for this functionality, use **com.rti.dds.domain.DomainParticipant.set_default_subscriber_qos_with_profile** (p. 966).

Parameters

library_name	<<***in***>> *(p. 404)* The library name containing the profile.
profile_name	<<***in***>> *(p. 404)* The profile name. If profile_name is null any previous default is unset.

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

com.rti.dds.subscription.Subscriber.get_default_profile (p. 2055)

com.rti.dds.subscription.Subscriber.get_default_profile_library (p. 2057)

8.327.2.18 get_default_profile_library()

```
String get_default_profile_library ( )
```

<<***extension***>> *(*p. *403)* Gets the library where the default XML QoS profile is contained for a **com.rti.dds.subscription.Subscriber** (p. 2039).

The default profile library is automatically set when **com.rti.dds.subscription.Subscriber.set_default_profile** (p. 2056) is called.

This library can be different than the **com.rti.dds.subscription.Subscriber** (p. 2039) default library (see **com.rti.dds.subscription.Subscriber.get_default_library** (p. 2054)).

Returns

The default profile library or null if the default profile was not set.

See also

com.rti.dds.subscription.Subscriber.set_default_profile (p. 2056)

8.327.2.19 set_listener()

```
void set_listener (
              SubscriberListener l,
             int mask )
```

Sets the subscriber listener.

Parameters

l	<<***in***>> *(*p. *404)* **com.rti.dds.subscription.SubscriberListener** (p. 2063) to set to.
mask	<<***in***>> *(*p. *404)* com.rti.dds.infrastructure.StatusMask associated with the **com.rti.dds.subscription.SubscriberListener** (p. 2063).

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

set_listener (abstract) (p. 1322)

8.327.2.20 get_listener()

```
SubscriberListener get_listener ( )
```

Get the subscriber listener.

Returns

com.rti.dds.subscription.SubscriberListener (p. 2063) of the **com.rti.dds.subscription.Subscriber** (p. 2039).

See also

get_listener (abstract) (p. 1323)

8.327.2.21 call_listenerT()

```
void call_listenerT (
             int mask )
```

Call the subscriber listener.

8.327.2.22 begin_access()

```
void begin_access ( )
```

Indicates that the application is about to access the data samples in any of the **com.rti.dds.subscription.DataReader** (p. 707) objects attached to the **com.rti.dds.subscription.Subscriber** (p. 2039).

If the **com.rti.dds.infrastructure.PresentationQosPolicy::access_scope** (p. 1682) of the **com.rti.dds.subscription.↩ Subscriber** (p. 2039) is com.rti.dds.infrastructure.PresentationQosPolicyAccessScopeKind.PresentationQosPolicy↩ AccessScopeKind.GROUP_PRESENTATION_QOS or com.rti.dds.infrastructure.PresentationQosPolicyAccess↩ ScopeKind.PresentationQosPolicyAccessScopeKind.HIGHEST_OFFERED_PRESENTATION_QOS and **com.rti.↩ dds.infrastructure.PresentationQosPolicy::ordered_access** (p. 1682) is com.rti.dds.infrastructure.true, the application is required to use this operation to access the samples in order across DataWriters of the same group (**com.↩ rti.dds.publication.Publisher** (p. 1767) with **com.rti.dds.infrastructure.PresentationQosPolicy.access_scope** (p. 1682) set to com.rti.dds.infrastructure.PresentationQosPolicyAccessScopeKind.PresentationQosPolicyAccess↩ ScopeKind.GROUP_PRESENTATION_QOS).

In the above case, this operation must be called prior to calling any of the sample-accessing operations, **com.rti.dds.subscription.Subscriber.get_datareaders** (p. 2050) on the **com.rti.dds.subscription.Subscriber** (p. 2039), and **com.rti.ndds.example.FooDataReader.read** (p. 1361), **com.rti.ndds.example.FooDataReader.take** (p. 1363), **com.rti.ndds.example.FooDataReader.read_w_condition** (p. 1368), and **com.rti.ndds.example.FooDataReader.take_w_condition** (p. 1369) on any **com.rti.dds.subscription.DataReader** (p. 707).

Once the application has finished accessing the data samples, it must call **com.rti.dds.subscription.Subscriber.end_access** (p. 2059)

The application is not required to call **com.rti.dds.subscription.Subscriber.begin_access** (p. 2058) / **com.rti.dds.subscription.Subscriber.end_access** (p. 2059) to access the samples in order if the **PRESENTATION** (p. 497) policy in the **com.rti.dds.publication.Publisher** (p. 1767) has **com.rti.dds.infrastructure.PresentationQosPolicy.access_scope** (p. 1682) set to something other than com.rti.dds.infrastructure.PresentationQosPolicyAccessScopeKind.PresentationQosPolicyAccessScopeKind.GROUP_PRESENTATION_QOS. In this case, calling **com.rti.dds.subscription.Subscriber.begin_access** (p. 2058) / **com.rti.dds.subscription.Subscriber.end_access** (p. 2059) is not considered an error and has no effect.

Calls to **com.rti.dds.subscription.Subscriber.begin_access** (p. 2058) / **com.rti.dds.subscription.Subscriber.end_access** (p. 2059) may be nested and must be balanced.

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

See also

Access to data samples (p. 80)

com.rti.dds.subscription.Subscriber.get_datareaders (p. 2050)

PRESENTATION (p. 497)

8.327.2.23 end_access()

```
void end_access ( )
```

Indicates that the application has finished accessing the data samples in **com.rti.dds.subscription.DataReader** (p. 707) objects managed by the **com.rti.dds.subscription.Subscriber** (p. 2039).

This operation must be used to close a corresponding **begin_access()** (p. 2058).

This call must close a previous call to **com.rti.dds.subscription.Subscriber.begin_access()** (p. 2058), otherwise the operation will fail with the error **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903) or **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902).

8.327.2.24 copy_from_topic_qos()

```
void copy_from_topic_qos (
            DataReaderQos datareader_qos,
            TopicQos topic_qos )
```

Copies the policies in the **com.rti.dds.topic.TopicQos** (p. 2133) to the corresponding policies in the **com.rti.dds.↩ subscription.DataReaderQos** (p. 777).

Copies the policies in the **com.rti.dds.topic.TopicQos** (p. 2133) to the corresponding policies in the **com.rti.dds.↩ subscription.DataReaderQos** (p. 777) (replacing values in the **com.rti.dds.subscription.DataReaderQos** (p. 777), if present).

This is a "convenience" operation most useful in combination with the operations **com.rti.dds.subscription.↩ Subscriber.get_default_datareader_qos** (p. 2042) and **com.rti.dds.topic.Topic.get_qos** (p. 2119). The operation **com.rti.dds.subscription.Subscriber.copy_from_topic_qos** (p. 2060) can be used to merge the **com.rti.dds.↩ subscription.DataReader** (p. 707) default QoS policies with the corresponding ones on the **com.rti.dds.topic.Topic** (p. 2116). The resulting QoS can then be used to create a new **com.rti.dds.subscription.DataReader** (p. 707), or set its QoS.

This operation does not check the resulting **com.rti.dds.subscription.DataReaderQos** (p. 777) for consistency. This is because the 'merged' **com.rti.dds.subscription.DataReaderQos** (p. 777) may not be the final one, as the application can still modify some policies prior to applying the policies to the **com.rti.dds.subscription.DataReader** (p. 707).

Parameters

datareader_qos	*<<**inout**>> (p. 404)* **com.rti.dds.subscription.DataReaderQos** (p. 777) to be filled-up. Cannot be NULL.
topic_qos	*<<**in**>> (p. 404)* **com.rti.dds.topic.TopicQos** (p. 2133) to be merged with **com.rti.dds.subscription.DataReaderQos** (p. 777). Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513)

8.327.2.25 get_participant()

```
DomainParticipant get_participant ( )
```

Returns the **com.rti.dds.domain.DomainParticipant** (p. 948) to which the **com.rti.dds.subscription.Subscriber** (p. 2039) belongs.

Returns

the **com.rti.dds.domain.DomainParticipant** (p. 948) to which the **com.rti.dds.subscription.Subscriber** (p. 2039) belongs.

8.327.2.26 delete_contained_entities()

```
void delete_contained_entities ( )
```

Deletes all the entities that were created by means of the "create" operation on the **com.rti.dds.subscription.↩ Subscriber** (p. 2039).

Deletes all contained **com.rti.dds.subscription.DataReader** (p. 707) objects. This pattern is applied recursively. In this manner, the operation **com.rti.dds.subscription.Subscriber.delete_contained_entities** (p. 2061) on the **com.↩ rti.dds.subscription.Subscriber** (p. 2039) will end up deleting all the entities recursively contained in the **com.rti.↩ dds.subscription.Subscriber** (p. 2039), including the **com.rti.dds.subscription.QueryCondition** (p. 1812), **com.↩ rti.dds.subscription.ReadCondition** (p. 1816), and **com.rti.dds.subscription.TopicQuery** (p. 2139) objects belonging to the contained **com.rti.dds.subscription.DataReader** (p. 707).

The operation will fail with **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903) if any of the contained entities is in a state where it cannot be deleted. This will occur, for example, if a contained **com.rti.dds.↩ subscription.DataReader** (p. 707) cannot be deleted because the application has called a **com.rti.ndds.example.↩ FooDataReader.read** (p. 1361) or **com.rti.ndds.example.FooDataReader.take** (p. 1363) operation and has not called the corresponding **com.rti.ndds.example.FooDataReader.return_loan** (p. 1386) operation to return the loaned samples.

Once **com.rti.dds.subscription.Subscriber.delete_contained_entities** (p. 2061) completes successfully, the application may delete the **com.rti.dds.subscription.Subscriber** (p. 2039).

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Exceptions

One	of the **Standard Return Codes** (p. 513), or **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903)

8.327.2.27 lookup_datareader_by_name()

```
DataReader lookup_datareader_by_name (
            String datareader_name )
```

<<***extension***>> *(*p. *403)* Retrieves a **com.rti.dds.subscription.DataReader** (p. 707) contained within the **com.rti.dds.subscription.Subscriber** (p. 2039) the **com.rti.dds.subscription.DataReader** (p. 707) entity name.

Every **com.rti.dds.subscription.DataReader** (p. 707) in the system has an entity name which is configured and stored in the <<***extension***>> *(*p. *403)* EntityName policy, **ENTITY_NAME** (p. 485).

This operation retrieves the **com.rti.dds.subscription.DataReader** (p. 707) within the **com.rti.dds.subscription.Subscriber** (p. 2039) whose name matches the one specified. If there are several **com.rti.dds.subscription.DataReader** (p. 707) with the same name within the **com.rti.dds.subscription.Subscriber** (p. 2039), the operation returns the first matching occurrence.

Parameters

datareader_name	<<***in***>> *(*p. *404)* Entity name of the **com.rti.dds.subscription.DataReader** (p. 707).

Returns

The first **com.rti.dds.subscription.DataReader** (p. 707) found with the specified name or NULL if it is not found.

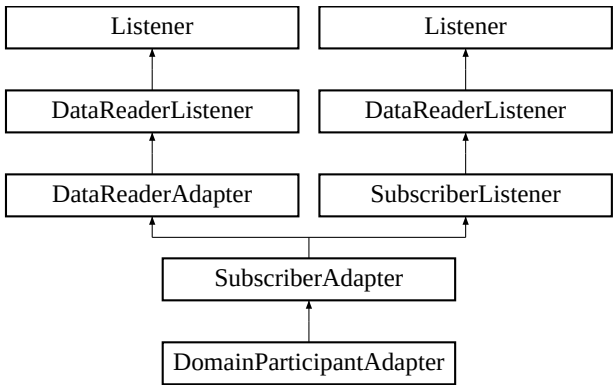
8.328 SubscriberAdapter Class Reference

A listener adapter in the spirit of the Java AWT listener adapters. (The Adapter provides empty implementations for the listener methods)

Inheritance diagram for SubscriberAdapter:



Public Member Functions

- void **on_data_on_readers** (**Subscriber** subs)

  Handles the com.rti.dds.infrastructure.StatusKind.StatusKind.DATA_ON_READERS_STATUS communication status.

8.328.1 Detailed Description

A listener adapter in the spirit of the Java AWT listener adapters. (The Adapter provides empty implementations for the listener methods)

Clients who do not wish to implement all listener methods can subclass this class and override only the methods of interest.

8.328.2 Member Function Documentation

8.328.2.1 on_data_on_readers()

```
void on_data_on_readers (
              Subscriber subs )
```

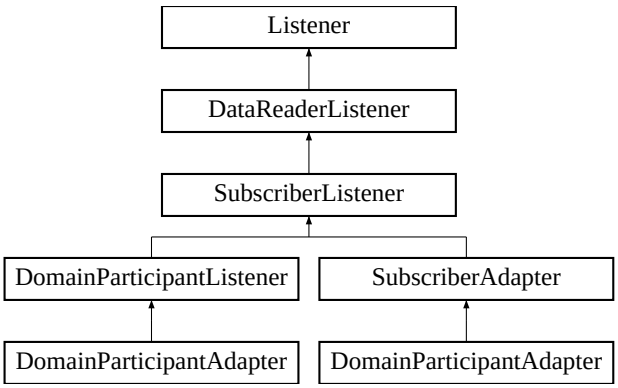
Handles the com.rti.dds.infrastructure.StatusKind.StatusKind.DATA_ON_READERS_STATUS communication status.

Implements **SubscriberListener** (p. 2064).

8.329 SubscriberListener Interface Reference

<<***interface***>> *(*p. *403)* **com.rti.dds.infrastructure.Listener** (p. 1528) for status about a subscriber.

Inheritance diagram for SubscriberListener:



Public Member Functions

- void **on_data_on_readers** (**Subscriber** subs)

  Handles the com.rti.dds.infrastructure.StatusKind.StatusKind.DATA_ON_READERS_STATUS communication status.

8.329.1 Detailed Description

<<***interface***>> *(p. 403)* **com.rti.dds.infrastructure.Listener** (p. 1528) for status about a subscriber.

Entity:

com.rti.dds.subscription.Subscriber (p. 2039)

Status:

com.rti.dds.infrastructure.StatusKind.StatusKind.DATA_AVAILABLE_STATUS;
com.rti.dds.infrastructure.StatusKind.StatusKind.DATA_ON_READERS_STATUS;
com.rti.dds.infrastructure.StatusKind.StatusKind.LIVELINESS_CHANGED_STATUS, **com.rti.dds.subscription.↩ LivelinessChangedStatus** (p. 1531);
com.rti.dds.infrastructure.StatusKind.StatusKind.REQUESTED_DEADLINE_MISSED_STATUS, **com.rti.dds.↩ subscription.RequestedDeadlineMissedStatus** (p. 1864);
com.rti.dds.infrastructure.StatusKind.StatusKind.REQUESTED_INCOMPATIBLE_QOS_STATUS, **com.rti.dds.↩ subscription.RequestedIncompatibleQosStatus** (p. 1865);
com.rti.dds.infrastructure.StatusKind.StatusKind.SAMPLE_LOST_STATUS_STATUS, **com.rti.dds.subscription.↩ SampleLostStatus** (p. 1958);
com.rti.dds.infrastructure.StatusKind.StatusKind.SAMPLE_REJECTED_STATUS, **com.rti.dds.subscription.↩ SampleRejectedStatus** (p. 1966);
com.rti.dds.infrastructure.StatusKind.StatusKind.SUBSCRIPTION_MATCHED_STATUS, **com.rti.dds.subscription.↩ SubscriptionMatchedStatus** (p. 2081);

com.rti.dds.infrastructure.Listener (p. 1528)

Status Kinds (p. 514)

Operations Allowed in Listener Callbacks (p. 1530)

8.329.2 Member Function Documentation

8.329.2.1 on_data_on_readers()

```
void on_data_on_readers (
            Subscriber subs )
```

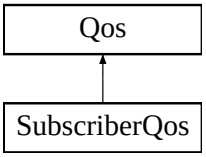
Handles the com.rti.dds.infrastructure.StatusKind.StatusKind.DATA_ON_READERS_STATUS communication status.

Implemented in **SubscriberAdapter** (p. 2063).

8.330 SubscriberQos Class Reference

QoS policies supported by a **com.rti.dds.subscription.Subscriber** (p. 2039) entity.

Inheritance diagram for SubscriberQos:



Public Member Functions

- String **toString** ()

  Overrides the builtin Object.toString method.
- String **toString** (**SubscriberQos** baseQos, **QosPrintFormat** format)

  *Obtains a string representation of a **SubscriberQos** (p. 2065) object.*
- String **toString** (**QosPrintFormat** format)

  *Obtains a string representation of a **SubscriberQos** (p. 2065) object.*
- String **toString** (**SubscriberQos** baseQos)

  *Obtains a string representation of a **DataReaderQos** (p. 777) object.*

Public Attributes

- final **PresentationQosPolicy** **presentation**

  *Presentation policy, **PRESENTATION** (p. 497).*
- final **PartitionQosPolicy** **partition**

  *<<**basic**>> (p. 123) Partition policy, **PARTITION** (p. 496).*
- final **GroupDataQosPolicy** **group_data**

  *Group data policy, **GROUP_DATA** (p. 486).*
- final **EntityFactoryQosPolicy** **entity_factory**

  *<<**basic**>> (p. 123) Entity factory policy, **ENTITY_FACTORY** (p. 484).*
- final **EntityNameQosPolicy** **subscriber_name**

  *<<**extension**>> (p. 403) EntityName policy, **ENTITY_NAME** (p. 485).*

8.330.1 Detailed Description

QoS policies supported by a **com.rti.dds.subscription.Subscriber** (p. 2039) entity.

You must set certain members in a consistent manner:

length of **com.rti.dds.infrastructure.GroupDataQosPolicy.value** (p. 1420) <= **com.rti.dds.infrastructure.Domain↩ ParticipantResourceLimitsQosPolicy.subscriber_group_data_max_length** (p. 1097)

length of **com.rti.dds.infrastructure.PartitionQosPolicy.name** (p. 1666) <= **com.rti.dds.infrastructure.Domain↩ ParticipantResourceLimitsQosPolicy.max_partitions** (p. 1098)

combined number of characters (including terminating 0) in **com.rti.dds.infrastructure.PartitionQosPolicy.↩ name** (p. 1666) <= **com.rti.dds.infrastructure.DomainParticipantResourceLimitsQosPolicy.max_partition_↩ cumulative_characters** (p. 1098)

If any of the above are not true, **com.rti.dds.subscription.Subscriber.set_qos** (p. 2052) and **com.rti.dds.↩ subscription.Subscriber.set_qos_with_profile** (p. 2053) will fail with **com.rti.dds.infrastructure.RETCODE_↩ INCONSISTENT_POLICY** (p. 1901)

8.330.2 Member Function Documentation

8.330.2.1 toString() [1/4]

```
String toString ( )
```

Overrides the builtin Object.toString method.

The various **toString()** (p. 2066) overloads allow formatting the output and printing only the differences with respect to another **DataReaderQos** (p. 777) object.

```
SubscriberQos qos = new SubscriberQos();
String theString = new String();
// The most basic version of the API simply overrides the builtin
// Object.toString method. Only the differences with respect to the
// documented default are printed to the string. The string is formatted
// according to the default values for QosPrintFormat.
theString = qos.toString();
// This overload allows us to specify a base profile. Only the differences
// with respect to this base profile are printed to the string. If the two
// Qos objects are equal, the resultant string will be empty.
SubscriberQos baseQos = new SubscriberQos(); // ...;
theString = qos.toString(baseQos);
// It is also possible to supply a custom format at this point
QosPrintFormat printFormat = new QosPrintFormat(); // ...;
theString = qos.toString(baseQos, format);
// The sentinel value SUBSCRIBER_QOS_PRINT_ALL can be used as
// the base in order to print the entire qos object
theString = qos.toString(SUBSCRIBER_QOS_PRINT_ALL);
```

This overload uses the default print format and only prints the differences between the supplied **DataReaderQos** (p. 777) and the documented default.

Returns

The string representation of the Qos.

References **SubscriberQos.toString()**.

Referenced by **SubscriberQos.toString()**.

8.330.2.2 toString() [2/4]

```
String toString (
            SubscriberQos baseQos,
            QosPrintFormat format )
```

Obtains a string representation of a **SubscriberQos** (p. 2065) object.

Parameters

format	The print format used to format the output.
baseQos	Only the differences between baseQos and the Qos object are included in the output string. If you want to print everything within the Qos, use the **com.rti.dds.domain.DomainParticipant.SUBSCRIBER_QOS_PRINT_ALL** (p. 49) sentinel value.

This overload prints the differences between the qos and the supplied baseQos. The output string is formatted using the supplied **com.rti.dds.infrastructure.QosPrintFormat** (p. 1809).

Returns

The string representation of the Qos.

References **DomainParticipant.SUBSCRIBER_QOS_PRINT_ALL**.

8.330.2.3 toString() [3/4]

```
String toString (
              QosPrintFormat format )
```

Obtains a string representation of a **SubscriberQos** (p. 2065) object.

Parameters

format	The print format used to format the output.

This overload prints the differences between the qos and the documented. default. The output string is formatted using the supplied **com.rti.dds.infrastructure.QosPrintFormat** (p. 1809).

Returns

The string representation of the Qos.

References **SubscriberQos.toString()**.

8.330.2.4 toString() [4/4]

```
String toString (
              SubscriberQos baseQos )
```

Obtains a string representation of a **DataReaderQos** (p. 777) object.

Parameters

baseQos	Only the differences between baseQos and the Qos object are included in the output string. If you want to print everything within the Qos, use the **com.rti.dds.domain.DomainParticipant.SUBSCRIBER_QOS_PRINT_ALL** (p. 49) sentinel value.

This overload prints the differences between the qos and the supplied baseQos. The output string is formatted using the default value for **com.rti.dds.infrastructure.QosPrintFormat** (p. 1809).

Returns

The string representation of the Qos.

References **SubscriberQos.toString()**.

8.330.3 Member Data Documentation

8.330.3.1 presentation

```
final PresentationQosPolicy presentation
```

Presentation policy, **PRESENTATION** (p. 497).

8.330.3.2 partition

```
final PartitionQosPolicy partition
```

<<***basic***>> *(p. 123)* Partition policy, **PARTITION** (p. 496).

8.330.3.3 group_data

```
final GroupDataQosPolicy group_data
```

Group data policy, **GROUP_DATA** (p. 486).

8.330.3.4 entity_factory

```
final EntityFactoryQosPolicy entity_factory
```

<<***basic***>> *(p. 123)* Entity factory policy, **ENTITY_FACTORY** (p. 484).

8.330.3.5 subscriber_name

```
final  EntityNameQosPolicy subscriber_name
```

<<***extension***>> *(*p. *403)* EntityName policy, **ENTITY_NAME** (p. 485).

8.331 SubscriberSeq Class Reference

Declares IDL `sequence` < **com.rti.dds.subscription.Subscriber** (p. 2039) > .

Inherits AbstractNativeSequence.

Public Member Functions

- **SubscriberSeq** (Collection<?> subscribers)
- int **getMaximum** ()

  Get the current maximum number of elements that can be stored in this sequence.

8.331.1 Detailed Description

Declares IDL `sequence` < **com.rti.dds.subscription.Subscriber** (p. 2039) > .

See also

com.rti.dds.infrastructure.com.rti.dds.util.Sequence

8.331.2 Constructor & Destructor Documentation

8.331.2.1 SubscriberSeq()

```
SubscriberSeq (
            Collection<?> subscribers )
```

Exceptions

NullPointerException	if the given collection is null

8.331.3 Member Function Documentation

8.331.3.1 getMaximum()

```
int getMaximum ( )
```

Get the current maximum number of elements that can be stored in this sequence.

The `maximum` of the sequence represents the maximum number of elements that the underlying buffer can hold. It does not represent the current number of elements.

The `maximum` is a non-negative number. It is initialized when the sequence is first created.

The `maximum` can be changed implicitly by adding an element to the sequence with **`add()`** (p. 583), or explicitly by calling com.rti.dds.infrastructure.com.rti.dds.util.Sequence.Sequence.setMaximum.

Returns

the current maximum of the sequence.

See also

com.rti.dds.infrastructure.com.rti.dds.util.Sequence.Sequence.size()

Implements **Sequence** (p. 1974).

8.332 SubscriptionBuiltinTopicData Class Reference

Entry created when a **com.rti.dds.subscription.DataReader** (p. 707) is discovered in association with its **Subscriber** (p. 2039).

Inherits AbstractBuiltinTopicData.

Public Attributes

- final **BuiltinTopicKey_t key**

  DCPS key to distinguish entries.
- final **BuiltinTopicKey_t participant_key**

  *DCPS key of the participant to which the **DataReader** (p. 707) belongs.*
- String **topic_name**

  *Name of the related **com.rti.dds.topic.Topic** (p. 2116).*
- String **type_name**

  *Name of the type attached to the **com.rti.dds.topic.Topic** (p. 2116).*
- final **DurabilityQosPolicy durability**

  *Policy of the corresponding **DataReader** (p. 707).*
- final **DeadlineQosPolicy deadline**

  *Policy of the corresponding **DataReader** (p. 707).*
- final **LatencyBudgetQosPolicy latency_budget**

  Tags of the corresponding ***DataReader*** (p. *707).*

8.332.1 Detailed Description

Entry created when a **com.rti.dds.subscription.DataReader** (p. 707) is discovered in association with its **Subscriber** (p. 2039).

Data associated with the built-in topic **com.rti.dds.subscription.builtin.SubscriptionBuiltinTopicDataType↩ Support.SUBSCRIPTION_TOPIC_NAME** (p. 412). It contains QoS policies and additional information that apply to the remote **com.rti.dds.subscription.DataReader** (p. 707) the related **com.rti.dds.subscription.Subscriber** (p. 2039).

See also

com.rti.dds.subscription.builtin.SubscriptionBuiltinTopicDataTypeSupport.SUBSCRIPTION_TOPIC_↩ NAME (p. 412)

builtin.SubscriptionBuiltinTopicDataDataReader (p. 2079)

8.332.2 Member Data Documentation

8.332.2.1 key

```
final  BuiltinTopicKey_t key
```

DCPS key to distinguish entries.

8.332.2.2 participant_key

```
final  BuiltinTopicKey_t participant_key
```

DCPS key of the participant to which the **DataReader** (p. 707) belongs.

8.332.2.3 topic_name

```
String topic_name
```

Name of the related **com.rti.dds.topic.Topic** (p. 2116).

The length of this string is limited to 255 characters.

8.332.2.4 type_name

```
String type_name
```

Name of the type attached to the **com.rti.dds.topic.Topic** (p. 2116).

The length of this string is limited to 255 characters.

8.332.2.5 durability

```
final  DurabilityQosPolicy durability
```

Policy of the corresponding **DataReader** (p. 707).

8.332.2.6 deadline

```
final  DeadlineQosPolicy deadline
```

Policy of the corresponding **DataReader** (p. 707).

8.332.2.7 latency_budget

```
final LatencyBudgetQosPolicy latency_budget
```

Policy of the corresponding **DataReader** (p. 707).

8.332.2.8 liveliness

```
final LivelinessQosPolicy liveliness
```

Policy of the corresponding **DataReader** (p. 707).

8.332.2.9 reliability

```
final ReliabilityQosPolicy reliability
```

Policy of the corresponding **DataReader** (p. 707).

8.332.2.10 ownership

```
final OwnershipQosPolicy ownership
```

Policy of the corresponding **DataReader** (p. 707).

8.332.2.11 destination_order

```
final DestinationOrderQosPolicy destination_order
```

Policy of the corresponding **DataReader** (p. 707).

Warning

Only the field **com.rti.dds.infrastructure.DestinationOrderQosPolicy.kind** (p. 905) is propagated during discovery. The other fields always contain their default values.

8.332.2.12 user_data

```
final  UserDataQosPolicy user_data
```

Policy of the corresponding **DataReader** (p. 707).

8.332.2.13 time_based_filter

```
final  TimeBasedFilterQosPolicy time_based_filter
```

Policy of the corresponding **DataReader** (p. 707).

8.332.2.14 presentation

```
final  PresentationQosPolicy presentation
```

Policy of the **Subscriber** (p. 2039) to which the **DataReader** (p. 707) belongs.

8.332.2.15 partition

```
final  PartitionQosPolicy partition
```

Policy of the **Subscriber** (p. 2039) to which the **DataReader** (p. 707) belongs.

8.332.2.16 type_consistency

```
final  TypeConsistencyEnforcementQosPolicy type_consistency
```

Policy of the corresponding **DataReader** (p. 707).

8.332.2.17 topic_data

```
final  TopicDataQosPolicy topic_data
```

Policy of the related Topic.

8.332.2.18 group_data

```
final GroupDataQosPolicy group_data
```

Policy of the **Subscriber** (p. 2039) to which the **DataReader** (p. 707) belongs.

8.332.2.19 type_code

```
TypeCode type_code
```

<<***extension***>> *(p. 403)* Type code information of the corresponding Topic.

If using TypeObject v2 (**com.rti.dds.infrastructure.DiscoveryConfigBuiltinChannelKind.TYPE_LOOKUP_SERVICE_CHANNEL** (p. 912)) this is NULL if the type is not yet resolved. If the remote endpoint's topic name matches the **com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.request_types_filter** (p. 942), this will always contain the TypeCode converted from the complete TypeObject v2 representation (if non-NULL); the minimal TypeObject v2 will not be provided even if available. If the topic name does not match the **com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.request_types_filter** (p. 942) and the complete TypeObject v2 is resolved, this will contain the TypeCode converted from the complete TypeObject v2 representation. If the topic name does not match the **com.rti.dds.infrastructure.DiscoveryConfigQosPolicy.request_types_filter** (p. 942), and only the minimal TypeObject v2 is resolved, this will contain the TypeCode converted from the minimal TypeObject v2 representation. As such, information that is not available in the minimal TypeObject v2 representation will be lost (such as default values) and member names will be the stringified version of the hashed member name, rather than the full member name. See `TypeLookupService` for more information.

8.332.2.20 subscriber_key

```
final BuiltinTopicKey_t subscriber_key
```

<<***extension***>> *(p. 403)* DCPS key of the subscriber to which the **DataReader** (p. 707) belongs.

8.332.2.21 property

```
final PropertyQosPolicy property
```

<<***extension***>> *(p. 403)* Properties of the corresponding **DataReader** (p. 707).

8.332.2.22 unicast_locators

```
final LocatorSeq unicast_locators
```

<<***extension***>> *(p. 403)* Custom unicast locators that the endpoint can specify. The default locators will be used if this is not specified.

8.332.2.23 multicast_locators

```
final  LocatorSeq multicast_locators
```

<<***extension***>> *(p. 403)* Custom multicast locators that the endpoint can specify. The default locators will be used if this is not specified.

8.332.2.24 content_filter_property

```
final  ContentFilterProperty_t content_filter_property
```

<<***extension***>> *(p. 403)* This field provides all the required information to enable content filtering on the Writer side.

8.332.2.25 virtual_guid

```
final  GUID_t virtual_guid
```

<<***extension***>> *(p. 403)* Virtual GUID associated to the **DataReader** (p. 707).

See also

com.rti.dds.infrastructure.GUID_t (p. 1423)

8.332.2.26 service

```
final  ServiceQosPolicy service
```

<<***extension***>> *(p. 403)* Policy of the corresponding **DataReader** (p. 707).

8.332.2.27 rtps_protocol_version

```
final  ProtocolVersion_t rtps_protocol_version
```

<<***extension***>> *(p. 403)* Version number of the RTPS wire protocol used.

8.332.2.28 rtps_vendor_id

```
final VendorId_t rtps_vendor_id
```

<<***extension***>> *(p. 403)* ID of vendor implementing the RTPS wire protocol.

8.332.2.29 product_version

```
final ProductVersion_t product_version
```

<<***extension***>> *(p. 403)* This is a vendor specific parameter. It gives the current version of RTI Connext

8.332.2.30 representation

```
final DataRepresentationQosPolicy representation
```

Data representation policy of the corresponding **DataReader** (p. 707).

8.332.2.31 disable_positive_acks

```
boolean disable_positive_acks
```

<<***extension***>> *(p. 403)* This is a vendor specific parameter. Determines whether the corresponding **DataReader** (p. 707) sends positive acknowledgments for reliability.

8.332.2.32 subscription_name

```
final EntityNameQosPolicy subscription_name
```

<<***extension***>> *(p. 403)* The subscription name and role name.

This member contains the name and the role name of the discovered subscription.

8.332.2.33 trust_protection_info

```
final EndpointTrustProtectionInfo trust_protection_info
```

<<***extension***>> *(*p. *403)* Trust plugins protection information associated with the discovered **DataReader** (p. 707).

e

Trust Plugins is a generic abstraction that represents any plugin intended to do transformation, interception, and validation of exchanged data and metadata.

trust_protection_info contains information about how RTPS wire serialization, discovery, and liveliness interact with the loaded Trust Plugins. Two endpoints will not match if their trust_protection_info is incompatible.

The meaning of the contents of this field may vary depending on what Trust Plugins the endpoint is using. For information about how this field interacts with the RTI Security Plugins, please refer to the `RTI Security Plugins User's Manual`.

8.332.2.34 trust_algorithm_info

```
final EndpointTrustAlgorithmInfo trust_algorithm_info
```

<<***extension***>> *(*p. *403)* Trust Plugins algorithms associated with the discovered **DataReader** (p. 707).

e

Trust Plugins is a generic abstraction that represents any plugin intended to do transformation, interception, and validation of exchanged data and metadata.

trust_algorithm_info contains information about what algorithms the loaded Trust Plugins are running. Two endpoints will not match if their trust_algorithm_info are incompatible.

The meaning of the contents of this field may vary depending on what Trust Plugins the endpoint is using. For information about how this field interacts with the RTI Security Plugins, please refer to the `RTI Security Plugins User's Manual`.

8.332.2.35 data_tags

```
final DataTagQosPolicy data_tags
```

Tags of the corresponding **DataReader** (p. 707).

8.333 SubscriptionBuiltinTopicDataDataReader Class Reference

Instantiates **DataReader** (p. 707) < **com.rti.dds.subscription.builtin.SubscriptionBuiltinTopicData** (p. 2070) >.

Inherits DataReaderImpl.

8.333.1 Detailed Description

Instantiates **DataReader** (p. 707) < **com.rti.dds.subscription.builtin.SubscriptionBuiltinTopicData** (p. 2070) >.

com.rti.dds.subscription.DataReader (p. 707) of topic **com.rti.dds.subscription.builtin.SubscriptionBuiltin↩ TopicDataTypeSupport.SUBSCRIPTION_TOPIC_NAME** (p. 412) used for accessing **com.rti.dds.subscription.↩ builtin.SubscriptionBuiltinTopicData** (p. 2070) of the remote **com.rti.dds.subscription.DataReader** (p. 707) and the associated **com.rti.dds.subscription.Subscriber** (p. 2039).

Instantiates:

<<***generic***>> *(*p. *403)* **com.rti.ndds.example.FooDataReader** (p. 1359)

8.336 SubscriptionMatchedStatus Class Reference

com.rti.dds.infrastructure.StatusKind.StatusKind.SUBSCRIPTION_MATCHED_STATUS

Inherits Status.

Public Attributes

- int **total_count** = 0

  *The total cumulative number of times that this **com.rti.dds.subscription.DataReader** (p. 707) discovered a "match" with a **com.rti.dds.publication.DataWriter** (p. 818).*
- int **total_count_change** = 0

  The changes in total_count since the last time the listener was called or the status was read.
- int **current_count** = 0

  *The current number of DataWriters with which the **com.rti.dds.subscription.DataReader** (p. 707) is matched.*
- int **current_count_peak** = 0

  *<<**extension**>> (p. 403) Greatest number of DataWriters that matched this **DataReader** (p. 707) simultaneously.*
- int **current_count_change** = 0

  The change in current_count since the last time the listener was called or the status was read.
- final **InstanceHandle_t** **last_publication_handle** = new **InstanceHandle_t**()

  *This InstanceHandle can be used to look up which remote **com.rti.dds.publication.DataWriter** (p. 818) was the last to cause this **DataReader** (p. 707)'s status to change, using **com.rti.dds.subscription.DataReader.get_matched_↩ publication_data** (p. 724).*

8.336.1 Detailed Description

com.rti.dds.infrastructure.StatusKind.StatusKind.SUBSCRIPTION_MATCHED_STATUS

A "match" happens when the **com.rti.dds.subscription.DataReader** (p. 707) finds a **com.rti.dds.publication.Data↩ Writer** (p. 818) with the same **com.rti.dds.topic.Topic** (p. 2116), same or compatible data type, and an offered QoS that is compatible with that requested by the **com.rti.dds.subscription.DataReader** (p. 707). (For information on compatible data types, see the `Extensible Types Guide`.)

This status is also changed (and the listener, if any, called) when a match is ended. A local **com.rti.dds.subscription.↩ DataReader** (p. 707) will become "unmatched" from a remote **com.rti.dds.publication.DataWriter** (p. 818) when that **com.rti.dds.publication.DataWriter** (p. 818) goes away for any of the following reasons:

- The **com.rti.dds.domain.DomainParticipant** (p. 948) containing the matched **com.rti.dds.publication.Data↩ Writer** (p. 818) has lost liveliness.
- This **DataReader** (p. 707) or the matched DataWriter has changed QoS such that the entities are now incompatible.
- The matched DataWriter has been deleted.

This status may reflect changes from multiple match or unmatch events, and the **com.rti.dds.subscription.↩ SubscriptionMatchedStatus.current_count_change** (p. 2083) can be used to determine the number of changes since the listener was called back or the status was checked.

Note: A DataWriter's loss of liveliness (which is determined by **com.rti.dds.infrastructure.LivelinessQosPolicyKind** (p. 1539)) does not trigger an unmatch event. So a DataWriter may still match even though its liveliness is lost.

8.336.2 Member Data Documentation

8.336.2.1 total_count

```
int total_count = 0
```

The total cumulative number of times that this **com.rti.dds.subscription.DataReader** (p. 707) discovered a "match" with a **com.rti.dds.publication.DataWriter** (p. 818).

This number increases whenever a new match is discovered. It does not decrease when an existing match goes away for any of the reasons described in **com.rti.dds.subscription.SubscriptionMatchedStatus** (p. 2081).

8.336.2.2 total_count_change

```
int total_count_change = 0
```

The changes in total_count since the last time the listener was called or the status was read.

Note that this number will never be negative (because it's the total number of times the **DataReader** (p. 707) ever matched with a DataWriter).

8.336.2.3 current_count

```
int current_count = 0
```

The current number of DataWriters with which the **com.rti.dds.subscription.DataReader** (p. 707) is matched.

This number increases when a new match is discovered and decreases when an existing match goes away for any of the reasons described in **com.rti.dds.subscription.SubscriptionMatchedStatus** (p. 2081).

8.336.2.4 current_count_peak

```
int current_count_peak = 0
```

<<***extension***>> *(p. 403)* Greatest number of DataWriters that matched this **DataReader** (p. 707) simultaneously.

That is, there was no moment in time when more than this many DataWriters matched this **DataReader** (p. 707). (As a result, total_count can be higher than current_count_peak.)

8.336.2.5 current_count_change

```
int current_count_change = 0
```

The change in current_count since the last time the listener was called or the status was read.

Note that a negative current_count_change means that one or more DataWriters have become unmatched for one or more of the reasons described in **com.rti.dds.subscription.SubscriptionMatchedStatus** (p. 2081).

8.336.2.6 last_publication_handle

```
final InstanceHandle_t last_publication_handle = new InstanceHandle_t()
```

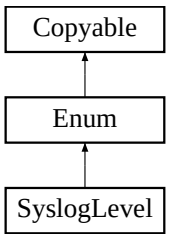
This InstanceHandle can be used to look up which remote **com.rti.dds.publication.DataWriter** (p. 818) was the last to cause this **DataReader** (p. 707)'s status to change, using **com.rti.dds.subscription.DataReader.get_matched_publication_data** (p. 724).

If the DataWriter no longer matches this **DataReader** (p. 707) due to any of the reasons in **com.rti.dds.subscription.SubscriptionMatchedStatus** (p. 2081) except incompatible QoS, then the DataWriter has been purged from this **DataReader** (p. 707)'s DomainParticipant discovery database. (See the "Discovery Overview" section of the User's Manual.) In that case, the **com.rti.dds.subscription.DataReader.get_matched_publication_data** (p. 724) method will not be able to return information about the DataWriter. The only way to get information about the lost DataWriter is if you cached the information previously.

8.337 SyslogLevel Class Reference

Syslog level category assigned to RTI Connext log messages. See Syslog Level and Verbosity Mapping, in the Core Libraries User's Manual, for more information.

Inheritance diagram for SyslogLevel:



Static Public Attributes

- static final **SyslogLevel NDDS_CONFIG_SYSLOG_LEVEL_EMERGENCY**
  System is unusable.
- static final **SyslogLevel NDDS_CONFIG_SYSLOG_LEVEL_ALERT**
  Should be corrected immediately.
- static final **SyslogLevel NDDS_CONFIG_SYSLOG_LEVEL_CRITICAL**
  Critical conditions.
- static final **SyslogLevel NDDS_CONFIG_SYSLOG_LEVEL_ERROR**
  Error conditions.
- static final **SyslogLevel NDDS_CONFIG_SYSLOG_LEVEL_WARNING**
  May indicate that an error will occur if action is not taken.
- static final **SyslogLevel NDDS_CONFIG_SYSLOG_LEVEL_NOTICE**
  Events that are unusual, but not error conditions.
- static final **SyslogLevel NDDS_CONFIG_SYSLOG_LEVEL_INFORMATIONAL**
  Normal operational messages that require no action.
- static final **SyslogLevel NDDS_CONFIG_SYSLOG_LEVEL_DEBUG**
  Information useful to developers for debugging the application.

Additional Inherited Members

8.337.1 Detailed Description

Syslog level category assigned to RTI Connext log messages. See `Syslog Level and Verbosity Mapping`, in the Core Libraries User's Manual, for more information.

8.337.2 Member Data Documentation

8.337.2.1 NDDS_CONFIG_SYSLOG_LEVEL_EMERGENCY

`final` **SyslogLevel** `NDDS_CONFIG_SYSLOG_LEVEL_EMERGENCY [static]`

System is unusable.

Maps to **com.rti.ndds.config.LogLevel.NDDS_CONFIG_LOG_LEVEL_FATAL_ERROR** (p. 1573).

8.337.2.2 NDDS_CONFIG_SYSLOG_LEVEL_ALERT

`final` **SyslogLevel** `NDDS_CONFIG_SYSLOG_LEVEL_ALERT [static]`

Should be corrected immediately.

Maps to **com.rti.ndds.config.LogLevel.NDDS_CONFIG_LOG_LEVEL_ERROR** (p. 1573).

8.337.2.3 NDDS_CONFIG_SYSLOG_LEVEL_CRITICAL

`final` **SyslogLevel** `NDDS_CONFIG_SYSLOG_LEVEL_CRITICAL [static]`

Critical conditions.

Maps to **com.rti.ndds.config.LogLevel.NDDS_CONFIG_LOG_LEVEL_ERROR** (p. 1573).

8.337.2.4 NDDS_CONFIG_SYSLOG_LEVEL_ERROR

`final` **SyslogLevel** `NDDS_CONFIG_SYSLOG_LEVEL_ERROR [static]`

Error conditions.

Maps to **com.rti.ndds.config.LogLevel.NDDS_CONFIG_LOG_LEVEL_ERROR** (p. 1573).

8.337.2.5 NDDS_CONFIG_SYSLOG_LEVEL_WARNING

```
final SyslogLevel NDDS_CONFIG_SYSLOG_LEVEL_WARNING [static]
```

May indicate that an error will occur if action is not taken.

Maps to **com.rti.ndds.config.LogLevel.NDDS_CONFIG_LOG_LEVEL_WARNING** (p. 1573).

8.337.2.6 NDDS_CONFIG_SYSLOG_LEVEL_NOTICE

```
final SyslogLevel NDDS_CONFIG_SYSLOG_LEVEL_NOTICE [static]
```

Events that are unusual, but not error conditions.

Maps to **com.rti.ndds.config.LogLevel.NDDS_CONFIG_LOG_LEVEL_STATUS_LOCAL** (p. 1573).

8.337.2.7 NDDS_CONFIG_SYSLOG_LEVEL_INFORMATIONAL

```
final SyslogLevel NDDS_CONFIG_SYSLOG_LEVEL_INFORMATIONAL [static]
```

Normal operational messages that require no action.

Maps to **com.rti.ndds.config.LogLevel.NDDS_CONFIG_LOG_LEVEL_STATUS_LOCAL** (p. 1573).

8.337.2.8 NDDS_CONFIG_SYSLOG_LEVEL_DEBUG

```
final SyslogLevel NDDS_CONFIG_SYSLOG_LEVEL_DEBUG [static]
```

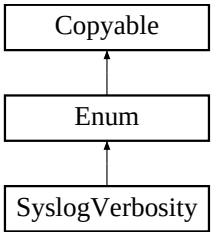
Information useful to developers for debugging the application.

Maps to **com.rti.ndds.config.LogLevel.NDDS_CONFIG_LOG_LEVEL_DEBUG** (p. 1574).

8.338 SyslogVerbosity Class Reference

The Syslog verbosities at which RTI Connext diagnostic information is logged. These Syslog verbosities are mapped to **com.rti.ndds.config.LogVerbosity** (p. 1579). See `Syslog Level and Verbosity Mapping`, in the Core Libraries User's Manual, for more information.

Inheritance diagram for SyslogVerbosity:



Static Public Attributes

- static final **SyslogVerbosity NDDS_CONFIG_SYSLOG_VERBOSITY_SILENT**

  No messages will be logged. (lowest verbosity)
- static final **SyslogVerbosity NDDS_CONFIG_SYSLOG_VERBOSITY_EMERGENCY**

  Emergency, critical, alert, and error messages will be logged.
- static final **SyslogVerbosity NDDS_CONFIG_SYSLOG_VERBOSITY_ALERT**

  Emergency, critical, and alert messages will be logged.
- static final **SyslogVerbosity NDDS_CONFIG_SYSLOG_VERBOSITY_CRITICAL**

  Emergency, critical, alert, and error messages will be logged.
- static final **SyslogVerbosity NDDS_CONFIG_SYSLOG_VERBOSITY_ERROR**

  Emergency, critical, alert, and error messages will be logged.
- static final **SyslogVerbosity NDDS_CONFIG_SYSLOG_VERBOSITY_WARNING**

  Emergency, critical, alert, error, and warning messages will be logged.
- static final **SyslogVerbosity NDDS_CONFIG_SYSLOG_VERBOSITY_NOTICE**

  Emergency, critical, alert, error, warning, notice and informational messages will be logged.
- static final **SyslogVerbosity NDDS_CONFIG_SYSLOG_VERBOSITY_INFORMATIONAL**

  Emergency, critical, alert, error, warning, notice, and informational messages will be logged.
- static final **SyslogVerbosity NDDS_CONFIG_SYSLOG_VERBOSITY_DEBUG**

  All messages will be logged.

Additional Inherited Members

8.338.1 Detailed Description

The Syslog verbosities at which RTI Connext diagnostic information is logged. These Syslog verbosities are mapped to **com.rti.ndds.config.LogVerbosity** (p. 1579). See `Syslog Level and Verbosity Mapping`, in the Core Libraries User's Manual, for more information.

8.338.2 Member Data Documentation

8.338.2.1 NDDS_CONFIG_SYSLOG_VERBOSITY_SILENT

```
final SyslogVerbosity NDDS_CONFIG_SYSLOG_VERBOSITY_SILENT [static]
```

No messages will be logged. (lowest verbosity)

Equivalent to **com.rti.ndds.config.LogVerbosity.NDDS_CONFIG_LOG_VERBOSITY_SILENT** (p. 1579).

8.338.2.2 NDDS_CONFIG_SYSLOG_VERBOSITY_EMERGENCY

```
final SyslogVerbosity NDDS_CONFIG_SYSLOG_VERBOSITY_EMERGENCY [static]
```

Emergency, critical, alert, and error messages will be logged.

This Syslog verbosity level is translated to **com.rti.ndds.config.LogVerbosity.NDDS_CONFIG_LOG_VERBOSITY↩ _ERROR** (p. 1580) when interpreted by RTI Connext. (That's why this level actually logs more than just emergency messages.)

8.338.2.3 NDDS_CONFIG_SYSLOG_VERBOSITY_ALERT

```
final SyslogVerbosity NDDS_CONFIG_SYSLOG_VERBOSITY_ALERT [static]
```

Emergency, critical, and alert messages will be logged.

This Syslog verbosity level is translated to **com.rti.ndds.config.LogVerbosity.NDDS_CONFIG_LOG_VERBOSITY↩ _ERROR** (p. 1580) when interpreted by RTI Connext. (That's why this level actually logs more than just emergency, critical and alert messages.)

8.338.2.4 NDDS_CONFIG_SYSLOG_VERBOSITY_CRITICAL

```
final SyslogVerbosity NDDS_CONFIG_SYSLOG_VERBOSITY_CRITICAL [static]
```

Emergency, critical, alert, and error messages will be logged.

This Syslog verbosity level is translated to **com.rti.ndds.config.LogVerbosity.NDDS_CONFIG_LOG_VERBOSITY↩ _ERROR** (p. 1580) when interpreted by RTI Connext. (That's why this level actually logs more than just emergency and critical messages.)

8.338.2.5 NDDS_CONFIG_SYSLOG_VERBOSITY_ERROR

```
final SyslogVerbosity NDDS_CONFIG_SYSLOG_VERBOSITY_ERROR [static]
```

Emergency, critical, alert, and error messages will be logged.

This Syslog verbosity level is translated to **com.rti.ndds.config.LogVerbosity.NDDS_CONFIG_LOG_VERBOSITY↩ _ERROR** (p. 1580) when interpreted by RTI Connext.

8.338.2.6 NDDS_CONFIG_SYSLOG_VERBOSITY_WARNING

```
final SyslogVerbosity NDDS_CONFIG_SYSLOG_VERBOSITY_WARNING [static]
```

Emergency, critical, alert, error, and warning messages will be logged.

This Syslog verbosity level is translated to **com.rti.ndds.config.LogVerbosity.NDDS_CONFIG_LOG_VERBOSITY↩ _WARNING** (p. 1580) when interpreted by RTI Connext.

8.338.2.7 NDDS_CONFIG_SYSLOG_VERBOSITY_NOTICE

final **SyslogVerbosity** NDDS_CONFIG_SYSLOG_VERBOSITY_NOTICE [static]

Emergency, critical, alert, error, warning, notice and informational messages will be logged.

This Syslog verbosity level is translated to **com.rti.ndds.config.LogVerbosity.NDDS_CONFIG_LOG_VERBOSITY↩ _STATUS_REMOTE** (p. 1580) when interpreted by RTI Connext. (That's why this level actually logs more than just emergency, critical, alert, error, warning and notice messages.)

8.338.2.8 NDDS_CONFIG_SYSLOG_VERBOSITY_INFORMATIONAL

final **SyslogVerbosity** NDDS_CONFIG_SYSLOG_VERBOSITY_INFORMATIONAL [static]

Emergency, critical, alert, error, warning, notice, and informational messages will be logged.

This Syslog verbosity level is translated to **com.rti.ndds.config.LogVerbosity.NDDS_CONFIG_LOG_VERBOSITY↩ _STATUS_REMOTE** (p. 1580) when interpreted by RTI Connext.

8.338.2.9 NDDS_CONFIG_SYSLOG_VERBOSITY_DEBUG

final **SyslogVerbosity** NDDS_CONFIG_SYSLOG_VERBOSITY_DEBUG [static]

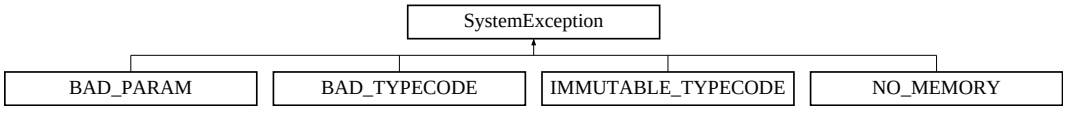
All messages will be logged.

This Syslog verbosity level is translated to **com.rti.ndds.config.LogVerbosity.NDDS_CONFIG_LOG_VERBOSITY↩ _STATUS_ALL** (p. 1580) when interpreted by RTI Connext.

8.339 SystemException Class Reference

System exception.

Inheritance diagram for SystemException:



8.339.1 Detailed Description

System exception.

This class is based on a similar class in CORBA.

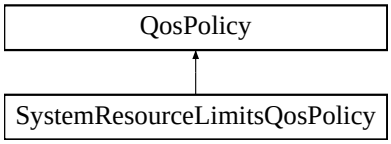
See also

http://java.sun.com/javase/6/docs/api/org/omg/CORBA/SystemException.html

8.340 SystemResourceLimitsQosPolicy Class Reference

*<<**extension**>> (p. 138)* Configures **com.rti.dds.domain.DomainParticipant** (p. 948)-independent resources used by RTI Connext. Mainly used to change the maximum number of **com.rti.dds.domain.DomainParticipant** (p. 948) entities that can be created within a single process (address space).

Inheritance diagram for SystemResourceLimitsQosPolicy:



Public Attributes

- int **max_objects_per_thread**

  [DEPRECATED] *(p. **358**) <<**extension**>> (p. 138) The maximum number of objects that can be stored per thread for a **com.rti.dds.domain.DomainParticipantFactory** (p. 1039).*
- int **initial_objects_per_thread**

  *<<**extension**>> (p. 138) The number of objects per thread for a **com.rti.dds.domain.DomainParticipantFactory** (p. 1039) for which infrastructure will initially be allocated.*

8.340.1 Detailed Description

*<<**extension**>> (p. 138)* Configures **com.rti.dds.domain.DomainParticipant** (p. 948)-independent resources used by RTI Connext. Mainly used to change the maximum number of **com.rti.dds.domain.DomainParticipant** (p. 948) entities that can be created within a single process (address space).

Entity:

com.rti.dds.domain.DomainParticipantFactory (p. 1039)

Properties:

RxO (p. 506) = N/A
Changeable (p. 507) = **NO** (p. 507)

8.340.2 Usage

Within a single process (or address space for some supported real-time operating systems), applications may create and use multiple **com.rti.dds.domain.DomainParticipant** (p. 948) entities. This QoS policy sets a parameter that places an effective upper bound on the maximum number of **com.rti.dds.domain.DomainParticipant** (p. 948) entities that can be created in a single process/address space. These values cannot be changed after a DomainParticipant has been created and they cannot be set in a QoS XML file.

8.340.3 Member Data Documentation

8.340.3.1 max_objects_per_thread

```
int max_objects_per_thread
```

[DEPRECATED] (p. **358)** <<***extension***>> *(*p. *138)* The maximum number of objects that can be stored per thread for a **com.rti.dds.domain.DomainParticipantFactory** (p. 1039).

This value is the upper bound on the number of objects that can be stored per thread. When a **com.rti.dds.domain.↩ DomainParticipantFactory** (p. 1039) is created, infrastructure will be created to manage the number of objects specified by initial_objects_per_thread. As more objects are required by the application, the infrastructure will be automatically grown to accommodate up to max_objects_per_thread objects. Leave this property set to the default value to allow the infrastructure to grow as needed. If you wish to strictly control memory allocation, set max_objects_per_thread to a smaller value, but note that this runs the risk of a runtime error and reduced application functionality if your limit is reached.

[default] 261120

[range] [1, 261120]

Categories

Immutable (p. 292), **Middleware Memory Management** (p. 244)

8.340.3.2 initial_objects_per_thread

```
int initial_objects_per_thread
```

<<***extension***>> *(*p. *138)* The number of objects per thread for a **com.rti.dds.domain.DomainParticipantFactory** (p. 1039) for which infrastructure will initially be allocated.

The infrastructure for managing thread-specific objects will initially be sized according to this value. The infrastructure will grow automatically, up to a maximum of max_objects_per_thread, as required by the application at runtime. If you are certain that more than the default value of initial_objects_per_thread will be required for your application and you wish to reduce the number of memory allocations performed while your application reaches steady state, you may set this value to a larger number. To improve the efficiency of memory allocation, RTI Connext may initially size the infrastructure to a larger value than the value of initial_objects_per_thread. The infrastructure will never be sized less than initial_objects_per_thread or greater than max_objects_per_thread. When the infrastructure for managing thread-specific objects is created or increased, a log message stating "Allowed number of thread specific objects is now " will be produced at the local log level.

[default] 1024

[range] [1, 261120]; must be less than or equal to max_objects_per_thread

Categories

Immutable (p. 292), **Middleware Memory Management** (p. 244)

8.341 Tag Class Reference

Tags are name/value pair objects.

Referenced by **TypeCodeFactory.get_primitive_tc()**.

8.344 ThreadSettings_t Class Reference

The properties of a thread of execution.

Inherits Struct.

Public Attributes

- int **mask**

  Describes the type of thread.
- int **priority**

  Thread priority.
- int **stack_size**

  The thread stack-size.
- final **IntSeq cpu_list** = new **IntSeq**()

  The list of processors on which the thread(s) may run.
- **ThreadSettingsCpuRotationKind cpu_rotation**

  Determines how processor affinity is applied to multiple threads.

8.344.1 Detailed Description

The properties of a thread of execution.

QoS:

com.rti.dds.infrastructure.EventQosPolicy (p. 1335) **com.rti.dds.infrastructure.DatabaseQosPolicy** (p. 702) **com.rti.dds.infrastructure.ReceiverPoolQosPolicy** (p. 1826) **com.rti.dds.infrastructure.Asynchronous↩ PublisherQosPolicy** (p. 593)

8.344.2 Member Data Documentation

8.344.2.1 mask

```
int mask
```

Describes the type of thread.

The meaning of each bit of the mask are defined by **com.rti.dds.infrastructure.ThreadSettingsKind** (p. 2105).

[default] 0, use default options of the OS

8.344.2.2 priority

```
int priority
```

Thread priority.

Important: The interpretation of numeric thread priority values is different based on whether the priority is specified in your application code or in an XML QoS profile document. This is because QoS profile documents are intended to be usable across programming languages.

[range] java.lang.Thread.MIN_PRIORITY to MAX_PRIORITY if set programmatically in Java code **[range]** Platform-dependent - Consult `Platform Notes` for additional details. if set in a QoS profile document

8.344.2.3 stack_size

```
int stack_size
```

The thread stack-size.

[range] Platform-dependent. Consult `Platform Notes` for additional details.

Categories

Middleware Memory Management (p. 244)

8.344.2.4 cpu_list

```
final IntSeq cpu_list = new IntSeq()
```

The list of processors on which the thread(s) may run.

A sequence of integers that represent the set of processors on which the thread(s) controlled by this QoS may run. An empty sequence (the default) means the middleware wlll make no CPU affinity adjustments.

Note: This feature is currently only supported on a subset of architectures (see the `Platform Notes`). The API may change as more architectures are added in future releases.

This value is only relevant to the **com.rti.dds.infrastructure.ReceiverPoolQosPolicy** (p. 1826). It is ignored within other QoS policies that include **com.rti.dds.infrastructure.ThreadSettings_t** (p. 2101).

See also

Controlling CPU Core Affinity for RTI Threads (p. 2104)

[default] Empty sequence

8.344.2.5 cpu_rotation

```
ThreadSettingsCpuRotationKind cpu_rotation
```

Initial value:

```
=
        ThreadSettingsCpuRotationKind.THREAD_SETTINGS_CPU_NO_ROTATION
```

Determines how processor affinity is applied to multiple threads.

This value is only relevant to the **com.rti.dds.infrastructure.ReceiverPoolQosPolicy** (p. 1826). It is ignored within other QoS policies that include **com.rti.dds.infrastructure.ThreadSettings_t** (p. 2101).

See also

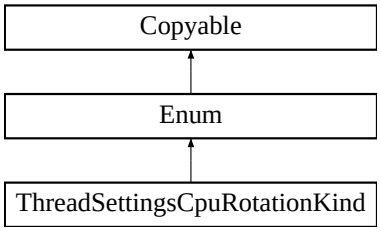
Controlling CPU Core Affinity for RTI Threads (p. 2104)

Note: This feature is currently only supported on a subset of architectures (see the `Platform Notes`). The API may change as more architectures are added in future releases.

8.345 ThreadSettingsCpuRotationKind Class Reference

Determines how **com.rti.dds.infrastructure.ThreadSettings_t.cpu_list** (p. 2103) affects processor affinity for thread-related QoS policies that apply to multiple threads.

Inheritance diagram for ThreadSettingsCpuRotationKind:



Static Public Attributes

- static final **ThreadSettingsCpuRotationKind THREAD_SETTINGS_CPU_NO_ROTATION**
  Any thread controlled by this QoS can run on any listed processor, as determined by OS scheduling.
- static final **ThreadSettingsCpuRotationKind THREAD_SETTINGS_CPU_RR_ROTATION**
  Threads controlled by this QoS will be assigned one processor from the list in round-robin order.

Additional Inherited Members

8.345.1 Detailed Description

Determines how **com.rti.dds.infrastructure.ThreadSettings_t.cpu_list** (p. 2103) affects processor affinity for thread-related QoS policies that apply to multiple threads.

8.345.2 Controlling CPU Core Affinity for RTI Threads

Most thread-related QoS settings apply to a single thread (such as for the **com.rti.dds.infrastructure.EventQosPolicy** (p. 1335), **com.rti.dds.infrastructure.DatabaseQosPolicy** (p. 702), and **com.rti.dds.infrastructure.AsynchronousPublisherQosPolicy** (p. 593)). However, the thread settings in the **com.rti.dds.infrastructure.ReceiverPoolQosPolicy** (p. 1826) control every receive thread created. In this case, there are several schemes to map M threads to N processors; the rotation kind controls which scheme is used.

Controlling CPU Core Affinity is only relevant to the **com.rti.dds.infrastructure.ReceiverPoolQosPolicy** (p. 1826). It is ignored within other QoS policies that include **com.rti.dds.infrastructure.ThreadSettings_t** (p. 2101).

If **com.rti.dds.infrastructure.ThreadSettings_t.cpu_list** (p. 2103) is empty, the rotation is irrelevant since no affinity adjustment will occur. Suppose instead that **com.rti.dds.infrastructure.ThreadSettings_t.cpu_list** (p. 2103) = {0, 1} and that the middleware creates three receive threads: {A, B, C}. If **com.rti.dds.infrastructure.ThreadSettings_t.cpu_rotation** (p. 2103) is **com.rti.dds.infrastructure.ThreadSettingsCpuRotationKind.THREAD_SETTINGS_CPU_NO_ROTATION** (p. 2105), threads A, B and C will have the same processor affinities (0-1), and the OS will control thread scheduling within this bound. It is common to denote CPU affinities as a bitmask, where set bits represent

allowed processors to run on. This mask is printed in hex, so a CPU core affinity of 0-1 can be represented by the mask 0x3.

If **com.rti.dds.infrastructure.ThreadSettings_t.cpu_rotation** (p. 2103) is **com.rti.dds.infrastructure.Thread↩ SettingsCpuRotationKind.THREAD_SETTINGS_CPU_RR_ROTATION** (p. 2105), each thread will be assigned in round-robin fashion to one of the processors in **com.rti.dds.infrastructure.ThreadSettings_t.cpu_list** (p. 2103); perhaps thread A to 0, B to 1, and C to 0. Note that the order in which internal middleware threads spawn is unspecified.

Not all of these options may be relevant for all operating systems. Refer to the Platform Notes for further information.

8.345.3 Member Data Documentation

8.345.3.1 THREAD_SETTINGS_CPU_NO_ROTATION

```
final ThreadSettingsCpuRotationKind THREAD_SETTINGS_CPU_NO_ROTATION [static]
```

Any thread controlled by this QoS can run on any listed processor, as determined by OS scheduling.

8.345.3.2 THREAD_SETTINGS_CPU_RR_ROTATION

```
final ThreadSettingsCpuRotationKind THREAD_SETTINGS_CPU_RR_ROTATION [static]
```

Threads controlled by this QoS will be assigned one processor from the list in round-robin order.

8.346 ThreadSettingsKind Class Reference

A collection of flags used to configure threads of execution.

Static Public Attributes

- static final int **THREAD_SETTINGS_KIND_MASK_DEFAULT**

  The mask of default thread options.
- static final int **THREAD_SETTINGS_FLOATING_POINT**

  Code executed within the thread may perform floating point operations. Currently applicable only for VxWorks platforms, where user callbacks use floating-point operations.
- static final int **THREAD_SETTINGS_STDIO**

  Code executed within the thread may access standard I/O. Currently applicable only for VxWorks platforms, where user callbacks do standard I/O operations.
- static final int **THREAD_SETTINGS_REALTIME_PRIORITY**

  The thread will be scheduled on a FIFO basis.
- static final int **THREAD_SETTINGS_PRIORITY_ENFORCE**

  Strictly enforce this thread's priority.
- static final int **THREAD_SETTINGS_CANCEL_ASYNCHRONOUS**

  Allows the thread to be cancelled without first reaching a cancellable state or cancellation point.

8.346.1 Detailed Description

A collection of flags used to configure threads of execution.

Not all of these options may be relevant for all operating systems. Consult `Platform Notes` for additional details.

8.346.2 Member Data Documentation

8.346.2.1 THREAD_SETTINGS_FLOATING_POINT

```
final int THREAD_SETTINGS_FLOATING_POINT  [static]
```

Code executed within the thread may perform floating point operations. Currently applicable only for VxWorks platforms, where user callbacks use floating-point operations.

8.346.2.2 THREAD_SETTINGS_STDIO

```
final int THREAD_SETTINGS_STDIO  [static]
```

Code executed within the thread may access standard I/O. Currently applicable only for VxWorks platforms, where user callbacks do standard I/O operations.

8.346.2.3 THREAD_SETTINGS_REALTIME_PRIORITY

```
final int THREAD_SETTINGS_REALTIME_PRIORITY  [static]
```

The thread will be scheduled on a FIFO basis.

8.346.2.4 THREAD_SETTINGS_PRIORITY_ENFORCE

```
final int THREAD_SETTINGS_PRIORITY_ENFORCE  [static]
```

Strictly enforce this thread's priority.

8.346.2.5 THREAD_SETTINGS_CANCEL_ASYNCHRONOUS

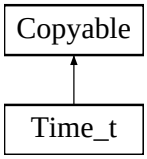
```
final int THREAD_SETTINGS_CANCEL_ASYNCHRONOUS  [static]
```

Allows the thread to be cancelled without first reaching a cancellable state or cancellation point.

8.347 Time_t Class Reference

Type for *time* representation.

Inheritance diagram for Time_t:



Public Member Functions

- **Time_t** (**Time_t** time)

  Copy constructor.
- **Time_t** (long **sec**, int **nanosec**)

  Constructor.
- **Time_t** ()

  Construct a new (invalid) ***Time_t*** *(*p. *2107)**.*
- boolean **is_invalid** ()
- boolean **is_zero** ()

  Check if time is zero.
- Object **copy_from** (Object src)

  Copy value of a data type from source.

Static Public Member Functions

- static **Time_t** **from_micros** (long micros)

  Creates a new time object from a time expressed in microseconds.
- static **Time_t** **from_nanos** (long nanos)

  Creates a new time object from a time expressed in nanoseconds.
- static **Time_t** **from_millis** (long millis)

  Creates a new time object from a time expressed in milliseconds.
- static **Time_t** **from_seconds** (long seconds)

  Creates a new time object from a time expressed in seconds.

Public Attributes

- long **sec**

  seconds
- int **nanosec**

  nanoseconds

Static Public Attributes

- static final long **TIME_INVALID_SEC**

  A sentinel indicating an invalid second of time.
- static final int **TIME_INVALID_NSEC**

  A sentinel indicating an invalid nano-second of time.
- static final **Time_t** **TIME_INVALID**

  A sentinel indicating an invalid time.
- static final **Time_t** **TIME_MAX**

  The maximum value of time.

8.347.1 Detailed Description

Type for *time* representation.

A **com.rti.dds.infrastructure.Time_t** (p. 2107) represents a moment in time.

8.347.2 Constructor & Destructor Documentation

8.347.2.1 Time_t() [1/3]

```
Time_t (
            Time_t time )
```

Copy constructor.

Parameters

time	The instance to copy. It must not be null.

References **Time_t.nanosec**, and **Time_t.sec**.

8.347.2.2 Time_t() [2/3]

```
Time_t (
            long sec,
            int nanosec )
```

Constructor.

Parameters

sec	must be >=0
nanosec	must be >=0 and < 1000000000

References **Time_t.nanosec**, and **Time_t.sec**.

8.347.2.3 Time_t() [3/3]

```
Time_t ( )
```

Construct a new (invalid) **Time_t** (p. 2107).

The primary purpose of this constructor is to satisfy the `java.io.Serializable` interface. The resulting object will have invalid seconds and nanoseconds.

References **Time_t.TIME_INVALID_NSEC**, and **Time_t.TIME_INVALID_SEC**.

Referenced by **Time_t.copy_from()**, **Time_t.from_micros()**, **Time_t.from_millis()**, **Time_t.from_nanos()**, and **Time_t.from_seconds()**.

8.347.3 Member Function Documentation

8.347.3.1 from_micros()

```
static  Time_t from_micros (
            long micros )  [static]
```

Creates a new time object from a time expressed in microseconds.

In case of an overflow this function returns **com.rti.dds.infrastructure.Time_t.TIME_MAX** (p. 2112).

References **Time_t.nanosec**, **Time_t.TIME_MAX**, and **Time_t.Time_t()**.

8.347.3.2 from_nanos()

```
static Time_t from_nanos (
            long nanos ) [static]
```

Creates a new time object from a time expressed in nanoseconds.

In case of an overflow this function returns **com.rti.dds.infrastructure.Time_t.TIME_MAX** (p. 2112).

References **Time_t.nanosec**, **Time_t.TIME_MAX**, and **Time_t.Time_t()**.

8.347.3.3 from_millis()

```
static Time_t from_millis (
            long millis ) [static]
```

Creates a new time object from a time expressed in milliseconds.

In case of an overflow this function returns **com.rti.dds.infrastructure.Time_t.TIME_MAX** (p. 2112).

References **Time_t.nanosec**, **Time_t.TIME_MAX**, and **Time_t.Time_t()**.

8.347.3.4 from_seconds()

```
static Time_t from_seconds (
            long seconds ) [static]
```

Creates a new time object from a time expressed in seconds.

References **Time_t.Time_t()**.

8.347.3.5 is_invalid()

```
boolean is_invalid ( )
```

Returns

com.rti.dds.infrastructure.true if the given time is not valid (i.e. is negative)

References **Time_t.nanosec**, and **Time_t.sec**.

Referenced by **DynamicDataWriter.register_instance_w_timestamp()**.

8.347.3.6 is_zero()

```
boolean is_zero ( )
```

Check if time is zero.

Returns

com.rti.dds.infrastructure.true if the given time is equal to com.rti.dds.infrastructure.Time_t.ZERO or com.rti.dds.↩ infrastructure.false otherwise.

References **Time_t.nanosec**, and **Time_t.sec**.

8.347.3.7 copy_from()

```
Object copy_from (
             Object src )
```

Copy value of a data type from source.

Copy data into *this* object from another. This copy is intended to be a deep copy, so that all data members (recursively) are copied (not just resetting Object references).

This operation returns the object that is copied if copy is successful.

Parameters

src	<<***in***>> *(*p. *404)* The Object which contains the data to be copied.

Returns

Generally, return *this* but special cases (such as Enum) exist.

Exceptions

NullPointerException	If *src* is null.
ClassCastException	If *src* is not the same type as *this*.

Implements **Copyable** (p. 701).

References **Time_t.Time_t()**.

8.347.4 Member Data Documentation

8.347.4.1 TIME_INVALID_SEC

```
final long TIME_INVALID_SEC [static]
```

A sentinel indicating an invalid second of time.

Referenced by **Time_t.Time_t()**.

8.347.4.2 TIME_INVALID_NSEC

```
final int TIME_INVALID_NSEC [static]
```

A sentinel indicating an invalid nano-second of time.

Referenced by **Time_t.Time_t()**.

8.347.4.3 TIME_INVALID

```
final Time_t TIME_INVALID [static]
```

A sentinel indicating an invalid time.

8.347.4.4 TIME_MAX

```
final Time_t TIME_MAX [static]
```

The maximum value of time.

Referenced by **Time_t.from_micros()**, **Time_t.from_millis()**, and **Time_t.from_nanos()**.

8.347.4.5 sec

```
long sec
```

seconds

Referenced by **SampleInfo.copy_from()**, **WriteParams_t.copy_from()**, **DynamicDataWriter.dispose_w_timestamp()**, **Time_t.is_invalid()**, **Time_t.is_zero()**, **DynamicDataWriter.register_instance_w_timestamp()**, **Time_t.Time_t()**, **DynamicDataWriter.unregister_instance_w_timestamp()**, **DynamicDataWriter.write_w_timestamp()**, and **WriteParams_t.WriteParams_t()**.

8.347.4.6 nanosec

```
int nanosec
```

nanoseconds

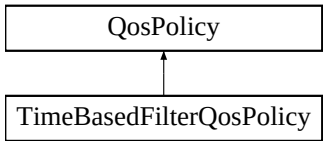
[range] [0,1000000000)

Referenced by **SampleInfo.copy_from()**, **WriteParams_t.copy_from()**, **DynamicDataWriter.dispose_w_timestamp()**, **Time_t.from_micros()**, **Time_t.from_millis()**, **Time_t.from_nanos()**, **Time_t.is_invalid()**, **Time_t.is_zero()**, **DynamicDataWriter.register_instance_w_timestamp()**, **Time_t.Time_t()**, **DynamicDataWriter.unregister_instance_w_timestamp()**, **DynamicDataWriter.write_w_timestamp()**, and **WriteParams_t.WriteParams_t()**.

8.348 TimeBasedFilterQosPolicy Class Reference

<<***spec***>> *(*p. *132)* Filter that allows a **com.rti.dds.subscription.DataReader** (p. 707) to specify that it is interested only in (potentially) a subset of the values of the data.

Inheritance diagram for TimeBasedFilterQosPolicy:



Public Attributes

- final **Duration_t minimum_separation**

  <<***basic***>> *(*p. *123)* <<***spec***>> *(*p. *132) The minimum separation duration between subsequent samples.*

8.348.1 Detailed Description

<<***spec***>> *(*p. *132)* Filter that allows a **com.rti.dds.subscription.DataReader** (p. 707) to specify that it is interested only in (potentially) a subset of the values of the data.

The filter states that the **com.rti.dds.subscription.DataReader** (p. 707) does not want to receive more than one value each `minimum_separation`, regardless of how fast the changes occur.

Entity:

com.rti.dds.subscription.DataReader (p. 707)

Properties:

RxO (p. 506) = N/A
Changeable (p. 507) = **YES** (p. 507)

8.348.2 Usage

You can use this QoS policy to reduce the amount of data received by a **com.rti.dds.subscription.DataReader** (p. 707). **com.rti.dds.publication.DataWriter** (p. 818) entities may send data faster than needed by a **com.rti.dds.↩ subscription.DataReader** (p. 707). For example, a **com.rti.dds.subscription.DataReader** (p. 707) of sensor data that is displayed to a human operator in a GUI application does not need to receive data updates faster than a user can reasonably perceive changes in data values. This is often measured in tenths (0.1) of a second up to several seconds. However, a **com.rti.dds.publication.DataWriter** (p. 818) of sensor information may have other **com.rti.dds.↩ subscription.DataReader** (p. 707) entities that are processing the sensor information to control parts of the system and thus need new data updates in measures of hundredths (0.01) or thousandths (0.001) of a second.

With this QoS policy, different **com.rti.dds.subscription.DataReader** (p. 707) entities can set their own time-based filters, so that data published faster than the period set by a each **com.rti.dds.subscription.DataReader** (p. 707) will not be delivered to that **com.rti.dds.subscription.DataReader** (p. 707).

The **TIME_BASED_FILTER** (p. 519) also applies to each instance separately; that is, the constraint is that the **com.rti.↩ dds.subscription.DataReader** (p. 707) does not want to see more than one sample of each instance per `minimum↩ _separation` period.

This QoS policy allows you to optimize resource usage (CPU and possibly network bandwidth) by only delivering the required amount of data to each **com.rti.dds.subscription.DataReader** (p. 707), accommodating the fact that, for rapidly-changing data, different subscribers may have different requirements and constraints as to how frequently they need or can handle being notified of the most current values. As such, it can also be used to protect applications that are running on a heterogeneous network where some nodes are capable of generating data much faster than others can consume it.

For best effort data delivery, if the data type is unkeyed and the **com.rti.dds.publication.DataWriter** (p. 818) has an infinite **com.rti.dds.infrastructure.LivelinessQosPolicy.lease_duration** (p. 1538), RTI Connext will only send as many packets to a **com.rti.dds.subscription.DataReader** (p. 707) as required by the TIME_BASED_FILTER, no matter how fast **com.rti.ndds.example.FooDataWriter.write** (p. 1397) is called.

For multicast data delivery to multiple DataReaders, the one with the lowest `minimum_separation` determines the DataWriter's send rate. For example, if a **com.rti.dds.publication.DataWriter** (p. 818) sends over multicast to two DataReaders, one with `minimum_separation` of 2 seconds and one with `minimum_separation` of 1 second, the DataWriter will send every 1 second.

In configurations where RTI Connext must send all the data published by the **com.rti.dds.publication.DataWriter** (p. 818) (for example, when the **com.rti.dds.publication.DataWriter** (p. 818) is reliable, when the data type is keyed, or when the **com.rti.dds.publication.DataWriter** (p. 818) has a finite **com.rti.dds.infrastructure.LivelinessQos↩ Policy.lease_duration** (p. 1538)), only the data that passes the TIME_BASED_FILTER will be stored in the receive queue of the **com.rti.dds.subscription.DataReader** (p. 707). Extra data will be accepted but dropped. Note that filtering is only applied on alive samples (that is, samples that have not been disposed/unregistered).

8.348.3 Consistency

It is inconsistent for a **com.rti.dds.subscription.DataReader** (p. 707) to have a `minimum_separation` longer than its **DEADLINE** (p. 467) `period`.

However, it is important to be aware of certain edge cases that can occur when your publication rate, minimum separation, and deadline period align and that can cause missed deadlines that you may not expect. For example, suppose that you nominally publish samples every second but that this rate can vary somewhat over time. You declare a minimum

separation of 1 second to filter out rapid updates and set a deadline of two seconds so that you will be aware if the rate falls too low. Even if your update rate never wavers, you can still miss deadlines! Here's why:

Suppose you publish the first sample at time t=0 seconds. You then publish your next sample at t=1 seconds. Depending on how your operating system schedules the time-based filter execution relative to the publication, this second sample may be filtered. You then publish your third sample at t=2 seconds, and depending on how your OS schedules this publication in relation to the deadline check, you could miss the deadline.

This scenario demonstrates a couple of rules of thumb:

- Beware of setting your `minimum_separation` to a value very close to your publication rate: you may filter more data than you intend to.
- Beware of setting your `minimum_separation` to a value that is too close to your deadline period relative to your publication rate. You may miss deadlines.

See **com.rti.dds.infrastructure.DeadlineQosPolicy** (p. 900) for more information about the interactions between deadlines and time-based filters.

The setting of a **TIME_BASED_FILTER** (p. 519) – that is, the selection of a `minimum_separation` with a value greater than zero – is consistent with all settings of the **HISTORY** (p. 487) and **RELIABILITY** (p. 510) QoS. The **TIME_BASED_FILTER** (p. 519) specifies the samples that are of interest to the **com.rti.dds.subscription.DataReader** (p. 707). The **HISTORY** (p. 487) and **RELIABILITY** (p. 510) QoS affect the behavior of the middleware with respect to the samples that have been determined to be of interest to the **com.rti.dds.subscription.DataReader** (p. 707); that is, they apply *after* the **TIME_BASED_FILTER** (p. 519) has been applied.

In the case where the reliability QoS kind is **com.rti.dds.infrastructure.ReliabilityQosPolicyKind.RELIABLE_RELIABILITY_QOS** (p. 1836), in steady-state – defined as the situation where the **com.rti.dds.publication.DataWriter** (p. 818) does not write new samples for a period "long" compared to the `minimum_separation` – the system should guarantee delivery of the last sample to the **com.rti.dds.subscription.DataReader** (p. 707).

8.349.1 Detailed Description

<<***interface***>> *(*p. *403)* The most basic description of the data to be published and subscribed.

QoS:

com.rti.dds.topic.TopicQos (p. 2133)

Status:

com.rti.dds.infrastructure.StatusKind.StatusKind.INCONSISTENT_TOPIC_STATUS, **com.rti.dds.topic.↩ InconsistentTopicStatus** (p. 1440)

Listener:

com.rti.dds.topic.TopicListener (p. 2131)

A **com.rti.dds.topic.Topic** (p. 2116) is identified by its name, which must be unique in the whole domain. In addition (by virtue of extending **com.rti.dds.topic.TopicDescription** (p. 2129)) it fully specifies the type of the data that can be communicated when publishing or subscribing to the **com.rti.dds.topic.Topic** (p. 2116).

com.rti.dds.topic.Topic (p. 2116) is the only **com.rti.dds.topic.TopicDescription** (p. 2129) that can be used for publications and therefore associated with a **com.rti.dds.publication.DataWriter** (p. 818).

The following operations may be called even if the **com.rti.dds.topic.Topic** (p. 2116) is not enabled. Other operations will fail with the value **com.rti.dds.infrastructure.RETCODE_NOT_ENABLED** (p. 1902) if called on a disabled **com.rti.dds.topic.Topic** (p. 2116):

- **com.rti.dds.infrastructure.Entity.enable** (p. 1323)
- **com.rti.dds.topic.Topic.set_qos** (p. 2118), **com.rti.dds.topic.Topic.get_qos** (p. 2119)
- **com.rti.dds.topic.Topic.set_qos_with_profile** (p. 2118)
- **com.rti.dds.topic.Topic.set_listener** (p. 2120), **com.rti.dds.topic.Topic.get_listener** (p. 2120)
- **com.rti.dds.infrastructure.Entity.get_statuscondition** (p. 1325), **com.rti.dds.infrastructure.Entity.get_status_changes** (p. 1325)
- **com.rti.dds.topic.Topic.get_inconsistent_topic_status** (p. 2117)

Operations Allowed in Listener Callbacks (p. 1530)

8.349.2 Member Function Documentation

8.349.2.1 get_inconsistent_topic_status()

```
void get_inconsistent_topic_status (
            InconsistentTopicStatus status )
```

Allows the application to retrieve the com.rti.dds.infrastructure.StatusKind.StatusKind.INCONSISTENT_TOPIC_STATUS status of a **com.rti.dds.topic.Topic** (p. 2116).

Retrieve the current **com.rti.dds.topic.InconsistentTopicStatus** (p. 1440)

Parameters

status	<<***inout***>> *(p. 404)* Status to be retrieved. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

com.rti.dds.topic.InconsistentTopicStatus (p. 1440)

8.349.2.2 set_qos()

```
void set_qos (
              TopicQos qos )
```

Set the topic QoS.

The **com.rti.dds.topic.TopicQos.topic_data** (p. 2136) and **com.rti.dds.topic.TopicQos.deadline** (p. 2137), **com.↩ rti.dds.topic.TopicQos.latency_budget** (p. 2137), **com.rti.dds.topic.TopicQos.transport_priority** (p. 2138) and **com.rti.dds.topic.TopicQos.lifespan** (p. 2138) can be changed. The other policies are immutable.

Parameters

qos	<<***in***>> *(p. 404)* Set of policies to be applied to **com.rti.dds.topic.Topic** (p. 2116).

Policies must be consistent. Immutable policies cannot be changed after **com.rti.dds.topic.Topic** (p. 2116) is enabled. The special value **com.rti.dds.domain.DomainParticipant.TOPIC_QOS_DEFAULT** (p. 47) can be used to indicate that the QoS of the **com.rti.dds.topic.Topic** (p. 2116) should be changed to match the current default **com.rti.dds.topic.↩ TopicQos** (p. 2133) set in the **com.rti.dds.domain.DomainParticipant** (p. 948). Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_IMMUTABLE_POLICY** (p. 1901) if immutable policy is changed, or **com.rti.dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901) if policies are inconsistent

See also

com.rti.dds.topic.TopicQos (p. 2133) for rules on consistency among QoS

set_qos (abstract) (p. 1321)

Operations Allowed in Listener Callbacks (p. 1530)

8.349.2.3 set_qos_with_profile()

```
void set_qos_with_profile (
            String library_name,
            String profile_name )
```

<<***extension***>> *(p. 403)* Change the QoS of this topic using the input XML QoS profile.

The **com.rti.dds.topic.TopicQos.topic_data** (p. 2136) and **com.rti.dds.topic.TopicQos.deadline** (p. 2137), **com.rti.dds.topic.TopicQos.latency_budget** (p. 2137), **com.rti.dds.topic.TopicQos.transport_priority** (p. 2138) and **com.rti.dds.topic.TopicQos.lifespan** (p. 2138) can be changed. The other policies are immutable.

Parameters

library_name	<<***in***>> *(p. 404)* Library name containing the XML QoS profile. If library_name is null RTI Connext will use the default library (see **com.rti.dds.domain.DomainParticipant.set_default_library** (p. 994)).
profile_name	<<***in***>> *(p. 404)* XML QoS Profile name. If profile_name is null RTI Connext will use the default profile (see **com.rti.dds.domain.DomainParticipant.set_default_profile** (p. 995)).

Exceptions

One	of the **Standard Return Codes** (p. 513), **com.rti.dds.infrastructure.RETCODE_IMMUTABLE_POLICY** (p. 1901) if immutable policy is changed, or **com.rti.dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901) if policies are inconsistent

com.rti.dds.topic.TopicQos (p. 2133) for rules on consistency among QoS

Operations Allowed in Listener Callbacks (p. 1530)

8.349.2.4 get_qos()

```
void get_qos (
             TopicQos qos )
```

Get the topic QoS.

This method may potentially allocate memory depending on the sequences contained in some QoS policies.

Parameters

qos	<<***inout***>> *(p. 404)* QoS to be filled up. Cannot be NULL.

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

get_qos (abstract) (p. 1322)

8.349.2.5 set_listener()

```
void set_listener (
             TopicListener l,
            int mask )
```

Set the topic listener.

Parameters

l	<<***in***>> *(p. 404)* Listener to be installed on entity.
mask	<<***in***>> *(p. 404)* Changes of communication status to be invoked on the listener. See com.rti.dds.infrastructure.StatusMask.

Exceptions

One	of the **Standard Return Codes** (p. 513)

See also

set_listener (abstract) (p. 1322)

8.349.2.6 get_listener()

```
TopicListener get_listener ( )
```

Get the topic listener.

Returns

Existing listener attached to the **com.rti.dds.topic.Topic** (p. 2116).

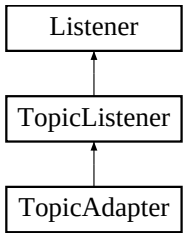
See also

get_listener (abstract) (p. 1323)

8.350 TopicAdapter Class Reference

<<***extension***>> *(p. 403)* A listener adapter in the spirit of the Java AWT listener adapters. (The Adapter provides empty implementations for the listener methods)

Inheritance diagram for TopicAdapter:



Public Member Functions

- void **on_inconsistent_topic** (**Topic** topic, **InconsistentTopicStatus** status)

  Handle the com.rti.dds.infrastructure.StatusKind.StatusKind.INCONSISTENT_TOPIC_STATUS status.

8.350.1 Detailed Description

<<***extension***>> *(p. 403)* A listener adapter in the spirit of the Java AWT listener adapters. (The Adapter provides empty implementations for the listener methods)

Clients who do not wish to implement all listener methods can subclass this class and override only the methods of interest.

8.350.2 Member Function Documentation

8.350.2.1 on_inconsistent_topic()

```
void on_inconsistent_topic (
             Topic topic,
             InconsistentTopicStatus status )
```

Handle the com.rti.dds.infrastructure.StatusKind.StatusKind.INCONSISTENT_TOPIC_STATUS status.

This callback is called when a remote **com.rti.dds.topic.Topic** (p. 2116) is discovered but is inconsistent with the locally created **com.rti.dds.topic.Topic** (p. 2116) of the same topic name.

Parameters

topic	<<***out***>> *(p. 404)* Locally created **com.rti.dds.topic.Topic** (p. 2116) that triggers the listener callback
status	<<***out***>> *(p. 404)* Current inconsistent status of locally created **com.rti.dds.topic.Topic** (p. 2116)

Implements **TopicListener** (p. 2132).

8.351.1 Detailed Description

Entry created when a **Topic** (p. 2116) object discovered.

Data associated with the built-in topic **com.rti.dds.topic.builtin.TopicBuiltinTopicDataTypeSupport.TOPIC_TOPIC_NAME** (p. 413). It contains QoS policies and additional information that apply to the remote **com.rti.dds.topic.Topic** (p. 2116).

Note: The **builtin.TopicBuiltinTopicData** (p. 2122) built-in topic is meant to convey information about discovered Topics. This **Topic** (p. 2116)'s samples are not propagated in a separate packet on the wire. Instead, the data is sent as part of the information carried by other built-in topics (**com.rti.dds.publication.builtin.PublicationBuiltinTopicData** (p. 1753) and **com.rti.dds.subscription.builtin.SubscriptionBuiltinTopicData** (p. 2070)). Therefore **TopicBuiltinTopicData** (p. 2122) DataReaders will not receive any data.

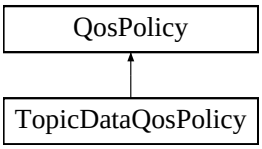
Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 53) during discovery.

Inheritance diagram for TopicDataQosPolicy:



Public Attributes

- final **ByteSeq value**
  a sequence of octets

8.355.1 Detailed Description

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 53) during discovery.

Entity:

com.rti.dds.topic.Topic (p. 2116)

Properties:

RxO (p. 506) = NO
Changeable (p. 507) = **YES** (p. 507)

See also

com.rti.dds.domain.DomainParticipant.get_builtin_subscriber (p. 998)

8.355.2 Usage

The purpose of this QoS is to allow the application to attach additional information to the created **com.rti.dds.topic.↩ Topic** (p. 2116) objects, so that when a remote application discovers their existence, it can access that information and use it for its own purposes. This extra data is not used by RTI Connext.

One possible use of this QoS is to attach security credentials or some other information that can be used by the remote application to authenticate the source.

In combination with **com.rti.dds.subscription.DataReaderListener** (p. 757), **com.rti.dds.publication.DataWriter↩ Listener** (p. 853), or operations such as **com.rti.dds.domain.DomainParticipant.ignore_topic** (p. 1002), this QoS policy can assist an application in defining and enforcing its own security policies.

The use of this QoS is not limited to security; it offers a simple, yet flexible extensibility mechanism.

Important: RTI Connext stores the data placed in this policy in pre-allocated pools. It is therefore necessary to configure RTI Connext with the maximum size of the data that will be stored in policies of this type. This size is configured with **com.rti.dds.infrastructure.DomainParticipantResourceLimitsQosPolicy.topic_data_max_length** (p. 1096).

8.356.1 Detailed Description

com.rti.dds.topic.Topic (p. 2116) entity and associated elements

<<***interface***>> *(*p. *403)* Base class for **com.rti.dds.topic.Topic** (p. 2116), **com.rti.dds.topic.ContentFilteredTopic** (p. 692), and **com.rti.dds.topic.MultiTopic** (p. 1618).

com.rti.dds.topic.TopicDescription (p. 2129) represents the fact that both publications and subscriptions are tied to a single data-type. Its attribute `type_name` defines a unique resulting type for the publication or the subscription and therefore creates an implicit association with a **com.rti.dds.topic.TypeSupport** (p. 2252).

com.rti.dds.topic.TopicDescription (p. 2129) has also a `name` that allows it to be retrieved locally.

See also

com.rti.dds.topic.TypeSupport (p. 2252), **com.rti.ndds.example.FooTypeSupport** (p. 1410)

8.356.2 Member Function Documentation

8.356.2.1 get_type_name()

```
String get_type_name ( )
```

Get the associated `type_name`.

The type name defines a locally unique type for the publication or the subscription.

The `type_name` corresponds to a unique string used to register a type via the **com.rti.ndds.example.FooType↩ Support.register_type** (p. 1411) method.

Thus, the `type_name` implies an association with a corresponding **com.rti.dds.topic.TypeSupport** (p. 2252) and this **com.rti.dds.topic.TopicDescription** (p. 2129).

Returns

the type name. The returned type name is valid until the **com.rti.dds.topic.TopicDescription** (p. 2129) is deleted.

Postcondition

The result is non-NULL.

See also

com.rti.dds.topic.TypeSupport (p. 2252), **com.rti.ndds.example.FooTypeSupport** (p. 1410)

8.356.2.2 get_name()

```
String get_name ( )
```

Get the name used to create this **com.rti.dds.topic.TopicDescription** (p. 2129) .

Returns

the name used to create this **com.rti.dds.topic.TopicDescription** (p. 2129). The returned topic name is valid until the **com.rti.dds.topic.TopicDescription** (p. 2129) is deleted.

Postcondition

The result is non-NULL.

8.356.2.3 get_participant()

```
DomainParticipant get_participant ( )
```

Get the **com.rti.dds.domain.DomainParticipant** (p. 948) to which the **com.rti.dds.topic.TopicDescription** (p. 2129) belongs.

Returns

The **com.rti.dds.domain.DomainParticipant** (p. 948) to which the **com.rti.dds.topic.TopicDescription** (p. 2129) belongs.

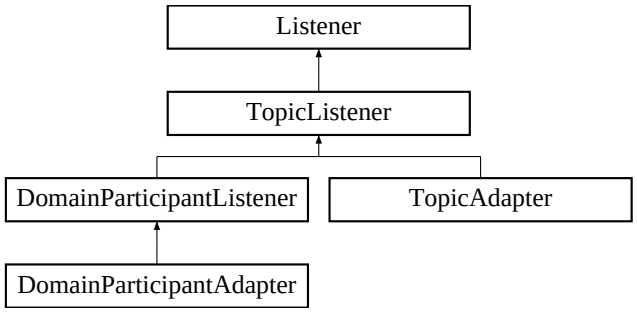
Postcondition

The result is non-NULL.

8.357 TopicListener Interface Reference

<<***interface***>> *(p. 403)* **com.rti.dds.infrastructure.Listener** (p. 1528) for **com.rti.dds.topic.Topic** (p. 2116) entities.

Inheritance diagram for TopicListener:



Public Member Functions

- void **on_inconsistent_topic** (**Topic** topic, **InconsistentTopicStatus** status)

  Handle the com.rti.dds.infrastructure.StatusKind.StatusKind.INCONSISTENT_TOPIC_STATUS status.

8.357.1 Detailed Description

<<***interface***>> *(p. 403)* **com.rti.dds.infrastructure.Listener** (p. 1528) for **com.rti.dds.topic.Topic** (p. 2116) entities.

Entity:

com.rti.dds.topic.Topic (p. 2116)

Status:

com.rti.dds.infrastructure.StatusKind.StatusKind.INCONSISTENT_TOPIC_STATUS, **com.rti.dds.topic.↩ InconsistentTopicStatus** (p. 1440)

This is the interface that can be implemented by an application-provided class and then registered with the **com.rti.↩ dds.topic.Topic** (p. 2116) such that the application can be notified by RTI Connext of relevant status changes.

See also

Status Kinds (p. 514)

com.rti.dds.infrastructure.Listener (p. 1528)

com.rti.dds.topic.Topic.set_listener (p. 2120)

Operations Allowed in Listener Callbacks (p. 1530)

8.357.2 Member Function Documentation

8.357.2.1 on_inconsistent_topic()

```
void on_inconsistent_topic (
             Topic topic,
             InconsistentTopicStatus status )
```

Handle the com.rti.dds.infrastructure.StatusKind.StatusKind.INCONSISTENT_TOPIC_STATUS status.

This callback is called when a remote **com.rti.dds.topic.Topic** (p. 2116) is discovered but is inconsistent with the locally created **com.rti.dds.topic.Topic** (p. 2116) of the same topic name.

Parameters

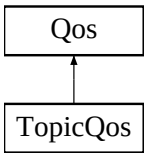
topic	<<***out***>> *(p. 404)* Locally created **com.rti.dds.topic.Topic** (p. 2116) that triggers the listener callback
status	<<***out***>> *(p. 404)* Current inconsistent status of locally created **com.rti.dds.topic.Topic** (p. 2116)

Implemented in **DomainParticipantAdapter** (p. 1029), and **TopicAdapter** (p. 2121).

8.358 TopicQos Class Reference

QoS policies supported by a **com.rti.dds.topic.Topic** (p. 2116) entity.

Inheritance diagram for TopicQos:



Public Member Functions

- String **toString** ()

  Overrides the builtin Object.toString method.
- String **toString** (**TopicQos** baseQos, **QosPrintFormat** format)

- final **DataRepresentationQosPolicy representation**

  Data representation policy, ***DATA_REPRESENTATION*** *(p. 462).*

8.358.1 Detailed Description

QoS policies supported by a **com.rti.dds.topic.Topic** (p. 2116) entity.

You must set certain members in a consistent manner:

length of **com.rti.dds.topic.TopicQos.topic_data** (p. 2136) .value <= **com.rti.dds.domain.DomainParticipant↩ Qos.resource_limits** (p. 1078) .topic_data_max_length

If any of the above are not true, **com.rti.dds.topic.Topic.set_qos** (p. 2118), **com.rti.dds.topic.Topic.set_qos_with_↩ profile** (p. 2118) and **com.rti.dds.domain.DomainParticipant.set_default_topic_qos** (p. 957) will fail with **com.rti.↩ dds.infrastructure.RETCODE_INCONSISTENT_POLICY** (p. 1901) and **com.rti.dds.domain.DomainParticipant.↩ create_topic** (p. 984) will return NULL.

Entity:

com.rti.dds.topic.Topic (p. 2116)

See also

All QoS Policies (p. 501) allowed ranges within each Qos.

8.358.2 Member Function Documentation

8.358.2.1 toString() [1/4]

```
String toString ( )
```

Overrides the builtin Object.toString method.

The various **toString()** (p. 2134) overloads allow formatting the output and printing only the differences with respect to another **TopicQos** (p. 2133) object.

```
TopicQos qos = new TopicQos();
String theString = new String();
// The most basic version of the API simply overrides the builtin
// Object.toString method. Only the differences with respect to the
// documented default are printed to the string. The string is formatted
// according to the default values for QosPrintFormat.
theString = qos.toString();
// This overload allows us to specify a base profile. Only the differences
// with respect to this base profile are printed to the string. If the two
// Qos objects are equal, the resultant string will be empty.
TopicQos baseQos = new TopicQos(); // ...;
theString = qos.toString(baseQos);
// It is also possible to supply a custom format at this point
QosPrintFormat printFormat = new QosPrintFormat(); // ...;
theString = qos.toString(baseQos, format);
// The sentinel value TOPIC_QOS_PRINT_ALL can be used as
// the base in order to print the entire qos object
theString = qos.toString(TOPIC_QOS_PRINT_ALL);
```

This overload uses the default print format and only prints the differences between the supplied **TopicQos** (p. 2133) and the documented default.

Returns

The string representation of the Qos.

References **TopicQos.toString()**.

Referenced by **TopicQos.toString()**.

8.358.2.2 toString() [2/4]

```
String toString (
              TopicQos baseQos,
              QosPrintFormat format )
```

Obtains a string representation of a **TopicQos** (p. 2133) object.

Parameters

format	The print format used to format the output.
baseQos	Only the differences between baseQos and the Qos object are included in the output string. If you want to print everything within the Qos, use the **com.rti.dds.domain.DomainParticipant.TOPIC_QOS_PRINT_ALL** (p. 47) sentinel value.

This overload prints the differences between the qos and the supplied baseQos. The output string is formatted using the supplied **com.rti.dds.infrastructure.QosPrintFormat** (p. 1809).

Returns

The string representation of the Qos.

References **DomainParticipant.TOPIC_QOS_PRINT_ALL**.

8.358.2.3 toString() [3/4]

```
String toString (
              QosPrintFormat format )
```

Obtains a string representation of a **TopicQos** (p. 2133) object.

Parameters

format	The print format used to format the output.

This overload prints the differences between the qos and the documented. default. The output string is formatted using the supplied **com.rti.dds.infrastructure.QosPrintFormat** (p. 1809).

Returns

The string representation of the Qos.

References **TopicQos.toString()**.

8.358.2.4 toString() [4/4]

```
String toString (
              TopicQos baseQos )
```

Obtains a string representation of a **TopicQos** (p. 2133) object.

Parameters

baseQos	Only the differences between baseQos and the Qos object are included in the output string. If you want to print everything within the Qos, use the **com.rti.dds.domain.DomainParticipant.TOPIC_QOS_PRINT_ALL** (p. 47) sentinel value.

This overload prints the differences between the qos and the supplied baseQos. The output string is formatted using the default value for **com.rti.dds.infrastructure.QosPrintFormat** (p. 1809).

Returns

The string representation of the Qos.

References **TopicQos.toString()**.

8.360.2 Member Function Documentation

8.360.2.1 copy_from()

```
Object copy_from (
             Object src )
```

This is the implementation of the `Copyable` interface. This method will perform a deep copy of `src` This method could be placed into `TopicQueryDataTypeSupport` rather than here by using the `-noCopyable` option to rtiddsgen.

Parameters

src	The Object which contains the data to be copied.

Returns

Returns `this`.

Exceptions

NullPointerException	If `src` is null.
ClassCastException	If `src` is not the same type as `this`.

See also

com.rti.dds.infrastructure.Copyable::copy_from (p. 701)(java.lang.Object)

Implements **Copyable** (p. 701).

References **TopicQuerySelection.copy_from()**, **TopicQueryData.original_related_reader_guid**, **TopicQueryData.topic_name**, and **TopicQueryData.topic_query_selection**.

8.360.3.1 topic_query_selection

```
TopicQuerySelection topic_query_selection = new  TopicQuerySelection()
```

The data selection.

Referenced by **TopicQueryData.copy_from()**.

8.360.3.2 topic_name

```
String topic_name = ""
```

The topic name of the **com.rti.dds.subscription.DataReader** (p. 707).

Referenced by **TopicQueryData.copy_from()**.

8.360.3.3 original_related_reader_guid

```
GUID_t original_related_reader_guid = new GUID_t()
```

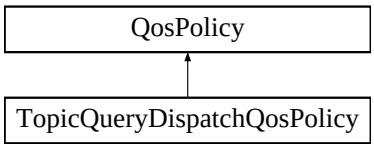
Identifies the **com.rti.dds.subscription.DataReader** (p. 707) that created the **com.rti.dds.subscription.TopicQuery** (p. 2139).

Referenced by **TopicQueryData.copy_from()**.

8.361 TopicQueryDispatchQosPolicy Class Reference

<<***extension***>> *(p. 138)* Configures the ability of a **com.rti.dds.publication.DataWriter** (p. 818) to publish samples in response to a **com.rti.dds.subscription.TopicQuery** (p. 2139)

Inheritance diagram for TopicQueryDispatchQosPolicy:



Public Attributes

- boolean **enable** = false

  <<***extension***>> *(p. 138) Allows this writer to dispatch TopicQueries*
- int **samples_per_period** = **ResourceLimitsQosPolicy.LENGTH_UNLIMITED**

  <<***extension***>> *(p. 138) Sets the maximum number of samples to publish in each publication_period.*
- final **Duration_t** **publication_period** = new **Duration_t**(1, 0)

  <<***basic***>> *(p. 123)* <<***extension***>> *(p. 138) Sets the periodic interval at which samples are published.*

8.361.1 Detailed Description

<<***extension***>> *(p. 138)* Configures the ability of a **com.rti.dds.publication.DataWriter** (p. 818) to publish samples in response to a **com.rti.dds.subscription.TopicQuery** (p. 2139)

Enables the ability of a **com.rti.dds.publication.DataWriter** (p. 818) to publish historical samples upon reception of a **com.rti.dds.subscription.TopicQuery** (p. 2139) and how often they are published.

Since a TopicQuery selects previously written samples, the DataWriter must have a **com.rti.dds.infrastructure.↩ DurabilityQosPolicy.kind** (p. 1119) different from com.rti.dds.infrastructure.DurabilityQosPolicyKind.DurabilityQos↩ PolicyKind.VOLATILE_DURABILITY_QOS. Also, **com.rti.dds.infrastructure.ReliabilityQosPolicy.kind** (p. 1831) must be set to **com.rti.dds.infrastructure.ReliabilityQosPolicyKind.RELIABLE_RELIABILITY_QOS** (p. 1836).

Only samples that fall within the **com.rti.dds.infrastructure.DurabilityQosPolicy.writer_depth** (p. 1119) for an instance are evaluated against the TopicQuery filter. While the DataWriter is waiting for acknowledgements from one

or more DataReaders, there may temporarily be more than **com.rti.dds.infrastructure.DurabilityQosPolicy.writer_depth** (p. 1119) samples per instance in the DataWriter's queue if the **com.rti.dds.infrastructure.HistoryQosPolicy.depth** (p. 1438) is set to a higher value than **com.rti.dds.infrastructure.DurabilityQosPolicy.writer_depth** (p. 1119). Those additional samples past **com.rti.dds.infrastructure.DurabilityQosPolicy.writer_depth** (p. 1119) are not eligible to be sent in response to the TopicQuery.

A TopicQuery may select multiple samples at once. The writer will publish them periodically, independently from newly written samples. **com.rti.dds.infrastructure.TopicQueryDispatchQosPolicy.publication_period** (p. 2144) configures the frequency of that period and **com.rti.dds.infrastructure.TopicQueryDispatchQosPolicy.samples_per_period** (p. 2143) configures the maximum number of samples to publish each period.

If the DataWriter blocks during the publication of one of these samples, it will stop and try again the next period. (See **com.rti.ndds.example.FooDataWriter.write** (p. 1397) for the conditions that may cause the write operation to block.)

All the DataWriters that belong to a single **com.rti.dds.publication.Publisher** (p. 1767) and enable TopicQueries share the same event thread, but each DataWriter schedules separate events. To configure that thread, see **com.rti.dds.infrastructure.AsynchronousPublisherQosPolicy.topic_query_publication_thread** (p. 596).

If the DataWriter is dispatching more than one TopicQuery at the same time, the configuration of this periodic event applies to all of them. For example, if a DataWriter receives two TopicQueries around the same time, the period is 1 second, the number of samples per period is 10, the first TopicQuery selects 5 samples, and the second one selects 8, the DataWriter will immediately attempt to publish all 5 for the first TopicQuery and 5 for the second one. After one second, it will publish the remaining 3 samples.

Entity:

com.rti.dds.publication.DataWriter (p. 818)

Properties:

RxO (p. 506) = N/A
Changeable (p. 507) = **NO** (p. 507)

8.362 TopicQueryHelper Class Reference

Helpers to provide utility operations related to **com.rti.dds.subscription.TopicQuery** (p. 2139).

Static Public Member Functions

- static void **topic_query_data_from_service_request** (**TopicQueryData** dst, **ServiceRequest** service↩ Request)

  *Retrieves the **com.rti.dds.subscription.TopicQueryData** (p. 2139) data contained in the specified **com.rti.dds.topic.↩ builtin.ServiceRequest** (p. 1985).*

8.362.1 Detailed Description

Helpers to provide utility operations related to **com.rti.dds.subscription.TopicQuery** (p. 2139).

8.362.2 Member Function Documentation

8.362.2.1 topic_query_data_from_service_request()

```
static void topic_query_data_from_service_request (
              TopicQueryData dst,
              ServiceRequest serviceRequest )  [static]
```

Retrieves the **com.rti.dds.subscription.TopicQueryData** (p. 2139) data contained in the specified **com.rti.dds.↩ topic.builtin.ServiceRequest** (p. 1985).

This operation will extract the content from the request body of the **com.rti.dds.topic.builtin.ServiceRequest** (p. 1985) and place it into the specified **com.rti.dds.subscription.TopicQueryData** (p. 2139) object.

The specified **com.rti.dds.topic.builtin.ServiceRequest** (p. 1985) must be a valid sample associated with the service id **com.rti.dds.topic.builtin.ServiceRequest.TOPIC_QUERY_SERVICE_ID** (p. 414). Otherwise this operation will return com.rti.dds.infrastructure.false.

This operation can be called within the context of a **com.rti.dds.publication.DataWriterListener::on_service_↩ request_accepted** (p. 860) to retrieve the **com.rti.dds.subscription.TopicQueryData** (p. 2139) of a **com.rti.dds.↩ topic.builtin.ServiceRequest** (p. 1985) that has been received with service id **com.rti.dds.topic.builtin.Service↩ Request.TOPIC_QUERY_SERVICE_ID** (p. 414)

Parameters

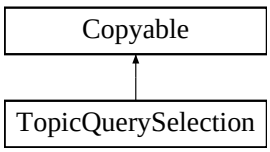
dst	*<<**inout**>> (p. 404)* A **com.rti.dds.subscription.TopicQueryData** (p. 2139) object where the content from the service request is extracted. Cannot be NULL.
serviceRequest	*<<**in**>> (p. 404)* Input **com.rti.dds.topic.builtin.ServiceRequest** (p. 1985) that contains the **com.rti.dds.subscription.TopicQueryData** (p. 2139) as part of its request body. Cannot be NULL.

References **ServiceRequest.request_body**.

8.363 TopicQuerySelection Class Reference

*<<**extension**>> (p. 403)* Specifies the data query that defines a **com.rti.dds.subscription.TopicQuery** (p. 2139)

Inheritance diagram for TopicQuerySelection:



Public Member Functions

- Object **copy_from** (Object src)

Public Attributes

- String **filter_class_name** = null

  The name of the filter to use.
- String **filter_expression** = null

  The filter expression.
- **StringSeq filter_parameters** = new **StringSeq**()

  The query parameters.
- **TopicQuerySelectionKind kind**

  Indicates whether the sample selection is limited to cached samples or not.

8.363.1 Detailed Description

<<***extension***>> *(*p. *403)* Specifies the data query that defines a **com.rti.dds.subscription.TopicQuery** (p. 2139)

The query format is similar to the expression and parameters of a **com.rti.dds.subscription.QueryCondition** (p. 1812) or a **com.rti.dds.topic.ContentFilteredTopic** (p. 692), as described in **com.rti.dds.domain.DomainParticipant.↩ create_contentfilteredtopic_with_filter** (p. 989).

There are two special queries:

- **com.rti.dds.subscription.DataReader.TOPIC_QUERY_SELECTION_SELECT_ALL** (p. 90)
- **com.rti.dds.subscription.DataReader.TOPIC_QUERY_SELECTION_USE_READER_CONTENT_FILTER** (p. 90)

Queries and Filters Syntax (p. 108)

8.363.2 Member Function Documentation

8.363.2.1 copy_from()

```
Object copy_from (
            Object src )
```

This is the implementation of the `Copyable` interface. This method will perform a deep copy of `src` This method could be placed into `TopicQuerySelectionTypeSupport` rather than here by using the `-noCopyable` option to rtiddsgen.

Parameters

src	The Object which contains the data to be copied.

Returns

Returns `this`.

Exceptions

NullPointerException	If `src` is null.
ClassCastException	If `src` is not the same type as `this`.

See also

com.rti.dds.infrastructure.Copyable::copy_from (p. 701)(java.lang.Object)

Implements **Copyable** (p. 701).

8.363.3 Member Data Documentation

8.363.3.1 filter_class_name

```
String filter_class_name = null
```

The name of the filter to use.

Name of content filter to use. Must be one of the built-in filter names or previously registered with **com.rti.dds.domain.↩ DomainParticipant.register_contentfilter** (p. 1018) on the same **com.rti.dds.domain.DomainParticipant** (p. 948).

Built-in filter names are **com.rti.dds.domain.DomainParticipant.SQLFILTER_NAME** (p. 52) and **com.rti.dds.↩ domain.DomainParticipant.STRINGMATCHFILTER_NAME** (p. 52).

[default] See **com.rti.dds.subscription.DataReader.TOPIC_QUERY_SELECTION_USE_READER_CONTENT_↩ FILTER** (p. 90)

Referenced by **TopicQuerySelection.copy_from()**.

8.363.3.2 filter_expression

```
String filter_expression = null
```

The filter expression.

The expression to filter samples in the DataWriters. It follows the format described in **Queries and Filters Syntax** (p. 108).

[default] See **com.rti.dds.subscription.DataReader.TOPIC_QUERY_SELECTION_USE_READER_CONTENT_↩ FILTER** (p. 90)

See also

Queries and Filters Syntax (p. 108)

Referenced by **TopicQuerySelection.copy_from()**.

8.363.3.3 filter_parameters

```
StringSeq filter_parameters = new StringSeq()
```

The query parameters.

[default] See **com.rti.dds.subscription.DataReader.TOPIC_QUERY_SELECTION_USE_READER_CONTENT_↩ FILTER** (p. 90)

See also

com.rti.dds.domain.DomainParticipant.create_contentfilteredtopic_with_filter (p. 989).

Referenced by **TopicQuerySelection.copy_from()**.

8.363.3.4 kind

```
TopicQuerySelectionKind kind
```

Initial value:

```
=
        TopicQuerySelectionKind.HISTORY_SNAPSHOT
```

Indicates whether the sample selection is limited to cached samples or not.

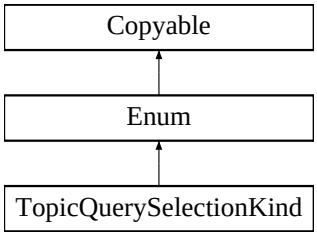
[default] com.rti.dds.subscription.TopicQuerySelectionKind.HISTORY_SNAPSHOT (p. 2149)

Referenced by **TopicQuerySelection.copy_from()**.

8.364 TopicQuerySelectionKind Class Reference

Kinds of **TopicQuerySelection** (p. 2145).

Inheritance diagram for TopicQuerySelectionKind:



Static Public Attributes

- static final **TopicQuerySelectionKind HISTORY_SNAPSHOT**

  *Indicates that the **com.rti.dds.subscription.TopicQuery** (p. 2139) may only select samples that were in the DataWriter cache upon reception.*
- static final **TopicQuerySelectionKind CONTINUOUS**

  *Indicates that the **com.rti.dds.subscription.TopicQuery** (p. 2139) may continue selecting samples published after its reception.*

Additional Inherited Members

8.364.1 Detailed Description

Kinds of **TopicQuerySelection** (p. 2145).

See also

com.rti.dds.subscription.TopicQuerySelection (p. 2145)

8.364.2 Member Data Documentation

8.364.2.1 HISTORY_SNAPSHOT

```
final TopicQuerySelectionKind HISTORY_SNAPSHOT [static]
```

Indicates that the **com.rti.dds.subscription.TopicQuery** (p. 2139) may only select samples that were in the DataWriter cache upon reception.

[default]

8.364.2.2 CONTINUOUS

```
final  TopicQuerySelectionKind CONTINUOUS  [static]
```

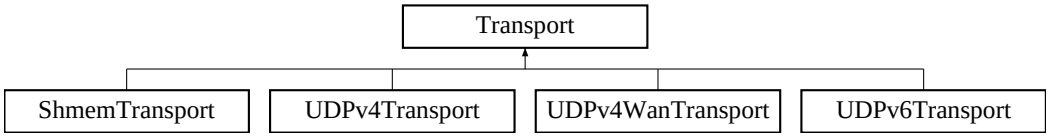
Indicates that the **com.rti.dds.subscription.TopicQuery** (p. 2139) may continue selecting samples published after its reception.

The subscribing application must explicitly delete the **TopicQuery** (p. 2139) (see **com.rti.dds.subscription.DataReader.delete_topic_query** (p. 733)) to signal the DataWriters to stop publishing samples for it.

8.365 Transport Interface Reference

RTI Connext's abstract pluggable transport interface.

Inheritance diagram for Transport:



Classes

- class **Property_t**

  *Base configuration structure that must be inherited by derived **Transport** (p. 2150) Plugin classes.*

8.365.1 Detailed Description

RTI Connext's abstract pluggable transport interface.

8.366 TransportBuiltinKind Class Reference

Built-in transport kind.

Static Public Attributes

- static final int **UDPv4**

  *Built-in UDPv4 transport, **com.rti.ndds.transport.UDPv4Transport** (p. 2255).*
- static final String **UDPv4_ALIAS**

  Alias name for the UDPv4 built-in transport: "builtin.udpv4".
- static final int **SHMEM**

  *Built-in shared memory transport, **com.rti.ndds.transport.ShmemTransport** (p. 1990).*
- static final String **SHMEM_ALIAS**

  Alias name for the shared memory built-in transport: "builtin.shmem".
- static final int **UDPv6**

  *Built-in UDPv6 transport, **com.rti.ndds.transport.UDPv6Transport** (p. 2265).*
- static final String **UDPv6_ALIAS**

  Alias name for the UDPv6 built-in transport: "builtin.udpv6".
- static final int **UDPv4_WAN**

  *Built-in UDPv4 asymmetric transport, **com.rti.ndds.transport.UDPv4WanTransport** (p. 2261).*
- static final String **UDPv4_WAN_ALIAS**

  Alias name for the UDPv4 asymmetric built-in transport: "builtin.udpv4_wan".
- static final int **MASK_NONE**

  *None of the built-in transports will be registered automatically when the **com.rti.dds.domain.DomainParticipant** (p. 948) is enabled.*
- static final int **MASK_DEFAULT**

  *The default value of **com.rti.dds.infrastructure.TransportBuiltinQosPolicy.mask** (p. 2153).*
- static final int **MASK_ALL**

  *All the available built-in transports are registered automatically when the **com.rti.dds.domain.DomainParticipant** (p. 948) is enabled.*

8.366.1 Detailed Description

Built-in transport kind.

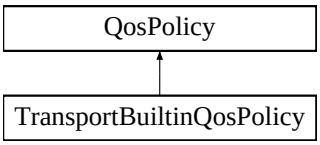
8.367 TransportBuiltinQosPolicy Class Reference

<<***extension***>> *(p. 138)* Specifies which built-in transports are used.

Inheritance diagram for TransportBuiltinQosPolicy:



Public Attributes

- int **mask**

  *<<**basic**>> (p. 123) <<**extension**>> (p. 138) Specifies the built-in transports that are registered automatically when the **com.rti.dds.domain.DomainParticipant** (p. 948) is enabled.*

8.367.1 Detailed Description

*<<**extension**>> (p. 138)* Specifies which built-in transports are used.

Three different transport plug-ins are built into the core RTI Connext libraries (for most supported target platforms): UDPv4, shared memory, and UDPv6.

This QoS policy allows you to control which of these built-in transport plug-ins are used by a **com.rti.dds.domain.↩ DomainParticipant** (p. 948). By default, only the UDPv4 and shared memory plug-ins are enabled (although on some embedded platforms, the shared memory plug-in is not available). In some cases, users will disable the shared memory transport when they do not want applications to use shared memory to communicate when running on the same node.

Entity:

com.rti.dds.domain.DomainParticipant (p. 948)

Properties:

RxO (p. 506) = N/A
Changeable (p. 507) = **NO** (p. 507)

8.367.2 Member Data Documentation

8.367.2.1 mask

```
int mask
```

*<<**basic**>> (p. 123) <<**extension**>> (p. 138)* Specifies the built-in transports that are registered automatically when the **com.rti.dds.domain.DomainParticipant** (p. 948) is enabled.

RTI Connext provides several built-in transports. Only those that are specified with this mask are registered automatically when the **com.rti.dds.domain.DomainParticipant** (p. 948) is enabled.

[default] com.rti.dds.infrastructure.TransportBuiltinKind.MASK_DEFAULT (p. 523)

            TransportMulticastMapping_t src )
```

Copy constructor.

References **TransportMulticastMapping_t.addresses**, **TransportMulticastMapping_t.mapping_function**, and **TransportMulticastMapping_t.topic_expression**.

8.370.3 Member Data Documentation

8.370.3.1 addresses

```
String addresses
```

<<***extension***>> *(*p. *138)* A string containing a comma-separated list of IP addresses or IP address ranges to be used to receive *multicast* traffic for the entity with a topic that matches the **com.rti.dds.infrastructure.TransportMulticast↩ Mapping_t.topic_expression** (p. 2157).

The string must contain IPv4 or IPv6 addresses separated by commas. For example: "239.255.100.1,239.255.100.↩ 2,239.255.100.3"

You may specify ranges of addresses by enclosing the start address and the end address in square brackets. For example: "[239.255.100.1,239.255.100.3]"

You may combine the two approaches. For example:

"239.255.200.1,[239.255.100.1,239.255.100.3], 239.255.200.3"

IPv4 addresses must be specified in Dot-decimal notation.

IPv6 addresses must be specified using 8 groups of 16-bit hexadecimal values separated by colons. For example: FF00:0000:0000:0000:0202:B3FF:FE1E:8329

Leading zeroes can be skipped. For example: "FF00:0:0:0:202:B3FF:FE1E:8329"

You may replace a consecutive number of zeroes with a double colon, but only once within an address. For example: "FF00::202:B3FF:FE1E:8329"

[default] NULL

Referenced by **TransportMulticastMapping_t.TransportMulticastMapping_t()**.

8.370.3.2 topic_expression

```
String topic_expression
```

<<***extension***>> *(*p. *138)* A regular expression that will be used to map topic names to corresponding multicast receive addresses.

A topic name must match the expression before a corresponding address is assigned.

[default] NULL

Referenced by **TransportMulticastMapping_t.TransportMulticastMapping_t()**.

8.370.3.3 mapping_function

```
TransportMulticastMappingFunction_t mapping_function
```

<<***extension***>> *(*p. *138)* Specifies a function that will define the mapping between a topic name and a specific multicast address from a list of addresses.

This function is optional. If not specified, the middleware will use a hash function to perform the mapping.

Referenced by **TransportMulticastMapping_t.TransportMulticastMapping_t()**.

8.371 TransportMulticastMappingFunction_t Class Reference

Type representing an external mapping function.

Inherits Struct.

Public Member Functions

- **TransportMulticastMappingFunction_t** ()

  Constructor.
- **TransportMulticastMappingFunction_t** (**TransportMulticastMappingFunction_t** src)

  Copy constructor.

Public Attributes

- String **dll**

  Specifies a dynamic library that contains a mapping function.
- String **function_name**

  Specifies the name of a mapping function.

8.371.1 Detailed Description

Type representing an external mapping function.

A mapping function is defined by a dynamic library name and a function name.

QoS:

com.rti.dds.infrastructure.TransportMulticastMappingQosPolicy (p. 2160)

8.371.2 Constructor & Destructor Documentation

8.371.2.1 TransportMulticastMappingFunction_t() [1/2]

```
TransportMulticastMappingFunction_t ( )
```

Constructor.

TransportMulticastMappingFunction_t (
            TransportMulticastMappingFunction_t src )
```

Copy constructor.

References **TransportMulticastMappingFunction_t.dll**, and **TransportMulticastMappingFunction_t.function_name**.

8.371.3 Member Data Documentation

8.371.3.1 dll

`String dll`

Specifies a dynamic library that contains a mapping function.

A relative or absolute path can be specified.

If the name is specified as "foo", the library name on Linux systems will be libfoo.so; on Windows systems it will be foo.dll.

[default] NULL

Referenced by **TransportMulticastMappingFunction_t.TransportMulticastMappingFunction_t()**.

8.371.3.2 function_name

`String function_name`

Specifies the name of a mapping function.

This function must be implemented in the library specified in **com.rti.dds.infrastructure.TransportMulticast↩ MappingFunction_t.dll** (p. 2159).

The function must implement the following interface:

int function(const char* topic_name, int numberOfAddresses);

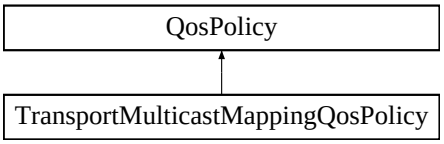
The function must return an integer that indicates the *index* of the address to use for the given `topic_name`. For example, if the first address in the list should be used, it must return 0; if the second address in the list should be used, it must return 1, etc.

Referenced by **TransportMulticastMappingFunction_t.TransportMulticastMappingFunction_t()**.

8.372 TransportMulticastMappingQosPolicy Class Reference

<<***extension***>> *(p. 138)* Specifies the multicast address on which a **com.rti.dds.subscription.DataReader** (p. 707) wants to receive its data. It can also specify a port number as well as a subset of the available (at the **com.rti.dds.↩ domain.DomainParticipant** (p. 948) level) transports with which to receive the multicast data.

Inheritance diagram for TransportMulticastMappingQosPolicy:



Public Attributes

- final **TransportMulticastMappingSeq value**

  *<<**basic**>> (p. 123) <<**extension**>> (p. 138) A sequence of multicast communications settings.*

8.372.1 Detailed Description

*<<**extension**>> (p. 138)* Specifies the multicast address on which a **com.rti.dds.subscription.DataReader** (p. 707) wants to receive its data. It can also specify a port number as well as a subset of the available (at the **com.rti.dds.domain.DomainParticipant** (p. 948) level) transports with which to receive the multicast data.

By default, a **com.rti.dds.publication.DataWriter** (p. 818) will send individually addressed packets for each **com.rti.dds.subscription.DataReader** (p. 707) that subscribes to the topic of the DataWriter – this is known as unicast delivery. Thus, as many copies of the data will be sent over the network as there are DataReaders for the data. The network bandwidth used by a DataWriter will thus increase linearly with the number of DataReaders.

Multicast addressing (on UDP/IP transports) allows multiple DataReaders to receive the *same* network packet. By using multicast, a **com.rti.dds.publication.DataWriter** (p. 818) can send a single network packet that is received by all subscribing applications. Thus the network bandwidth usage will be constant, independent of the number of DataReaders.

Coordinating the multicast address specified by DataReaders can help optimize network bandwidth usage in systems where there are multiple DataReaders for the same **com.rti.dds.topic.Topic** (p. 2116).

Entity:

com.rti.dds.subscription.DataReader (p. 707)

Properties:

RxO (p. 506) = N/A
Changeable (p. 507) = **NO** (p. 507)

8.372.2 Member Data Documentation

8.372.2.1 value

`final` **`TransportMulticastMappingSeq`** `value`

*<<**basic**>> (p. 123) <<**extension**>> (p. 138)* A sequence of multicast communications settings.

An empty sequence means that multicast is not used by the entity.

The RTPS wire protocol currently limits the maximum number of multicast locators to

1. Note that this is a hard limit that cannot be increased. However, this limit can be decreased by configuring the 'dds.domain_participant.max_announced_locator_list_size' property in the **com.rti.dds.infrastructure.PropertyQosPolicy** (p. 1739) associated with the **com.rti.dds.domain.DomainParticipantQos** (p. 1073).

[default] Empty sequence.

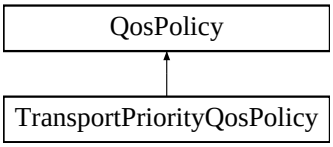
8.378 TransportPriorityQosPolicy Class Reference

*<<**spec**>> (p. 132)* This QoS policy allows the application to take advantage of transports that are capable of sending messages with different priorities.

Inheritance diagram for TransportPriorityQosPolicy:



Public Attributes

- int **value**

  *<<**spec**>> (p. 132) This policy is a hint to the infrastructure as to how to set the priority of the underlying transport used to send the data.*

8.378.1 Detailed Description

<<***spec***>> *(p. 132)* This QoS policy allows the application to take advantage of transports that are capable of sending messages with different priorities.

The Transport Priority QoS policy is optional and only supported on certain OSs and transports. It allows you to specify on a per-DataWriter or DataReader basis that the data sent by that endpoint is of a different priority.

The DDS specification does not indicate how a DDS implementation should treat data of different priorities. It is often difficult or impossible for DDS implementations to treat data of higher priority differently than data of lower priority, especially when data is being sent (delivered to a physical transport) directly by the thread that called **com.rti.ndds.example.FooDataWriter.write** (p. 1397). Also, many physical network transports themselves do not have a end-user controllable level of data packet priority.

Entity:

com.rti.dds.publication.DataWriter (p. 818), **com.rti.dds.subscription.DataReader** (p. 707), **com.rti.dds.topic.Topic** (p. 2116)

Properties:

RxO (p. 506) = N/A
Changeable (p. 507) = **NO** (p. 507)

8.378.2 Usage

In RTI Connext, for the IP-based transports (UDPv4, UDPv6, Real-Time WAN, and TCP), the value set in the Transport Priority QoS policy can be used to set the differentiated services field (DS field) bits of the IPv4 and IPv6 headers for datagrams sent by a **com.rti.dds.publication.DataWriter** (p. 818) or **com.rti.dds.subscription.DataReader** (p. 707). It is platform-dependent on how and whether setting the DS field has an effect. Some platforms may require external permissions in order to set the DS field.

The transport priority value is not provided as is to the transports, but transformed according to the following fields: transport_priority_mask (for example, see **com.rti.ndds.transport.UDPv4Transport.Property_t.transport_priority_mask** (p. 1715)), transport_priority_mapping_low (for example, see **com.rti.ndds.transport.UDPv4Transport.Property_t.transport_priority_mapping_low** (p. 1715)), and transport_priority_mapping_high (for example, see **com.rti.ndds.transport.UDPv4Transport.Property_t.transport_priority_mapping_high** (p. 1716)). If you want the priority value to be exactly equal to the DS value, then the only change you need to make is to set transport_priority_mask to `0xff` (and keep the transport_priority_mapping_low and transport_priority_mapping_high defaults).

It is incorrect to assume that using the Transport Priority QoS policy will have any effect at all on the end-to-end delivery of data from a **com.rti.dds.publication.DataWriter** (p. 818) and a **com.rti.dds.subscription.DataReader** (p. 707). All network elements, including switches and routers, must have the capability and be enabled to actually use the DS field to treat higher priority packets differently. Thus the ability to use the Transport Priority QoS policy must be designed and configured at a *system* level; just turning it on in an application may have no effect at all at a transport level.

For additional details on how to set the DS field in IP-based transports, see the "TRANSPORT_PRIORITY QosPolicy" section of the `User's Manual`.

8.378.3 Member Data Documentation

8.378.3.1 value

```
int value
```

<<***spec***>> *(p. 132)* This policy is a hint to the infrastructure as to how to set the priority of the underlying transport used to send the data.

You may choose any value within the range of a 32-bit signed integer; higher values indicate higher priority. However, any further interpretation of this policy is specific to a particular transport and a particular DDS implementation. For example, a particular transport is permitted to treat a range of priority values as equivalent to one another.

[default] 0

<<***interface***>> *(p. 403)* The utility class used to configure RTI Connext pluggable transports.

8.380.2 Member Function Documentation

8.380.2.1 get_builtin_transport_property()

```
static void get_builtin_transport_property (
              DomainParticipant participant_in,
             Transport.Property_t builtin_transport_property_inout )  [static]
```

Get the properties used to create a builtin transport plugin.

Retrieves the properties that will be used to create a builtin transport plugin.

Precondition

The `builtin_transport_property_inout` parameter must be of the type specified by the `builtin↩ _transport_kind_in`.

Parameters

participant↩ _in	<<***in***>> *(p. 404)* A valid non-null **com.rti.dds.domain.DomainParticipant** (p. 948)

Parameters

builtin_transport_property_inout	<<***inout***>> *(p. 404)* The storage area where the retrieved property will be output. The specific type required by the `builtin_transport_kind_in` must be used.

Exceptions

One	of the **Standard Return Codes** (p. 513), or **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).

See also

com.rti.ndds.transport.TransportSupport.set_builtin_transport_property() (p. 2173)

References **TransportBuiltinKind.SHMEM**, **TransportBuiltinKind.UDPv4**, **TransportBuiltinKind.UDPv4_WAN**, and **TransportBuiltinKind.UDPv6**.

8.380.2.2 set_builtin_transport_property()

```
static void set_builtin_transport_property (
              DomainParticipant participant_in,
             Transport.Property_t builtin_transport_property_in )  [static]
```

Set the properties used to create a builtin transport plugin.

Specifies the properties that will be used to create a builtin transport plugin.

If the builtin transport is already registered when this operation is called, these property changes will *not* have any effect. Builtin transport properties should always be set before the transport is registered. See **Built-in Transport Plugins** (p. 106) for details on when a builtin transport is registered.

Precondition

A disabled **com.rti.dds.domain.DomainParticipant** (p. 948). The `builtin_transport_property_inout` parameter must be of the type specified by the `builtin_transport_kind_in`.

Parameters

participant_in	<<***in***>> *(p. 404)* A valid non-null **com.rti.dds.domain.DomainParticipant** (p. 948) that has not been enabled.

Parameters

builtin_transport_property_in	<<***inout***>> *(*p. *404)* The new transport property that will be used to the create the builtin transport plugin. The specific type required by the `builtin_transport_kind_in` must be used.

Exceptions

One	of the **Standard Return Codes** (p. 513), or **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).

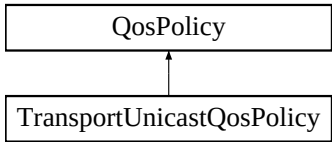
The native method will return NULL if the given index is out of range. That should only happen if there's an NDDS bug, so throw an IllegalStateException instead of a **RETCODE_ERROR** (p. 1900) exception.

8.383 TransportUnicastQosPolicy Class Reference

<<***extension***>> *(*p. *138)* Specifies a subset of transports and a port number that can be used by an **Entity** (p. 1320) to receive data.

Inheritance diagram for TransportUnicastQosPolicy:



Public Attributes

- final **TransportUnicastSettingsSeq value**
  <<***extension***>> *(*p. *138) A sequence of unicast communication settings.*

8.383.1 Detailed Description

<<***extension***>> *(*p. *138)* Specifies a subset of transports and a port number that can be used by an **Entity** (p. 1320) to receive data.

Entity:

com.rti.dds.domain.DomainParticipant (p. 948), **com.rti.dds.subscription.DataReader** (p. 707), **com.rti.dds.publication.DataWriter** (p. 818)

Properties:

RxO (p. 506) = N/A
Changeable (p. 507) = **NO** (p. 507)

8.383.2 Usage

RTI Connext may send data to a variety of Entities, not just DataReaders. For example, reliable DataWriters may receive ACK/NACK packets from reliable DataReaders.

During discovery, each **com.rti.dds.infrastructure.Entity** (p. 1320) announces to remote applications a list of (up to 16) unicast addresses to which the remote application should send data (either user data packets or reliable protocol meta-data such as ACK/NACKs and heartbeats). Note that this is a hard limit that cannot be increased. However, this limit can be decreased by configuring the 'dds.domain_participant.max_announced_locator_list_size' property in the **com.rti.dds.infrastructure.PropertyQosPolicy** (p. 1739) associated with the **com.rti.dds.domain.DomainParticipantQos** (p. 1073).

Note: RTI Connext internally uses several dynamic locator lists to keep track of configured unicast locators. The initial size of these lists can be configured with the **com.rti.dds.domain.DomainParticipant** (p. 948) property 'dds.domain↩ _participant.initial_locator_list_size'. By default, the initial size is derived from local information, such as the number of local locators. To prevent dynamic resizing at runtime, set the property's value to the maximum number of locators that a single participant or endpoint may advertise at any given time in your system.

By default, the list of addresses is populated automatically with values obtained from the enabled transport plug-ins allowed to be used by the **Entity** (p. 1320) (see **com.rti.dds.infrastructure.TransportBuiltinQosPolicy** (p. 2152) and **com.rti.dds.infrastructure.TransportSelectionQosPolicy** (p. 2170)). Also, the associated ports are automatically determined (see **com.rti.dds.infrastructure.RtpsWellKnownPorts_t** (p. 1931)).

Use this QoS policy to manually set the receive address list for an **Entity** (p. 1320). You may optionally set a port to use a non-default receive port as well. Only the first 16 addresses will be used.

RTI Connext will create a receive thread for every unique port number that it encounters (on a per transport basis).

- For a **com.rti.dds.domain.DomainParticipant** (p. 948), this QoS policy sets the default list of addresses used by other applications to send user data for local DataReaders.
- For a **com.rti.dds.subscription.DataReader** (p. 707), if set, then other applications will use the specified list of addresses to send user data (and reliable protocol packets for reliable DataReaders). Otherwise, if not set, the other applications will use the addresses set by the **com.rti.dds.domain.DomainParticipant** (p. 948).
- For a reliable **com.rti.dds.publication.DataWriter** (p. 818), if set, then other applications will use the specified list of addresses to send reliable protocol packets (ACKS/NACKS) on the behalf of reliable DataReaders. Otherwise, if not set, the other applications will use the addresses set by the **com.rti.dds.domain.DomainParticipant** (p. 948).

8.383.3 Member Data Documentation

8.383.3.1 value

```
final TransportUnicastSettingsSeq value
```

<<***extension***>> *(p. 138)* A sequence of unicast communication settings.

An empty sequence means that applicable defaults specified by elsewhere (e.g. **com.rti.dds.domain.Domain↩ ParticipantQos.default_unicast** (p. 1078)) should be used.

The RTPS wire protocol currently limits the maximum number of unicast locators to

1. Note that this is a hard limit that cannot be increased. However, this limit can be decreased by configuring the 'dds.domain_participant.max_announced_locator_list_size' property in the **com.rti.dds.infrastructure.↩ PropertyQosPolicy** (p. 1739) associated with the **com.rti.dds.domain.DomainParticipantQos** (p. 1073).

[default] Empty sequence.

8.386 TrustAlgorithmRequirements Class Reference

Type to describe Trust Plugins algorithm requirements for an entity.

Inherits Struct.

Public Member Functions

- **TrustAlgorithmRequirements** ()
  Create an instance with the default Trust Algorithm Requirements.
- **TrustAlgorithmRequirements** (int **supported_mask**, int **required_mask**)
  Create an instance with the Trust Algorithm Requirements passed as input.

Public Attributes

- int **supported_mask**
  Trust Plugins algorithms that an entity supports.
- int **required_mask**
  Trust Plugins algorithms that an entity uses.

8.386.1 Detailed Description

Type to describe Trust Plugins algorithm requirements for an entity.

8.386.2 Constructor & Destructor Documentation

8.386.2.1 TrustAlgorithmRequirements() [1/2]

```
TrustAlgorithmRequirements ( )
```

Create an instance with the default Trust Algorithm Requirements.

The meaning of this field may vary depending on what Trust Plugins the entity is using.

8.386.2.2 TrustAlgorithmRequirements() [2/2]

```
TrustAlgorithmRequirements (
            int supported_mask,
            int required_mask )
```

Create an instance with the Trust Algorithm Requirements passed as input.

The meaning of this field may vary depending on what Trust Plugins the entity is using.

References **TrustAlgorithmRequirements.required_mask**, and **TrustAlgorithmRequirements.supported_mask**.

8.386.3 Member Data Documentation

8.386.3.1 supported_mask

```
int supported_mask
```

Trust Plugins algorithms that an entity supports.

Referenced by **TrustAlgorithmRequirements.TrustAlgorithmRequirements()**.

8.386.3.2 required_mask

```
int required_mask
```

Trust Plugins algorithms that an entity uses.

Referenced by **TrustAlgorithmRequirements.TrustAlgorithmRequirements()**.

8.387 TypeCode Class Reference

The definition of a particular data type, which you can use to inspect the name, members, and other properties of types generated with rtiddsgen (see the `Code Generator User's Manual`) or to modify types you define yourself at runtime.

Inherits Serializable.

Public Member Functions

- **TCKind kind** ()

  *Gets the **com.rti.dds.typecode.TCKind** (p. 2094) value of a type code.*
- **ExtensibilityKind extensibility_kind** ()

  *Gets the **com.rti.dds.typecode.ExtensibilityKind** (p. 1338) value of a type code.*
- boolean **equal** (**TypeCode** tc)

  *Compares two **com.rti.dds.typecode.TypeCode** (p. 2183) objects for equality.*
- boolean **equals** (Object tc)

  *Compares two **com.rti.dds.typecode.TypeCode** (p. 2183) objects for equality.*
- boolean **assignable** (**TypeCode** from)

  *Checks if this **com.rti.dds.typecode.TypeCode** (p. 2183) is assignable from the input **com.rti.dds.typecode.TypeCode** (p. 2183).*
- int **length** () throws BadKind

  Returns the number of elements in the type described by this type code.
- String **name** () throws BadKind

  *Retrieves the simple name identifying this **com.rti.dds.typecode.TypeCode** (p. 2183) object within its enclosing scope.*
- boolean **is_alias_pointer** () throws BadKind

  Function that tells if an alias is a pointer or not.
- short **type_modifier** () throws BadKind

  *Returns a constant indicating the modifier of the value type that this **com.rti.dds.typecode.TypeCode** (p. 2183) object describes.*
- **TypeCode concrete_base_type** () throws BadKind

  *Returns the **com.rti.dds.typecode.TypeCode** (p. 2183) that describes the concrete base type of the value type that this **com.rti.dds.typecode.TypeCode** (p. 2183) object describes.*
- **TypeCode content_type** () throws BadKind

  *Returns the **com.rti.dds.typecode.TypeCode** (p. 2183) object representing the type for the members of the object described by this **com.rti.dds.typecode.TypeCode** (p. 2183) object.*
- int **array_dimension_count** () throws BadKind

  This function returns the number of dimensions of an array type code.
- int **array_dimension** (int index) throws BadKind,Bounds

  This function returns the index-th dimension of an array type code.
- int **element_count** () throws BadKind

  The number of elements in an array.
- int **member_count** () throws BadKind

  Returns the number of members of the type code.
- String **member_name** (int index) throws BadKind,Bounds

  Returns the name of a type code member identified by the given index.
- **TypeCode member_type** (int index) throws BadKind,Bounds

*Retrieves the **com.rti.dds.typecode.TypeCode** (p. 2183) object describing the type of the member identified by the given index.*

- int **member_id** (int index) throws BadKind,Bounds

  *Returns the ID of the **TypeCode** (p. 2183) member identified by the given index.*
- int **member_label_count** (int index) throws BadKind,Bounds

  Returns the number of labels associated to the index-th union member.
- int **member_label** (int member_index, int label_index) throws BadKind,Bounds

  Return the label_index-th label associated to the member_index-th member.
- int **member_ordinal** (int index) throws BadKind,Bounds

  Returns the ordinal that corresponds to the index-th enum value.
- boolean **is_member_key** (int index) throws BadKind,Bounds

  Function that tells if a member is a key or not.
- boolean **is_member_required** (int index) throws BadKind,Bounds

  Indicates whether a given member of a type is required to be present in every sample of that type.
- boolean **is_member_pointer** (int index) throws BadKind,Bounds

  Function that tells if a member is a pointer or not.
- boolean **is_member_must_understand** (int index) throws BadKind,Bounds

  *Returns the "must understand" property for a member of this **com.rti.dds.typecode.TypeCode** (p. 2183).*
- boolean **is_member_bitfield** (int index) throws BadKind,Bounds

  Function that tells if a member is a bitfield or not.
- short **member_bitfield_bits** (int index) throws BadKind,Bounds

  Returns the number of bits of a bitfield member.
- short **member_visibility** (int index) throws BadKind,Bounds

  Returns the constant that indicates the visibility of the index-th member.
- **TypeCode** **discriminator_type** () throws BadKind

  Returns the discriminator type code.
- int **default_index** () throws BadKind

  Returns the index of the default member, or -1 if there is no default member.
- int **find_member_by_name** (String **name**) throws BadKind

  Get the index of the member of the given name.
- void **print_IDL** (int indent)

  *Prints a **com.rti.dds.typecode.TypeCode** (p. 2183) in IDL notation.*
- void **print_IDL** (int indent, Writer out) throws IOException

  *Prints a **com.rti.dds.typecode.TypeCode** (p. 2183) in a pseudo-IDL notation.*
- void **print_complete_IDL** (Writer writer) throws IOException
- int **add_member** (String **name**, int id, **TypeCode** tc, byte member_flags) throws BadKind,BadMemberName,↩ BadMemberId

  *Add a new member to this **com.rti.dds.typecode.TypeCode** (p. 2183).*
- int **add_member** (String **name**, int id, **TypeCode** tc, byte member_flags, short visibility, boolean is↩ _pointer, short bits, boolean is_must_understand) throws BadKind,BadMemberName,BadMemberId,BAD_↩ PARAM,IllegalStateException

  *Add a new member to this **com.rti.dds.typecode.TypeCode** (p. 2183).*
- synchronized int **add_member_to_enum** (String **name**, int ordinal) throws BadKind,BadMemberName

  *Add a new enumerated constant to this enum **com.rti.dds.typecode.TypeCode** (p. 2183).*
- synchronized int **add_member_to_union** (String **name**, int id, int labels_in[ ], **TypeCode** tc, boolean is_pointer) throws BadKind,BadMemberName, BadMemberId

  *Add a new member to a union **com.rti.dds.typecode.TypeCode** (p. 2183).*
- String **signature** () throws RETCODE_ERROR

*Gets an MD5 signature of the **com.rti.dds.typecode.TypeCode** (p. 2183).*

- final long **cdr_serialized_sample_min_size** (short representation_id) throws UserException, SystemException

  Gets the minimum serialized size of samples of this type.
- final long **cdr_serialized_sample_min_size** () throws UserException, SystemException

  Gets the minimum serialized size of samples of this type.
- final long **cdr_serialized_sample_max_size** (short representation_id) throws UserException, SystemException

  Gets the maximum serialized size of samples of this type.
- final long **cdr_serialized_sample_max_size** () throws UserException, SystemException

  Gets the maximum serialized size of samples of this type.
- final long **cdr_serialized_sample_key_max_size** (short representation_id) throws UserException, System↩ Exception

  Gets the maximum serialized size of sample keys of this type.
- final long **cdr_serialized_sample_key_max_size** () throws UserException, SystemException

  Gets the maximum serialized size of sample keys of this type.
- long **get_type_object_serialized_size** ()

  *Gets the serialized size of the TypeObject v1 created from this **com.rti.dds.typecode.TypeCode** (p. 2183).*

Static Public Attributes

- static final **TypeCode TC_NULL**

  Basic null type.
- static final **TypeCode TC_SHORT**

  Basic 16-bit signed integer type.
- static final **TypeCode TC_LONG**

  Basic 32-bit signed integer type.
- static final **TypeCode TC_USHORT**

  Basic unsigned 16-bit integer type.
- static final **TypeCode TC_ULONG**

  Basic unsigned 32-bit integer type.
- static final **TypeCode TC_FLOAT**

  Basic 32-bit floating point type.
- static final **TypeCode TC_DOUBLE**

  Basic 64-bit floating point type.
- static final **TypeCode TC_BOOLEAN**

  Basic Boolean type.
- static final **TypeCode TC_CHAR**

  Basic single-byte character type.
- static final **TypeCode TC_OCTET**

  Basic octet/byte type.
- static final **TypeCode TC_INT8**

  Basic signed 8-bit int type.
- static final **TypeCode TC_UINT8**

  Basic unsigned 8-bit int type.
- static final **TypeCode TC_LONGLONG**

  Basic 64-bit integer type.
- static final **TypeCode TC_ULONGLONG**

Basic unsigned 64-bit integer type.

- static final **TypeCode TC_LONGDOUBLE**

  Basic 128-bit floating point type.
- static final **TypeCode TC_WCHAR**

  Basic four-byte character type.
- static final int **MEMBER_ID_INVALID**

  *A sentinel indicating an invalid **com.rti.dds.typecode.TypeCode** (p. 2183) member ID.*
- static final int **MAX_MEMBER_ID**

  Maximum value for member id. ID.
- static final int **INDEX_INVALID**

  *A sentinel indicating an invalid **com.rti.dds.typecode.TypeCode** (p. 2183) member index.*
- static final byte **NONKEY_MEMBER**

  A flag indicating that a type member is optional and not part of the key.
- static final byte **KEY_MEMBER**

  A flag indicating that a type member is part of the key for that type, and therefore required.
- static final byte **NONKEY_REQUIRED_MEMBER**

  A flag indicating that a type member is not part of the key but is nevertheless required.
- static final short **NOT_BITFIELD**

  Indicates that a member of a type is not a bitfield.

8.387.1 Detailed Description

The definition of a particular data type, which you can use to inspect the name, members, and other properties of types generated with rtiddsgen (see the `Code Generator User's Manual`) or to modify types you define yourself at runtime.

You create **com.rti.dds.typecode.TypeCode** (p. 2183) objects using the **com.rti.dds.typecode.TypeCodeFactory** (p. 2232) singleton. Then you can use the methods on *this* class to inspect and modify the data type definition.

This class is based on a similar class from CORBA.

MT Safety:

SAFE for read-only access, UNSAFE for modification. Modifying a single **com.rti.dds.typecode.TypeCode** (p. 2183) object concurrently from multiple threads is *unsafe*. Modifying a **com.rti.dds.typecode.TypeCode** (p. 2183) from a single thread while concurrently reading the state of that **com.rti.dds.typecode.TypeCode** (p. 2183) from another thread is also *unsafe*. However, reading the state of a **com.rti.dds.typecode.TypeCode** (p. 2183) concurrently from multiple threads, without any modification, is *safe*.

8.387.2 Member Function Documentation

8.387.2.1 kind()

```
TCKind kind ( )
```

Gets the **com.rti.dds.typecode.TCKind** (p. 2094) value of a type code.

Retrieves the kind of this **com.rti.dds.typecode.TypeCode** (p. 2183) object. The kind of a type code determines which **com.rti.dds.typecode.TypeCode** (p. 2183) methods may legally be invoked on it.

MT Safety:

SAFE.

Returns

The type code kind.

Referenced by **TypeCode.concrete_base_type()**, **TypeCode.equal()**, **DynamicData.get_char()**, **DynamicData.get_char_array()**, **DynamicData.get_char_seq()**, **DynamicData.get_string()**, **DynamicData.set_char()**, **DynamicData.set_char_array()**, **DynamicData.set_char_seq()**, and **DynamicData.set_string()**.

8.387.2.2 extensibility_kind()

```
ExtensibilityKind extensibility_kind ( )
```

Gets the **com.rti.dds.typecode.ExtensibilityKind** (p. 1338) value of a type code.

Retrieves the extensibility kind of this **com.rti.dds.typecode.TypeCode** (p. 2183) object.

In some cases, it is desirable for types to evolve without breaking interoperability with deployed components already using those types. For example:

- A new set of applications to be integrated into an existing system may want to introduce additional fields into a structure. These new fields can be safely ignored by already deployed applications, but applications that do understand the new fields can benefit from their presence.
- A new set of applications to be integrated into an existing system may want to increase the maximum size of some sequence or string in a Type. Existing applications can receive data samples from these new applications as long as the actual number of elements (or length of the strings) in the received data sample does not exceed what the receiving applications expects. If a received data sample exceeds the limits expected by the receiving application, then the sample can be safely ignored (filtered out) by the receiver.

In order to support use cases such as these, the type system introduces the concept of appendable and mutable types.

- A type may be final, indicating that the range of its possible data values is strictly defined. In particular, it is not possible to add elements to members of collection or aggregated types while maintaining type assignability.

- A type may be appendable, indicating that two types, where one contains all of the elements/members of the other plus additional elements/members appended to the end, may remain assignable.
- A type may be mutable, indicating that two types may differ from one another in the additional, removal, and/or transposition of elements/members while remaining assignable.

The extensibility of **com.rti.dds.typecode.TCKind.TK_STRUCT** (p. 2098), **com.rti.dds.typecode.TCKind.TK_UNION** (p. 2098), **com.rti.dds.typecode.TCKind.TK_VALUE** (p. 2101), and **com.rti.dds.typecode.TCKind.TK_ENUM** (p. 2098) can be change using the built-in "Extensibility" annotation when the type is declared.

IDL examples:

```
@final

struct MyType {

    long member_1;

}
@appendable

struct MyType {

    long member_1;

}
@mutable

struct MyType {

    long member_1;

}
```

XML example:

```
<struct name="MyType" extensibility="final">

    <member name="member_1" type="long"/>

</struct>
<struct name="MyType" extensibility="appendable">

    <member name="member_1" type="long"/>

</struct>
<struct name="MyType" extensibility="mutable">

    <member name="member_1" type="long"/>

</struct>
```

XSD example:

```
<xsd:complexType name="MyType">

    <xsd:sequence>

        <xsd:element name="member_1" minOccurs="1" maxOccurs="1" type="xsd:int"/>

    </xsd:sequence>

</xsd:complexType>

<!-- @struct true -->

<!-- @extensibility FINAL_EXTENSIBILITY -->
<xsd:complexType name="MyType">

    <xsd:sequence>

        <xsd:element name="member_1" minOccurs="1" maxOccurs="1" type="xsd:int"/>

    </xsd:sequence>

</xsd:complexType>
```

```
<!-- @struct true -->

<!-- @extensibility EXTENSIBLE_EXTENSIBILITY -->
<xsd:complexType name="MyType">

    <xsd:sequence>

        <xsd:element name="member_1" minOccurs="1" maxOccurs="1" type="xsd:int"/>

    </xsd:sequence>

</xsd:complexType>

<!-- @struct true -->

<!-- @extensibility MUTABLE_EXTENSIBILITY -->
```

For TypeCodes built at run-time using the **com.rti.dds.typecode.TypeCodeFactory** (p. 2232) API, the extensibility can be provided as a parameter of the following APIs:

- **com.rti.dds.typecode.TypeCodeFactory.create_struct_tc** (p. 2235)
- **com.rti.dds.typecode.TypeCodeFactory.create_value_tc** (p. 2236)
- **com.rti.dds.typecode.TypeCodeFactory.create_union_tc** (p. 2238)
- **com.rti.dds.typecode.TypeCodeFactory.create_enum_tc** (p. 2239)

See also

com.rti.dds.typecode.ExtensibilityKind (p. 1338)

MT Safety:

SAFE.

Returns

The type code extensibility kind.

Referenced by **TypeCode.equal()**.

8.387.2.3 equal()

```
boolean equal (
               TypeCode tc )
```

Compares two **com.rti.dds.typecode.TypeCode** (p. 2183) objects for equality.

MT Safety:

SAFE.

For equality and assignability purposes, **com.rti.dds.typecode.TCKind.TK_STRUCT** (p. 2098) and **com.rti.dds.typecode.TCKind.TK_VALUE** (p. 2101) are considered equivalent.

The **com.rti.dds.typecode.TypeCode** (p. 2183) of structs inheriting from other structs has a **com.rti.dds.typecode.TCKind.TK_VALUE** (p. 2101) kind.

For example:

```
struct MyStruct: MyBaseStruct {

    long member_1;

};
```

The code generation for the previous type will generate a **com.rti.dds.typecode.TypeCode** (p. 2183) with **com.rti.dds.typecode.TCKind.TK_VALUE** (p. 2101) kind.

Additionally, for equality and assignability purposes, **com.rti.dds.typecode.TCKind.TK_OCTET** (p. 2097), **com.rti.dds.typecode.TCKind.TK_INT8** (p. 2101), and **com.rti.dds.typecode.TCKind.TK_UINT8** (p. 2101) are considered equivalent.

Parameters

tc	<<***in***>> *(p. 404)* Type code that will be compared with this **com.rti.dds.typecode.TypeCode** (p. 2183).

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BAD_PARAM	if tc is null.

Returns

com.rti.dds.infrastructure.true if the type codes are equal. Otherwise, com.rti.dds.infrastructure.false.

See also

http://java.sun.com/javase/6/docs/api/org/omg/CORBA/TypeCode.html#equal(org.omg.CORBA.TypeCode)

References **TypeCode.array_dimension()**, **TypeCode.array_dimension_count()**, **TypeCode.concrete_base_type()**, **TypeCode.content_type()**, **TypeCode.default_index()**, **TypeCode.discriminator_type()**, **TypeCode.equal()**, **TypeCode.equals()**, **TypeCode.extensibility_kind()**, **TypeCode.is_alias_pointer()**, **TypeCode.is_member_bitfield()**, **TypeCode.is_member_key()**, **TypeCode.is_member_pointer()**, **TypeCode.is_member_required()**, **TypeCode.kind()**, **TypeCode.length()**, **TypeCode.member_bitfield_bits()**, **TypeCode.member_count()**, **TypeCode.member_id()**, **TypeCode.member_label()**, **TypeCode.member_label_count()**, **TypeCode.member_name()**, **TypeCode.member_ordinal()**, **TypeCode.member_type()**, **TypeCode.member_visibility()**, **TypeCode.name()**, **TypeCode.TC_NULL**, **TCKind.TK_ALIAS**, **TCKind.TK_ARRAY**, **TCKind.TK_ENUM**, **TCKind.TK_SEQUENCE**, **TCKind.TK_STRING**, **TCKind.TK_STRUCT**, **TCKind.TK_UNION**, **TCKind.TK_VALUE**, **TCKind.TK_WSTRING**, and **TypeCode.type_modifier()**.

Referenced by **TypeCode.equal()**, and **TypeCode.equals()**.

8.387.2.4 equals()

```
boolean equals (
            Object tc )
```

Compares two **com.rti.dds.typecode.TypeCode** (p. 2183) objects for equality.

MT Safety:

SAFE.

Parameters

tc	<<***in***>> *(p. 404)* Type code that will be compared with this **com.rti.dds.typecode.TypeCode** (p. 2183).

Returns

com.rti.dds.infrastructure.true if the type codes are equal. Otherwise, com.rti.dds.infrastructure.false.

See also

http://java.sun.com/javase/6/docs/api/java/lang/Object.html#equals(java.↩
lang.Object)

References **TypeCode.equal()**.

Referenced by **TypeCode.equal()**.

8.387.2.5 assignable()

```
boolean assignable (
             TypeCode from )
```

Checks if this **com.rti.dds.typecode.TypeCode** (p. 2183) is assignable from the input **com.rti.dds.typecode.Type↩
Code** (p. 2183).

MT Safety:

SAFE.

This method checks if this type code is assignable from the type code provided as a parameter.

In order to maintain the loose coupling between data producers and consumers, especially as systems change over time, it is desirable that the two be permitted to use slightly different versions of a type, and that the infrastructure perform any necessary translation. To support type evolution and inheritance the type system defines the "is-assignable-from" directed binary relationship between every pair of types in the Type System.

Intuitively, if T1 is-assignable-from T2, it means that in general it is possible, in a structural way, to set the contents of an object of type T1 to the contents of an object of T2 (or perhaps a subset of those contents) without leading to incorrect interpretations of that information.

For example:

```
struct MyBaseType {

    long member_1;

};

struct MyDerivedType: MyBaseType {

    long member_2;

};
```

The previous two types that are related to each other by an inheritance relationship are assignable.

For additional information on type assignability refer to the `OMG Extensible and Dynamic Topic Types for DDS Specification`.

Parameters

from	<<***in***>> *(*p. *404)* From type code

Returns

com.rti.dds.infrastructure.true if the "this" is assignable from "from". Otherwise, com.rti.dds.infrastructure.false.

8.387.2.6 length()

```
int length ( ) throws  BadKind
```

Returns the number of elements in the type described by this type code.

Length is:

- The maximum length of the string for string type codes.
- The maximum length of the sequence for sequence type codes.
- The first dimension of the array for array type codes.

Precondition

self kind is **com.rti.dds.typecode.TCKind.TK_ARRAY** (p. 2099), **com.rti.dds.typecode.TCKind.TK_↩ SEQUENCE** (p. 2099), **com.rti.dds.typecode.TCKind.TK_STRING** (p. 2098) or **com.rti.dds.typecode.↩ TCKind.TK_WSTRING** (p. 2100).

MT Safety:

SAFE.

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BadKind	if the method is invoked on an inappropriate kind of **TypeCode** (p. 2183) object.

Returns

The bound for strings and sequences, or the number of elements for arrays if no errors.

References **TCKind.TK_ARRAY**, **TCKind.TK_SEQUENCE**, **TCKind.TK_STRING**, and **TCKind.TK_WSTRING**.

Referenced by **TypeCode.equal()**.

8.387.2.7 name()

```
String name ( ) throws BadKind
```

Retrieves the simple name identifying this **com.rti.dds.typecode.TypeCode** (p. 2183) object within its enclosing scope.

Precondition

self kind is **com.rti.dds.typecode.TCKind.TK_STRUCT** (p. 2098), **com.rti.dds.typecode.TCKind.TK_UNION** (p. 2098), **com.rti.dds.typecode.TCKind.TK_ENUM** (p. 2098), **com.rti.dds.typecode.TCKind.TK_VALUE** (p. 2101), or **com.rti.dds.typecode.TCKind.TK_ALIAS** (p. 2099).

MT Safety:

SAFE.

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BadKind	if the method is invoked on an inappropriate kind of **TypeCode** (p. 2183) object.

Returns

Name of the type code if no errors.

Referenced by **TypeCode.add_member()**, **TypeCode.add_member_to_enum()**, **TypeCode.add_member_to_union()**, **TypeCode.equal()**, and **TypeCode.find_member_by_name()**.

8.387.2.8 is_alias_pointer()

```
boolean is_alias_pointer ( ) throws BadKind
```

Function that tells if an alias is a pointer or not.

This function is an RTI Connext extension to the CORBA Type Code Specification.

Precondition

self kind is **com.rti.dds.typecode.TCKind.TK_ALIAS** (p. 2099).

MT Safety:

SAFE.

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BadKind	if the method is invoked on an inappropriate kind of **TypeCode** (p. 2183) object.

Returns

com.rti.dds.infrastructure.true if an alias is a pointer to the aliased type. Otherwise, com.rti.dds.infrastructure.false.

References **TCKind.TK_ALIAS**.

Referenced by **TypeCode.equal()**.

8.387.2.9 type_modifier()

```
short type_modifier ( ) throws BadKind
```

Returns a constant indicating the modifier of the value type that this **com.rti.dds.typecode.TypeCode** (p. 2183) object describes.

Precondition

self kind is **com.rti.dds.typecode.TCKind.TK_VALUE** (p. 2101) or **com.rti.dds.typecode.TCKind.TK_STRUCT** (p. 2098).

For **com.rti.dds.typecode.TCKind.TK_STRUCT** (p. 2098), this method always returns com.rti.dds.typecode.Value↩ Modifier.VM_NONE.

MT Safety:

SAFE.

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BadKind	if the method is invoked on an inappropriate kind of **TypeCode** (p. 2183) object.

Returns

One of the following type modifiers: com.rti.dds.typecode.ValueModifier.VM_NONE, com.rti.dds.typecode.↩ ValueModifier.VM_ABSTRACT, com.rti.dds.typecode.ValueModifier.VM_CUSTOM or com.rti.dds.typecode.↩ ValueModifier.VM_TRUNCATABLE.

References **TCKind.TK_STRUCT**, and **TCKind.TK_VALUE**.

Referenced by **TypeCode.equal()**.

8.387.2.10 concrete_base_type()

```
TypeCode concrete_base_type ( ) throws  BadKind
```

Returns the **com.rti.dds.typecode.TypeCode** (p. 2183) that describes the concrete base type of the value type that this **com.rti.dds.typecode.TypeCode** (p. 2183) object describes.

Precondition

self kind is **com.rti.dds.typecode.TCKind.TK_VALUE** (p. 2101) or **com.rti.dds.typecode.TCKind.TK_STRUCT** (p. 2098).

MT Safety:

SAFE.

For **com.rti.dds.typecode.TCKind.TK_STRUCT** (p. 2098), this method always returns **com.rti.dds.typecode.↩ TCKind.TK_NULL** (p. 2096).

The **com.rti.dds.typecode.TypeCode** (p. 2183) of structs inheriting from other structs has a **com.rti.dds.typecode.↩ TCKind.TK_VALUE** (p. 2101) kind.

For example:

```
struct MyStruct: MyBaseStruct {

    long member_1;

};
```

The code generation for the previous type will generate a **com.rti.dds.typecode.TypeCode** (p. 2183) with **com.rti.↩ dds.typecode.TCKind.TK_VALUE** (p. 2101) kind.

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BadKind	if the method is invoked on an inappropriate kind of **TypeCode** (p. 2183) object.

Returns

com.rti.dds.typecode.TypeCode (p. 2183) that describes the concrete base type or null if there is no a concrete base type.

References **TypeCode.kind()**, **TypeCode.TC_NULL**, **TCKind.TK_NULL**, **TCKind.TK_STRUCT**, and **TCKind.TK_VALUE**.

Referenced by **TypeCode.equal()**.

8.387.2.11 content_type()

```
TypeCode content_type ( ) throws BadKind
```

Returns the **com.rti.dds.typecode.TypeCode** (p. 2183) object representing the type for the members of the object described by this **com.rti.dds.typecode.TypeCode** (p. 2183) object.

For sequences and arrays, it returns the element type. For aliases, it returns the original type.

Precondition

self kind is **com.rti.dds.typecode.TCKind.TK_ARRAY** (p. 2099), **com.rti.dds.typecode.TCKind.TK_SEQUENCE** (p. 2099) or **com.rti.dds.typecode.TCKind.TK_ALIAS** (p. 2099).

MT Safety:

SAFE.

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BadKind	if the method is invoked on an inappropriate kind of **TypeCode** (p. 2183) object.

Returns

A **com.rti.dds.typecode.TypeCode** (p. 2183) object representing the element type for sequences and arrays, and the original type for aliases.

References **TCKind.TK_ALIAS**, **TCKind.TK_ARRAY**, and **TCKind.TK_SEQUENCE**.

Referenced by **TypeCode.equal()**, **DynamicData.get_char_array()**, **DynamicData.get_char_seq()**, **Dynamic↩ Data.set_char_array()**, and **DynamicData.set_char_seq()**.

8.387.2.12 array_dimension_count()

```
int array_dimension_count ( ) throws  BadKind
```

This function returns the number of dimensions of an array type code.

This function is an RTI Connext extension to the CORBA Type Code Specification.

Precondition

self kind is **com.rti.dds.typecode.TCKind.TK_ARRAY** (p. 2099).

MT Safety:

SAFE.

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BadKind	if the method is invoked on an inappropriate kind of **TypeCode** (p. 2183) object.

Returns

Number of dimensions if no errors.

References **TCKind.TK_ARRAY**.

Referenced by **TypeCode.equal()**.

8.387.2.13 array_dimension()

```
int array_dimension (
            int index ) throws  BadKind, Bounds
```

This function returns the index-th dimension of an array type code.

This function is an RTI Connext extension to the CORBA Type Code Specification.

Precondition

self kind is **com.rti.dds.typecode.TCKind.TK_ARRAY** (p. 2099).
Dimension index in the interval [0,(dimensions count-1)].

MT Safety:

SAFE.

Parameters

index	<<***in***>> *(p. 404)* Dimension index in the interval [0,(dimensions count-1)].

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BadKind	if the method is invoked on an inappropriate kind of **TypeCode** (p. 2183) object.
com.rti.dds.infrastructure.ExceptionCode_t.Bounds	- if the index parameter/s are out of range.

Returns

Requested dimension if no errors.

References **TCKind.TK_ARRAY**.

Referenced by **TypeCode.element_count()**, and **TypeCode.equal()**.

8.387.2.14 element_count()

```
int element_count ( ) throws  BadKind
```

The number of elements in an array.

This operation isn't relevant for other kinds of types.

MT Safety:

SAFE.

References **TypeCode.array_dimension()**, and **TCKind.TK_ARRAY**.

8.387.2.15 member_count()

```
int member_count ( ) throws  BadKind
```

Returns the number of members of the type code.

The method member_count can be invoked on structure, union, and enumeration **com.rti.dds.typecode.TypeCode** (p. 2183) objects.

Precondition

self kind is **com.rti.dds.typecode.TCKind.TK_STRUCT** (p. 2098), **com.rti.dds.typecode.TCKind.TK_UNION** (p. 2098), **com.rti.dds.typecode.TCKind.TK_ENUM** (p. 2098) or **com.rti.dds.typecode.TCKind.TK_VALUE** (p. 2101).

MT Safety:

SAFE.

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BadKind	if the method is invoked on an inappropriate kind of **TypeCode** (p. 2183) object.

Returns

The number of members constituting the type described by this **com.rti.dds.typecode.TypeCode** (p. 2183) object if no errors.

References **TCKind.TK_ENUM**, **TCKind.TK_STRUCT**, **TCKind.TK_UNION**, and **TCKind.TK_VALUE**.

Referenced by **TypeCode.equal()**, **TypeCode.find_member_by_name()**, **TypeCode.is_member_bitfield()**, **TypeCode.is_member_key()**, **TypeCode.is_member_must_understand()**, **TypeCode.is_member_pointer()**, **TypeCode.is_member_required()**, **TypeCode.member_bitfield_bits()**, **TypeCode.member_id()**, **TypeCode.member_label()**, **TypeCode.member_label_count()**, **TypeCode.member_name()**, **TypeCode.member_ordinal()**, **TypeCode.member_type()**, and **TypeCode.member_visibility()**.

8.387.2.16 member_name()

```
String member_name (
            int index ) throws  BadKind, Bounds
```

Returns the name of a type code member identified by the given index.

The method member_name can be invoked on structure, union, and enumeration **com.rti.dds.typecode.TypeCode** (p. 2183) objects.

Precondition

self kind is **com.rti.dds.typecode.TCKind.TK_STRUCT** (p. 2098), **com.rti.dds.typecode.TCKind.TK_UNION** (p. 2098), **com.rti.dds.typecode.TCKind.TK_ENUM** (p. 2098) or **com.rti.dds.typecode.TCKind.TK_VALUE** (p. 2101).
The index param must be in the interval [0,(member count-1)].

MT Safety:

SAFE.

Parameters

index	*<<**in**>> (p. 404)* Member index in the interval [0,(member count-1)].

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BadKind	if the method is invoked on an inappropriate kind of **TypeCode** (p. 2183) object.
com.rti.dds.infrastructure.ExceptionCode_t.Bounds	- if the index parameter/s are out of range.

Returns

Name of the member if no errors.

References **TypeCode.member_count()**, **EnumMember.name**, **StructMember.name**, **UnionMember.name**, **ValueMember.name**, **TCKind.TK_ENUM**, **TCKind.TK_STRUCT**, **TCKind.TK_UNION**, and **TCKind.TK_VALUE**.

Referenced by **TypeCode.equal()**, and **TypeCode.find_member_by_name()**.

8.387.2.17 member_type()

```
TypeCode member_type (
            int index ) throws  BadKind, Bounds
```

Retrieves the **com.rti.dds.typecode.TypeCode** (p. 2183) object describing the type of the member identified by the given index.

The method member_type can be invoked on structure and union type codes.

Precondition

self kind is **com.rti.dds.typecode.TCKind.TK_STRUCT** (p. 2098), **com.rti.dds.typecode.TCKind.TK_UNION** (p. 2098) or **com.rti.dds.typecode.TCKind.TK_VALUE** (p. 2101).
The index param must be in the interval [0,(member count-1)].

MT Safety:

SAFE.

Parameters

index	<<***in***>> *(*p. *404)* Member index in the interval [0,(member count-1)].

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BadKind	if the method is invoked on an inappropriate kind of **TypeCode** (p. 2183) object.
com.rti.dds.infrastructure.ExceptionCode_t.Bounds	- if the index parameter/s are out of range.

Returns

The **com.rti.dds.typecode.TypeCode** (p. 2183) object describing the member at the given index if no errors.

References **TypeCode.member_count()**, **TCKind.TK_STRUCT**, **TCKind.TK_UNION**, **TCKind.TK_VALUE**, **StructMember.type**, **UnionMember.type**, and **ValueMember.type**.

Referenced by **TypeCode.equal()**.

8.387.2.18 member_id()

```
int member_id (
             int index ) throws  BadKind, Bounds
```

Returns the ID of the **TypeCode** (p. 2183) member identified by the given index.

This function is an RTI Connext extension to the CORBA Type Code Specification.

The method can be invoked on aggregation **com.rti.dds.typecode.TypeCode** (p. 2183) objects.

All members of aggregated types have an integral member ID that uniquely identifies them within their defining type.

In IDL, you can specify the member ID using the built-in annotation ID. For example:

```
struct MyType {

    long member_1; //@ID 200

} //@Extensibility MUTABLE_EXTENSIBILITY
```

In XML, you can specify the member ID using the attribute 'id':

```
<struct name="MyType" extensibility="mutable" id="200">

    <member name="member_1" type="long"/>

</struct>
```

In XSD, you can specify the member ID using the built-in annotation ID

```
<xsd:complexType name="MyType">

    <xsd:sequence>

        <xsd:element name="member_1" minOccurs="1" maxOccurs="1" type="xsd:int"/>

        <!-- @id 200 -->

    </xsd:sequence>

</xsd:complexType>

<!-- @extensibility MUTABLE_EXTENSIBILITY -->
```

Precondition

self kind is **com.rti.dds.typecode.TCKind.TK_STRUCT** (p. 2098), **com.rti.dds.typecode.TCKind.TK_VALUE** (p. 2101), or **com.rti.dds.typecode.TCKind.TK_UNION** (p. 2098)
Member index in the interval [0,(member count-1)].

MT Safety:

SAFE.

Parameters

index	<<***in***>> *(*p. *404)* Member index in the interval [0,(member count-1)].

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BadKind	if the method is invoked on an inappropriate kind of **TypeCode** (p. 2183) object.
com.rti.dds.infrastructure.ExceptionCode_t.Bounds	- if the index parameter/s are out of range.

Returns

ID of the member if no errors.

References **StructMember.id**, **UnionMember.id**, **ValueMember.id**, **TypeCode.member_count()**, **TCKind.TK_STRUCT**, **TCKind.TK_UNION**, and **TCKind.TK_VALUE**.

Referenced by **TypeCode.equal()**.

8.387.2.19 member_label_count()

```
int member_label_count (
             int index ) throws  BadKind, Bounds
```

Returns the number of labels associated to the index-th union member.

The method can be invoked on union **com.rti.dds.typecode.TypeCode** (p. 2183) objects.

This function is an RTI Connext extension to the CORBA Type Code Specification.

Precondition

self kind is **com.rti.dds.typecode.TCKind.TK_UNION** (p. 2098).
The index param must be in the interval [0,(member count-1)].

MT Safety:

SAFE.

Parameters

index	<<***in***>> *(*p. *404)* Member index in the interval [0,(member count-1)].

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BadKind	if the method is invoked on an inappropriate kind of **TypeCode** (p. 2183) object.
com.rti.dds.infrastructure.ExceptionCode_t.Bounds	- if the index parameter/s are out of range.

Returns

Number of labels if no errors.

References **UnionMember.labels**, **TypeCode.member_count()**, and **TCKind.TK_UNION**.

Referenced by **TypeCode.equal()**.

8.387.2.20 member_label()

```
int member_label (
             int member_index,
             int label_index ) throws  BadKind, Bounds
```

Return the label_index-th label associated to the member_index-th member.

This method has been modified for RTI Connext from the CORBA Type code Specification.

Example:
case 1: Label index 0
case 2: Label index 1
short short_member;

The method can be invoked on union **com.rti.dds.typecode.TypeCode** (p. 2183) objects.

Precondition

self kind is **com.rti.dds.typecode.TCKind.TK_UNION** (p. 2098).
The member_index param must be in the interval [0,(member count-1)].
The label_index param must be in the interval [0,(member labels count-1)].

MT Safety:

SAFE.

Parameters

member_index	<<***in***>> *(*p. *404)* Member index.
label_index	<<***in***>> *(*p. *404)* Label index.

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BadKind	if the method is invoked on an inappropriate kind of **TypeCode** (p. 2183) object.
com.rti.dds.infrastructure.ExceptionCode_t.Bounds	- if the index parameter/s are out of range.

Returns

The evaluated value of the label if no errors.

References **UnionMember.labels**, **TypeCode.member_count()**, and **TCKind.TK_UNION**.

Referenced by **TypeCode.equal()**.

8.387.2.21 member_ordinal()

```
int member_ordinal (
             int index ) throws  BadKind, Bounds
```

Returns the ordinal that corresponds to the index-th enum value.

The method can be invoked on enum **com.rti.dds.typecode.TypeCode** (p. 2183) objects.

This function is an RTI Connext extension to the CORBA Type Code Specification.

Precondition

self kind is **com.rti.dds.typecode.TCKind.TK_ENUM** (p. 2098).
Member index in the interval [0,(member count-1)].

MT Safety:

SAFE.

Parameters

index	<<***in***>> *(*p. *404)* Member index in the interval [0,(member count-1)].

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BadKind	if the method is invoked on an inappropriate kind of **TypeCode** (p. 2183) object.
com.rti.dds.infrastructure.ExceptionCode_t.Bounds	- if the index parameter/s are out of range.

Returns

Ordinal that corresponds to the index-th enumerator if no errors.

References **TypeCode.member_count()**, **EnumMember.ordinal**, and **TCKind.TK_ENUM**.

Referenced by **TypeCode.equal()**.

8.387.2.22 is_member_key()

```
boolean is_member_key (
             int index ) throws  BadKind, Bounds
```

Function that tells if a member is a key or not.

This function is an RTI Connext extension to the CORBA Type Code Specification.

Precondition

self kind is **com.rti.dds.typecode.TCKind.TK_STRUCT** (p. 2098) or **com.rti.dds.typecode.TCKind.TK_VALUE** (p. 2101).
The index param must be in the interval [0,(member count-1)].

MT Safety:

SAFE.

Parameters

index	<<***in***>> *(p. 404)* Member index in the interval [0,(member count-1)].

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BadKind	if the method is invoked on an inappropriate kind of **TypeCode** (p. 2183) object.
com.rti.dds.infrastructure.ExceptionCode_t.Bounds	- if the index parameter/s are out of range.

Returns

com.rti.dds.infrastructure.true if the member is a key. Otherwise, com.rti.dds.infrastructure.false.

References **StructMember.is_key**, **ValueMember.is_key**, **TypeCode.member_count()**, **TCKind.TK_STRUCT**, and **TCKind.TK_VALUE**.

Referenced by **TypeCode.equal()**.

8.387.2.23 is_member_required()

```
boolean is_member_required (
            int index ) throws  BadKind, Bounds
```

Indicates whether a given member of a type is required to be present in every sample of that type.

A non-key member is required if it has not been marked as optional. All key members are required.

See also

com.rti.dds.typecode.TypeCode.NONKEY_MEMBER (p. 2230)

com.rti.dds.typecode.TypeCode.NONKEY_REQUIRED_MEMBER (p. 2231)

MT Safety:

SAFE.

References **StructMember.is_optional**, **ValueMember.is_optional**, **TypeCode.member_count()**, **TCKind.TK_↩ STRUCT**, **TCKind.TK_UNION**, and **TCKind.TK_VALUE**.

Referenced by **TypeCode.equal()**.

8.387.2.24 is_member_pointer()

```
boolean is_member_pointer (
            int index ) throws  BadKind, Bounds
```

Function that tells if a member is a pointer or not.

The method is_member_pointer can be invoked on union and structs type objects

This function is an RTI Connext extension to the CORBA Type Code Specification.

Precondition

self kind is **com.rti.dds.typecode.TCKind.TK_STRUCT** (p. 2098), **com.rti.dds.typecode.TCKind.TK_UNION** (p. 2098) or **com.rti.dds.typecode.TCKind.TK_VALUE** (p. 2101).
The index param must be in the interval [0,(member count-1)].

MT Safety:

SAFE.

Parameters

index	<<***in***>> *(*p. *404)* Index of the member for which type information is begin requested.

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BadKind	if the method is invoked on an inappropriate kind of **TypeCode** (p. 2183) object.
com.rti.dds.infrastructure.ExceptionCode_t.Bounds	- if the index parameter/s are out of range.

Returns

com.rti.dds.infrastructure.true if the member is a pointer. Otherwise, com.rti.dds.infrastructure.false.

References **StructMember.is_pointer**, **UnionMember.is_pointer**, **ValueMember.is_pointer**, **TypeCode.member_count()**, **TCKind.TK_STRUCT**, **TCKind.TK_UNION**, and **TCKind.TK_VALUE**.

Referenced by **TypeCode.equal()**.

8.387.2.25 is_member_must_understand()

```
boolean is_member_must_understand (
             int index ) throws  BadKind, Bounds
```

Returns the "must understand" property for a member of this **com.rti.dds.typecode.TypeCode** (p. 2183).

The "must understand" property is typically controlled through annotations, but it may sometimes be constrained by other properties of a member. When invoked on such members, this function will always return a fixed value:

- com.rti.dds.infrastructure.true for members that are part of the key of a struct or value type.
- com.rti.dds.infrastructure.false for any member of a union.

Precondition

self kind is **com.rti.dds.typecode.TCKind.TK_STRUCT** (p. 2098), **com.rti.dds.typecode.TCKind.TK_UNION** (p. 2098), or **com.rti.dds.typecode.TCKind.TK_VALUE** (p. 2101).

member pointed to by index of a numerical kind.

MT Safety:

SAFE

Parameters

index	index of the target member

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BadKind	if the method is invoked on an inappropriate kind of **TypeCode** (p. 2183) object.
com.rti.dds.infrastructure.ExceptionCode_t.Bounds	- if the index parameter/s are out of range.

Returns

the "must understand" property of the selected member of this **com.rti.dds.typecode.TypeCode** (p. 2183)

References **StructMember.is_key**, **ValueMember.is_key**, **StructMember.is_must_understand**, **ValueMember.↩ is_must_understand**, **TypeCode.member_count()**, **TCKind.TK_STRUCT**, **TCKind.TK_UNION**, and **TCKind.↩ TK_VALUE**.

8.387.2.26 is_member_bitfield()

```
boolean is_member_bitfield (
            int index ) throws  BadKind, Bounds
```

Function that tells if a member is a bitfield or not.

The method can be invoked on struct type objects.

This function is an RTI Connext extension to the CORBA Type Code Specification.

Precondition

self kind is **com.rti.dds.typecode.TCKind.TK_STRUCT** (p. 2098) or **com.rti.dds.typecode.TCKind.TK_VALUE** (p. 2101).
The index param must be in the interval [0,(member count-1)].

MT Safety:

SAFE.

Parameters

index	<<***in***>> *(p. 404)* Member index in the interval [0,(member count-1)].

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BadKind	if the method is invoked on an inappropriate kind of **TypeCode** (p. 2183) object.
com.rti.dds.infrastructure.ExceptionCode_t.Bounds	- if the index parameter/s are out of range.

Returns

com.rti.dds.infrastructure.true if the member is a bitfield. Otherwise, com.rti.dds.infrastructure.false.

References **TypeCode.member_count()**, **TypeCode.NOT_BITFIELD**, **TCKind.TK_STRUCT**, and **TCKind.TK_↩ VALUE**.

Referenced by **TypeCode.equal()**.

8.387.2.27 member_bitfield_bits()

```
short member_bitfield_bits (
            int index ) throws  BadKind, Bounds
```

Returns the number of bits of a bitfield member.

The method can be invoked on struct type objects.

This function is an RTI Connext extension to the CORBA Type Code Specification.

Precondition

self kind is **com.rti.dds.typecode.TCKind.TK_STRUCT** (p. 2098) or **com.rti.dds.typecode.TCKind.TK_VALUE** (p. 2101).
The index param must be in the interval [0,(member count-1)].

MT Safety:

SAFE.

Parameters

index	<<***in***>> *(p. 404)* Member index in the interval [0,(member count-1)].

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BadKind	if the method is invoked on an inappropriate kind of **TypeCode** (p. 2183) object.

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.Bounds	- if the index parameter/s are out of range.

Returns

The number of bits of the bitfield or **com.rti.dds.typecode.TypeCode.NOT_BITFIELD** (p. 2232) if the member is not a bitfield.

References **StructMember.bits**, **ValueMember.bits**, **TypeCode.member_count()**, **TCKind.TK_STRUCT**, and **TCKind.TK_VALUE**.

Referenced by **TypeCode.equal()**.

8.387.2.28 member_visibility()

```
short member_visibility (
            int index ) throws  BadKind, Bounds
```

Returns the constant that indicates the visibility of the index-th member.

Precondition

self kind is **com.rti.dds.typecode.TCKind.TK_VALUE** (p. 2101) or **com.rti.dds.typecode.TCKind.TK_STRUCT** (p. 2098). The index param must be in the interval [0,(member count-1)].

MT Safety:

SAFE.

For **com.rti.dds.typecode.TCKind.TK_STRUCT** (p. 2098), this method always returns com.rti.dds.typecode.↩ Visibility.PUBLIC_MEMBER.

Parameters

index	*<<**in**>> (p. 404)* Member index in the interval [0,(member count-1)].

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BadKind	if the method is invoked on an inappropriate kind of **TypeCode** (p. 2183) object.
com.rti.dds.infrastructure.ExceptionCode_t.Bounds	- if the index parameter/s are out of range.

Returns

One of the following constants: com.rti.dds.typecode.Visibility.PRIVATE_MEMBER or com.rti.dds.typecode.↩ Visibility.PUBLIC_MEMBER.

References **ValueMember.access**, **TypeCode.member_count()**, **TCKind.TK_STRUCT**, **TCKind.TK_VALUE**, and **PUBLIC_MEMBER.VALUE**.

Referenced by **TypeCode.equal()**.

8.387.2.29 discriminator_type()

```
TypeCode discriminator_type ( ) throws BadKind
```

Returns the discriminator type code.

The method discriminator_type can be invoked only on union **com.rti.dds.typecode.TypeCode** (p. 2183) objects.

Precondition

self kind is **com.rti.dds.typecode.TCKind.TK_UNION** (p. 2098).

MT Safety:

SAFE.

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BadKind	if the method is invoked on an inappropriate kind of **TypeCode** (p. 2183) object.

Returns

com.rti.dds.typecode.TypeCode (p. 2183) object describing the discriminator of the union type if no errors.

References **TCKind.TK_UNION**.

Referenced by **TypeCode.equal()**.

8.387.2.30 default_index()

```
int default_index ( ) throws BadKind
```

Returns the index of the default member, or -1 if there is no default member.

The method default_index can be invoked only on union **com.rti.dds.typecode.TypeCode** (p. 2183) objects.

Precondition

self kind is **com.rti.dds.typecode.TCKind.TK_UNION** (p. 2098)

MT Safety:

SAFE.

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BadKind	if the method is invoked on an inappropriate kind of **TypeCode** (p. 2183) object.

Returns

The index of the default member, or -1 if there is no default member.

References **TCKind.TK_UNION**.

Referenced by **TypeCode.equal()**.

8.387.2.31 find_member_by_name()

```
int find_member_by_name (
            String name ) throws  BadKind
```

Get the index of the member of the given name.

This method is applicable to **com.rti.dds.typecode.TypeCode** (p. 2183) objects representing structs (**com.rti.dds.typecode.TCKind.TK_STRUCT** (p. 2098)) and union (**com.rti.dds.typecode.TCKind.TK_UNION** (p. 2098)) types.

Parameters

name	<<***in***>> *(p. 404)* The member name.

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BadKind	if the method is invoked on an inappropriate kind of **TypeCode** (p. 2183) object.

Returns

The index of the member of the given name or **com.rti.dds.typecode.TypeCode.INDEX_INVALID** (p. 2230) if the member is not found.

MT Safety:

SAFE.

References **TypeCode.INDEX_INVALID**, **TypeCode.member_count()**, **TypeCode.member_name()**, **TypeCode.name()**, **TCKind.TK_ENUM**, **TCKind.TK_STRUCT**, **TCKind.TK_UNION**, and **TCKind.TK_VALUE**.

8.387.2.32 print_IDL() [1/2]

```
void print_IDL (
            int indent )
```

Prints a **com.rti.dds.typecode.TypeCode** (p. 2183) in IDL notation.

MT Safety:

SAFE.

Parameters

indent	<<***in***>> *(p. 404)* Indent.

References **TypeCode.print_IDL()**.

Referenced by **TypeCode.print_complete_IDL()**, and **TypeCode.print_IDL()**.

8.387.2.33 print_IDL() [2/2]

```
void print_IDL (
            int indent,
            Writer out ) throws IOException
```

Prints a **com.rti.dds.typecode.TypeCode** (p. 2183) in a pseudo-IDL notation.

MT Safety:

SAFE.

Parameters

indent	<<***in***>> *(p. 404)* Indent.
out	<<***out***>> *(p. 404)* Output stream.

References **TypeCode.print_IDL()**.

8.387.2.34 print_complete_IDL()

```
void print_complete_IDL (
             Writer writer ) throws IOException
```

Print all IDL constructs needed by the code generator to generate code for this type.

Parameters

writer	The writer to which the IDL is to be written.

Exceptions

IOException	If there were issues writing to the writer.

References **TypeCode.print_IDL()**.

8.387.2.35 add_member() [1/2]

```
int add_member (
             String name,
             int id,
              TypeCode tc,
             byte member_flags ) throws  BadKind, BadMemberName, BadMemberId
```

Add a new member to this **com.rti.dds.typecode.TypeCode** (p. 2183).

This method is applicable to **com.rti.dds.typecode.TypeCode** (p. 2183) objects representing structures (**com.rti.dds.typecode.TCKind.TK_STRUCT** (p. 2098)), value types (**com.rti.dds.typecode.TCKind.TK_VALUE** (p. 2101)), and unions (**com.rti.dds.typecode.TCKind.TK_UNION** (p. 2098)). To add a constant to an enumeration, see **com.rti.dds.typecode.TypeCode.add_member_to_enum** (p. 2219).

Calling this method clones the type code passed as the `tc` parameter if the type code is not a builtin one. To delete this cloned type code, call **com.rti.dds.typecode.TypeCodeFactory.delete_tc** (p. 2245).

The ability to modify a **com.rti.dds.typecode.TypeCode** (p. 2183) – such as by adding a member – is important if you are using the **Dynamic Data** (p. 67) APIs.

Here's a simple code example that adds two fields to a data type, one an integer and another a sequence of integers.

```
// Integer:

myTypeCode.add_member(

    "myFieldName",
```

```
    TypeCode.MEMBER_ID_INVALID,
    TypeCode.TC_LONG,
    // New field is a required non-key member:
    TypeCode.NONKEY_REQUIRED_MEMBER);

// Sequence of 10 or fewer integers:
myTypeCode.add_member(
    "myFieldName",
    TypeCode.MEMBER_ID_INVALID,
    TypeCodeFactory.get_instance().create_sequence_tc(10, TypeCode.TC_LONG),
    // New field is a required non-key member:
    TypeCode.NONKEY_REQUIRED_MEMBER);
```

MT Safety:

UNSAFE.

Parameters

name	<<***in***>> *(p. 404)* The name of the new member.
id	<<***in***>> *(p. 404)* Member ID or case value. • For **com.rti.dds.typecode.TCKind.TK_STRUCT** (p. 2098), and **com.rti.dds.typecode.TCKind.TK_VALUE** (p. 2101), this parameter is used to provide the member ID. For automatic assignment of the member ID specify **com.rti.dds.typecode.TypeCode.MEMBER_ID_INVALID** (p. 2230). • For **com.rti.dds.typecode.TCKind.TK_UNION** (p. 2098), this parameter is used to provide the case value associated with the member. The member ID is assigned automatically. To explicitly assign the member ID, use the API com.rti.dds.typecode.TypeCode.add_member_to_union.
tc	<<***in***>> *(p. 404)* The type of the new member. You can get or create this **com.rti.dds.typecode.TypeCode** (p. 2183) with the **com.rti.dds.typecode.TypeCodeFactory** (p. 2232).
member_flags	<<***in***>> *(p. 404)* Indicates whether the member is part of the key and whether it is required.

Returns

The zero-based index of the new member relative to any other members that previously existed.

Referenced by **TypeCode.add_member()**.

8.387.2.36 add_member() [2/2]

```
int add_member (
             String name,
             int id,
              TypeCode tc,
             byte member_flags,
             short visibility,
             boolean is_pointer,
             short bits,
             boolean is_must_understand ) throws  BadKind, BadMemberName, BadMemberId, BAD_↩
PARAM,IllegalStateException
```

Add a new member to this **com.rti.dds.typecode.TypeCode** (p. 2183).

This method is applicable to **com.rti.dds.typecode.TypeCode** (p. 2183) objects representing structures (**com.rti.↩ dds.typecode.TCKind.TK_STRUCT** (p. 2098)), value types (**com.rti.dds.typecode.TCKind.TK_VALUE** (p. 2101)), and unions (**com.rti.dds.typecode.TCKind.TK_UNION** (p. 2098)). To add a constant to an enumeration, see **com.↩ rti.dds.typecode.TypeCode.add_member_to_enum** (p. 2219).

Calling this method clones the type code passed in as the `tc` parameter if the type code is not a builtin one. To delete this cloned type code, call **com.rti.dds.typecode.TypeCodeFactory.delete_tc** (p. 2245).

The ability to modify a **com.rti.dds.typecode.TypeCode** (p. 2183) – such as by adding a member – is important if you are using the **Dynamic Data** (p. 67) APIs.

MT Safety:

UNSAFE.

Parameters

name	<<***in***>> *(p. 404)* The name of the new member.

Parameters

id	<<***in***>> *(*p. *404)* Member ID or case value. • For **com.rti.dds.typecode.TCKind.TK_STRUCT** (p. 2098) and **com.rti.dds.typecode.TCKind.TK_VALUE** (p. 2101), this parameter is used to provide the member ID. • For **com.rti.dds.typecode.TCKind.TK_STRUCT** (p. 2098) and **com.rti.dds.typecode.TCKind.TK_VALUE** (p. 2101) only: For automatic assignment of the member ID, specify **com.rti.dds.typecode.TypeCode.MEMBER_ID_INVALID** (p. 2230). • For **com.rti.dds.typecode.TCKind.TK_UNION** (p. 2098), this parameter is used to provide the case value associated with the member. The member ID is assigned automatically. To explicitly assign the member ID, use the API com.rti.dds.typecode.TypeCode.add_member_to_union.
tc	<<***in***>> *(*p. *404)* The type of the new member. You can get or create this **com.rti.dds.typecode.TypeCode** (p. 2183) with the **com.rti.dds.typecode.TypeCodeFactory** (p. 2232).
member_flags	<<***in***>> *(*p. *404)* Indicates whether the member is part of the key and whether it is required.
visibility	<<***in***>> *(*p. *404)* Whether the new member is public or private. Non-public members are only relevant for types of kind **com.rti.dds.typecode.TCKind.TK_VALUE** (p. 2101). Possible values include: • com.rti.dds.typecode.Visibility.PRIVATE_MEMBER • com.rti.dds.typecode.Visibility.PUBLIC_MEMBER
is_pointer	<<***in***>> *(*p. *404)* Whether the data member, in its deserialized form, should be stored by pointer as opposed to by value.
bits	<<***in***>> *(*p. *404)* The number of bits, if this new member is a bit field, or **com.rti.dds.typecode.TypeCode.NOT_BITFIELD** (p. 2232).
is_must_understand	<<***in***>> *(*p. *404)* Whether the data member should be marked as "must understand" or not. This value will be ignored and assumed to be true if member_flags indicates that the member is part of the key.

Returns

The zero-based index of the new member relative to any other members that previously existed.

8.387.2.37 add_member_to_enum()

```
synchronized int add_member_to_enum (
            String name,
            int ordinal ) throws  BadKind, BadMemberName
```

Add a new enumerated constant to this enum **com.rti.dds.typecode.TypeCode** (p. 2183).

This method is applicable to **com.rti.dds.typecode.TypeCode** (p. 2183) objects representing enumerations (**com.rti.dds.typecode.TCKind.TK_ENUM** (p. 2098)). To add a field to a structured type, see **com.rti.dds.typecode.TypeCode.add_member_to_enum** (p. 2219).

Modifying a **com.rti.dds.typecode.TypeCode** (p. 2183) – such as by adding a member – is important if you are using the **Dynamic Data** (p. 67) APIs.

MT Safety:

UNSAFE.

Parameters

name	<<***in***>> *(p. 404)* The name of the new member. This string must be unique within this type and must not be null.
ordinal	<<***in***>> *(p. 404)* The relative order of the new member in this enum or a custom integer value. The value must be unique within the type.

Returns

The zero-based index of the new member relative to any other members that previously existed.

```
synchronized int add_member_to_union (
            String name,
            int id,
            int labels_in[],
             TypeCode tc,
            boolean is_pointer ) throws  BadKind, BadMemberName,  BadMemberId
```

Add a new member to a union **com.rti.dds.typecode.TypeCode** (p. 2183).

This method is applicable to **com.rti.dds.typecode.TypeCode** (p. 2183) objects representing unions (**com.rti.dds.typecode.TCKind.TK_UNION** (p. 2098)).

Modifying a **com.rti.dds.typecode.TypeCode** (p. 2183) – such as by adding a member – is important if you are using the **Dynamic Data** (p. 67) APIs.

MT Safety:

UNSAFE.

Parameters

name	<<***in***>> *(*p. *404)* The name of the new member.
id	<<***in***>> *(*p. *404)* The member ID. For automatic assignment of the member ID specify **com.rti.dds.typecode.TypeCode.MEMBER_ID_INVALID** (p. 2230).
labels_in	<<***in***>> *(*p. *404)* A sequence of labels or case values associated with the member .
tc	<<***in***>> *(*p. *404)* The type of the new member. You can get or create this **com.rti.dds.typecode.TypeCode** (p. 2183) with the **com.rti.dds.typecode.TypeCodeFactory** (p. 2232).
is_pointer	<<***in***>> *(*p. *404)* Whether the data member, in its deserialized form, should be stored by pointer as opposed to by value.

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BadKind	com.rti.dds.infrastructure.ExceptionCode_t.BadMember↩ Name com.rti.dds.infrastructure.ExceptionCode_t.BadMemberId

Returns

The zero-based index of the new member relative to any other members that previously existed.

8.387.2.39 signature()

```
String signature ( ) throws  RETCODE_ERROR
```

Gets an MD5 signature of the **com.rti.dds.typecode.TypeCode** (p. 2183).

MT Safety:

SAFE.

Returns

MD5 signature.

References **TypeCode.signature()**.

Referenced by **TypeCode.signature()**.

8.387.2.40 cdr_serialized_sample_min_size() [1/2]

```
final long cdr_serialized_sample_min_size (
            short representation_id ) throws  UserException,  SystemException
```

Gets the minimum serialized size of samples of this type.

Obtains the minimum possible size in bytes of any serialized data sample of this type.

Precondition

The type is an aggregation type (struct, union)

Parameters

representation↩ _id	The serialized data representation for which we calculate the minimum size.

Returns

The minimum size

8.387.2.41 cdr_serialized_sample_min_size() [2/2]

```
final long cdr_serialized_sample_min_size ( ) throws UserException, SystemException
```

Gets the minimum serialized size of samples of this type.

Obtains the minimum possible size in bytes of any serialized data sample of this type.

Assumes the com.rti.dds.infrastructure.DataRepresentationId_t to be DDS_AUTO_DATA_REPRESENTATION

Precondition

The type is an aggregation type (struct, union)

Returns

The minimum size

References **DataRepresentationQosPolicy.AUTO_DATA_REPRESENTATION**, and **TypeCode.cdr_serialized_↩ sample_min_size()**.

Referenced by **TypeCode.cdr_serialized_sample_min_size()**.

8.387.2.42 cdr_serialized_sample_max_size() [1/2]

```
final long cdr_serialized_sample_max_size (
            short representation_id ) throws UserException, SystemException
```

Gets the maximum serialized size of samples of this type.

Obtains the maximum possible size in bytes of any serialized data sample of this type.

Precondition

The type is an aggregation type (struct, union)

Parameters

representation↩ _id	The serialized data representation for which we calculate the maximum size.

Returns

The maximum size

8.387.2.43 cdr_serialized_sample_max_size() [2/2]

```
final long cdr_serialized_sample_max_size ( ) throws UserException, SystemException
```

Gets the maximum serialized size of samples of this type.

Obtains the maximum possible size in bytes of any serialized data sample of this type.

Assumes the com.rti.dds.infrastructure.DataRepresentationId_t to be DDS_AUTO_DATA_REPRESENTATION

Precondition

The type is an aggregation type (struct, union)

Returns

The maximum size

References **DataRepresentationQosPolicy.AUTO_DATA_REPRESENTATION**, and **TypeCode.cdr_serialized_↩ sample_max_size()**.

Referenced by **TypeCode.cdr_serialized_sample_max_size()**.

8.387.2.44 cdr_serialized_sample_key_max_size() [1/2]

```
final long cdr_serialized_sample_key_max_size (
            short representation_id ) throws UserException, SystemException
```

Gets the maximum serialized size of sample keys of this type.

Obtains the maximum possible size in bytes of the serialized keys of any data sample of this type

Precondition

The type is an aggregation type (struct, union)

Parameters

representation↩ _id	The serialized data representation for which we calculate the maximum key size.

Returns

The maximum key size

8.387.2.45 cdr_serialized_sample_key_max_size() [2/2]

```
final long cdr_serialized_sample_key_max_size ( ) throws UserException, SystemException
```

Gets the maximum serialized size of sample keys of this type.

Obtains the maximum possible size in bytes of the serialized keys of any data sample of this type

Assumes the com.rti.dds.infrastructure.DataRepresentationId_t to be DDS_AUTO_DATA_REPRESENTATION

Precondition

The type is an aggregation type (struct, union)

Returns

The maximum key size

References **DataRepresentationQosPolicy.AUTO_DATA_REPRESENTATION**, and **TypeCode.cdr_serialized_↩ sample_key_max_size()**.

Referenced by **TypeCode.cdr_serialized_sample_key_max_size()**.

8.387.2.46 get_type_object_serialized_size()

```
long get_type_object_serialized_size ( )
```

Gets the serialized size of the TypeObject v1 created from this **com.rti.dds.typecode.TypeCode** (p. 2183).

The default buffer size used for storing a TypeObject v1 is 8192 bytes. For a large TypeObject v1, this API can be used to determine the size that needs to be set in **com.rti.dds.infrastructure.DomainParticipantResourceLimitsQos↩ Policy.type_object_max_serialized_length** (p. 1099)

MT Safety:

SAFE.

Returns

The TypeObject v1 serialized size.

8.387.3 Member Data Documentation

8.387.3.1 TC_NULL

```
final TypeCode TC_NULL [static]
```

Basic null type.

See also

com.rti.dds.typecode.TypeCodeFactory.get_primitive_tc (p. 2245)

Referenced by **TypeCode.concrete_base_type()**, **TypeCode.equal()**, and **TypeCodeFactory.get_primitive_tc()**.

8.387.3.2 TC_SHORT

```
final TypeCode TC_SHORT [static]
```

Basic 16-bit signed integer type.

See also

com.rti.dds.typecode.TypeCodeFactory.get_primitive_tc (p. 2245)

Referenced by **TypeCodeFactory.get_primitive_tc()**.

8.387.3.3 TC_LONG

```
final TypeCode TC_LONG [static]
```

Basic 32-bit signed integer type.

See also

com.rti.dds.typecode.TypeCodeFactory.get_primitive_tc (p. 2245)

Referenced by **TypeCodeFactory.get_primitive_tc()**.

8.387.3.4 TC_USHORT

```
final TypeCode TC_USHORT [static]
```

Basic unsigned 16-bit integer type.

See also

com.rti.dds.typecode.TypeCodeFactory.get_primitive_tc (p. 2245)

Referenced by **TypeCodeFactory.get_primitive_tc()**.

8.387.3.5 TC_ULONG

```
final TypeCode TC_ULONG [static]
```

Basic unsigned 32-bit integer type.

com.rti.dds.typecode.TypeCodeFactory.get_primitive_tc (p. 2245)

Referenced by **TypeCodeFactory.get_primitive_tc()**.

8.387.3.6 TC_FLOAT

```
final TypeCode TC_FLOAT [static]
```

Basic 32-bit floating point type.

See also

com.rti.dds.typecode.TypeCodeFactory.get_primitive_tc (p. 2245)

Referenced by **TypeCodeFactory.get_primitive_tc()**.

8.387.3.7 TC_DOUBLE

```
final  TypeCode TC_DOUBLE  [static]
```

Basic 64-bit floating point type.

See also

com.rti.dds.typecode.TypeCodeFactory.get_primitive_tc (p. 2245)

Referenced by **TypeCodeFactory.get_primitive_tc()**.

8.387.3.8 TC_BOOLEAN

```
final  TypeCode TC_BOOLEAN  [static]
```

Basic Boolean type.

See also

com.rti.dds.typecode.TypeCodeFactory.get_primitive_tc (p. 2245)

Referenced by **TypeCodeFactory.get_primitive_tc()**.

8.387.3.9 TC_CHAR

```
final  TypeCode TC_CHAR  [static]
```

Basic single-byte character type.

See also

com.rti.dds.typecode.TypeCodeFactory.get_primitive_tc (p. 2245)

Referenced by **TypeCodeFactory.get_primitive_tc()**.

8.387.3.10 TC_OCTET

```
final TypeCode TC_OCTET [static]
```

Basic octet/byte type.

See also

com.rti.dds.typecode.TypeCodeFactory.get_primitive_tc (p. 2245)

Referenced by **TypeCodeFactory.get_primitive_tc()**.

8.387.3.11 TC_INT8

```
final TypeCode TC_INT8 [static]
```

Basic signed 8-bit int type.

See also

com.rti.dds.typecode.TypeCodeFactory.get_primitive_tc (p. 2245)

Referenced by **TypeCodeFactory.get_primitive_tc()**.

8.387.3.12 TC_UINT8

```
final TypeCode TC_UINT8 [static]
```

Basic unsigned 8-bit int type.

See also

com.rti.dds.typecode.TypeCodeFactory.get_primitive_tc (p. 2245)

Referenced by **TypeCodeFactory.get_primitive_tc()**.

8.387.3.13 TC_LONGLONG

```
final TypeCode TC_LONGLONG [static]
```

Basic 64-bit integer type.

See also

com.rti.dds.typecode.TypeCodeFactory.get_primitive_tc (p. 2245)

Referenced by **TypeCodeFactory.get_primitive_tc()**.

8.387.3.14 TC_ULONGLONG

```
final TypeCode TC_ULONGLONG [static]
```

Basic unsigned 64-bit integer type.

See also

com.rti.dds.typecode.TypeCodeFactory.get_primitive_tc (p. 2245)

Referenced by **TypeCodeFactory.get_primitive_tc()**.

8.387.3.15 TC_LONGDOUBLE

```
final TypeCode TC_LONGDOUBLE [static]
```

Basic 128-bit floating point type.

See also

com.rti.dds.typecode.TypeCodeFactory.get_primitive_tc (p. 2245)

Referenced by **TypeCodeFactory.get_primitive_tc()**.

8.387.3.16 TC_WCHAR

```
final TypeCode TC_WCHAR [static]
```

Basic four-byte character type.

See also

com.rti.dds.typecode.TypeCodeFactory.get_primitive_tc (p. 2245)

Referenced by **TypeCodeFactory.get_primitive_tc()**.

8.387.3.17 MEMBER_ID_INVALID

```
final int MEMBER_ID_INVALID [static]
```

A sentinel indicating an invalid **com.rti.dds.typecode.TypeCode** (p. 2183) member ID.

Referenced by **StructMember.StructMember()**, **UnionMember.UnionMember()**, and **ValueMember.Value↩ Member()**.

8.387.3.18 MAX_MEMBER_ID

```
final int MAX_MEMBER_ID [static]
```

Maximum value for member id. ID.

This value was introduced with the Extensible Types specification

8.387.3.19 INDEX_INVALID

```
final int INDEX_INVALID [static]
```

A sentinel indicating an invalid **com.rti.dds.typecode.TypeCode** (p. 2183) member index.

Referenced by **TypeCode.add_member_to_enum()**, and **TypeCode.find_member_by_name()**.

8.387.3.20 NONKEY_MEMBER

```
final byte NONKEY_MEMBER  [static]
```

A flag indicating that a type member is optional and not part of the key.

If a type is used with the **Dynamic Data** (p. 67) facility, a **com.rti.dds.dynamicdata.DynamicData** (p. 1134) sample of the type will only contain a value for a **com.rti.dds.typecode.TypeCode.NONKEY_MEMBER** (p. 2230) field if one has been explicitly set (see, for example, com.rti.dds.dynamicdata.DynamicData.DynamicData.set_int). The middleware will *not* assume any default value.

See also

com.rti.dds.typecode.TypeCode.KEY_MEMBER (p. 2231)
com.rti.dds.typecode.TypeCode.NONKEY_REQUIRED_MEMBER (p. 2231)
com.rti.dds.typecode.TypeCode.KEY_MEMBER (p. 2231)
com.rti.dds.typecode.TypeCode.add_member (p. 2215)
com.rti.dds.typecode.TypeCode.add_member (p. 2215)
com.rti.dds.typecode.TypeCode.is_member_key (p. 2206)
com.rti.dds.typecode.TypeCode.is_member_required (p. 2207)
com.rti.dds.typecode.StructMember.is_key (p. 2038)
com.rti.dds.typecode.ValueMember.is_key (p. 2278)

8.387.3.21 KEY_MEMBER

```
final byte KEY_MEMBER  [static]
```

A flag indicating that a type member is part of the key for that type, and therefore required.

If a type is used with the **Dynamic Data** (p. 67) facility, all **com.rti.dds.dynamicdata.DynamicData** (p. 1134) samples of the type will contain a value for all **com.rti.dds.typecode.TypeCode.KEY_MEMBER** (p. 2231) fields. If you do not set a value of the member explicitly (see, for example, com.rti.dds.dynamicdata.DynamicData.DynamicData.set_int), the middleware will assume a default "zero" value: numeric values will be set to zero; strings and sequences will be of zero length.

See also

com.rti.dds.typecode.TypeCode.NONKEY_REQUIRED_MEMBER (p. 2231)
com.rti.dds.typecode.TypeCode.NONKEY_MEMBER (p. 2230)
com.rti.dds.typecode.TypeCode.add_member (p. 2215)
com.rti.dds.typecode.TypeCode.add_member (p. 2215)
com.rti.dds.typecode.TypeCode.is_member_key (p. 2206)
com.rti.dds.typecode.TypeCode.is_member_required (p. 2207)
com.rti.dds.typecode.StructMember.is_key (p. 2038)
com.rti.dds.typecode.ValueMember.is_key (p. 2278)

8.387.3.22 NONKEY_REQUIRED_MEMBER

```
final byte NONKEY_REQUIRED_MEMBER  [static]
```

A flag indicating that a type member is not part of the key but is nevertheless required.

This is the most common kind of member.

If a type is used with the **Dynamic Data** (p. 67) facility, all **com.rti.dds.dynamicdata.DynamicData** (p. 1134) samples of the type will contain a value for all **com.rti.dds.typecode.TypeCode.NONKEY_REQUIRED_MEMBER** (p. 2231) fields. If you do not set a value of the member explicitly (see, for example, com.rti.dds.dynamicdata.DynamicData.↩ DynamicData.set_int), the middleware will assume a default "zero" value: numeric values will be set to zero; strings and sequences will be of zero length.

com.rti.dds.typecode.StructMember.is_key (p. 2038)
com.rti.dds.typecode.ValueMember.is_key (p. 2278)

8.387.3.23 NOT_BITFIELD

```
final short NOT_BITFIELD  [static]
```

Indicates that a member of a type is not a bitfield.

Referenced by **TypeCode.add_member()**, and **TypeCode.is_member_bitfield()**.

8.388 TypeCodeFactory Class Reference

A singleton factory for creating, copying, and deleting data type definitions dynamically.

Public Member Functions

  *Constructs a **com.rti.dds.typecode.TCKind.TK_ARRAY** (p. 2099) **com.rti.dds.typecode.TypeCode** (p. 2183).*
- **TypeCode create_array_tc** (int length, **TypeCode** element_type) throws BAD_PARAM

  *Constructs a **com.rti.dds.typecode.TCKind.TK_ARRAY** (p. 2099) **com.rti.dds.typecode.TypeCode** (p. 2183) for a single-dimensional array.*
- **TypeCode clone_tc** (**TypeCode** tc)

  *Creates and returns a copy of the input **com.rti.dds.typecode.TypeCode** (p. 2183).*
- void **delete_tc** (**TypeCode** tc)

  *Deletes the input **com.rti.dds.typecode.TypeCode** (p. 2183).*
- **TypeCode get_primitive_tc** (**TCKind** kind) throws BAD_PARAM

  *Get the **com.rti.dds.typecode.TypeCode** (p. 2183) for a primitive type (integers, floating point values, etc.) identified by the given **com.rti.dds.typecode.TCKind** (p. 2094).*

Static Public Member Functions

- static final **TypeCodeFactory get_instance** ()

  Gets the singleton instance of this class.

8.388.1 Detailed Description

A singleton factory for creating, copying, and deleting data type definitions dynamically.

You can access the singleton with the **com.rti.dds.typecode.TypeCodeFactory.get_instance** (p. 2235) method.

If you want to publish and subscribe to data of types that are not known to you at system design time, this class will be your starting point. After creating a data type definition with this class, you will modify that definition using the **com.rti.dds.typecode.TypeCode** (p. 2183) class and then register it with the **Dynamic Data** (p. 67) API.

The methods of this class fall into several categories:

Getting definitions for primitive types:
Type definitions for primitive types (e.g. integers, floating point values, etc.) are pre-defined; your application only needs to *get* them, not *create* them.

- **com.rti.dds.typecode.TypeCodeFactory.get_primitive_tc** (p. 2245)

Creating definitions for strings, arrays, and sequences:
Type definitions for strings, arrays, and sequences (i.e. variables-size lists) must be created as you need them, because the type definition includes the maximum length of those containers.

- **com.rti.dds.typecode.TypeCodeFactory.create_string_tc** (p. 2241)
- **com.rti.dds.typecode.TypeCodeFactory.create_wstring_tc** (p. 2241)
- **com.rti.dds.typecode.TypeCodeFactory.create_array_tc** (p. 2242)
- com.rti.dds.typecode.TypeCodeFactory.TypeCodeFactory.create_array_tc
- **com.rti.dds.typecode.TypeCodeFactory.create_sequence_tc** (p. 2242)

Creating definitions for structured types:
Structured types include structures, value types, and unions.

- **com.rti.dds.typecode.TypeCodeFactory.create_struct_tc** (p. 2235)
- **com.rti.dds.typecode.TypeCodeFactory.create_value_tc** (p. 2236)
- **com.rti.dds.typecode.TypeCodeFactory.create_union_tc** (p. 2238)

Creating definitions for other types:
The type system also supports enumerations and aliases (i.e. `typedef`s in C and C++).

- **com.rti.dds.typecode.TypeCodeFactory.create_enum_tc** (p. 2239)
- **com.rti.dds.typecode.TypeCodeFactory.create_alias_tc** (p. 2240)

Deleting type definitions:
When you're finished using a type definition, you should delete it. (*Note* that you only need to delete a **com.rti.dds.typecode.TypeCode** (p. 2183) that you *created*; if you got the object from **com.rti.dds.typecode.TypeCodeFactory.get_primitive_tc** (p. 2245), you must *not* delete it.)

- **com.rti.dds.typecode.TypeCodeFactory.delete_tc** (p. 2245)

Copying type definitions:
You can also create deep copies of type definitions:

- **com.rti.dds.typecode.TypeCodeFactory.clone_tc** (p. 2244)

8.388.2 Member Function Documentation

8.388.2.1 get_instance()

```
static final  TypeCodeFactory get_instance ( )  [static]
```

Gets the singleton instance of this class.

Returns

The **com.rti.dds.typecode.TypeCodeFactory** (p. 2232) instance if no errors. Otherwise, null.

8.388.2.2 create_struct_tc() [1/2]

```
TypeCode create_struct_tc (
            String name,
             ExtensibilityKind extensibility_kind,
             StructMember[] members ) throws  BAD_PARAM
```

Constructs a **com.rti.dds.typecode.TCKind.TK_STRUCT** (p. 2098) **com.rti.dds.typecode.TypeCode** (p. 2183).

Parameters

name	*<<**in**>> (p. 404)* Name of the struct type. Cannot be null.
extensibility_kind	*<<**in**>> (p. 404)* Type extensibility.
members	*<<**in**>> (p. 404)* Initial members of the structure. This list may be empty (that is, com.rti.dds.infrastructure.com.rti.dds.util.Sequence.Sequence.size() may return zero). If the list is not empty, the elements must describe valid struct members. (For example, the names must be unique within the type.) This argument may be null.

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BAD_PARAM.	Illegal parameter value.

Returns

A newly-created **com.rti.dds.typecode.TypeCode** (p. 2183) object describing a struct.

8.388.2.3 create_struct_tc() [2/2]

```
TypeCode create_struct_tc (
            String name,
             StructMember[] members ) throws  BAD_PARAM
```

Constructs a **com.rti.dds.typecode.TCKind.TK_STRUCT** (p. 2098) **com.rti.dds.typecode.TypeCode** (p. 2183).

Parameters

name	*<<**in**>> (p. 404)* Name of the struct type. Cannot be null.
members	*<<**in**>> (p. 404)* Initial members of the structure. This list may be empty (that is, com.rti.dds.infrastructure.com.rti.dds.util.Sequence.Sequence.size() may return zero). If the list is not empty, the elements must describe valid struct members. (For example, the names must be unique within the type.) This argument may be null.

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BAD_PARAM.	Illegal parameter value.

Returns

A newly-created **com.rti.dds.typecode.TypeCode** (p. 2183) object describing a struct.

References **ExtensibilityKind.EXTENSIBLE_EXTENSIBILITY**.

8.388.2.4 create_value_tc() [1/2]

```
TypeCode create_value_tc (
            String name,
             ExtensibilityKind extensibility_kind,
            short type_modifier,
             TypeCode concrete_base,
             ValueMember[] members ) throws  BAD_PARAM
```

Constructs a **com.rti.dds.typecode.TCKind.TK_VALUE** (p. 2101) **com.rti.dds.typecode.TypeCode** (p. 2183).

Parameters

name	*<<**in**>> (p. 404)* Name of the value type. Cannot be null.
extensibility_kind	*<<**in**>> (p. 404)* Type extensibility.
type_modifier	*<<**in**>> (p. 404)* One of the value type modifier constants: com.rti.dds.typecode.ValueModifier.VM_NONE, com.rti.dds.typecode.ValueModifier.VM_CUSTOM, com.rti.dds.typecode.ValueModifier.VM_ABSTRACT or com.rti.dds.typecode.ValueModifier.VM_TRUNCATABLE.

Parameters

concrete_base	*<<**in**>> (p. 404)* **com.rti.dds.typecode.TypeCode** (p. 2183) object describing the concrete valuetype base. It may be null if the valuetype does not have a concrete base.
members	*<<**in**>> (p. 404)* Initial members of the value type. This list may be empty. If the list is not empty, the elements must describe valid value type members. (For example, the names must be unique within the type.) This argument may be null.

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BAD_PARAM.	Illegal parameter value.

Returns

A newly-created **com.rti.dds.typecode.TypeCode** (p. 2183) object describing a value.

8.388.2.5 create_value_tc() [2/2]

```
TypeCode create_value_tc (
            String name,
            short type_modifier,
             TypeCode concrete_base,
             ValueMember[] members ) throws  BAD_PARAM
```

Constructs a **com.rti.dds.typecode.TCKind.TK_VALUE** (p. 2101) **com.rti.dds.typecode.TypeCode** (p. 2183).

Parameters

name	*<<**in**>> (p. 404)* Name of the value type. Cannot be null.
type_modifier	*<<**in**>> (p. 404)* One of the value type modifier constants: com.rti.dds.typecode.ValueModifier.VM_NONE, com.rti.dds.typecode.ValueModifier.VM_CUSTOM, com.rti.dds.typecode.ValueModifier.VM_ABSTRACT or com.rti.dds.typecode.ValueModifier.VM_TRUNCATABLE.
concrete_base	*<<**in**>> (p. 404)* **com.rti.dds.typecode.TypeCode** (p. 2183) object describing the concrete valuetype base. It may be null if the valuetype does not have a concrete base.
members	*<<**in**>> (p. 404)* Initial members of the value type. This list may be empty. If the list is not empty, the elements must describe valid value type members. (For example, the names must be unique within the type.) This argument may be null.

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BAD_PARAM.	Illegal parameter value.

Returns

A newly-created **com.rti.dds.typecode.TypeCode** (p. 2183) object describing a value.

References **ExtensibilityKind.EXTENSIBLE_EXTENSIBILITY**, and **TCKind.TK_NULL**.

8.388.2.6 create_union_tc() [1/2]

```
TypeCode create_union_tc (
            String name,
             ExtensibilityKind extensibility_kind,
             TypeCode discriminator_type,
            int default_index,
             UnionMember[] members ) throws  BAD_PARAM
```

Constructs a **com.rti.dds.typecode.TCKind.TK_UNION** (p. 2098) **com.rti.dds.typecode.TypeCode** (p. 2183).

Parameters

name	<<***in***>> *(p. 404)* Name of the union type. Cannot be null.
extensibility_kind	<<***in***>> *(p. 404)* Type extensibility.
discriminator_type	<<***in***>> *(p. 404)* Discriminator Type Code. Cannot be null.
default_index	<<***in***>> *(p. 404)* Index of the default member, or -1 if there is no default member.
members	<<***in***>> *(p. 404)* Initial members of the union. This list may be empty. If the list is not empty, the elements must describe valid struct members. (For example, the names must be unique within the type.) This argument may be null.

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BAD_PARAM.	Illegal parameter value.

Returns

A newly-created **com.rti.dds.typecode.TypeCode** (p. 2183) object describing a union.

8.388.2.7 create_union_tc() [2/2]

```
TypeCode create_union_tc (
            String name,
             TypeCode discriminator_type,
            int default_index,
             UnionMember[] members ) throws  BAD_PARAM
```

Constructs a **com.rti.dds.typecode.TCKind.TK_UNION** (p. 2098) **com.rti.dds.typecode.TypeCode** (p. 2183).

Parameters

name	<<***in***>> *(p. 404)* Name of the union type. Cannot be null.
discriminator_type	<<***in***>> *(p. 404)* Discriminator Type Code. Cannot be null.
default_index	<<***in***>> *(p. 404)* Index of the default member, or -1 if there is no default member.
members	<<***in***>> *(p. 404)* Initial members of the union. This list may be empty. If the list is not empty, the elements must describe valid struct members. (For example, the names must be unique within the type.) This argument may be null.

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BAD_PARAM.	Illegal parameter value.

Returns

A newly-created **com.rti.dds.typecode.TypeCode** (p. 2183) object describing a union.

References **ExtensibilityKind.EXTENSIBLE_EXTENSIBILITY**.

8.388.2.8 create_enum_tc() [1/2]

```
TypeCode create_enum_tc (
            String name,
             ExtensibilityKind extensibility_kind,
             EnumMember[] members ) throws  BAD_PARAM
```

Constructs a **com.rti.dds.typecode.TCKind.TK_ENUM** (p. 2098) **com.rti.dds.typecode.TypeCode** (p. 2183).

Parameters

name	<<***in***>> *(p. 404)* Name of the enum type. Cannot be null.
extensibility_kind	<<***in***>> *(p. 404)* Type extensibility.
members	<<***in***>> *(p. 404)* Initial members of the enumeration. All members must have non-null names, and both names and ordinal values must be unique within the type. Note that it is also possible to add members later with **com.rti.dds.typecode.TypeCode.add_member_to_enum** (p. 2219). This argument may be null.

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BAD_PARAM.	Illegal parameter value.

Returns

A newly-created **com.rti.dds.typecode.TypeCode** (p. 2183) object describing an enumeration.

References **Enum.ordinal()**, and **TCKind.TK_ENUM**.

8.388.2.9 create_enum_tc() [2/2]

```
TypeCode create_enum_tc (
            String name,
             EnumMember[] members ) throws  BAD_PARAM
```

Constructs a **com.rti.dds.typecode.TCKind.TK_ENUM** (p. 2098) **com.rti.dds.typecode.TypeCode** (p. 2183).

Parameters

name	<<***in***>> *(*p. *404)* Name of the enum type. Cannot be null.
members	<<***in***>> *(*p. *404)* Initial members of the enumeration. All members must have non-null names, and both names and ordinal values must be unique within the type. Note that it is also possible to add members later with **com.rti.dds.typecode.TypeCode.add_member_to_enum** (p. 2219). This argument may be null.

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BAD_PARAM.	Illegal parameter value.

Returns

A newly-created **com.rti.dds.typecode.TypeCode** (p. 2183) object describing an enumeration.

References **ExtensibilityKind.EXTENSIBLE_EXTENSIBILITY**, **Enum.ordinal()**, and **TCKind.TK_ENUM**.

8.388.2.10 create_alias_tc()

```
TypeCode create_alias_tc (
            String name,
             TypeCode original_type,
            boolean is_pointer ) throws  BAD_PARAM
```

Constructs a **com.rti.dds.typecode.TCKind.TK_ALIAS** (p. 2099) (typedef) **com.rti.dds.typecode.TypeCode** (p. 2183).

Parameters

name	<<***in***>> *(p. 404)* Name of the alias. Cannot be null.
original_type	<<***in***>> *(p. 404)* Aliased type code. Cannot be null.
is_pointer	<<***in***>> *(p. 404)* Indicates if the alias is a pointer to the aliased type code.

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BAD_PARAM.	Illegal parameter value.

Returns

A newly-created **com.rti.dds.typecode.TypeCode** (p. 2183) object describing an alias.

8.388.2.11 create_string_tc()

```
TypeCode create_string_tc (
            int bound ) throws  BAD_PARAM
```

Constructs a **com.rti.dds.typecode.TCKind.TK_STRING** (p. 2098) **com.rti.dds.typecode.TypeCode** (p. 2183).

Parameters

bound	<<***in***>> *(p. 404)* Maximum length of the string. It cannot be negative.

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BAD_PARAM.	Illegal parameter value.

Returns

A newly-created **com.rti.dds.typecode.TypeCode** (p. 2183) object describing a string.

References **TCKind.TK_STRING**.

8.388.2.12 create_wstring_tc()

```
TypeCode create_wstring_tc (
            int bound ) throws  BAD_PARAM
```

Constructs a **com.rti.dds.typecode.TCKind.TK_WSTRING** (p. 2100) **com.rti.dds.typecode.TypeCode** (p. 2183).

Parameters

bound	<<***in***>> *(*p. *404)* Maximum length of the wide string. It cannot be negative.

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BAD_PARAM.	Illegal parameter value.

Returns

A newly-created **com.rti.dds.typecode.TypeCode** (p. 2183) object describing a wide string.

References **TCKind.TK_WSTRING**.

8.388.2.13 create_sequence_tc()

```
TypeCode create_sequence_tc (
            int bound,
             TypeCode element_type ) throws  BAD_PARAM
```

Constructs a **com.rti.dds.typecode.TCKind.TK_SEQUENCE** (p. 2099) **com.rti.dds.typecode.TypeCode** (p. 2183).

Parameters

bound	<<***in***>> *(*p. *404)* The bound for the sequence (> 0).
element_type	<<***in***>> *(*p. *404)* **com.rti.dds.typecode.TypeCode** (p. 2183) object describing the sequence elements.

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BAD_PARAM.	Illegal parameter value.

Returns

A newly-created **com.rti.dds.typecode.TypeCode** (p. 2183) object describing a sequence.

8.388.2.14 create_array_tc() [1/2]

```
TypeCode create_array_tc (
            int[] dimensions,
             TypeCode element_type ) throws  BAD_PARAM
```

Constructs a **com.rti.dds.typecode.TCKind.TK_ARRAY** (p. 2099) **com.rti.dds.typecode.TypeCode** (p. 2183).

Parameters

dimensions	*<<**in**>> (*p. *404)* Dimensions of the array. Each dimension has to be greater than 0.
element_type	*<<**in**>> (*p. *404)* **com.rti.dds.typecode.TypeCode** (p. 2183) describing the array elements. Cannot be null.

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BAD_PARAM.	Illegal parameter value.

Returns

A newly-created **com.rti.dds.typecode.TypeCode** (p. 2183) object describing a sequence.

Referenced by **TypeCodeFactory.create_array_tc()**.

8.388.2.15 create_array_tc() [2/2]

```
TypeCode create_array_tc (
            int length,
             TypeCode element_type ) throws  BAD_PARAM
```

Constructs a **com.rti.dds.typecode.TCKind.TK_ARRAY** (p. 2099) **com.rti.dds.typecode.TypeCode** (p. 2183) for a single-dimensional array.

Parameters

length	*<<**in**>> (*p. *404)* Length of the single-dimensional array.
element_type	*<<**in**>> (*p. *404)* **com.rti.dds.typecode.TypeCode** (p. 2183) describing the array elements. Cannot be null.

Exceptions

com.rti.dds.infrastructure.ExceptionCode_t.BAD_PARAM.	Illegal parameter value.

Returns

A newly-created **com.rti.dds.typecode.TypeCode** (p. 2183) object describing a sequence.

References **TypeCodeFactory.create_array_tc()**.

8.388.2.16 clone_tc()

```
TypeCode clone_tc (
            TypeCode tc )
```

Creates and returns a copy of the input **com.rti.dds.typecode.TypeCode** (p. 2183).

Parameters

tc	<<***in***>> *(p. 404)* Type code that will be copied. Cannot be null.

Returns

A clone of tc.

8.388.2.17 delete_tc()

```
void delete_tc (
            TypeCode tc )
```

Deletes the input **com.rti.dds.typecode.TypeCode** (p. 2183).

Calling this method is optional. If you do not call it, the garbage collector will perform the deletion when it is able.

Parameters

tc	<<***inout***>> *(p. 404)* Type code that will be deleted. Cannot be null.

8.388.2.18 get_primitive_tc()

```
TypeCode get_primitive_tc (
            TCKind kind ) throws  BAD_PARAM
```

Get the **com.rti.dds.typecode.TypeCode** (p. 2183) for a primitive type (integers, floating point values, etc.) identified by the given **com.rti.dds.typecode.TCKind** (p. 2094).

  *<<**spec**>> (p. 132) Controls whether enumeration constant names are taken into consideration for type assignability.*

8.389.1 Detailed Description

*<<**spec**>> (p. 132)* Defines the rules for determining whether the type used to publish a given topic is consistent with that used to subscribe to it.

This policy defines a type consistency kind, which allows applications to select from among a set of predetermined behaviors. The following consistency kinds are specified: com.rti.dds.infrastructure.TypeConsistencyKind.TypeConsistencyKind.DISALLOW_TYPE_COERCION, com.rti.dds.infrastructure.TypeConsistencyKind.TypeConsistencyKind.ALLOW_TYPE_COERCION and com.rti.dds.infrastructure.TypeConsistencyKind.TypeConsistencyKind.AUTO_TYPE_COERCION.

The type-consistency-enforcement rules consist of two steps:

Step 1. If both the DataWriter and DataReader specify a TypeObject, it is considered first. If the DataReader allows type coercion, then its type must be assignable from the DataWriter's type, taking into account the values of prevent_type_widening, ignore_sequence_bounds, ignore_string_bounds, ignore_member_names, and ignore_enum_literal_names. If the DataReader does not allow type coercion, then its type must be equivalent to the type of the DataWriter.

Step 2. If either the DataWriter or the DataReader does not provide a TypeObject definition, then the registered type names are examined. The DataReader's and DataWriter's registered type names must match exactly, as was true in RTI Connext releases prior to 5.0.0.

If either Step 1 or Step 2 fails, the Topics associated with the DataReader and DataWriter are considered to be inconsistent and the **com.rti.dds.topic.InconsistentTopicStatus** (p. 1440) is updated.

The default enforcement kind is com.rti.dds.infrastructure.TypeConsistencyKind.TypeConsistencyKind.AUTO_TYPE_COERCION. This default kind translates to com.rti.dds.infrastructure.TypeConsistencyKind.TypeConsistencyKind.ALLOW_TYPE_COERCION except in the following cases:

- When a **Zero Copy** (p. 58) DataReader is used, the kind is translated to com.rti.dds.infrastructure.TypeConsistencyKind.TypeConsistencyKind.DISALLOW_TYPE_COERCION.
- When the middleware is introspecting the built-in topic data declaration of a remote DataReader in order to determine whether it can match with a local DataWriter, if it observes that no **TypeConsistencyEnforcementQosPolicy** (p. 2246) value is provided (as would be the case when communicating with a Service implementation not in conformance with this specification), it assumes a kind of com.rti.dds.infrastructure.TypeConsistencyKind.TypeConsistencyKind.DISALLOW_TYPE_COERCION.

For additional information on type consistency enforcement refer to the `Extensible Types Guide` and the `OMG Extensible and Dynamic Topic Types for DDS Specification`.

Entity:

com.rti.dds.subscription.DataReader (p. 707)

Properties:

Changeable (p. 507) = **UNTIL ENABLE** (p. 507)

8.389.2 Member Data Documentation

8.389.2.1 kind

```
TypeConsistencyKind kind
```

<<***spec***>> *(p. 132)* Type consistency kind.

[default] com.rti.dds.infrastructure.TypeConsistencyKind.TypeConsistencyKind.AUTO_TYPE_COERCION

Categories

Immutable (p. 292), **Matching** (p. 355), **Discovery Metadata** (p. 348), **Type System** (p. 289)

8.389.2.2 ignore_sequence_bounds

```
boolean ignore_sequence_bounds
```

<<***spec***>> *(p. 132)* Controls whether sequence bounds are taken into consideration for type assignability.

If the option is set to com.rti.dds.infrastructure.true, then sequence bounds (maximum lengths) are not considered as part of the type assignability. This means that a T2 sequence type with maximum length L2 would be assignable to a T1 sequence type with maximum length L1, even if L2 is greater than L1. If the option is set to com.rti.dds.infrastructure.↩ false, then sequence bounds are taken into consideration for type assignability, and in order for T1 to be assignable from T2, it is required that L1 >= L2.

[default] com.rti.dds.infrastructure.true

Categories

Immutable (p. 292), **Matching** (p. 355), **Discovery Metadata** (p. 348), **Type System** (p. 289)

8.389.2.3 ignore_string_bounds

```
boolean ignore_string_bounds
```

<<***spec***>> *(p. 132)* Controls whether string bounds are taken into consideration for type assignability.

If the option is set to com.rti.dds.infrastructure.true, then string bounds (maximum lengths) are not considered as part of the type assignability. This means that a T2 string type with maximum length L2 would be assignable to a T1 string type with maximum length L1, even if L2 is greater than L1. If the option is set to com.rti.dds.infrastructure.false, then string bounds are taken into consideration for type assignability, and in order for T1 to be assignable from T2, it is required that L1 >= L2.

[default] com.rti.dds.infrastructure.true

Categories

Immutable (p. 292), **Matching** (p. 355), **Discovery Metadata** (p. 348), **Type System** (p. 289)

8.389.2.4 ignore_member_names

```
boolean ignore_member_names
```

<<***spec***>> *(p. 132)* Controls whether member names are taken into consideration for type assignability.

If the option is set to com.rti.dds.infrastructure.true, then member names are not considered as part of the type assignability. If the option is set to com.rti.dds.infrastructure.false, then member names are taken into consideration for type assignability, and in order for members with the same ID to be assignable, the members must also have the same name.

[default] com.rti.dds.infrastructure.false

Categories

Immutable (p. 292), **Matching** (p. 355), **Discovery Metadata** (p. 348), **Type System** (p. 289)

8.389.2.5 prevent_type_widening

```
boolean prevent_type_widening
```

<<***spec***>> *(p. 132)* Controls whether type widening is allowed.

If the option is set to com.rti.dds.infrastructure.false, then type widening is permitted. If the option is set to com.rti.↩ dds.infrastructure.true, then a wider type may not be assignable from a narrower type.

[default] com.rti.dds.infrastructure.false

Categories

Immutable (p. 292), **Matching** (p. 355), **Discovery Metadata** (p. 348), **Type System** (p. 289)

8.389.2.6 force_type_validation

```
boolean force_type_validation
```

<<***spec***>> *(p. 132)* Controls whether type information must be available in order to complete matching between a **com.rti.dds.publication.DataWriter** (p. 818) and a **com.rti.dds.subscription.DataReader** (p. 707).

If the option is set to com.rti.dds.infrastructure.true, then type information must be available in order to complete matching between a **com.rti.dds.publication.DataWriter** (p. 818) and a **com.rti.dds.subscription.DataReader** (p. 707). If the option is set to com.rti.dds.infrastructure.false, then matching can occur without complete type information as long as the type names match exactly. Note that if the types have the same name but are not assignable, DataReaders may fail to deserialize incoming data samples.

[default] com.rti.dds.infrastructure.false

Categories

Immutable (p. 292), **Matching** (p. 355), **Discovery Metadata** (p. 348), **Type System** (p. 289)

8.389.2.7 ignore_enum_literal_names

```
boolean ignore_enum_literal_names
```

<<***spec***>> *(p. 132)* Controls whether enumeration constant names are taken into consideration for type assignability.

If the option is set to com.rti.dds.infrastructure.true, then enumeration constants may change their names, but not their values, and still maintain assignability. If the option is set to com.rti.dds.infrastructure.false, then in order for enumerations to be assignable, any constant that has the same value in both enumerations must also have the same name.

[default] com.rti.dds.infrastructure.false

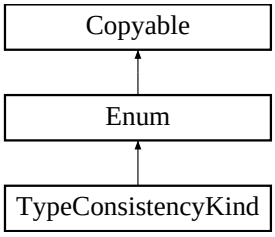
Categories

Immutable (p. 292), **Matching** (p. 355), **Discovery Metadata** (p. 348), **Type System** (p. 289)

8.390 TypeConsistencyKind Class Reference

Kinds of type consistency.

Inheritance diagram for TypeConsistencyKind:



Static Public Attributes

- static final **TypeConsistencyKind DISALLOW_TYPE_COERCION**

  The DataWriter and the DataReader must support the same data type in order for them to communicate.
- static final **TypeConsistencyKind ALLOW_TYPE_COERCION**

  The DataWriter and the DataReader need not support the same data type in order for them to communicate as long as the DataReader's type is assignable from the DataWriter's type. For example, the following two extensible types will be assignable to each other since MyDerivedType contains all the members of MyBaseType (member_1) plus some additional elements (member_2).
- static final **TypeConsistencyKind AUTO_TYPE_COERCION**

  This AUTO value will be applied as com.rti.dds.infrastructure.TypeConsistencyKind.TypeConsistencyKind.DISALLOW_↩ TYPE_COERCION when the data type is annotated with @transfer_mode(SHMEM_REF) and the @language_binding is PLAIN (default) while using C, Traditional C++, or Modern C++ APIs. In all other cases, this AUTO value will be applied as com.rti.dds.infrastructure.TypeConsistencyKind.TypeConsistencyKind.ALLOW_TYPE_COERCION.

Additional Inherited Members

8.390.1 Detailed Description

Kinds of type consistency.

QoS:

com.rti.dds.infrastructure.TypeConsistencyEnforcementQosPolicy (p. 2246)

8.390.2 Member Data Documentation

8.390.2.1 DISALLOW_TYPE_COERCION

```
final TypeConsistencyKind DISALLOW_TYPE_COERCION [static]
```

The DataWriter and the DataReader must support the same data type in order for them to communicate.

This is the degree of type consistency enforcement required by the `OMG DDS Specification` prior to the `OMG Extensible and Dynamic Topic Types for DDS Specification`.

8.390.2.2 ALLOW_TYPE_COERCION

```
final TypeConsistencyKind ALLOW_TYPE_COERCION [static]
```

Initial value:

```
=
        new TypeConsistencyKind("ALLOW_TYPE_COERCION", 1)
```

The DataWriter and the DataReader need not support the same data type in order for them to communicate as long as the DataReader's type is assignable from the DataWriter's type. For example, the following two extensible types will be assignable to each other since MyDerivedType contains all the members of MyBaseType (member_1) plus some additional elements (member_2).

```
struct MyBaseType {
 long member_1;
 };

 struct MyDerivedType: MyBaseType {
 long member_2;
 };
```

Even if MyDerivedType was not explicitly inheriting from MyBaseType the types would still be assignable. For example:

```
struct MyBaseType {
 long member_1;
 };

 struct MyDerivedType {
 long member_1;
 long member_2;
 };
```

For additional information on type assignability refer to the `OMG Extensible and Dynamic Topic Types for DDS Specification`.

8.390.2.3 AUTO_TYPE_COERCION

```
final  TypeConsistencyKind AUTO_TYPE_COERCION  [static]
```

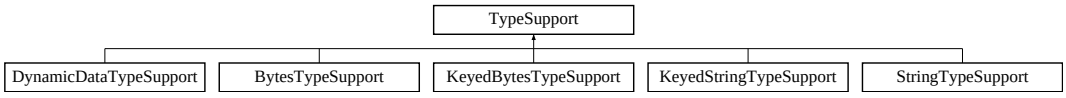
This AUTO value will be applied as com.rti.dds.infrastructure.TypeConsistencyKind.TypeConsistencyKind.DISALLOW↩ _TYPE_COERCION when the data type is annotated with @transfer_mode(SHMEM_REF) and the @language_binding is PLAIN (default) while using C, Traditional C++, or Modern C++ APIs. In all other cases, this AUTO value will be applied as com.rti.dds.infrastructure.TypeConsistencyKind.TypeConsistencyKind.ALLOW_TYPE_COERCION.

[default]

8.391 TypeSupport Interface Reference

<<***interface***>> *(*p. *403)* An abstract *marker* interface that has to be specialized for each concrete user data type that will be used by the application.

Inheritance diagram for TypeSupport:



8.391.1 Detailed Description

<<***interface***>> *(*p. *403)* An abstract *marker* interface that has to be specialized for each concrete user data type that will be used by the application.

The implementation provides an automatic means to generate a type-specific class, **com.rti.ndds.example.FooType↩ Support** (p. 1410), from a description of the type in IDL.

A **com.rti.dds.topic.TypeSupport** (p. 2252) must be registered using the **com.rti.ndds.example.FooTypeSupport.↩ register_type** (p. 1411) operation on this type-specific class before it can be used to create **com.rti.dds.topic.Topic** (p. 2116) objects.

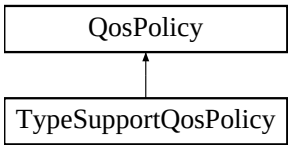
com.rti.ndds.example.FooTypeSupport (p. 1410)

the `Code Generator User's Manual`

8.392 TypeSupportQosPolicy Class Reference

[DEPRECATED] (p. **358)** <<***extension***>> *(*p. *138)* Allows you to attach application-specific values to a **com.rti.dds.publication.DataWriter** (p. 818) or **com.rti.dds.subscription.DataReader** (p. 707), which are passed to the serialization or deserialization routine of the associated data type and choose whether to set padding bytes to zero during serialization.

Inheritance diagram for TypeSupportQosPolicy:



Public Attributes

- transient Object **plugin_data**

  [DEPRECATED] (p. ***358)*** <<***extension***>> *(*p. *138) Value to pass into the type plugin's de-/serialization function*
- **CdrPaddingKind cdr_padding_kind**

  [DEPRECATED] (p. ***358)*** <<***extension***>> *(*p. *138) Determines whether or not the padding bytes will be set to zero during CDR serialization.*

8.392.1 Detailed Description

[DEPRECATED] (p. **358)** <<***extension***>> *(*p. *138)* Allows you to attach application-specific values to a **com.rti.dds.publication.DataWriter** (p. 818) or **com.rti.dds.subscription.DataReader** (p. 707), which are passed to the serialization or deserialization routine of the associated data type and choose whether to set padding bytes to zero during serialization.

The purpose of this QoS is to allow a user application to pass data to a type plugin's support functions and choose whether or not to set the padding bytes to zero when serializing a sample using CDR encapsulation.

Entity:

com.rti.dds.domain.DomainParticipant (p. 948), **com.rti.dds.subscription.DataReader** (p. 707), **com.rti.dds.publication.DataWriter** (p. 818)

Properties:

RxO (p. 506) = NO

Changeable (p. 507) = **UNTIL ENABLE** (p. 507)

8.392.2 Usage

The **com.rti.dds.infrastructure.TypeSupportQosPolicy.plugin_data** (p. 2254) allows you to associate a pointer to an object with a **com.rti.dds.publication.DataWriter** (p. 818) or **com.rti.dds.subscription.DataReader** (p. 707). This object pointer is passed to the serialization routine of the data type associated with the **com.rti.dds.publication.DataWriter** (p. 818) or the deserialization routine of the data type associated with the **com.rti.dds.subscription.DataReader** (p. 707).

You can modify the rtiddsgen-generated code so that the de/serialization routines act differently depending on the information passed in via the object pointer. (The generated serialization and deserialization code does not use the pointer.)

This functionality can be used to change how data sent by a **com.rti.dds.publication.DataWriter** (p. 818) or received by a **com.rti.dds.subscription.DataReader** (p. 707) is serialized or deserialized on a per DataWriter and DataReader basis.

It can also be used to dynamically change how serialization (or for a less common case, deserialization) occurs. For example, a data type could represent a table, including the names of the rows and columns. However, since the row/column names of an instance of the table (a Topic) don't change, they only need to be sent once. The information passed in through the TypeSupport QoS policy could be used to signal the serialization routine to send the row/column names the first time a **com.rti.dds.publication.DataWriter** (p. 818) calls **com.rti.ndds.example.FooDataWriter.write** (p. 1397), and then never again.

The **com.rti.dds.infrastructure.TypeSupportQosPolicy.cdr_padding_kind** (p. 2254) allows you to choose whether or not the padding bytes are set to zero during CDR serialization.

8.392.3 Member Data Documentation

8.392.3.1 plugin_data

```
transient Object plugin_data
```

[DEPRECATED] (p. **358)** <<***extension***>> *(*p. *138)* Value to pass into the type plugin's de-/serialization function

[default] NULL

Categories

Immutable (p. 292), **Application-Defined Metadata** (p. 191)

8.392.3.2 cdr_padding_kind

```
CdrPaddingKind cdr_padding_kind
```

[DEPRECATED] (p. **358**) <<***extension***>> *(p. 138)* Determines whether or not the padding bytes will be set to zero during CDR serialization.

In a DomainParticipant, this value configures how the padding bytes are set when serializing data for the Built-In Topic DataWriters and DataReaders. A value of com.rti.dds.infrastructure.CdrPaddingKind.CdrPaddingKind.AUTO_CDR_↩ PADDING defaults to com.rti.dds.infrastructure.CdrPaddingKind.CdrPaddingKind.NOT_SET_CDR_PADDING.

For DataWriters and DataReaders, this value configures how padding bytes are set when serializing data for that entity. A value of com.rti.dds.infrastructure.CdrPaddingKind.CdrPaddingKind.AUTO_CDR_PADDING means that the entity will inherit whatever value is set on the DomainParticipant.

8.393.1 Detailed Description

Transport (p. 2150) plug-in using UDP/IPv4.

This transport plugin uses UDPv4 sockets to send and receive messages. It supports both unicast and multicast communications in a single instance of the plugin. By default, this plugin will use all interfaces that it finds enabled and "UP" at instantiation time to send and receive messages. This transport is installed as a built-in transport plugin with the alias **com.rti.dds.infrastructure.TransportBuiltinKind.UDPv4_ALIAS** (p. 522).

You can configure an instance of this plugin to only use unicast or only use multicast, see **com.rti.ndds.transport.UDPv4Transport.Property_t.unicast_enabled** (p. 1711) and **com.rti.ndds.transport.UDPv4Transport.Property_t.multicast_enabled** (p. 1711).

In addition, you can configure an instance of this plugin to selectively use the network interfaces of a node (and restrict a plugin from sending multicast messages on specific interfaces) by specifying the **com.rti.ndds.transport.Transport.Property_t.max_interface_count** (p. 1706) and the "white" and "black" lists in the base property's fields (**com.rti.ndds.transport.Transport.Property_t.allow_interfaces_list** (p. 1704), **com.rti.ndds.transport.Transport.Property_t.deny_interfaces_list** (p. 1705), **com.rti.ndds.transport.Transport.Property_t.allow_multicast_interfaces_list** (p. 1705), **com.rti.ndds.transport.Transport.Property_t.deny_multicast_interfaces_list** (p. 1706)).

RTI Connext can implicitly create this plugin and register with the **com.rti.dds.domain.DomainParticipant** (p. 948) if this transport is specified in **com.rti.dds.infrastructure.TransportBuiltinQosPolicy** (p. 2152).

To specify the properties of the builtin UDPv4 transport that is implicitly registered, you can either:

- call **com.rti.ndds.transport.TransportSupport.set_builtin_transport_property** (p. 2173) or
- specify the predefined property names in **com.rti.dds.infrastructure.PropertyQosPolicy** (p. 1739) associated with the **com.rti.dds.domain.DomainParticipant** (p. 948). (see **UDPv4 Transport Property Names in Property QoS Policy of Domain Participant** (p. 2257)). Builtin transport plugin properties specified in **com.rti.dds.infrastructure.PropertyQosPolicy** (p. 1739) always overwrite the ones specified through **com.rti.ndds.transport.TransportSupport.set_builtin_transport_property()** (p. 2173). The default value is assumed on any unspecified property.

Note that all properties should be set before the transport is implicitly created and registered by RTI Connext. Any properties set after the builtin transport is registered will be ignored. See **Built-in Transport Plugins** (p. 106) for details on when a builtin transport is registered.

8.393.2 UDPv4 Transport Property Names in Property QoS Policy of Domain Participant

The following table lists the predefined property names that can be set in the **com.rti.dds.domain.DomainParticipantQos.property** (p. 1079) to configure the builtin UDPv4 transport plugin.

Table 8.1192 ***Property Names for UDPv4 Transport (*** p. ***2150) Plugin***

Property Name	Description
dds.transport.UDPv4.builtin.parent.classid	See **com.rti.ndds.transport.Transport.Property_t.classid** (p. 1702)
dds.transport.UDPv4.builtin.parent.address_bit_count	See **com.rti.ndds.transport.Transport.Property_t.address_bit_count** (p. 1703)
dds.transport.UDPv4.builtin.parent.properties_bitmap	See **com.rti.ndds.transport.Transport.Property_t.properties_bitmap** (p. 1703)
dds.transport.UDPv4.builtin.parent.gather_send_buffer_count_max	See **com.rti.ndds.transport.Transport.Property_t.gather_send_buffer_count_max** (p. 1704)
dds.transport.UDPv4.builtin.parent.message_size_max	See **com.rti.ndds.transport.Transport.Property_t.message_size_max** (p. 1704)
dds.transport.UDPv4.builtin.parent.allow_interfaces	See **com.rti.ndds.transport.Transport.Property_t.allow_interfaces_list** (p. 1704) and com.rti.ndds.transport.Transport.Property_t.allow_interfaces_list_length. Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example, 127.0.0.1,eth0
dds.transport.UDPv4.builtin.parent.deny_interfaces	See **com.rti.ndds.transport.Transport.Property_t.deny_interfaces_list** (p. 1705) and com.rti.ndds.transport.Transport.Property_t.deny_interfaces_list_length. Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.UDPv4.builtin.parent.allow_multicast_interfaces	See **com.rti.ndds.transport.Transport.Property_t.allow_multicast_interfaces_list** (p. 1705) and com.rti.ndds.transport.Transport.Property_t.allow_multicast_interfaces_list_length. Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For

example: 127.0.0.1,eth0

Property Name	Description
dds.transport.UDPv4.builtin.parent.deny_multicast_↩ interfaces	See **com.rti.ndds.transport.Transport.Property↩ _t.deny_multicast_interfaces_list** (p. 1706) and com.rti.ndds.transport.Transport.Property_t.deny_↩ multicast_interfaces_list_length. Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.UDPv4.builtin.parent.max_interface_count	See **com.rti.ndds.transport.Transport.Property_t.↩ max_interface_count** (p. 1706)
dds.transport.UDPv4.builtin.parent.thread_name_prefix	See com.rti.ndds.transport.Transport.Property_t.↩ thread_name_prefix
dds.transport.UDPv4.builtin.send_socket_buffer_size	See **com.rti.ndds.transport.UDPv4Transport.↩ Property_t.send_socket_buffer_size** (p. 1710)
dds.transport.UDPv4.builtin.recv_socket_buffer_size	See **com.rti.ndds.transport.UDPv4Transport.↩ Property_t.recv_socket_buffer_size** (p. 1710)
dds.transport.UDPv4.builtin.unicast_enabled	See **com.rti.ndds.transport.UDPv4Transport.↩ Property_t.unicast_enabled** (p. 1711)
dds.transport.UDPv4.builtin.multicast_enabled	See **com.rti.ndds.transport.UDPv4Transport.↩ Property_t.multicast_enabled** (p. 1711)
dds.transport.UDPv4.builtin.multicast_ttl	See **com.rti.ndds.transport.UDPv4Transport.↩ Property_t.multicast_ttl** (p. 1712)
dds.transport.UDPv4.builtin.multicast_loopback_↩ disabled	See **com.rti.ndds.transport.UDPv4Transport.↩ Property_t.multicast_loopback_disabled** (p. 1712)
dds.transport.UDPv4.builtin.ignore_loopback_interface	See **com.rti.ndds.transport.UDPv4Transport.↩ Property_t.ignore_loopback_interface** (p. 1712)
dds.transport.UDPv4.builtin.ignore_nonrunning_↩ interfaces	See **com.rti.ndds.transport.UDPv4Transport.↩ Property_t.ignore_nonrunning_interfaces** (p. 1713)
dds.transport.UDPv4.builtin.ignore_nonup_interfaces	**[DEPRECATED]** See **com.rti.ndds.transport.↩ UDPv4Transport.Property_t.ignore_nonup_↩ interfaces** (p. 1713)
dds.transport.UDPv4.builtin.no_zero_copy	**[DEPRECATED]** See **com.rti.ndds.transport.↩ UDPv4Transport.Property_t.no_zero_copy** (p. 1714)
dds.transport.UDPv4.builtin.send_blocking	See **com.rti.ndds.transport.UDPv4Transport.↩ Property_t.send_blocking** (p. 1714)
dds.transport.UDPv4.builtin.transport_priority_mask	See **com.rti.ndds.transport.UDPv4Transport.↩ Property_t.transport_priority_mask** (p. 1715)
dds.transport.UDPv4.builtin.transport_priority_↩ mapping_low	See **com.rti.ndds.transport.UDPv4Transport.↩ Property_t.transport_priority_mapping_low** (p. 1715)
dds.transport.UDPv4.builtin.transport_priority_↩ mapping_high	See **com.rti.ndds.transport.UDPv4Transport.↩ Property_t.transport_priority_mapping_high** (p. 1716)
dds.transport.UDPv4.builtin.send_ping	See **com.rti.ndds.transport.UDPv4Transport.↩ Property_t.send_ping** (p. 1716)
dds.transport.UDPv4.builtin.force_interface_poll_↩ detection	See **com.rti.ndds.transport.UDPv4Transport.↩ Property_t.force_interface_poll_detection** (p. 1716)
dds.transport.UDPv4.builtin.interface_poll_period	See **com.rti.ndds.transport.UDPv4Transport.↩ Property_t.interface_poll_period** (p. 1717)
dds.transport.UDPv4.builtin.reuse_multicast_receive_↩ resource	See **com.rti.ndds.transport.UDPv4Transport.↩ Property_t.reuse_multicast_receive_resource** (p. 1717)

Property Name	Description
dds.transport.UDPv4.builtin.protocol_overhead_max	See **com.rti.ndds.transport.UDPv4Transport.↩ Property_t.protocol_overhead_max** (p. 1717)
dds.transport.UDPv4.builtin.disable_interface_tracking	See **com.rti.ndds.transport.UDPv4Transport.↩ Property_t.disable_interface_tracking** (p. 1718)
dds.transport.UDPv4.builtin.public_address	See **com.rti.ndds.transport.UDPv4Transport.↩ Property_t.public_address** (p. 1719)
dds.transport.UDPv4.builtin.join_multicast_group_↩ timeout	See **com.rti.ndds.transport.UDPv4Transport.↩ Property_t.join_multicast_group_timeout** (p. 1718)
dds.transport.UDPv4.builtin.port_offset	See **com.rti.ndds.transport.UDPv4Transport.↩ Property_t.port_offset** (p. 1719)

8.393.3 Member Data Documentation

8.393.3.1 CLASSID

```
final int CLASSID = 1  [static]
```

The UDPv4 **Transport** (p. 2150) class id

Referenced by **UDPv4Transport.Property_t.Property_t()**.

8.393.3.2 BLOCKING_NEVER

```
final int BLOCKING_NEVER  [static]
```

Value for **com.rti.ndds.transport.UDPv4Transport.Property_t.send_blocking** (p. 1714) to specify non-blocking sockets.

8.393.3.3 BLOCKING_ALWAYS

```
final int BLOCKING_ALWAYS  [static]
```

[default] Value for **com.rti.ndds.transport.UDPv4Transport.Property_t.send_blocking** (p. 1714) to specify blocking sockets.

Referenced by **UDPv4Transport.Property_t.Property_t()**.

8.393.3.4 UDPV4_PAYLOAD_SIZE_MAX

```
final int UDPV4_PAYLOAD_SIZE_MAX  [static]
```

Maximum value for **com.rti.ndds.transport.Transport.Property_t.message_size_max** (p. 1704) for the UDPv4 transport.

8.393.3.5 MESSAGE_SIZE_MAX_DEFAULT

```
final int MESSAGE_SIZE_MAX_DEFAULT  [static]
```

Default value for **com.rti.ndds.transport.Transport.Property_t.message_size_max** (p. 1704).

Referenced by **UDPv4Transport.Property_t.Property_t()**.

8.393.3.6 SOCKET_BUFFER_SIZE_OS_MAX

```
final int SOCKET_BUFFER_SIZE_OS_MAX = -2  [static]
```

OS maximum to be used to specify the socket buffer size.

This property, if set, uses the maximum allowable size set in your OS for send and receive socket buffer sizes. If you update the maximum allowable size in your OS setting, then RTI Connext will automatically pick up that change. This property is not supported on all platforms because not all platforms have maximum values for the size of the send and receive buffers for sockets. See the `Platform Notes` to determine if this property is supported on your platform.

8.393.3.7 SOCKET_BUFFER_SIZE_OS_DEFAULT

```
final int SOCKET_BUFFER_SIZE_OS_DEFAULT = -1  [static]
```

OS default to be used to specify the socket buffer size.

8.393.3.8 SEND_SOCKET_BUFFER_SIZE_DEFAULT

```
final int SEND_SOCKET_BUFFER_SIZE_DEFAULT = 2097152  [static]
```

Default value for **com.rti.ndds.transport.UDPv4Transport.Property_t.send_socket_buffer_size** (p. 1710) and **com.rti.ndds.transport.UDPv4WanTransport.Property_t.send_socket_buffer_size** (p. 1722).

The default value is 2097152 bytes (1048576 bytes on AIX platforms).

Referenced by **UDPv4Transport.Property_t.Property_t()**.

8.393.3.9 RECV_SOCKET_BUFFER_SIZE_DEFAULT

```
final int RECV_SOCKET_BUFFER_SIZE_DEFAULT = 2097152  [static]
```

Default value for **com.rti.ndds.transport.UDPv4Transport.Property_t.recv_socket_buffer_size** (p. 1710) and **com.rti.ndds.transport.UDPv4WanTransport.Property_t.recv_socket_buffer_size** (p. 1722).

The default value is 2097152 bytes (1048576 bytes on AIX platforms).

Referenced by **UDPv4Transport.Property_t.Property_t()**.

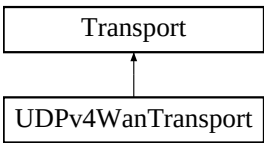
Transport (p. 2150) plug-in using UDP/IPv4 for WAN communications..

Inheritance diagram for UDPv4WanTransport:



Classes

- class **Property_t**

  Configurable IPv4/UDP WAN Transport-Plugin properties.

8.394.1 Detailed Description

Transport (p. 2150) plug-in using UDP/IPv4 for WAN communications..

RTI Real-Time WAN **Transport** (p. 2150) (RWT) is a transport that enables secure, scalable, and high-performance communication over wide area networks (WANs), including public networks.

It extends RTI Connext capabilities to WAN environments. Real-Time WAN **Transport** (p. 2150) uses UDPv4 as the underlying IP transport-layer protocol to better anticipate and adapt to the challenges of diverse network conditions, device mobility, and the dynamic nature of WAN system architectures.

Real-Time WAN **Transport** (p. 2150), in combination with RTI Cloud Discovery Service (CDS), provides a complete, seamless solution out of the box for WAN connectivity.

This transport is not installed as part of an RTI Connext package; it must be downloaded and installed separately.

Real-Time WAN **Transport** (p. 2150) replaces the transport capabilities of the Secure WAN **Transport** (p. 2150) optionally available with previous RTI Connext releases (prior to 7.0.0), and provides the following capabilities:

- NAT (Network Address Translator) traversal: Ability to communicate between DomainParticipants running in a Local Area Network (LAN) that is behind a NAT-enabled router, and DomainParticipants on the outside of the NAT across a WAN. This functionality is provided in combination with Cloud Discovery Service.
- IP mobility: Support for network transitions and changes in IP addresses in any of the DomainParticipants participating in the communication.
- Security: Secure communications between DomainParticipants using Security Plugins.

Real-Time WAN **Transport** (p. 2150) does not require third-party components, such as STUN servers, or protocols like SIP to handle session establishment. Using a single API and security model, you can leverage the extensive capabilities of the RTI Connext framework and ecosystem, including tools and infrastructure services, even for real-time connectivity from edge to cloud and back in highly distributed systems that communicate across wide area networks.

This transport plugin uses UDPv4 sockets to send and receive messages. It supports unicast communications in a single instance of the plugin. By default, this plugin will use all interfaces that it finds enabled and "UP" at instantiation time to send and receive messages. This transport is installed as a built-in transport plugin with the alias **com.rti.↩ dds.infrastructure.TransportBuiltinKind.UDPv4_WAN_ALIAS** (p. 523).

In addition, you can configure an instance of this plugin to selectively use the network interfaces of a node by specifying the **com.rti.ndds.transport.Transport.Property_t.max_interface_count** (p. 1706) and the "white" and "black" lists in the base property's fields (**com.rti.ndds.transport.Transport.Property_t.allow_interfaces_list** (p. 1704), **com.rti.↩ ndds.transport.Transport.Property_t.deny_interfaces_list** (p. 1705)).

RTI Connext can implicitly create this plugin and register with the **com.rti.dds.domain.DomainParticipant** (p. 948) if this transport is specified in **com.rti.dds.infrastructure.TransportBuiltinQosPolicy** (p. 2152).

To specify the properties of the Real-Time WAN **Transport** (p. 2150) that is implicitly registered, you can either:

- call **com.rti.ndds.transport.TransportSupport.set_builtin_transport_property** (p. 2173) or

- specify the predefined property names in **com.rti.dds.infrastructure.PropertyQosPolicy** (p. 1739) associated with the **com.rti.dds.domain.DomainParticipant** (p. 948). (see **Real-Time WAN Transport Property** (p. 2263)). Builtin transport plugin properties specified in **com.rti.dds.infrastructure.PropertyQosPolicy** (p. 1739) always overwrite the ones specified through **com.rti.ndds.transport.TransportSupport.set_builtin_transport_property()** (p. 2173). The default value is assumed on any unspecified property.

Note that all properties should be set before the transport is implicitly created and registered by RTI Connext. Any properties set after the builtin transport is registered will be ignored. See **Built-in Transport Plugins** (p. 106) for details on when a builtin transport is registered.

For additional details on how to configure and use the Real-Time WAN Transport (p. 2150), see the `Core Libraries User's Manual`.

8.394.2 Real-Time WAN Transport Property

Names in Property QoS Policy of Domain Participant

The following table lists the predefined property names that can be set in the **com.rti.dds.domain.DomainParticipantQos.property** (p. 1079) to configure the Real-Time WAN **Transport** (p. 2150) plugin.

Table 8.1193 ***Property Names for Real-Time WAN Transport (p. 2150) Plugin***

Property Name	Description
dds.transport.UDPv4_WAN.builtin.parent.classid	See **com.rti.ndds.transport.Transport.Property_t.classid** (p. 1702)
dds.transport.UDPv4_WAN.builtin.parent.address_bit_count	See **com.rti.ndds.transport.Transport.Property_t.address_bit_count** (p. 1703)
dds.transport.UDPv4_WAN.builtin.parent.properties_bitmap	See **com.rti.ndds.transport.Transport.Property_t.properties_bitmap** (p. 1703)
dds.transport.UDPv4_WAN.builtin.parent.gather_send_buffer_count_max	See **com.rti.ndds.transport.Transport.Property_t.gather_send_buffer_count_max** (p. 1704)
dds.transport.UDPv4_WAN.builtin.parent.message_size_max	See **com.rti.ndds.transport.Transport.Property_t.message_size_max** (p. 1704)
dds.transport.UDPv4_WAN.builtin.parent.allow_interfaces	See **com.rti.ndds.transport.Transport.Property_t.allow_interfaces_list** (p. 1704) and com.rti.ndds.transport.Transport.Property_t.allow_interfaces_list_length. Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example, 127.0.0.1,eth0
dds.transport.UDPv4_WAN.builtin.parent.deny_interfaces	See **com.rti.ndds.transport.Transport.Property_t.deny_interfaces_list** (p. 1705) and com.rti.ndds.transport.Transport.Property_t.deny_interfaces_list_length. Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.UDPv4_WAN.builtin.parent.max_interface_count	See **com.rti.ndds.transport.Transport.Property_t.max_interface_count** (p. 1706)

Property Name	Description
dds.transport.UDPv4_WAN.builtin.parent.thread_↩ name_prefix	See com.rti.ndds.transport.Transport.Property_t.↩ thread_name_prefix

8.395.1 Detailed Description

Transport (p. 2150) plug-in using UDP/IPv6.

This transport plugin uses UDPv6 sockets to send and receive messages. It supports both unicast and multicast communications in a single instance of the plugin. By default, this plugin will use all interfaces that it finds enabled and "UP" at instantiation time to send and receive messages. This transport is installed as a built-in transport plugin with the alias **com.rti.dds.infrastructure.TransportBuiltinKind.UDPv6_ALIAS** (p. 523).

You can configure an instance of this plugin to only use unicast or only use multicast, see **com.rti.ndds.transport.↩ UDPv6Transport.Property_t.unicast_enabled** (p. 1734) and **com.rti.ndds.transport.UDPv6Transport.Property_↩ t.multicast_enabled** (p. 1734).

In addition, you can configure an instance of this plugin to selectively use the network interfaces of a node (and restrict a plugin from sending multicast messages on specific interfaces) by specifying the **com.rti.ndds.transport.Transport.Property_t.max_interface_count** (p. 1706) and the "white" and "black" lists in the base property's fields (**com.rti.ndds.transport.Transport.Property_t.allow_interfaces_list** (p. 1704), **com.rti.ndds.transport.Transport.Property_t.deny_interfaces_list** (p. 1705), **com.rti.ndds.transport.Transport.Property_t.allow_multicast_interfaces_list** (p. 1705), **com.rti.ndds.transport.Transport.Property_t.deny_multicast_interfaces_list** (p. 1706)).

RTI Connext can implicitly create this plugin and register it with the **com.rti.dds.domain.DomainParticipant** (p. 948) if this transport is specified in the **com.rti.dds.infrastructure.TransportBuiltinQosPolicy** (p. 2152).

To specify the properties of the builtin UDPv6 transport that is implicitly registered, you can either:

- call **com.rti.ndds.transport.TransportSupport.set_builtin_transport_property** (p. 2173) or
- specify the predefined property names in **com.rti.dds.infrastructure.PropertyQosPolicy** (p. 1739) associated with the **com.rti.dds.domain.DomainParticipant** (p. 948). (see **UDPv6 Transport Property Names in Property QoS Policy of Domain Participant** (p. 2266)). Builtin transport plugin properties specified in **com.rti.dds.infrastructure.PropertyQosPolicy** (p. 1739) always overwrite the ones specified through **com.rti.ndds.transport.TransportSupport.set_builtin_transport_property()** (p. 2173). The default value is assumed on any unspecified property.

Note that all properties should be set before the transport is implicitly created and registered by RTI Connext. Any properties that are set after the builtin transport is registered will be ignored. See **Built-in Transport Plugins** (p. 106) for details on when a builtin transport is registered.

8.395.2 UDPv6 Transport Property Names in Property QoS Policy of Domain Participant

The following table lists the predefined property names that can be set in **com.rti.dds.infrastructure.PropertyQosPolicy** (p. 1739) of a **com.rti.dds.domain.DomainParticipant** (p. 948) to configure the builtin UDPv6 transport plugin.

Table 8.1194 ***Property Names for UDPv6 Transport (*** p. ***2150) Plugin***

Property Name	Description
dds.transport.UDPv6.builtin.parent.address_bit_count	See **com.rti.ndds.transport.Transport.Property_t.address_bit_count** (p. 1703)
dds.transport.UDPv6.builtin.parent.properties_bitmap	See **com.rti.ndds.transport.Transport.Property_t.properties_bitmap** (p. 1703)
dds.transport.UDPv6.builtin.parent.gather_send_buffer_count_max	See **com.rti.ndds.transport.Transport.Property_t.gather_send_buffer_count_max** (p. 1704)
dds.transport.UDPv6.builtin.parent.message_size_max	See **com.rti.ndds.transport.Transport.Property_t.message_size_max** (p. 1704)
dds.transport.UDPv6.builtin.parent.allow_interfaces	See **com.rti.ndds.transport.Transport.Property_t.allow_interfaces_list** (p. 1704) and com.rti.ndds.transport.Transport.Property_t.allow_interfaces_list_length. Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0

Property Name	Description
dds.transport.UDPv6.builtin.parent.deny_interfaces	See **com.rti.ndds.transport.Transport.Property_t.deny_interfaces_list** (p. 1705) and com.rti.ndds.transport.Transport.Property_t.deny_interfaces_list_length. Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.UDPv6.builtin.parent.allow_multicast_interfaces	See **com.rti.ndds.transport.Transport.Property_t.allow_multicast_interfaces_list** (p. 1705) and com.rti.ndds.transport.Transport.Property_t.allow_multicast_interfaces_list_length. Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.UDPv6.builtin.parent.deny_multicast_interfaces	See **com.rti.ndds.transport.Transport.Property_t.deny_multicast_interfaces_list** (p. 1706) and com.rti.ndds.transport.Transport.Property_t.deny_multicast_interfaces_list_length. Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.UDPv6.builtin.parent.max_interface_count	See **com.rti.ndds.transport.Transport.Property_t.max_interface_count** (p. 1706)
dds.transport.UDPv6.builtin.parent.thread_name_prefix	See com.rti.ndds.transport.Transport.Property_t.thread_name_prefix
dds.transport.UDPv6.builtin.send_socket_buffer_size	See **com.rti.ndds.transport.UDPv6Transport.Property_t.send_socket_buffer_size** (p. 1733)
dds.transport.UDPv6.builtin.recv_socket_buffer_size	See **com.rti.ndds.transport.UDPv6Transport.Property_t.recv_socket_buffer_size** (p. 1733)
dds.transport.UDPv6.builtin.unicast_enabled	See **com.rti.ndds.transport.UDPv6Transport.Property_t.unicast_enabled** (p. 1734)
dds.transport.UDPv6.builtin.multicast_enabled	See **com.rti.ndds.transport.UDPv6Transport.Property_t.multicast_enabled** (p. 1734)
dds.transport.UDPv6.builtin.multicast_ttl	See **com.rti.ndds.transport.UDPv6Transport.Property_t.multicast_ttl** (p. 1735)
dds.transport.UDPv6.builtin.multicast_loopback_disabled	See **com.rti.ndds.transport.UDPv6Transport.Property_t.multicast_loopback_disabled** (p. 1735)
dds.transport.UDPv6.builtin.ignore_loopback_interface	See **com.rti.ndds.transport.UDPv6Transport.Property_t.ignore_loopback_interface** (p. 1735)
dds.transport.UDPv6.builtin.ignore_nonrunning_interfaces	See **com.rti.ndds.transport.UDPv6Transport.Property_t.ignore_nonrunning_interfaces** (p. 1736)
dds.transport.UDPv6.builtin.no_zero_copy	**[DEPRECATED]** See **com.rti.ndds.transport.UDPv6Transport.Property_t.no_zero_copy** (p. 1736)
dds.transport.UDPv6.builtin.send_blocking	See **com.rti.ndds.transport.UDPv6Transport.Property_t.send_blocking** (p. 1737)

8.395.3 Member Data Documentation

8.395.3.1 CLASSID

```
final int CLASSID = 2  [static]
```

The UDPv6 **Transport** (p. 2150) class id

Referenced by **UDPv6Transport.Property_t.Property_t()**.

8.395.3.2 BLOCKING_NEVER

```
final int BLOCKING_NEVER  [static]
```

Value for **com.rti.ndds.transport.UDPv6Transport.Property_t.send_blocking** (p. 1737) to specify non-blocking sockets.

8.395.3.3 BLOCKING_ALWAYS

```
final int BLOCKING_ALWAYS  [static]
```

[default] Value for **com.rti.ndds.transport.UDPv6Transport.Property_t.send_blocking** (p. 1737) to specify blocking sockets.

Referenced by **UDPv6Transport.Property_t.Property_t()**.

8.396 Union Class Reference

Inherited by TypeId.

8.396.1 Detailed Description

Base class for all generated unions. The purpose of this class is to recognize a nddsgen generated union using reflection

Author

jaime_c

8.397 UnionMember Class Reference

A description of a member of a union.

Inherits Serializable.

Public Member Functions

- **UnionMember** (String **name**, boolean **is_pointer**, int[ ] **labels**, **TypeCode type**)

Public Attributes

- String **name**

  The name of the union member.
- boolean **is_pointer**

  Indicates whether the union member is a pointer or not.
- int[ ] **labels**

  The labels of the union member.
- **TypeCode type**

  The type of the union member.
- int **id**

  The member ID.

8.397.1 Detailed Description

A description of a member of a union.

See also

com.rti.dds.typecode.TypeCodeFactory.create_union_tc (p. 2238)

8.397.2 Constructor & Destructor Documentation

8.397.2.1 UnionMember()

```
UnionMember (
            String name,
            boolean is_pointer,
            int[] labels,
             TypeCode type )
```

Constructs a **UnionMember** (p. 2269) object initialized with the given values.

References **UnionMember.is_pointer**, **UnionMember.labels**, **TypeCode.MEMBER_ID_INVALID**, **Union↩ Member.name**, and **UnionMember.type**.

8.397.3 Member Data Documentation

8.397.3.1 name

```
String name
```

The name of the union member.

Cannot be null.

Referenced by **TypeCode.member_name()**, and **UnionMember.UnionMember()**.

8.397.3.2 is_pointer

```
boolean is_pointer
```

Indicates whether the union member is a pointer or not.

Referenced by **TypeCode.is_member_pointer()**, and **UnionMember.UnionMember()**.

8.397.3.3 labels

```
int [] labels
```

The labels of the union member.

Each union member should contain at least one label. If the union discriminator type is not com.rti.dds.infrastructure.int the label value should be evaluated to an integer value. For instance, 'a' would be evaluated to 97.

Referenced by **TypeCode.member_label()**, **TypeCode.member_label_count()**, and **UnionMember.Union↩ Member()**.

8.397.3.4 type

```
TypeCode type
```

The type of the union member.

Cannot be null.

Referenced by **TypeCode.member_type()**, and **UnionMember.UnionMember()**.

8.397.3.5 id

```
int id
```

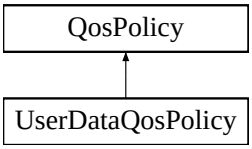
The member ID.

Referenced by **TypeCode.member_id()**.

8.398 UserDataQosPolicy Class Reference

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 53) during discovery.

Inheritance diagram for UserDataQosPolicy:



Public Attributes

- final **ByteSeq value**
  <<***spec***>> *(p. 132) a sequence of octets*

8.398.1 Detailed Description

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 53) during discovery.

Entity:

com.rti.dds.domain.DomainParticipant (p. 948), **com.rti.dds.subscription.DataReader** (p. 707), **com.rti.dds.publication.DataWriter** (p. 818)

Properties:

RxO (p. 506) = NO;
Changeable (p. 507) = **YES** (p. 507)

See also

com.rti.dds.domain.DomainParticipant.get_builtin_subscriber (p. 998)

8.398.2 Usage

The purpose of this QoS is to allow the application to attach additional information to the created **com.rti.dds.infrastructure.Entity** (p. 1320) objects, so that when a remote application discovers their existence, it can access that information and use it for its own purposes. This information is not used by RTI Connext.

One possible use of this QoS is to attach security credentials or some other information that can be used by the remote application to authenticate the source.

In combination with operations such as **com.rti.dds.domain.DomainParticipant.ignore_participant** (p. 1001), **com.rti.dds.domain.DomainParticipant.ignore_publication** (p. 1003), **com.rti.dds.domain.DomainParticipant.ignore_subscription** (p. 1004), and **com.rti.dds.domain.DomainParticipant.ignore_topic** (p. 1002), this QoS policy can assist an application to define and enforce its own security policies.

The use of this QoS is not limited to security; it offers a simple, yet flexible extensibility mechanism.

Important: RTI Connext stores the data placed in this policy in pre-allocated pools. It is therefore necessary to configure RTI Connext with the maximum size of the data that will be stored in policies of this type. This size is configured with **com.rti.dds.infrastructure.DomainParticipantResourceLimitsQosPolicy.participant_user_data_max_length** (p. 1096), **com.rti.dds.infrastructure.DomainParticipantResourceLimitsQosPolicy.writer_user_data_max_length** (p. 1097), and **com.rti.dds.infrastructure.DomainParticipantResourceLimitsQosPolicy.reader_user_data_max_length** (p. 1098).

8.398.3 Member Data Documentation

8.398.3.1 value

```
final ByteSeq value
```

<<***spec***>> *(p. 132)* a sequence of octets

[default] empty (zero-length)

[range] Octet sequence of length [0,max_length]

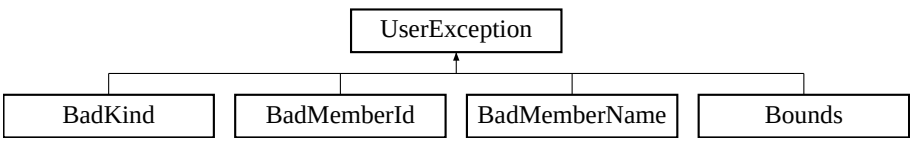
Categories

Mutable (p. 338), **Application-Defined Metadata** (p. 191), **Discovery Metadata** (p. 348)

8.399 UserException Class Reference

User exception.

Inheritance diagram for UserException:



8.399.1 Detailed Description

User exception.

This class is based on a similar class in CORBA.

8.400 Utility Class Reference

Other Utilities APIs.

Static Public Member Functions

- static void **spin** (long spinCount)
  Performs the spin operation as many times as indicated.
- static native long **get_spin_per_microsecond** ()
  Returns the number of spin operations to perform to wait 1 microsecond.
- static native boolean **enable_heap_monitoring** ()
  [DEPRECATED] *See:* ***com.rti.ndds.utility.HeapMonitoring.enable*** *(*p. *1427).*
- static native void **disable_heap_monitoring** ()
  [DEPRECATED] *See:* ***com.rti.ndds.utility.HeapMonitoring.disable*** *(*p. *1428).*
- static native boolean **pause_heap_monitoring** ()
  [DEPRECATED] *See:* ***com.rti.ndds.utility.HeapMonitoring.pause*** *(*p. *1428).*
- static native boolean **resume_heap_monitoring** ()
  [DEPRECATED] *See:* ***com.rti.ndds.utility.HeapMonitoring.resume*** *(*p. *1428)*
- static native boolean **take_heap_snapshot** (String filename, boolean print_details)
  [DEPRECATED] *See:* ***com.rti.ndds.utility.HeapMonitoring.take_heap_snapshot*** *(*p. *1429).*

8.400.1 Detailed Description

Other Utilities APIs.

8.400.2 Member Function Documentation

8.400.2.1 spin()

```
static void spin (
            long spinCount )  [static]
```

Performs the spin operation as many times as indicated.

Spinning is the action of performing useless operations in a for loop in order to actively wait some time without yielding the CPU. Given that the resolution of sleep is in the order of ms, you can use this utility to wait times in the order of microseconds. To properly use this functionality, it is useful to measure previously the number of spin operations needed to wait the equivalent to microsecond (using the utility get_spin_per_microsecond) and then compute the corresponding spin count desired.

Parameters

spinCount	<<***in***>> *(p. 404)* Number of spin operations to perform.

8.400.2.2 get_spin_per_microsecond()

```
static native long get_spin_per_microsecond ( )  [static]
```

Returns the number of spin operations to perform to wait 1 microsecond.

This utility can be used to measure how many spin operations must be performed to wait 1 microsecond. Since the time that it takes the CPU to perform 1 spin operation depends on the CPU frequency, it is recommended to use this utility before using **spin()** (p. 2274).

Returns

Number of spin operations to wait 1 microsecond.

com.rti.ndds.utility.Utility.spin

8.400.2.3 enable_heap_monitoring()

```
static native boolean enable_heap_monitoring ( )  [static]
```

[DEPRECATED] See: **com.rti.ndds.utility.HeapMonitoring.enable** (p. 1427).

8.400.2.4 disable_heap_monitoring()

```
static native void disable_heap_monitoring ( )  [static]
```

[DEPRECATED] See: **com.rti.ndds.utility.HeapMonitoring.disable** (p. 1428).

8.400.2.5 pause_heap_monitoring()

```
static native boolean pause_heap_monitoring ( )  [static]
```

[DEPRECATED] See: **com.rti.ndds.utility.HeapMonitoring.pause** (p. 1428).

8.400.2.6 resume_heap_monitoring()

```
static native boolean resume_heap_monitoring ( )  [static]
```

[DEPRECATED] See: **com.rti.ndds.utility.HeapMonitoring.resume** (p. 1428)

8.400.2.7 take_heap_snapshot()

```
static native boolean take_heap_snapshot (
            String filename,
            boolean print_details )  [static]
```

[DEPRECATED] See: **com.rti.ndds.utility.HeapMonitoring.take_heap_snapshot** (p. 1429).

8.401 ValueMember Class Reference

A description of a member of a value type.

Inherits Serializable.

Public Member Functions

- **ValueMember** (String **name**, boolean **is_pointer**, short **bits**, boolean **is_key**, short **access**, **TypeCode type**)

Public Attributes

- String **name**

  The name of the value member.
- **TypeCode type**

  The type of the value member.
- boolean **is_pointer**

  Indicates whether the value member is a pointer or not.
- short **bits**

  Number of bits of a bitfield member.
- boolean **is_key**

  Indicates if the value member is a key member or not.
- short **access**

  The type of access (public, private) for the value member.
- int **id**

  The member ID.
- boolean **is_optional**

  Indicates if the value member is optional or required.
- boolean **is_must_understand**

  Indicates if the value member is annotated as "must understand".

8.401.1 Detailed Description

A description of a member of a value type.

See also

com.rti.dds.typecode.TypeCodeFactory.create_value_tc (p. 2236)

8.401.2 Constructor & Destructor Documentation

8.401.2.1 ValueMember()

```
ValueMember (
            String name,
            boolean is_pointer,
            short bits,
            boolean is_key,
            short access,
             TypeCode type )
```

Constructs a **ValueMember** (p. 2276) object initialized with the given values.

References **ValueMember.access**, **ValueMember.bits**, **ValueMember.is_key**, **ValueMember.is_pointer**, **TypeCode.MEMBER_ID_INVALID**, **ValueMember.name**, and **ValueMember.type**.

8.401.3 Member Data Documentation

8.401.3.1 name

```
String name
```

The name of the value member.

Cannot be null.

Referenced by **TypeCode.member_name()**, and **ValueMember.ValueMember()**.

8.401.3.2 type

```
TypeCode type
```

The type of the value member.

Cannot be null.

Referenced by **TypeCode.member_type()**, and **ValueMember.ValueMember()**.

8.401.3.3 is_pointer

```
boolean is_pointer
```

Indicates whether the value member is a pointer or not.

Referenced by **TypeCode.is_member_pointer()**, and **ValueMember.ValueMember()**.

8.401.3.4 bits

```
short bits
```

Number of bits of a bitfield member.

If the struct member is a bitfield, this field contains the number of bits of the bitfield. Otherwise, bits should contain **com.rti.dds.typecode.TypeCode.NOT_BITFIELD** (p. 2232).

Referenced by **TypeCode.member_bitfield_bits()**, and **ValueMember.ValueMember()**.

8.401.3.5 is_key

```
boolean is_key
```

Indicates if the value member is a key member or not.

Referenced by **TypeCode.is_member_key()**, **TypeCode.is_member_must_understand()**, and **ValueMember.↩ ValueMember()**.

8.401.3.6 access

```
short access
```

The type of access (public, private) for the value member.

It can take the values: com.rti.dds.typecode.Visibility.PRIVATE_MEMBER or com.rti.dds.typecode.Visibility.PUBLIC_↩ MEMBER.

Referenced by **TypeCode.member_visibility()**, and **ValueMember.ValueMember()**.

8.401.3.7 id

```
int id
```

The member ID.

Use **com.rti.dds.typecode.TypeCode.MEMBER_ID_INVALID** (p. 2230) to have the member ID automatically assigned.

Referenced by **TypeCode.member_id()**.

8.401.3.8 is_optional

```
boolean is_optional
```

Indicates if the value member is optional or required.

Referenced by **TypeCode.is_member_required()**.

8.401.3.9 is_must_understand

```
boolean is_must_understand
```

Indicates if the value member is annotated as "must understand".

Referenced by **TypeCode.is_member_must_understand()**.

8.402 VendorId_t Class Reference

<<***extension***>> *(*p. *403)* Type used to represent the vendor of the service implementing the RTPS protocol.

Inherits Struct.

Public Member Functions

- **VendorId_t** ()
  Constructor.

Public Attributes

- final byte[ ] **vendorId** = new byte[**LENGTH_MAX**]
  The vendor Id.

Static Public Attributes

- static final **VendorId_t** **UNKNOWN**
  The ID used when the vendor of the service implementing the RTPS protocol is not known.
- static final int **LENGTH_MAX** = 2
  Length of vendor id.

8.402.1 Detailed Description

<<***extension***>> *(*p. *403)* Type used to represent the vendor of the service implementing the RTPS protocol.

8.402.2 Constructor & Destructor Documentation

8.402.2.1 VendorId_t()

```
VendorId_t ( )
```

Constructor.

8.402.3 Member Data Documentation

8.402.3.1 UNKNOWN

```
final  VendorId_t UNKNOWN  [static]
```

The ID used when the vendor of the service implementing the RTPS protocol is not known.

8.402.3.2 LENGTH_MAX

```
final int LENGTH_MAX = 2  [static]
```

Length of vendor id.

8.402.3.3 vendorId

```
final byte [] vendorId = new byte[ LENGTH_MAX]
```

The vendor Id.

8.403 Version Class Reference

<<*interface*>> *(*p. *403)* The version of an RTI Connext distribution.

Public Member Functions

- **ProductVersion_t get_product_version** ()
  Get the RTI Connext product version.
- **LibraryVersion_t get_java_api_version** ()
  Get the version of the Java API library.
- **LibraryVersion_t get_c_api_version** ()
  Get the version of the C API library.
- **LibraryVersion_t get_core_version** ()
  Get the version of the core library.
- String **toString** ()
  Get this version in string form.

Static Public Member Functions

- static **Version get_instance** ()
  Get the singleton instance of this type.

8.403.1 Detailed Description

<<***interface***>> *(*p. *403)* The version of an RTI Connext distribution.

The complete version is made up of the versions of the individual libraries that make up the product distribution.

8.403.2 Member Function Documentation

8.403.2.1 get_instance()

```
static Version get_instance ( ) [static]
```

Get the singleton instance of this type.

8.403.2.2 get_product_version()

```
ProductVersion_t get_product_version ( )
```

Get the RTI Connext product version.

8.403.2.3 get_java_api_version()

```
LibraryVersion_t get_java_api_version ( )
```

Get the version of the Java API library.

8.403.2.4 get_c_api_version()

```
LibraryVersion_t get_c_api_version ( )
```

Get the version of the C API library.

8.403.2.5 get_core_version()

```
LibraryVersion_t get_core_version ( )
```

Get the version of the core library.

8.403.2.6 toString()

```
String toString ( )
```

Get this version in string form.

Combine all of the constituent library versions into a single string.

8.404 ViewStateKind Class Reference

Indicates whether or not an instance is new.

Static Public Attributes

- static final int **NEW_VIEW_STATE** = 0x0001 << 0

  New instance. This latest generation of the instance has not previously been accessed.
- static final int **NOT_NEW_VIEW_STATE** = 0x0001 << 1

  Not a new instance. This latest generation of the instance has previously been accessed.
- static final int **ANY_VIEW_STATE** = 0xffff

  Any view state com.rti.dds.subscription.ViewStateKind.ViewStateKind.NEW_VIEW_STATE | com.rti.dds.subscription.↩ ViewStateKind.ViewStateKind.NOT_NEW_VIEW_STATE.

8.404.1 Detailed Description

Indicates whether or not an instance is new.

For each instance (identified by the key), the middleware internally maintains a view state relative to each **com.rti.dds.subscription.DataReader** (p. 707). The view state can be either:

- com.rti.dds.subscription.ViewStateKind.ViewStateKind.NEW_VIEW_STATE indicates that either this is the first time that the **com.rti.dds.subscription.DataReader** (p. 707) has ever accessed samples of that instance, or else that the **com.rti.dds.subscription.DataReader** (p. 707) has accessed previous samples of the instance, but the instance has since been reborn (i.e. become not-alive and then alive again). These two cases are distinguished by examining the **com.rti.dds.subscription.SampleInfo.disposed_generation_count** (p. 1950) and the **com.rti.dds.subscription.SampleInfo.no_writers_generation_count** (p. 1950).

- com.rti.dds.subscription.ViewStateKind.ViewStateKind.NOT_NEW_VIEW_STATE indicates that the **com.rti.dds.subscription.DataReader** (p. 707) has already accessed samples of the same instance and that the instance has not been reborn since.

The view_state available in the **com.rti.dds.subscription.SampleInfo** (p. 1944) is a snapshot of the view state of the instance relative to the **com.rti.dds.subscription.DataReader** (p. 707) used to access the samples at the time the collection was obtained (i.e. at the time read or take was called). The view_state is therefore the same for all samples in the returned collection that refer to the same instance.

Once an instance has been detected as not having any "live" writers and all the samples associated with the instance are "taken" from the **com.rti.dds.subscription.DataReader** (p. 707), the middleware can reclaim all local resources regarding the instance. Future samples will be treated as "never seen."

8.404.2 Member Data Documentation

8.404.2.1 NEW_VIEW_STATE

```
final int NEW_VIEW_STATE = 0x0001 << 0  [static]
```

New instance. This latest generation of the instance has not previously been accessed.

8.404.2.2 NOT_NEW_VIEW_STATE

```
final int NOT_NEW_VIEW_STATE = 0x0001 << 1  [static]
```

Not a new instance. This latest generation of the instance has previously been accessed.

8.405 VM_ABSTRACT Class Reference

Constant used to indicate that a value type has the `abstract` modifier.

Static Public Attributes

- static final short **VALUE**

8.405.1 Detailed Description

Constant used to indicate that a value type has the `abstract` modifier.

An abstract value type may not be instantiated.

8.405.2 Member Data Documentation

8.405.2.1 VALUE

```
final short VALUE  [static]
```

Constant value.

8.406 VM_CUSTOM Class Reference

Constant used to indicate that a value type has the `custom` modifier.

Static Public Attributes

- static final short **VALUE**

8.406.1 Detailed Description

Constant used to indicate that a value type has the `custom` modifier.

This modifier is used to specify whether the value type uses custom marshaling.

8.406.2 Member Data Documentation

8.406.2.1 VALUE

```
final short VALUE  [static]
```

Constant value.

8.407 VM_NONE Class Reference

Constant used to indicate that a value type has no modifiers.

Static Public Attributes

- static final short **VALUE**

8.407.1 Detailed Description

Constant used to indicate that a value type has no modifiers.

8.407.2 Member Data Documentation

8.407.2.1 VALUE

```
final short VALUE  [static]
```

Constant value.

8.408 VM_TRUNCATABLE Class Reference

Constant used to indicate that a value type has the `truncatable` modifier.

Static Public Attributes

- static final short **VALUE**

8.408.1 Detailed Description

Constant used to indicate that a value type has the `truncatable` modifier.

A value with a state that derives from another value with a state can be declared as truncatable. A truncatable type means the object can be truncated to the base type.

8.408.2 Member Data Documentation

8.408.2.1 VALUE

```
final short VALUE  [static]
```

Constant value.

8.409 WaitSet Class Reference

<<***interface***>> *(*p. *403)* Allows an application to wait until one or more of the attached **com.rti.dds.infrastructure.↩ Condition** (p. 686) objects has a `trigger_value` of com.rti.dds.infrastructure.true or else until the timeout expires.

Inherits AbstractNativeObject, and AutoCloseable.

Public Member Functions

- **WaitSet** ()

  Default no-argument constructor.
- **WaitSet** (**WaitSetProperty_t** prop)

  <<***extension***>> *(*p. *403) Constructor for a **com.rti.dds.infrastructure.WaitSet** (*p. *2287) that may delay for more while specifying that will be woken up after the given number of events or delay period, whichever happens first*
- void **wait** (**ConditionSeq** active_conditions, **Duration_t** timeout)

  Allows an application thread to wait for the occurrence of certain conditions.
- void **attach_condition** (**Condition** cond)

  *Attaches a **com.rti.dds.infrastructure.Condition** (*p. *686) to the **com.rti.dds.infrastructure.WaitSet** (*p. *2287).*
- void **detach_condition** (**Condition** cond)

  *Detaches a **com.rti.dds.infrastructure.Condition** (*p. *686) from the **com.rti.dds.infrastructure.WaitSet** (*p. *2287).*
- void **get_conditions** (**ConditionSeq** attached_conditions)

  *Retrieves the list of attached **com.rti.dds.infrastructure.Condition** (*p. *686) (s).*
- void **set_property** (**WaitSetProperty_t** prop)

  <<***extension***>> *(*p. *403) Sets the **com.rti.dds.infrastructure.WaitSetProperty_t** (*p. *2295), to configure the associated **com.rti.dds.infrastructure.WaitSet** (*p. *2287) to return after one or more trigger events have occurred.*
- void **get_property** (**WaitSetProperty_t** prop)

  <<***extension***>> *(*p. *403) Retrieves the **com.rti.dds.infrastructure.WaitSetProperty_t** (*p. *2295) configuration of the associated **com.rti.dds.infrastructure.WaitSet** (*p. *2287).*
- void **delete** ()

  Destructor.
- void **close** ()

  *See **delete()** (*p. *2295).*

8.409.1 Detailed Description

<<***interface***>> *(p. 403)* Allows an application to wait until one or more of the attached **com.rti.dds.infrastructure.↩ Condition** (p. 686) objects has a `trigger_value` of com.rti.dds.infrastructure.true or else until the timeout expires.

8.409.2 Usage

com.rti.dds.infrastructure.Condition (p. 686) (s) (in conjunction with wait-sets) provide an alternative mechanism to allow the middleware to communicate communication status changes (including arrival of data) to the application.

This mechanism is wait-based. Its general use pattern is as follows:

- The application indicates which relevant information it wants to get by creating **com.rti.dds.infrastructure.↩ Condition** (p. 686) objects (**com.rti.dds.infrastructure.StatusCondition** (p. 2008), **com.rti.dds.subscription.↩ ReadCondition** (p. 1816) or **com.rti.dds.subscription.QueryCondition** (p. 1812)) and attaching them to a **com.rti.dds.infrastructure.WaitSet** (p. 2287).

- It then waits on that **com.rti.dds.infrastructure.WaitSet** (p. 2287) until the `trigger_value` of one or several **com.rti.dds.infrastructure.Condition** (p. 686) objects become com.rti.dds.infrastructure.true.

- It then uses the result of the wait (i.e., active_conditions, the list of **com.rti.dds.infrastructure.Condition** (p. 686) objects with `trigger_value` == com.rti.dds.infrastructure.true) to actually get the information:
  - by calling **com.rti.dds.infrastructure.Entity.get_status_changes** (p. 1325) and then `get_<communication↩ _status>()` on the relevant **com.rti.dds.infrastructure.Entity** (p. 1320), if the condition is a **com.rti.↩ dds.infrastructure.StatusCondition** (p. 2008) and the status changes, refer to plain communication status;
  - by calling **com.rti.dds.infrastructure.Entity.get_status_changes** (p. 1325) and then **com.rti.dds.↩ subscription.Subscriber.get_datareaders** (p. 2050) on the relevant **com.rti.dds.subscription.↩ Subscriber** (p. 2039) (and then **com.rti.ndds.example.FooDataReader.read()** (p. 1361) or **com.rti.↩ ndds.example.FooDataReader.take** (p. 1363) on the returned **com.rti.dds.subscription.DataReader** (p. 707) objects), if the condition is a **com.rti.dds.infrastructure.StatusCondition** (p. 2008) and the status changes refers to com.rti.dds.infrastructure.StatusKind.StatusKind.DATA_ON_READERS_STATUS;
  - by calling **com.rti.dds.infrastructure.Entity.get_status_changes** (p. 1325) and then **com.rti.ndds.↩ example.FooDataReader.read()** (p. 1361) or **com.rti.ndds.example.FooDataReader.take** (p. 1363) on the relevant **com.rti.dds.subscription.DataReader** (p. 707), if the condition is a **com.rti.dds.↩ infrastructure.StatusCondition** (p. 2008) and the status changes refers to com.rti.dds.infrastructure.↩ StatusKind.StatusKind.DATA_AVAILABLE_STATUS;
  - by calling directly **com.rti.ndds.example.FooDataReader.read_w_condition** (p. 1368) or **com.rti.↩ ndds.example.FooDataReader.take_w_condition** (p. 1369) on a **com.rti.dds.subscription.DataReader** (p. 707) with the **com.rti.dds.infrastructure.Condition** (p. 686) as a parameter if it is a **com.rti.dds.↩ subscription.ReadCondition** (p. 1816) or a **com.rti.dds.subscription.QueryCondition** (p. 1812).

Usually the first step is done in an initialization phase, while the others are put in the application main loop.

As there is no extra information passed from the middleware to the application when a wait returns (only the list of triggered **com.rti.dds.infrastructure.Condition** (p. 686) objects), **com.rti.dds.infrastructure.Condition** (p. 686) objects

are meant to embed all that is needed to react properly when enabled. In particular, **com.rti.dds.infrastructure.↩ Entity** (p. 1320)-related conditions are related to exactly one **com.rti.dds.infrastructure.Entity** (p. 1320) and cannot be shared.

The blocking behavior of the **com.rti.dds.infrastructure.WaitSet** (p. 2287) is illustrated below.

The result of a com.rti.dds.infrastructure.WaitSet.WaitSet.wait operation depends on the state of the **com.rti.↩ dds.infrastructure.WaitSet** (p. 2287), which in turn depends on whether at least one attached **com.rti.dds.↩ infrastructure.Condition** (p. 686) has a `trigger_value` of com.rti.dds.infrastructure.true. If the wait operation is called on **com.rti.dds.infrastructure.WaitSet** (p. 2287) with state BLOCKED, it will block the calling thread. If wait is called on a **com.rti.dds.infrastructure.WaitSet** (p. 2287) with state UNBLOCKED, it will return immediately. In addition, when the **com.rti.dds.infrastructure.WaitSet** (p. 2287) transitions from BLOCKED to UNBLOCKED it wakes up any threads that had called wait on it.

A key aspect of the **Condition** (p. 686) and **WaitSet** (p. 2287) mechanism is the setting of the `trigger_value` of each **com.rti.dds.infrastructure.Condition** (p. 686).

The **com.rti.dds.infrastructure.WaitSet** (p. 2287) cannot be used after calling **com.rti.dds.domain.Domain↩ ParticipantFactory.finalize_instance** (p. 1042).

8.409.3 Trigger State of a com.rti.dds.infrastructure.StatusCondition

The `trigger_value` of a **com.rti.dds.infrastructure.StatusCondition** (p. 2008) is the boolean OR of the ChangedStatusFlag of all the communication statuses (see **Status Kinds** (p. 514)) to which it is sensitive. That is, `trigger_value` == com.rti.dds.infrastructure.false only if all the values of the ChangedStatusFlags are com.↩ rti.dds.infrastructure.false.

The sensitivity of the **com.rti.dds.infrastructure.StatusCondition** (p. 2008) to a particular communication status is controlled by the list of `enabled_statuses` set on the condition by means of the **com.rti.dds.infrastructure.↩ StatusCondition.set_enabled_statuses** (p. 2009) operation.

Once the `trigger_value` of a **StatusCondition** (p. 2008) becomes true, it remains true until the status that changed is reset. To reset a status, call the related get_*_status() operation. Or, in the case of the data available status, call read(), take(), or one of their variants. Therefore, if you are using a **com.rti.dds.infrastructure.StatusCondition** (p. 2008) on a **com.rti.dds.infrastructure.WaitSet** (p. 2287) to be notified of events, your thread will wake up when one of the statuses associated with the **StatusCondition** (p. 2008) becomes true. If you do not reset the status, the **Status↩ Condition** (p. 2008) `trigger_value` remains true and your **WaitSet** (p. 2287) will not block again; it will immediately wake up when you call com.rti.dds.infrastructure.WaitSet.WaitSet.wait.

8.409.4 Trigger State of a com.rti.dds.subscription.ReadCondition

Similar to the **com.rti.dds.infrastructure.StatusCondition** (p. 2008), a **com.rti.dds.subscription.ReadCondition** (p. 1816) also has a `trigger_value` that determines whether the attached **com.rti.dds.infrastructure.WaitSet** (p. 2287) is BLOCKED or UNBLOCKED. However, unlike the **com.rti.dds.infrastructure.StatusCondition** (p. 2008), the `trigger_value` of the **com.rti.dds.subscription.ReadCondition** (p. 1816) is tied to the presence of *at least a sample* managed by RTI Connext with **com.rti.dds.subscription.SampleStateKind** (p. 1972) and **com.rti.dds.↩ subscription.ViewStateKind** (p. 2283) matching those of the **com.rti.dds.subscription.ReadCondition** (p. 1816). Furthermore, for the **com.rti.dds.subscription.QueryCondition** (p. 1812) to have a `trigger_value` == com.↩ rti.dds.infrastructure.true, the data associated with the sample must be such that the `query_expression` evaluates to com.rti.dds.infrastructure.true.

The fact that the trigger_value of a **com.rti.dds.subscription.ReadCondition** (p. 1816) depends on the presence of samples on the associated **com.rti.dds.subscription.DataReader** (p. 707) implies that a single take operation can potentially change the `trigger_value` of several **com.rti.dds.subscription.ReadCondition** (p. 1816) or **com.rti.dds.subscription.QueryCondition** (p. 1812) conditions. For example, if all samples are taken, any **com.rti.dds.subscription.ReadCondition** (p. 1816) and **com.rti.dds.subscription.QueryCondition** (p. 1812) conditions associated with the **com.rti.dds.subscription.DataReader** (p. 707) that had their `trigger_value==TRUE` before will see the `trigger_value` change to FALSE. Note that this does not guarantee that **com.rti.dds.infrastructure.WaitSet** (p. 2287) objects that were separately attached to those conditions will not be woken up. Once we have `trigger_value==TRUE` on a condition, it may wake up the attached **com.rti.dds.infrastructure.WaitSet** (p. 2287), the condition transitioning to `trigger_value==FALSE` does not necessarily 'unwakeup' the **WaitSet** (p. 2287) as 'unwakening' may not be possible in general.

The consequence is that an application blocked on a **com.rti.dds.infrastructure.WaitSet** (p. 2287) may return from the wait with a list of conditions, some of which are not no longer 'active'. This is unavoidable if multiple threads are concurrently waiting on separate **com.rti.dds.infrastructure.WaitSet** (p. 2287) objects and taking data associated with the same **com.rti.dds.subscription.DataReader** (p. 707) entity.

To elaborate further, consider the following example: A **com.rti.dds.subscription.ReadCondition** (p. 1816) that has a `sample_state_mask` = {com.rti.dds.subscription.SampleStateKind.SampleStateKind.NOT_READ_SAMPLE_STATE} will have `trigger_value` of com.rti.dds.infrastructure.true whenever a new sample arrives and will transition to com.rti.dds.infrastructure.false as soon as all the newly-arrived samples are either read (so their sample state changes to READ) or taken (so they are no longer managed by RTI Connext). However if the same **com.rti.dds.subscription.ReadCondition** (p. 1816) had a `sample_state_mask` = { com.rti.dds.subscription.SampleStateKind.SampleStateKind.READ_SAMPLE_STATE, com.rti.dds.subscription.SampleStateKind.SampleStateKind.NOT_READ_SAMPLE_STATE }, then the `trigger_value` would only become com.rti.dds.infrastructure.false once all the newly-arrived samples are taken (it is not sufficient to read them as that would only change the sample state to READ), which overlaps the mask on the **com.rti.dds.subscription.ReadCondition** (p. 1816).

8.409.5 Trigger State of a com.rti.dds.infrastructure.GuardCondition

The `trigger_value` of a **com.rti.dds.infrastructure.GuardCondition** (p. 1421) is completely controlled by the application via the operation **com.rti.dds.infrastructure.GuardCondition.set_trigger_value** (p. 1422).

Important: The **com.rti.dds.infrastructure.WaitSet** (p. 2287) allocates native resources. When **com.rti.dds.infrastructure.WaitSet** (p. 2287) is no longer being used, user should call com.rti.dds.infrastructure.WaitSet.WaitSet.delete explicitly to properly cleanup all native resources.

8.409.6 Constructor & Destructor Documentation

8.409.6.1 WaitSet() [1/2]

```
WaitSet ( )
```

Default no-argument constructor.

Construct a new **com.rti.dds.infrastructure.WaitSet** (p. 2287).

Important: **WaitSet** (p. 2287) allocates native resources. When a **WaitSet** (p. 2287) is no longer being used, **close()** (p. 2295) must be called.

Exceptions

com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES *(p. 1903)*	if a new **com.rti.dds.infrastructure.WaitSet** (p. 2287) could not be allocated.

8.409.6.2 WaitSet() [2/2]

```
WaitSet (
            WaitSetProperty_t prop )
```

<<***extension***>> *(p. 403)* Constructor for a **com.rti.dds.infrastructure.WaitSet** (p. 2287) that may delay for more while specifying that will be woken up after the given number of events or delay period, whichever happens first

Constructs a new **com.rti.dds.infrastructure.WaitSet** (p. 2287).

Important: **WaitSet** (p. 2287) allocates native resources. When a **WaitSet** (p. 2287) is no longer being used, **close()** (p. 2295) must be called.

Parameters

prop	<<***in***>> *(p. 404)* Property of wait set controlling when the wait set should be woken up

Exceptions

com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES *(p. 1903)*	if a new **com.rti.dds.infrastructure.WaitSet** (p. 2287) could not be allocated.

8.409.7 Member Function Documentation

8.409.7.1 wait()

```
void wait (
              ConditionSeq active_conditions,
              Duration_t timeout )
```

Allows an application thread to wait for the occurrence of certain conditions.

If none of the conditions attached to the **com.rti.dds.infrastructure.WaitSet** (p. 2287) have a `trigger_value` of com.rti.dds.infrastructure.true, the wait operation will block, suspending the calling thread.

The result of the wait operation is the list of all the attached conditions that have a `trigger_value` of com.rti.dds.↩ infrastructure.true (i.e., the conditions that unblocked the wait).

The wait operation takes a `timeout` argument that specifies the maximum duration for the wait. If this duration is exceeded and none of the attached **com.rti.dds.infrastructure.Condition** (p. 686) objects are com.rti.dds.↩ infrastructure.true, wait fails with **com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904). In this case, the resulting list of conditions will be empty. If a negative duration is passed, wait fails with **com.rti.dds.infrastructure.RETCODE**↩ **_BAD_PARAMETER** (p. 1899).

Note: The resolution of the `timeout` period is constrained by the resolution of the system clock.

When the **com.rti.dds.infrastructure.WaitSet** (p. 2287) is configured to wait for more than one trigger event and the timeout is exceeded before that number is reached, this function returns normally as long as at least one trigger event has occurred.

It is not allowable for more than one application thread to be waiting on the same **com.rti.dds.infrastructure.Wait**↩ **Set** (p. 2287). If the wait operation is invoked on a **com.rti.dds.infrastructure.WaitSet** (p. 2287) that already has a thread blocking on it, the operation will return immediately with the value **com.rti.dds.infrastructure.RETCODE_**↩ **PRECONDITION_NOT_MET** (p. 1903).

Parameters

active_conditions	<<***inout***>> *(p. 404)* a valid non-null **com.rti.dds.infrastructure.ConditionSeq** (p. 687) object. Note that RTI Connext will not allocate a new object if `active_conditions` is null; the method will return **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).
timeout	<<***in***>> *(p. 404)* a wait timeout

Exceptions

One	of the **Standard Return Codes** (p. 513) or **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903) or **com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904).

References **Duration_t.nanosec**, and **Duration_t.sec**.

8.409.7.2 attach_condition()

```
void attach_condition (
              Condition cond )
```

Attaches a **com.rti.dds.infrastructure.Condition** (p. 686) to the **com.rti.dds.infrastructure.WaitSet** (p. 2287).

It is possible to attach a **com.rti.dds.infrastructure.Condition** (p. 686) on a **com.rti.dds.infrastructure.WaitSet** (p. 2287) that is currently being waited upon (via the wait operation). In this case, if the **com.rti.dds.infrastructure.↩ Condition** (p. 686) has a `trigger_value` of com.rti.dds.infrastructure.true, then attaching the condition will unblock the **com.rti.dds.infrastructure.WaitSet** (p. 2287).

If the same **com.rti.dds.infrastructure.Condition** (p. 686) is attached multiple times, only the first attachment has any effect. Subsequent attempts to attach the same **com.rti.dds.infrastructure.Condition** (p. 686) are silently ignored. As a result, the **com.rti.dds.infrastructure.Condition** (p. 686) is only considered attached once and must only be detached once.

Parameters

cond	*<<**in**>> (p. 404)* **Condition** (p. 686) to be attached.

Exceptions

One	of the **Standard Return Codes** (p. 513), or **com.rti.dds.infrastructure.RETCODE_OUT_OF_RESOURCES** (p. 1903).

8.409.7.3 detach_condition()

```
void detach_condition (
              Condition cond )
```

Detaches a **com.rti.dds.infrastructure.Condition** (p. 686) from the **com.rti.dds.infrastructure.WaitSet** (p. 2287).

It is possible to detach a **com.rti.dds.infrastructure.Condition** (p. 686) on a **com.rti.dds.infrastructure.WaitSet** (p. 2287) that is currently being waited upon (via the wait operation). If the **com.rti.dds.infrastructure.Condition** (p. 686) was not attached to the **com.rti.dds.infrastructure.WaitSet** (p. 2287), the operation will return **com.rti.dds.↩ infrastructure.RETCODE_BAD_PARAMETER** (p. 1899).

If the same **com.rti.dds.infrastructure.Condition** (p. 686) had been previously attached multiple times, only a single detach is required; the **com.rti.dds.infrastructure.Condition** (p. 686) is considered attached only once.

Parameters

cond	*<<**in**>> (p. 404)* **Condition** (p. 686) to be detached.

Exceptions

One	of the **Standard Return Codes** (p. 513), or **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).

8.409.7.4 get_conditions()

```
void get_conditions (
            ConditionSeq attached_conditions )
```

Retrieves the list of attached **com.rti.dds.infrastructure.Condition** (p. 686) (s).

Parameters

attached_conditions	*<<**inout**>> (p. 404)* a **com.rti.dds.infrastructure.ConditionSeq** (p. 687) object where the list of attached conditions will be returned

Exceptions

One	of the **Standard Return Codes** (p. 513), or **com.rti.dds.infrastructure.RETCODE_PRECONDITION_NOT_MET** (p. 1903).

8.409.7.5 set_property()

```
void set_property (
            WaitSetProperty_t prop )
```

*<<**extension**>> (p. 403)* Sets the **com.rti.dds.infrastructure.WaitSetProperty_t** (p. 2295), to configure the associated **com.rti.dds.infrastructure.WaitSet** (p. 2287) to return after one or more trigger events have occurred.

Parameters

prop	*<<**in**>> (p. 404)*

Exceptions

One	of the **Standard Return Codes** (p. 513)

8.409.7.6 get_property()

```
void get_property (
              WaitSetProperty_t prop )
```

<<***extension***>> *(p. 403)* Retrieves the **com.rti.dds.infrastructure.WaitSetProperty_t** (p. 2295) configuration of the associated **com.rti.dds.infrastructure.WaitSet** (p. 2287).

Parameters

prop	<<***out***>> *(p. 404)*

Exceptions

One	of the **Standard Return Codes** (p. 513)

8.409.7.7 delete()

```
void delete ( )
```

Destructor.

Releases the resources asociated with this **com.rti.dds.infrastructure.WaitSet** (p. 2287).

Calling this method multiple times on the same **com.rti.dds.infrastructure.WaitSet** (p. 2287) is safe; subsequent deletions will have no effect.

Referenced by **WaitSet.close()**.

8.409.7.8 close()

```
void close ( )
```

See **delete()** (p. 2295).

References **WaitSet.delete()**.

8.410 WaitSetProperty_t Class Reference

<<***extension***>> *(p. 403)* Specifies the **com.rti.dds.infrastructure.WaitSet** (p. 2287) behavior for multiple trigger events.

Inherits Struct.

Public Attributes

- int **max_event_count**

  *Maximum number of trigger events to cause a **com.rti.dds.infrastructure.WaitSet** (p. 2287) to awaken.*
- final **Duration_t max_event_delay**

  *Maximum delay from occurrence of first trigger event to cause a **com.rti.dds.infrastructure.WaitSet** (p. 2287) to awaken.*

8.410.1 Detailed Description

<<***extension***>> *(p. 403)* Specifies the **com.rti.dds.infrastructure.WaitSet** (p. 2287) behavior for multiple trigger events.

In simple use, a **com.rti.dds.infrastructure.WaitSet** (p. 2287) returns when a single trigger event occurs on one of its attached **com.rti.dds.infrastructure.Condition** (p. 686) (s), or when the `timeout` maximum wait duration specified in the com.rti.dds.infrastructure.WaitSet.WaitSet.wait call expires.

The **com.rti.dds.infrastructure.WaitSetProperty_t** (p. 2295) allows configuration of the waiting behavior of a **com.rti.dds.infrastructure.WaitSet** (p. 2287). If no conditions are true at the time of the call to wait, then the `max_event_count` parameter may be used to configure the **WaitSet** (p. 2287) to wait for `max_event_count` trigger events to occur before returning, or to wait for up to `max_event_delay` time from the occurrence of the first trigger event before returning.

The `timeout` maximum wait duration specified in the com.rti.dds.infrastructure.WaitSet.WaitSet.wait call continues to apply.

Entity:

com.rti.dds.infrastructure.WaitSet (p. 2287)

Properties:

RxO (p. 506) = N/A

Changeable (p. 507) = **YES** (p. 507)

8.410.2 Member Data Documentation

8.410.2.1 max_event_count

```
int max_event_count
```

Maximum number of trigger events to cause a **com.rti.dds.infrastructure.WaitSet** (p. 2287) to awaken.

The **com.rti.dds.infrastructure.WaitSet** (p. 2287) will wait until up to `max_event_count` trigger events have occurred before returning. The **com.rti.dds.infrastructure.WaitSet** (p. 2287) may return earlier if either the `timeout` duration has expired, or `max_event_delay` has elapsed since the occurrence of the first trigger event. `max_event_count` may be used to "collect" multiple trigger events for processing at the same time.

[default] 1

[range] >= 1

8.410.2.2 max_event_delay

```
final Duration_t max_event_delay
```

Maximum delay from occurrence of first trigger event to cause a **com.rti.dds.infrastructure.WaitSet** (p. 2287) to awaken.

The **com.rti.dds.infrastructure.WaitSet** (p. 2287) will return no later than `max_event_delay` after the first trigger event. `max_event_delay` may be used to establish a maximum latency for events reported by the **com.rti.dds.infrastructure.WaitSet** (p. 2287).

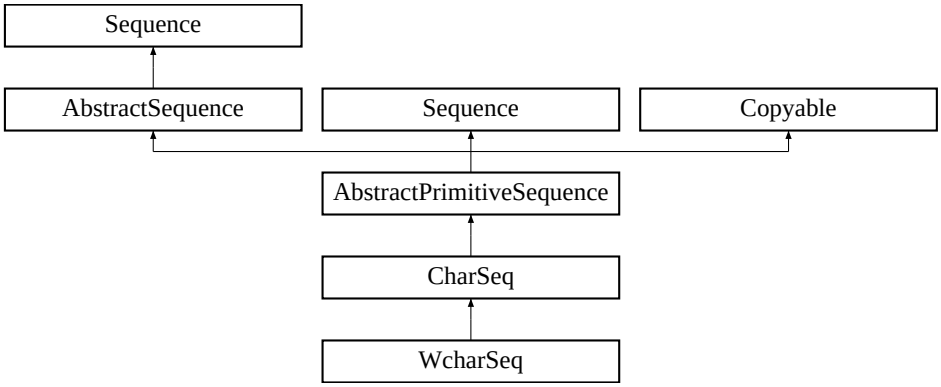
Note that **com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904) is *not* returned if `max_event_delay` is exceeded. **com.rti.dds.infrastructure.RETCODE_TIMEOUT** (p. 1904) is returned only if the `timeout` duration expires before any trigger events occur.

[default] com.rti.dds.infrastructure.Duration_t.DURATION_INFINITE (p. 1133)

8.411 WcharSeq Class Reference

Instantiates `com.rti.dds.infrastructure.com.rti.dds.util.Sequence` < com.rti.dds.infrastructure.char >

Inheritance diagram for WcharSeq:



Public Member Functions

- **WcharSeq** ()

  Constructs an empty sequence of wide characters with an initial maximum of zero.
- **WcharSeq** (int initialMaximum)

  Constructs an empty sequence of wide characters with the given initial maximum.
- **WcharSeq** (char[ ] chars)

  Constructs a new sequence containing the given wide characters.

8.411.1 Detailed Description

Instantiates `com.rti.dds.infrastructure.com.rti.dds.util.Sequence` < com.rti.dds.infrastructure.↩ char >

Instantiates:

<<***generic***>> *(*p. *403)* com.rti.dds.infrastructure.com.rti.dds.util.Sequence

8.411.2 Constructor & Destructor Documentation

8.411.2.1 WcharSeq() [1/3]

```
WcharSeq ( )
```

Constructs an empty sequence of wide characters with an initial maximum of zero.

8.411.2.2 WcharSeq() [2/3]

```
WcharSeq (
            int initialMaximum )
```

Constructs an empty sequence of wide characters with the given initial maximum.

8.411.2.3 WcharSeq() [3/3]

```
WcharSeq (
            char[] chars )
```

Constructs a new sequence containing the given wide characters.

Parameters

chars	the initial contents of this sequence

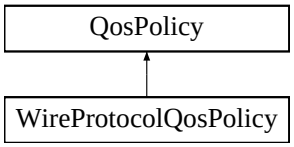
Exceptions

NullPointerException	if the input array is null

8.412 WireProtocolQosPolicy Class Reference

<<***extension***>> *(*p. *138)* Specifies the wire-protocol-related attributes for the **com.rti.dds.domain.Domain↩ Participant** (p. 948).

Inheritance diagram for WireProtocolQosPolicy:



Public Attributes

- int **participant_id**

  <<***basic***>> *(*p. *123)* <<***extension***>> *(*p. *138) A value used to distinguish among different participants belonging to the same domain on the same host.*

  <<***extension***>> *(*p. *138) Kind of auto mechanism used to calculate the GUID prefix.*
- boolean **compute_crc**

  <<***extension***>> *(*p. *138) Adds RTPS CRC submessage to every message when this field is set to com.rti.dds.↩ infrastructure.true.*
- boolean **check_crc**

  <<***extension***>> *(*p. *138) Checks if the received RTPS message is valid by comparing the computed CRC with the received RTPS CRC submessage when this field is set to com.rti.dds.infrastructure.true.*

Static Public Attributes

- static final int **RTPS_AUTO_ID** = 0

  Indicates that RTI Connext should choose an appropriate host, app, instance or object ID automatically.

8.412.1 Detailed Description

<<***extension***>> *(p. 138)* Specifies the wire-protocol-related attributes for the **com.rti.dds.domain.Domain↩ Participant** (p. 948).

Entity:

com.rti.dds.domain.DomainParticipant (p. 948)

Properties:

RxO (p. 506) = N/A
Changeable (p. 507) = **NO** (p. 507)

8.412.2 Usage

This QoS policy configures some participant-wide properties of the DDS Real-Time Publish Subscribe (RTPS) on-the-wire protocol. (**com.rti.dds.infrastructure.DataWriterProtocolQosPolicy** (p. 860) and **com.rti.dds.infrastructure.↩ DataReaderProtocolQosPolicy** (p. 761) configure RTPS and reliability properties on a per **com.rti.dds.publication.↩ DataWriter** (p. 818) or **com.rti.dds.subscription.DataReader** (p. 707) basis.)

NOTE: The default QoS policies returned by RTI Connext contain the correctly initialized wire protocol attributes. The defaults are not normally expected to be modified, but are available to the advanced user customizing the implementation behavior.

The default values should not be modified without an understanding of the underlying Real-Time Publish Subscribe (RTPS) wire protocol.

In order for the discovery process to work correctly, each **com.rti.dds.domain.DomainParticipant** (p. 948) must have a unique identifier. This QoS policy specifies how that identifier should be generated.

RTPS defines a 96-bit prefix to this identifier; each **com.rti.dds.domain.DomainParticipant** (p. 948) must have a unique value for this prefix relative to all other participants in its domain.

If an application dies unexpectedly and is restarted, the IDs used by the new instance of DomainParticipants should be different than the ones used by the previous instances. A change in these values allows other DomainParticipants to know that they are communicating with a new instance of an application, and not the previous instance.

For legacy reasons, RTI Connext divides the 96-bit prefix into three integers:

- The first integer is called host ID. The original purpose of this integer was to contain the identity of the machine on which the DomainParticipant is executing.

- The second integer is called an application ID. The original purpose of this integer was to contain a value that identifies the process or task in which the DomainParticipant is contained.
- The third integer is called instance ID. The original purpose was to contain a value that uniquely identifies a DomainParticipant within a task or process.

The **com.rti.dds.infrastructure.WireProtocolQosPolicy.rtps_auto_id_kind** (p. 2306) field can be used to configure the algorithm that RTI Connext uses to populate the 96-bit prefix. Then you can optionally overwrite specific parts of the 96-bit prefix by explicitly configuring the **com.rti.dds.infrastructure.WireProtocolQosPolicy.rtps_host_id** (p. 2304) (first integer), **com.rti.dds.infrastructure.WireProtocolQosPolicy.rtps_app_id** (p. 2305) (second integer), and **com.rti.dds.infrastructure.WireProtocolQosPolicy.rtps_instance_id** (p. 2305) (third integer).

The **com.rti.dds.infrastructure.WireProtocolQosPolicy.rtps_auto_id_kind** (p. 2306) field supports three different prefix generation algorithms:

1. In the default and most common scenario, **com.rti.dds.infrastructure.WireProtocolQosPolicy.rtps_auto_↩ id_kind** (p. 2306) is set to **com.rti.dds.infrastructure.WireProtocolQosPolicyAutoKind.RTPS_AUTO_ID_↩ FROM_UUID** (p. 536). As the name suggests, this mechanism uses a unique, randomly generated UUID to fill the **rtps_host_id**, **rtps_app_id**, or **rtps_instance_id** fields. The first two bytes of the **rtps_host_id** are replaced with the RTI vendor ID (0x0101).

2. (Legacy) When rtps_auto_id_kind is set to **com.rti.dds.infrastructure.WireProtocolQosPolicyAutoKind.↩ RTPS_AUTO_ID_FROM_IP** (p. 536), the 96-bit prefix is generated as follows:

   - **rtps_host_id:** The 32-bit value of the IPv4 of the first up and running interface of the host machine is assigned. If the host does not have an IPv4 address, the host-id will be automatically set to 0x7F000001.
   - **rtps_app_id:** The process (or task) ID is assigned.
   - **rtps_instance_id:** A counter is assigned that is incremented per new participant within a process.

   DDS_RTPS_AUTO_ID_FROM_IP is not a good algorithm to guarantee prefix uniqueness, because the process ID can be recycled by the OSs.

3. (Legacy) When rtps_auto_id_kind is set to **com.rti.dds.infrastructure.WireProtocolQosPolicyAutoKind.↩ RTPS_AUTO_ID_FROM_MAC** (p. 536), the 96-bit prefix is generated as follows:

   - **rtps_host_id:** The first 32 bits of the MAC address of the first up and running interface of the host machine are assigned.
   - **rtps_app_id:** The last 32 bits of the MAC address of the first up and running interface of the host machine are assigned.
   - **rtps_instance_id:** This field is split into two different parts. The process (or task) ID is assigned to the first 24 bits. A counter is assigned to the last 8 bits. This counter is incremented per new participant.

   DDS_RTPS_AUTO_ID_FROM_IP is not a good algorithm to guarantee prefix uniqueness, because the process ID can be recycled by the OSs.

Some examples are provided to clarify the behavior of this QoSPolicy in case you want to change the default behavior with **com.rti.dds.infrastructure.WireProtocolQosPolicyAutoKind.RTPS_AUTO_ID_FROM_MAC** (p. 536).

First, get the participant QoS from the DomainParticipantFactory:

```
DomainParticipantFactory.TheParticipantFactory.

                get_default_participant_qos(participant_qos);
```

<P>

Second, change the **com.rti.dds.infrastructure.WireProtocolQosPolicy** (p. 2299) using one of the options shown below.

Third, create the **com.rti.dds.domain.DomainParticipant** (p. 948) as usual, using the modified QoS structure instead of the default one.

Option 1: Use **com.rti.dds.infrastructure.WireProtocolQosPolicyAutoKind.RTPS_AUTO_ID_FROM_MAC** (p. 536) to explicitly set just the application/task identifier portion of the **rtps_instance_id** field.

```
participant_qos.wire_protocol.rtps_auto_id_kind =

                WireProtocolQosPolicyAutoKind.RTPS_AUTO_ID_FROM_MAC;

participant_qos.wire_protocol.rtps_host_id      =

                WireProtocolQosPolicy.RTPS_AUTO_ID;

participant_qos.wire_protocol.rtps_app_id       =

                WireProtocolQosPolicy.RTPS_AUTO_ID;

participant_qos.wire_protocol.rtps_instance_id  = (/* App ID */ (12 << 8) |

                                                   /* Instance ID*/ (WireProtocolQosPolicy.RTPS_AUTO_ID));
```

Option 2: Handle only the per participant counter and let RTI Connext handle the application/task identifier:

```
participant_qos.wire_protocol.rtps_auto_id_kind =

                        WireProtocolQosPolicyAutoKind.RTPS_AUTO_ID_FROM_MAC;

participant_qos.wire_protocol.rtps_host_id      = WireProtocolQosPolicy.RTPS_AUTO_ID;

participant_qos.wire_protocol.rtps_app_id       = WireProtocolQosPolicy.RTPS_AUTO_ID;

participant_qos.wire_protocol.rtps_instance_id  =  (/* App ID */ (WireProtocolQosPolicy.RTPS_AUTO_ID) |

                                                   /* Instance ID*/ (12));
```

Option 3: Handle the entire **rtps_instance_id** field yourself:

```
participant_qos.wire_protocol.rtps_auto_id_kind = WireProtocolQosPolicyAutoKind.RTPS_AUTO_ID_FROM_MAC;

participant_qos.wire_protocol.rtps_host_id      = WireProtocolQosPolicy.RTPS_AUTO_ID;

participant_qos.wire_protocol.rtps_app_id       = WireProtocolQosPolicy.RTPS_AUTO_ID;

participant_qos.wire_protocol.rtps_instance_id  = ( /* App ID */ (12 << 8)) |

                                                    /* Instance ID */ (9) )
```

NOTE: If you are using **com.rti.dds.infrastructure.WireProtocolQosPolicyAutoKind.RTPS_AUTO_ID_FROM_MAC** (p. 536) as **rtps_auto_id_kind** and you decide to manually handle the **rtps_instance_id** field, you must ensure that both parts are non-zero (otherwise RTI Connext will take responsibility for them). RTI recommends that you always specify the two parts separately in order to avoid errors.

Option 4: Let RTI Connext handle the entire **rtps_instance_id** field:

```
participant_qos.wire_protocol.rtps_auto_id_kind =

                WireProtocolQosPolicyAutoKind.RTPS_AUTO_ID_FROM_MAC;

participant_qos.wire_protocol.rtps_host_id      = WireProtocolQosPolicy.RTPS_AUTO_ID;

participant_qos.wire_protocol.rtps_app_id       = WireProtocolQosPolicy.RTPS_AUTO_ID;

participant_qos.wire_protocol.rtps_instance_id  = WireProtocolQosPolicy.RTPS_AUTO_ID;
```

NOTE: If you are using **com.rti.dds.infrastructure.WireProtocolQosPolicyAutoKind.RTPS_AUTO_ID_FROM_MAC** (p. 536) as **rtps_auto_id_kind** and you decide to manually handle the **rtps_instance_id** field, you must ensure that both parts are non-zero (otherwise RTI Connext will take responsibility for them). RTI recommends that you always specify the two parts separately in order to clearly show the difference.

8.412.3 Member Data Documentation

8.412.3.1 RTPS_AUTO_ID

```
final int RTPS_AUTO_ID = 0  [static]
```

Indicates that RTI Connext should choose an appropriate host, app, instance or object ID automatically.

If this special value is assigned to **com.rti.dds.infrastructure.WireProtocolQosPolicy.rtps_host_id** (p. 2304), **com.↩ rti.dds.infrastructure.WireProtocolQosPolicy.rtps_app_id** (p. 2305), **com.rti.dds.infrastructure.WireProtocol↩ QosPolicy.rtps_instance_id** (p. 2305), **com.rti.dds.infrastructure.DataWriterProtocolQosPolicy.rtps_object_id** (p. 862) or **com.rti.dds.infrastructure.DataReaderProtocolQosPolicy.rtps_object_id** (p. 762) RTI Connext will assign the ID automatically.

The actual ID value is chosen when the QoS is set: the QoS returned from **com.rti.dds.domain.DomainParticipant.↩ get_qos** (p. 993), **com.rti.dds.publication.DataWriter.get_qos** (p. 823) or **com.rti.dds.subscription.DataReader.↩ get_qos** (p. 716) will never have this value.

QoS:

com.rti.dds.infrastructure.WireProtocolQosPolicy.rtps_host_id (p. 2304) **com.rti.dds.infrastructure.↩ WireProtocolQosPolicy.rtps_app_id** (p. 2305) **com.rti.dds.infrastructure.WireProtocolQosPolicy.rtps_↩ instance_id** (p. 2305)

8.412.3.2 participant_id

```
int participant_id
```

*<<**basic**>> (p. 123) <<**extension**>> (p. 138)* A value used to distinguish among different participants belonging to the same domain on the same host.

Determines the unicast port on which meta-traffic is received. Also defines the *default* unicast port for receiving user-traffic for DataReaders and DataWriters (can be overridden by the **com.rti.dds.subscription.DataReaderQos.unicast** (p. 784) or **com.rti.dds.publication.DataWriterQos.unicast** (p. 886)).

For more information on port mapping, please refer to **com.rti.dds.infrastructure.RtpsWellKnownPorts_t** (p. 1931).

Each **com.rti.dds.domain.DomainParticipant** (p. 948) in the same domain and running on the same host, must have a unique `participant_id`. The participants may be in the same address space or in distinct address spaces.

A negative number (-1) means that RTI Connext will *automatically* resolve the participant ID as follows.

- RTI Connext will pick the *smallest* participant ID based on the unicast ports available on the transports enabled for discovery.

- RTI Connext will attempt to resolve an automatic port index either when a DomainPartcipant is enabled, or when a DataReader or DataWriter is created. Therefore, all the transports enabled for discovery must have been registered by this time. Otherwise, the discovery transports registered after resolving the automatic port index may produce port conflicts when the DomainPartcipant is enabled.

[default] -1 [automatic], i.e. RTI Connext will automatically pick the `participant_id`, as described above.

[range] [>= 0], or -1, and does not violate guidelines stated in **com.rti.dds.infrastructure.RtpsWellKnownPorts_t** (p. 1931).

8.412.3.4 rtps_host_id

```
int rtps_host_id
```

<<***extension***>> *(*p. *138)* The RTPS Host ID of the domain participant.

A specific host ID that is unique in the domain.

[default] com.rti.dds.infrastructure.WireProtocolQosPolicy.RTPS_AUTO_ID (p. 2303). The default value is interpreted as follows:
If **com.rti.dds.infrastructure.WireProtocolQosPolicy.rtps_auto_id_kind** (p. 2306) is equal to **com.rti.dds.infrastructure.WireProtocolQosPolicyAutoKind.RTPS_AUTO_ID_FROM_IP** (p. 536), the value will be interpreted as the IPv4 address of the *first* up and running interface of the host machine.
If **com.rti.dds.infrastructure.WireProtocolQosPolicy.rtps_auto_id_kind** (p. 2306) is equal to **com.rti.dds.infrastructure.WireProtocolQosPolicyAutoKind.RTPS_AUTO_ID_FROM_MAC** (p. 536), the value will be interpreted as the first 32 bits of the MAC address assigned to the *first* up and running interface of the host machine.
If **com.rti.dds.infrastructure.WireProtocolQosPolicy.rtps_auto_id_kind** (p. 2306) is equal to **com.rti.dds.infrastructure.WireProtocolQosPolicyAutoKind.RTPS_AUTO_ID_FROM_UUID** (p. 536), the value will be the first 32 bits of the GUID prefix assigned by the UUID algorithm.

[range] [0,0xffffffff]

Categories

Immutable (p. 292), **Discovery** (p. 212)

8.412.3.5 rtps_app_id

```
int rtps_app_id
```

<<***extension***>> *(*p. *138)* The RTPS App ID of the domain participant.

A participant specific ID that, together with the rtps_instance_id, is unique within the scope of the rtps_host_id.

If a participant dies and is restarted, it is recommended that it be given an app ID that is distinct from the previous one so that other participants in the domain can distinguish between them.

[default] com.rti.dds.infrastructure.WireProtocolQosPolicy.RTPS_AUTO_ID (p. 2303). The default value is interpreted as follows:
If **com.rti.dds.infrastructure.WireProtocolQosPolicy.rtps_auto_id_kind** (p. 2306) is equal to ***com.rti.dds.infrastructure.WireProtocolQosPolicyAutoKind.RTPS_AUTO_ID_FROM_IP*** *(*p. *536)* the value will be the process (or task) ID.
If **com.rti.dds.infrastructure.WireProtocolQosPolicy.rtps_auto_id_kind** (p. 2306) is equal to ***com.rti.dds.infrastructure.WireProtocolQosPolicyAutoKind.RTPS_AUTO_ID_FROM_MAC*** *(*p. *536)* the value will be the last 32 bits of the MAC address assigned to the *first* up and running interface of the host machine.
If **com.rti.dds.infrastructure.WireProtocolQosPolicy.rtps_auto_id_kind** (p. 2306) is equal to ***com.rti.dds.infrastructure.WireProtocolQosPolicyAutoKind.RTPS_AUTO_ID_FROM_UUID*** *(*p. *536)*, the value will be the middle 32 bits of the GUID prefix assigned by the UUID algorithm.

[range] [0,0xffffffff]

Categories

Immutable (p. 292), **Discovery** (p. 212)

8.412.3.6 rtps_instance_id

```
int rtps_instance_id
```

<<***extension***>> *(*p. *138)* The RTPS Instance ID of the **com.rti.dds.domain.DomainParticipant** (p. 948).

This is an instance-specific ID of a participant that, together with the rtps_app_id, is unique within the scope of the rtps_host_id.

If a participant dies and is restarted, it is recommended that it be given an instance ID that is distinct from the previous one so that other participants in the domain can distinguish between them.

[default] com.rti.dds.infrastructure.WireProtocolQosPolicy.RTPS_AUTO_ID (p. 2303). The default value is interpreted as follows:
If **com.rti.dds.infrastructure.WireProtocolQosPolicy.rtps_auto_id_kind** (p. 2306) is equal to ***com.rti.dds.infrastructure.WireProtocolQosPolicyAutoKind.RTPS_AUTO_ID_FROM_IP*** *(*p. *536)*, a counter is assigned that is incremented per new participant. For VxWorks-653, the first 8 bits are assigned to the partition id for the application.
If **com.rti.dds.infrastructure.WireProtocolQosPolicy.rtps_auto_id_kind** (p. 2306) is equal to ***com.rti.dds.infrastructure.WireProtocolQosPolicyAutoKind.RTPS_AUTO_ID_FROM_MAC*** *(*p. *536)*, the first 24 bits are assigned to the application/task identifier and the last 8 bits are assigned to a counter that is incremented per new paricipant.
If **com.rti.dds.infrastructure.WireProtocolQosPolicy.rtps_auto_id_kind** (p. 2306) is equal to ***com.rti.dds.infrastructure.WireProtocolQosPolicyAutoKind.RTPS_AUTO_ID_FROM_UUID*** *(*p. *536)*, the value will be the last 32 bits of the GUID prefix assigned by the UUID algorithm.

[range] [0,0xffffffff] **NOTE:** If you use ***com.rti.dds.infrastructure.WireProtocolQosPolicyAutoKind.RTPS_AUTO_ID_FROM_MAC*** *(*p. *536)* as **rtps_auto_id_kind** and you decide to manually handle the **rtps_instance_id** field, you must ensure that both the two parts are non-zero, otherwise the middleware will take responsibility for them. We recommend that you always specify the two parts separately in order to avoid errors. (`examples`)

```
Object copy_from (
            Object src )
```

Copy value of a data type from source.

Copy data into *this* object from another. This copy is intended to be a deep copy, so that all data members (recursively) are copied (not just resetting Object references).

This operation returns the object that is copied if copy is successful.

Parameters

src	<<***in***>> *(*p. *404)* The Object which contains the data to be copied.

Returns

Generally, return *this* but special cases (such as Enum) exist.

Exceptions

NullPointerException	If *src* is null.
ClassCastException	If *src* is not the same type as *this*.

Implements **Copyable** (p. 701).

References **InstanceHandle_t.copy_from()**, **AbstractPrimitiveSequence.copy_from()**, **WriteParams_t.flag**, **WriteParams_t.handle**, **WriteParams_t.identity**, **Time_t.nanosec**, **WriteParams_t.priority**, **WriteParams_t.↩ related_reader_guid**, **WriteParams_t.related_sample_identity**, **WriteParams_t.related_source_guid**, **Time_t.↩ sec**, **WriteParams_t.source_guid**, **WriteParams_t.source_timestamp**, **Cookie_t.value**, and **WriteParams_t.↩ WriteParams_t()**.

8.414.4 Member Data Documentation

8.414.4.1 identity

```
SampleIdentity_t identity
```

Initial value:

```
=
        new SampleIdentity_t(SampleIdentity_t.AUTO_SAMPLE_IDENTITY)
```

Identity of the sample.

Identifies the sample being written. The identity consists of a pair (Virtual Writer GUID, Virtual Sequence Number).

Use the default value to let RTI Connext determine the sample identity as follows:

- The Virtual Writer GUID is the virtual GUID associated with the writer writing the sample. This virtual GUID is configured using **com.rti.dds.infrastructure.DataWriterProtocolQosPolicy.virtual_guid** (p. 862).
- The sequence number is increased by one with respect to the previous value.

The virtual sequence numbers for a virtual writer must be strictly monotonically increasing. If the user tries to write a sample with a sequence number smaller or equal to the last sequence number, the write operation will fail.

A DataReader can access the identity of a received sample by using the fields **com.rti.dds.subscription.Sample↩ Info.original_publication_virtual_guid** (p. 1953) and **com.rti.dds.subscription.SampleInfo.original_publication↩ _virtual_sequence_number** (p. 1953) in the **com.rti.dds.subscription.SampleInfo** (p. 1944).

[default] com.rti.dds.infrastructure.SampleIdentity_t.SampleIdentity_t.AUTO_SAMPLE_IDENTITY.

Referenced by **WriteParams_t.copy_from()**, **Requester**< **TReq, TRep** >**.sendRequest()**, and **WriteParams_t.↩ WriteParams_t()**.

8.414.4.2 related_sample_identity

```
final  SampleIdentity_t related_sample_identity
```

Initial value:

```
=
       new SampleIdentity_t(SampleIdentity_t.UNKNOWN_SAMPLE_IDENTITY)
```

The identity of another sample related to this one.

Identifies another sample that is logically related to the one that is written.

When this field is set, the related sample identity is propagated and subscribing applications can retrieve it from the **com.rti.dds.subscription.SampleInfo** (p. 1944) (see com.rti.dds.subscription.SampleInfo.get_related_sample_↩ identity).

The default value is com.rti.dds.infrastructure.SampleIdentity_t.SampleIdentity_t.UNKNOWN_SAMPLE_IDENTITY, and is not propagated.

A DataReader can access the related identity of a received sample by using the fields **com.rti.dds.subscription.↩ SampleInfo.related_original_publication_virtual_guid** (p. 1954) and **com.rti.dds.subscription.SampleInfo.↩ related_original_publication_virtual_sequence_number** (p. 1954) in the **com.rti.dds.subscription.SampleInfo** (p. 1944).

[default] com.rti.dds.infrastructure.SampleIdentity_t.SampleIdentity_t.UNKNOWN_SAMPLE_IDENTITY

Referenced by **WriteParams_t.copy_from()**, and **WriteParams_t.WriteParams_t()**.

8.414.4.3 source_timestamp

```
Time_t source_timestamp = new  Time_t( Time_t.TIME_INVALID)
```

Source timestamp upon write.

Specifies the source timestamp that will be available to the **com.rti.dds.subscription.DataReader** (p. 707) objects by means of the `source_timestamp` attribute within the **com.rti.dds.subscription.SampleInfo** (p. 1944).

[default] com.rti.dds.infrastructure.Time_t.INVALID.

Referenced by **WriteParams_t.copy_from()**, and **WriteParams_t.WriteParams_t()**.

8.414.4.4 handle

```
InstanceHandle_t handle = new  InstanceHandle_t()
```

Instance handle.

Either the handle returned by a previous call to **com.rti.ndds.example.FooDataWriter.register_instance** (p. 1390), or else the special value **com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL** (p. 1447).

[default] com.rti.dds.infrastructure.InstanceHandle_t.HANDLE_NIL (p. 1447)

Referenced by **WriteParams_t.copy_from()**, and **WriteParams_t.WriteParams_t()**.

8.414.4.5 priority

```
int priority =  UNDEFINED
```

<<***extension***>> *(*p. *138)* Publication priority

A positive integer value designating the relative priority of the **com.rti.dds.publication.DataWriter** (p. 818), used to determine the transmission order of pending writes.

Use of publication priorities requires the asynchronous publisher (com.rti.dds.infrastructure.PublishModeQosPolicy↩ Kind.PublishModeQosPolicyKind.ASYNCHRONOUS_PUBLISH_MODE_QOS) with **com.rti.dds.publication.Flow↩ ControllerProperty_t.scheduling_policy** (p. 1352) set to com.rti.dds.publication.FlowControllerSchedulingPolicy.↩ FlowControllerSchedulingPolicy.HPF_FLOW_CONTROLLER_SCHED_POLICY.

Larger numbers have higher priority.

For multi-channel DataWriters, if the publication priority of any channel is set to any value other than com.rti.dds.↩ infrastructure.PUBLICATION_PRIORITY_UNDEFINED, then the channel's priority will take precedence over that of the DataWriter.

For multi-channel DataWriters, if the publication priority of any channel is com.rti.dds.infrastructure.PUBLICATION_↩ PRIORITY_UNDEFINED, then the channel will inherit the publication priority of the DataWriter.

If the publicaton priority of the DataWriter, and of any channel of a multi-channel DataWriter, are com.rti.dds.↩ infrastructure.PUBLICATION_PRIORITY_UNDEFINED, then the priority of the DataWriter or DataWriter channel will be assigned the lowest priority value.

If the publication priority of the DataWriter is com.rti.dds.infrastructure.PUBLICATION_PRIORITY_AUTOMATIC, then the DataWriter will be assigned the priority of the largest publication priority of all samples in the DataWriter.

The publication priority of each sample can be set in the **com.rti.dds.infrastructure.WriteParams_t** (p. 2308) of the **com.rti.ndds.example.FooDataWriter.write_w_params** (p. 1402) function.

For dispose and unregister samples, use the **com.rti.dds.infrastructure.WriteParams_t** (p. 2308) of **com.rti.ndds.↩ example.FooDataWriter.dispose_w_params** (p. 1406) and **com.rti.ndds.example.FooDataWriter.unregister_↩ instance_w_params** (p. 1396).

[default] com.rti.dds.infrastructure.PUBLICATION_PRIORITY_UNDEFINED

[range] [-1, MAX_INT]

Categories

Immutable (p. 292), **Flow Control** (p. 226)

Referenced by **WriteParams_t.copy_from()**, and **WriteParams_t.WriteParams_t()**.

8.414.4.6 flag

```
int flag = 0
```

Flags associated with the sample.

The flags are represented as a 32-bit integer, of which only the 16 least-significant bits are used.

RTI reserves least-significant bits [0-7] for middleware-specific usage.

The application can use least-significant bits [8-15].

The first bit (**com.rti.dds.infrastructure.SampleFlagBits.REDELIVERED_SAMPLE** (p. 1940)) is reserved for marking samples as redelivered when using RTI Queuing Service.

The second bit (**com.rti.dds.infrastructure.SampleFlagBits.INTERMEDIATE_REPLY_SEQUENCE_SAMPLE** (p. 1940)) is used to indicate that a response sample is not the last response sample for a given request. This bit is usually set by a Replier sending multiple responses for a request.

An application can inspect the flags associated with a received sample by checking the field **com.rti.dds.↩ subscription.SampleInfo.flag** (p. 1954).

[default] 0 (no flags are set)

Referenced by **WriteParams_t.copy_from()**, and **WriteParams_t.WriteParams_t()**.

8.414.4.7 source_guid

```
GUID_t source_guid = new GUID_t( GUID_t.GUID_AUTO)
```

Identifies the application logical data source associated with the sample being written.

When this field is set, the source_guid is propagated and subscribing applications can retrieve it from the **com.rti.↩ dds.subscription.SampleInfo** (p. 1944) (see **com.rti.dds.subscription.SampleInfo.source_guid** (p. 1955)).

The default value is **com.rti.dds.infrastructure.GUID_t.GUID_AUTO** (p. 1426), and is not propagated.

This field is used by RTI Connext in the following cases:

- In RTI Queuing Service, this field and **com.rti.dds.infrastructure.WriteParams_t.related_source_guid** (p. 2314) play a crucial role in ensuring that replies are correctly routed back to the requester in request/reply scenarios.
- In RTI Routing Service, this field is used by the TopicQuery proxy feature to identify the original writer(s) that published the response samples for the TopicQuery. When dealing with snapshot TopicQueries, there will be one final sample (sample without the flag **com.rti.dds.infrastructure.SampleFlagBits.INTERMEDIATE_TOPIC_↩ QUERY_SAMPLE** (p. 1940)) per original writer that published one or more response samples.

You can use this field for your own purposes unless you are using Queuing Service or Routing Service as described above.

[default] com.rti.dds.infrastructure.GUID_t.GUID_AUTO (p. 1426) (the source_guid is automatically set to the **com.rti.dds.publication.DataWriter** (p. 818) virtual GUID).

See also

com.rti.dds.infrastructure.WriteParams_t.related_source_guid (p. 2314)

Referenced by **WriteParams_t.copy_from()**, and **WriteParams_t.WriteParams_t()**.

8.414.4.8 related_source_guid

```
GUID_t related_source_guid = new  GUID_t()
```

Identifies the application logical data source that is related to the sample being written.

When this field is set, the related_source_guid is propagated and subscribing applications can retrieve it from the **com.rti.dds.subscription.SampleInfo** (p. 1944) (see **com.rti.dds.subscription.SampleInfo.related_source_guid** (p. 1955)).

This field and **com.rti.dds.infrastructure.WriteParams_t.source_guid** (p. 2314) are used by RTI Queuing Service, to ensure that replies are correctly routed back to the requester in request/reply scenarios.

The default value is **com.rti.dds.infrastructure.GUID_t.GUID_UNKNOWN** (p. 1426), and is not propagated.

[default] com.rti.dds.infrastructure.GUID_t.GUID_UNKNOWN (p. 1426)

See also

com.rti.dds.infrastructure.WriteParams_t.source_guid (p. 2314)

Referenced by **WriteParams_t.copy_from()**, and **WriteParams_t.WriteParams_t()**.

8.414.4.9 related_reader_guid

```
GUID_t related_reader_guid = new  GUID_t()
```

Identifies a DataReader that is logically related to the sample that is being written.

When this field is set, the related_reader_guid is propagated and subscribing applications can retrieve it from the **com.rti.dds.subscription.SampleInfo** (p. 1944) (see **com.rti.dds.subscription.SampleInfo.related_subscription_guid** (p. 1955)).

The default value is **com.rti.dds.infrastructure.GUID_t.GUID_UNKNOWN** (p. 1426), and is not propagated.

The main use case for this field is point-to-point sample distribution using CFT. DataReaders install a CFT on the related_reader_guid using a unique GUID. For example, the filter for DataReader 'n' can be:

```
@related_reader_guid.value = &hex(00000000000000000000000000000001)
```

Then, a DataWriter that wants to send the sample to DataReader 'n' will use the **com.rti.ndds.example.FooDataWriter.write_w_params** (p. 1402) method and set related_reader_guid to the value used by DataReader 'n' in its filter expression.

This field is currently used by RTI Queuing Service to distribute a sample to only one of the Consumer's DataReaders attached to a SharedReaderQueue.

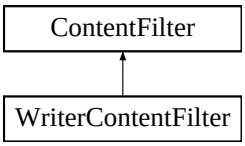
[default] com.rti.dds.infrastructure.GUID_t.GUID_UNKNOWN (p. 1426)

Referenced by **WriteParams_t.copy_from()**, and **WriteParams_t.WriteParams_t()**.

8.415 WriterContentFilter Interface Reference

<<***interface***>> *(p. 403)* Interface to be used by a custom filter of a **com.rti.dds.topic.ContentFilteredTopic** (p. 692).

Inheritance diagram for WriterContentFilter:



Public Member Functions

- void **writer_attach** (**ObjectHolder** writer_filter_data)

  A writer-side filtering API to create some state that can facilitate filtering on the writer side.
- void **writer_detach** (Object writer_filter_data)

  *A writer-side filtering API to clean up a previously created state using **com.rti.dds.topic.WriterContentFilter.writer_attach** (p. 2317).*
- void **writer_compile** (Object writer_filter_data, **ExpressionProperty** prop, String expression, **StringSeq** parameters, **TypeCode** type_code, String type_class_name, **Cookie_t** cookie)

  *A writer-side filtering API to compile an instance of the content filter according to the filter expression and parameters specified by a matching **com.rti.dds.subscription.DataReader** (p. 707).*
- **CookieSeq** **writer_evaluate** (Object writer_filter_data, Object sample, **FilterSampleInfo** meta_data)

  A writer-side filtering API to retrieve a list of DataReaders whose content filters pass the sample.
- void **writer_finalize** (Object writer_filter_data, **Cookie_t** cookie)

  A writer-side filtering API to clean up a previously compiled instance of the content filter.

8.415.1 Detailed Description

<<***interface***>> *(p. 403)* Interface to be used by a custom filter of a **com.rti.dds.topic.ContentFilteredTopic** (p. 692).

Entity:

com.rti.dds.topic.ContentFilteredTopic (p. 692)

This interface can be implemented by an application-provided class and then registered with the **com.rti.dds.domain.DomainParticipant** (p. 948) such that samples can be filtered for a **com.rti.dds.topic.ContentFilteredTopic** (p. 692) with the given filter name.

Note: The API for using a custom content filter is subject to change in a future release.

See also

com.rti.dds.topic.ContentFilteredTopic (p. 692)

com.rti.dds.domain.DomainParticipant.register_contentfilter (p. 1018)

8.415.2 Member Function Documentation

8.415.2.1 writer_attach()

```
void writer_attach (
             ObjectHolder writer_filter_data )
```

A writer-side filtering API to create some state that can facilitate filtering on the writer side.

This method is called to create some state required to perform filtering on the writer side using writer-side filtering APIs. This method will be called for every **com.rti.dds.publication.DataWriter** (p. 818); it will be called only the first time the **com.rti.dds.publication.DataWriter** (p. 818) matches a **com.rti.dds.subscription.DataReader** (p. 707) using the specified filter. This function will not be called for any subsequent DataReaders that match the DataWriter and are using the same filter.

Parameters

writer_filter_data	*<<**out**>> (p. 404)* A user-specified opaque pointer to some state created on the **com.rti.dds.publication.DataWriter** (p. 818) that will help perform writer-side filtering efficiently.

8.415.2.2 writer_detach()

```
void writer_detach (
             Object writer_filter_data )
```

A writer-side filtering API to clean up a previously created state using **com.rti.dds.topic.WriterContentFilter.writer_attach** (p. 2317).

This method is called to delete any state created using the **com.rti.dds.topic.WriterContentFilter.writer_attach** (p. 2317) function. This method will be called when the **com.rti.dds.publication.DataWriter** (p. 818) is deleted.

Parameters

writer_filter_data	*<<**in**>> (p. 404)* A pointer to the state created using **com.rti.dds.topic.WriterContentFilter.writer_attach** (p. 2317).

8.415.2.3 writer_compile()

```
void writer_compile (
             Object writer_filter_data,
```

```
 ExpressionProperty prop,
String expression,
 StringSeq parameters,
 TypeCode type_code,
String type_class_name,
 Cookie_t cookie )
```

A writer-side filtering API to compile an instance of the content filter according to the filter expression and parameters specified by a matching **com.rti.dds.subscription.DataReader** (p. 707).

This method is called when the **com.rti.dds.publication.DataWriter** (p. 818) discovers a **com.rti.dds.subscription.↩ DataReader** (p. 707) with a **com.rti.dds.topic.ContentFilteredTopic** (p. 692) or when a **com.rti.dds.publication.↩ DataWriter** (p. 818) is notified of a change in a DataReader's filter parameter for the locally registered content filter instance.

It is possible for multiple threads to be calling into this function at the same time.

Parameters

writer_filter_data	*<<**in**>> (p. 404)* A pointer to the state created using **com.rti.dds.topic.WriterContentFilter.writer_attach** (p. 2317) .
prop	*<<**out**>> (p. 404)* A pointer to **com.rti.dds.topic.ExpressionProperty** (p. 1337) that allows you to indicate to RTI Connext if a filter expression can be optimized.
expression	*<<**in**>> (p. 404)* An ASCIIZ string with the filter expression. The memory used by this string is owned by RTI Connext and **must** not be freed. If you want to manipulate this string, you **must** first make a copy of it.
parameters	*<<**in**>> (p. 404)* A string sequence with the expression parameters with which the **com.rti.dds.topic.ContentFilteredTopic** (p. 692) was created. The string sequence is **equal** (but **not** identical) to the string sequence passed to **com.rti.dds.domain.DomainParticipant.create_contentfilteredtopic** (p. 988). Note that the sequence passed to the compile function is **owned** by RTI Connext and **must not** be referenced outside the compile function.
type_code	*<<**in**>> (p. 404)* A pointer to the type code for the related **com.rti.dds.topic.Topic** (p. 2116) of the **com.rti.dds.topic.ContentFilteredTopic** (p. 692). A type_code is a description of a type in terms of which types it contains (int32, string, etc.) and the corresponding member field names in the data type structure. The type code can be used to write custom content filters that can be used with any type. This parameter is always NULL in Java.
type_class_name	*<<**in**>> (p. 404)* Fully qualified class name of the related **com.rti.dds.topic.Topic** (p. 2116).
cookie	*<<**in**>> (p. 404)* **com.rti.dds.infrastructure.Cookie_t** (p. 699) to uniquely identify **com.rti.dds.subscription.DataReader** (p. 707) for which **com.rti.dds.topic.WriterContentFilter.writer_compile** (p. 2317) was called.

Exceptions

One	of the **Standard Return Codes** (p. 513)

8.415.2.4 writer_evaluate()

```
CookieSeq writer_evaluate (
            Object writer_filter_data,
            Object sample,
             FilterSampleInfo meta_data )
```

A writer-side filtering API to retrieve a list of DataReaders whose content filters pass the sample.

This method is called every time a **com.rti.dds.publication.DataWriter** (p. 818) writes a new sample. Its purpose is to evaluate the sample for all the readers for which the **com.rti.dds.publication.DataWriter** (p. 818) is performing writer-side filtering and return the list of **com.rti.dds.infrastructure.Cookie_t** (p. 699) structures associated with the DataReaders whose filters pass the sample.

It is possible for multiple threads to be calling into this function at the same time

Parameters

writer_filter_data	*<<**in**>> (p. 404)* A pointer to the state created using **com.rti.dds.topic.WriterContentFilter.writer_attach** (p. 2317) .
sample	*<<**in**>> (p. 404)* Pointer to a deserialized sample to be filtered.
meta_data	*<<**in**>> (p. 404)* Pointer to meta data associated with the sample.

Returns

The function returns **com.rti.dds.infrastructure.CookieSeq** (p. 700) which identifies the set of DataReaders whose filters pass the sample.

8.415.2.5 writer_finalize()

```
void writer_finalize (
            Object writer_filter_data,
             Cookie_t cookie )
```

A writer-side filtering API to clean up a previously compiled instance of the content filter.

This method is called to notify the filter implementation that the **com.rti.dds.publication.DataWriter** (p. 818) is no longer matching with a **com.rti.dds.subscription.DataReader** (p. 707) for which it was previously performing writer-side filtering. This will allow the filter to purge any state it was maintaining for the **com.rti.dds.subscription.DataReader** (p. 707).

It is possible for multiple threads to be calling into this function at the same time.

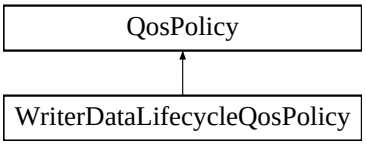
Parameters

writer_filter_data	*<<**in**>> (p. 404)* A pointer to the state created using **com.rti.dds.topic.WriterContentFilter.writer_attach** (p. 2317).
cookie	**com.rti.dds.infrastructure.Cookie_t** (p. 699) to uniquely identify
Generated by Doxygen	**com.rti.dds.subscription.DataReader** (p. 707) for which **com.rti.dds.topic.WriterContentFilter.writer_finalize** (p. 2319) was called.

8.416 WriterDataLifecycleQosPolicy Class Reference

<<***spec***>> *(p. 132)* Controls how a **com.rti.dds.publication.DataWriter** (p. 818) handles the lifecycle of the instances (keys) that it is registered to manage.

Inheritance diagram for WriterDataLifecycleQosPolicy:



Public Attributes

- boolean **autodispose_unregistered_instances**

  <<***spec***>> *(p. 132) Boolean flag that controls whether or not a writer will also dispose of an instance when the* ***com.rti.dds.publication.DataWriter*** *(p. 818) unregisters from the instance by means of the unregister operations.*
- final **Duration_t autopurge_unregistered_instances_delay**

  <<***extension***>> *(p. 138) Maximum duration for which the* ***com.rti.dds.publication.DataWriter*** *(p. 818) will maintain information regarding an instance once it has unregistered the instance.*
- final **Duration_t autopurge_disposed_instances_delay**

  <<***extension***>> *(p. 138) Maximum duration for which the* ***com.rti.dds.publication.DataWriter*** *(p. 818) will maintain information regarding an instance once it has disposed the instance.*

8.416.1 Detailed Description

<<***spec***>> *(p. 132)* Controls how a **com.rti.dds.publication.DataWriter** (p. 818) handles the lifecycle of the instances (keys) that it is registered to manage.

Entity:

com.rti.dds.publication.DataWriter (p. 818)

Properties:

RxO (p. 506) = N/A
Changeable (p. 507) = **YES** (p. 507)

8.416.2 Usage

This policy determines how the **com.rti.dds.publication.DataWriter** (p. 818) acts with regards to the lifecycle of the data instances it manages (data instances that have been either explicitly registered with the **com.rti.dds.publication.Data↩ Writer** (p. 818) or implicitly registered by directly writing the data).

You may use **com.rti.ndds.example.FooDataWriter.unregister_instance** (p. 1392) to indicate that the **com.rti.dds.↩ publication.DataWriter** (p. 818) no longer wants to send data for a **com.rti.dds.topic.Topic** (p. 2116).

The behavior controlled by this QoS policy applies on a per instance (key) basis for keyed Topics, so that when a **com.rti.dds.publication.DataWriter** (p. 818) unregisters an instance, RTI Connext can automatically also dispose that instance. This is the default behavior.

In many cases where the ownership of a Topic is shared (see **com.rti.dds.infrastructure.OwnershipQosPolicy** (p. 1640)), DataWriters may want to relinquish their ownership of a particular instance of the Topic to allow other Data↩ Writers to send updates for the value of that instance regardless of Ownership Strength. In that case, you may only want a DataWriter to unregister an instance without disposing the instance. *Disposing* an instance is a statement that an instance no longer exists. User applications may be coded to trigger on the disposal of instances, thus the ability to unregister without disposing may be useful to properly maintain the semantic of disposal.

8.416.3 Member Data Documentation

8.416.3.1 autodispose_unregistered_instances

```
boolean autodispose_unregistered_instances
```

<<***spec***>> *(p. 132)* Boolean flag that controls whether or not a writer will also dispose of an instance when the **com.↩ rti.dds.publication.DataWriter** (p. 818) unregisters from the instance by means of the unregister operations.

- com.rti.dds.infrastructure.true
  The **com.rti.dds.publication.DataWriter** (p. 818) will dispose of the instance each time it is unregistered. The behavior is identical to explicitly calling one of the `dispose` operations on the instance prior to calling the `unregister` operation.
- com.rti.dds.infrastructure.false (default)
  The **com.rti.dds.publication.DataWriter** (p. 818) will not dispose of the instance. The application can still call one of the dispose operations prior to unregistering the instance and dispose of the instance that way.

[default] com.rti.dds.infrastructure.false

Categories

Immutable (p. 292), **Instance Lifecycle** (p. 232), **Sample Memory Management** (p. 276)

8.416.3.2 autopurge_unregistered_instances_delay

```
final  Duration_t autopurge_unregistered_instances_delay
```

<<***extension***>> *(*p. *138)* Maximum duration for which the **com.rti.dds.publication.DataWriter** (p. 818) will maintain information regarding an instance once it has unregistered the instance.

Determines how long the **com.rti.dds.publication.DataWriter** (p. 818) will maintain information regarding an instance that has been unregistered. By default, the **com.rti.dds.publication.DataWriter** (p. 818) resources associated with an instance (e.g., the space needed to remember the Instance Key or KeyHash) are released lazily. This means the resources are only reclaimed when the space is needed for another instance because **com.rti.dds.↩ infrastructure.ResourceLimitsQosPolicy.max_instances** (p. 1896) is exceeded. This behavior can be changed by setting autopurge_unregistered_instances_delay to a value other than **com.rti.dds.infrastructure.Duration_t.↩ DURATION_INFINITE** (p. 1133).

After this time elapses, the **com.rti.dds.publication.DataWriter** (p. 818) will purge all internal information regarding the instance, including historical samples, even if **com.rti.dds.infrastructure.ResourceLimitsQosPolicy.max_instances** (p. 1896) has not been reached.

The purging of unregistered instances can be done based on the source timestamp of the unregister sample or the time where the unregister sample was added to the DataWriter queue by setting the following property to 1 or 0 respectively (default: 0): **dds.data_writer.history.source_timestamp_based_autopurge_instances_delay**.

For durable writer history, autopurge_unregistered_instances_delay supports only the **com.rti.dds.infrastructure.↩ Duration_t.DURATION_INFINITE** (p. 1133) value.

With com.rti.dds.infrastructure.DurabilityQosPolicyKind.DurabilityQosPolicyKind.VOLATILE_DURABILITY_QOS durability, unregistered instances are removed as soon as all samples for the instance are fully acknowledged, regardless of how this field is set.

[default] com.rti.dds.infrastructure.Duration_t.DURATION_INFINITE (p. 1133) (disabled) for all **com.rti.dds.↩ publication.DataWriter** (p. 818) except for the built-in discovery DataWriters com.rti.dds.infrastructure.Duration_t.ZERO for built-in discovery DataWriters (see **com.rti.dds.infrastructure.↩ DiscoveryConfigQosPolicy.publication_writer_data_lifecycle** (p. 925), **com.rti.dds.infrastructure.Discovery↩ ConfigQosPolicy.subscription_writer_data_lifecycle** (p. 926) and **com.rti.dds.infrastructure.DiscoveryConfig↩ QosPolicy.participant_configuration_writer_data_lifecycle** (p. 941)).

[range] [0, 1 year] or **com.rti.dds.infrastructure.Duration_t.DURATION_INFINITE** (p. 1133)

Categories

Immutable (p. 292), **Instance Lifecycle** (p. 232), **Sample Memory Management** (p. 276)

8.416.3.3 autopurge_disposed_instances_delay

```
final  Duration_t autopurge_disposed_instances_delay
```

<<***extension***>> *(p. 138)* Maximum duration for which the **com.rti.dds.publication.DataWriter** (p. 818) will maintain information regarding an instance once it has disposed the instance.

Determines how long the **com.rti.dds.publication.DataWriter** (p. 818) will maintain information regarding an instance that has been disposed of. By default, disposing of an instance does not make it eligible to be purged. By setting autopurge_disposed_instances_delay to a value other than **com.rti.dds.infrastructure.Duration_t.DURATION_INFINITE** (p. 1133), the DataWriter will delete the resources associated with an instance (including historical samples) once the time has elapsed and all matching DataReaders have acknowledged all the samples for this instance including the dispose sample.

The purging of disposed instances can be done based on the source timestamp of the dispose sample or the time when the dispose sample was added to the DataWriter queue by setting the following property to 1 or 0 respectively (default: 0): **dds.data_writer.history.source_timestamp_based_autopurge_instances_delay**.

This QoS value is supported with durable DataWriter queues only for com.rti.dds.infrastructure.Duration_t.ZERO and **com.rti.dds.infrastructure.Duration_t.DURATION_INFINITE** (p. 1133) values (finite values are not supported).

[default] com.rti.dds.infrastructure.Duration_t.DURATION_INFINITE (p. 1133) (disabled)

[range] [0, 1 year] or **com.rti.dds.infrastructure.Duration_t.DURATION_INFINITE** (p. 1133)

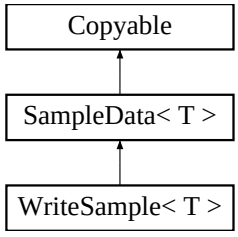
Categories

Immutable (p. 292), **Instance Lifecycle** (p. 232), **Sample Memory Management** (p. 276)

8.417 WriteSample< T > Interface Template Reference

A sample for writing data.

Inheritance diagram for WriteSample< T >:



Public Member Functions

- **WriteParams_t getInfo** ()

  Gets the write parameters.
- void **setInfo** (**WriteParams_t** info)

  Replaces the parameters with a new value.
- void **setData** (T data)

  Sets the data to be written.

8.417.1 Detailed Description

A sample for writing data.

WriteSamples are value types containing data that can be sent and optional parameters that configure how the data is written.

Template Parameters

T	The data type that this sample contains

8.417.2 Member Function Documentation

8.417.2.1 getInfo()

```
WriteParams_t getInfo ( )
```

Gets the write parameters.

The parameters are input and output to write operations. They can be set to configure the write operation (e.g. setting a specific publication timestamp) or they can be looked up afterward (e.g. what was the actual timestamp the sample was written with).

See also

com.rti.connext.requestreply.Requester<TReq,TRep>.sendRequest(WriteSample<TReq>) (p. 1872)

com.rti.connext.requestreply.Replier<TReq,TRep>.sendReply(WriteSample<TRep>, SampleIdentity_t) (p. 1851)

Referenced by **Replier< TReq, TRep >.sendReply()**, and **Requester< TReq, TRep >.sendRequest()**.

8.417.2.2 setInfo()

```
void setInfo (
              WriteParams_t info )
```

Replaces the parameters with a new value.

8.417.2.3 setData()

```
void setData (
             T data )
```

Sets the data to be written.

Replaces the current data with a new element.

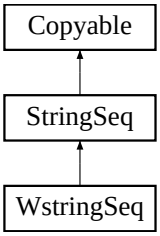
Parameters

data	The new data

8.418 WstringSeq Class Reference

Instantiates `com.rti.dds.infrastructure.com.rti.dds.util.Sequence` < com.rti.dds.infrastructure.↩ char* >

Inheritance diagram for WstringSeq:



Public Member Functions

- **WstringSeq** ()

  Constructs an empty sequence of wide strings with an initial maximum of zero.
- **WstringSeq** (int initialMaximum)

  Constructs an empty sequence of wide strings with the given initial maximum.
- **WstringSeq** (Collection strings)

  Constructs a new sequence containing the given wide strings.

Static Public Member Functions

- static void **readWstringArray** (String[ ] value, CdrObjectInput in, int length) throws IOException
- static void **writeWstringArray** (String[ ] value, CdrObjectOutput out, int length, int maxStringLength) throws IOException

8.418.1 Detailed Description

Instantiates `com.rti.dds.infrastructure.com.rti.dds.util.Sequence` < com.rti.dds.infrastructure.↩ char* >

Instantiates:

<<***generic***>> *(*p. *403)* com.rti.dds.infrastructure.com.rti.dds.util.Sequence

See also

com.rti.dds.infrastructure.char

com.rti.dds.infrastructure.StringSeq (p. 2027)

com.rti.dds.infrastructure.com.rti.dds.util.Sequence

8.418.2 Constructor & Destructor Documentation

8.418.2.1 WstringSeq() [1/3]

```
WstringSeq ( )
```

Constructs an empty sequence of wide strings with an initial maximum of zero.

8.418.2.2 WstringSeq() [2/3]

```
WstringSeq (
            int initialMaximum )
```

Constructs an empty sequence of wide strings with the given initial maximum.

8.418.2.3 WstringSeq() [3/3]

```
WstringSeq (
            Collection strings )
```

Constructs a new sequence containing the given wide strings.

Parameters

strings	the initial contents of this sequence

8.418.3 Member Function Documentation

8.418.3.1 readWstringArray()

```
static void readWstringArray (
            String[] value,
            CdrObjectInput in,
            int length ) throws IOException  [static]
```

Read array of strings. The length specified **must** match the expected length of array. Otherwise, the stream will be positioned incorrectly, leading to corrupt reads. The length of array must be at least the value of length parameter (otherwise, ArrayOutOfBoundException will be thrown).

Parameters

value	array to read into
in	Interface for reading object in CDR encoding.
length	the length of array (<= value.length)

8.418.3.2 writeWstringArray()

```
static void writeWstringArray (
             String[] value,
             CdrObjectOutput out,
             int length,
             int maxStringLength ) throws IOException  [static]
```

Write array of wstring up to the specified length.

8.419 Compliance.XTypesMask Class Reference

XTypes compliance mask.

Public Member Functions

- **XTypesMask** ()
  Default constructor.
- **XTypesMask** (**XTypesMask** mask)
  Copy constructor.
- **XTypesMask** (int mask)
  Constructor.
- int **get** ()
  Get the mask value.
- void **set** (int mask)
  Set the mask value.
- void **set_bit** (int bit)
  Set a bit in the mask.
- void **unset_bit** (int bit)
  Unset a bit in the mask.
- boolean **is_dheader_in_non_primitive_collections_enabled** ()

*Check if the bit **com.rti.ndds.config.Compliance.XTypesMask.DHEADER_IN_NON_PRIMITIVE_COLLECTIONS_BIT** (p. 2335) is set.*

- boolean **is_enum_as_primitive_in_collections_enabled** ()

  *Check if the bit **com.rti.ndds.config.Compliance.XTypesMask.ENUM_AS_PRIMITIVE_IN_COLLECTIONS_BIT** (p. 2336) is set.*

- boolean **is_parameter_length_with_padding_enabled** ()

  *Check if the bit **com.rti.ndds.config.Compliance.XTypesMask.PARAMETER_LENGTH_WITH_PADDING_BIT** (p. 2336) is set.*

- boolean **is_encapsulation_options_with_padding_enabled** ()

  *Check if the bit **com.rti.ndds.config.Compliance.XTypesMask.ENCAPSULATION_OPTIONS_WITH_PADDING_BIT** (p. 2337) is set.*

- boolean **is_accept_unknown_enum_value_enabled** ()

  *Check if the bit **com.rti.ndds.config.Compliance.XTypesMask.ACCEPT_UNKNOWN_ENUM_VALUE_BIT** (p. 2337) is set.*

- boolean **is_accept_unknown_discriminator_enabled** ()

  *Check if the bit **com.rti.ndds.config.Compliance.XTypesMask.ACCEPT_UNKNOWN_DISCRIMINATOR_BIT** (p. 2338) is set.*

- boolean **is_select_default_discriminator_enabled** ()

  *Check if the bit **com.rti.ndds.config.Compliance.XTypesMask.SELECT_DEFAULT_DISCRIMINATOR_BIT** (p. 2338) is set.*

- boolean **is_sentinel_in_empty_union_enabled** ()

  *Check if the bit **com.rti.ndds.config.Compliance.XTypesMask.SENTINEL_IN_EMPTY_UNION_BIT** (p. 2339) is set.*

- boolean **is_initialize_discriminator_to_default_enabled** ()

  *Check if the bit **com.rti.ndds.config.Compliance.XTypesMask.INITIALIZE_DISCRIMINATOR_TO_DEFAULT_BIT** (p. 2339) is set.*

- boolean **is_java_key_hash_750_enabled** ()

  *Check if the bit **com.rti.ndds.config.Compliance.XTypesMask.JAVA_KEYHASH_750_BIT** (p. 2340) is set.*

- boolean **is_python_int8_730_enabled** ()

  Check if the bit com.rti.ndds.config.Compliance.NDDS_CONFIG_XTYPES_PYTHON_INT8_730_BIT is set.

- boolean **is_must_understand_in_key_and_discriminator_enabled** ()

  Check if the bit com.rti.ndds.config.Compliance.NDDS_CONFIG_XTYPES_MUST_UNDERSTAND_IN_KEY_AND_↩ DISCRIMINATOR_BIT is set.

Static Public Attributes

- static final int **DHEADER_IN_NON_PRIMITIVE_COLLECTIONS_BIT**

  When this bit is set, the serialization of sequences and arrays with non-primitive members includes a DHEADER.

- static final int **ENUM_AS_PRIMITIVE_IN_COLLECTIONS_BIT**

  When this bit is set, enums are considered primitive types in collection types.

- static final int **PARAMETER_LENGTH_WITH_PADDING_BIT**

  When this bit is set, the length of a member header in a mutable type or an optional member will include padding bytes to a 4-byte boundary.

- static final int **ENCAPSULATION_OPTIONS_WITH_PADDING_BIT**

  When this bit is set, RTI Connext will set the padding bits in the options field of the encapsulation header of a serialized payload.

- static final int **ACCEPT_UNKNOWN_ENUM_VALUE_BIT**

  When this bit is set, samples containing an unknown enumerator can be successfully deserialized to the default enumeration value.

- static final int **ACCEPT_UNKNOWN_DISCRIMINATOR_BIT**

When this bit is set, samples containing an unknown discriminator can be successfully deserialized, and the sample won't be dropped.

- static final int **SELECT_DEFAULT_DISCRIMINATOR_BIT**

  When this bit is set, samples containing a discriminator value that does not select any member in the union will be assigned the default discriminator value; if the bit is not set, the sample will preserve the discriminator value.
- static final int **SENTINEL_IN_EMPTY_UNION_BIT**

  When this bit is set, samples of a mutable union that contain an unknown discriminator will be serialized with a 4-byte sentinel value.
- static final int **INITIALIZE_DISCRIMINATOR_TO_DEFAULT_BIT**

  When this bit is set, the union discriminator will be initialized to the default value of its type.
- static final int **JAVA_KEYHASH_750_BIT**

  When this bit is set, the KeyHash calculation for a Java instance will match the one produced by the Java API in Connext 7.5.0 and earlier versions.
- static final int **PYTHON_INT8_730_BIT**

  Set this bit to interoperate with Connext 7.3.0 Python applications that published or subscribed to types with int8 members.
- static final int **MUST_UNDERSTAND_IN_KEY_AND_DISCRIMINATOR_BIT**

  When this bit is set, the parameter ID for members that are part of the key, or for the discriminator of a union, will have the parameter ID's FLAG_MUST_UNDERSTAND bit set when serialized using XCDR2.
- static final int **COMPLIANCE_MASK_VENDOR**

  XTypes vendor compliance mask. This value is fully aligned with the XTypes specification.
- static final int **COMPLIANCE_MASK_DEFAULT**

  Default XTypes compliance mask.

8.419.1 Detailed Description

XTypes compliance mask.

The **com.rti.ndds.config.Compliance.XTypesMask** (p. 2327) configures different aspects of the Extended CDR encoding (XCDR and XCDR2).

Applications that don't use the exact same XTypes compliance mask may not be interoperable.

By default, data serialization is not fully compliant with Extended CDR encoding. While this doesn't affect correctness, it may prevent interoperability with other vendors.

You can change the default compliance mask for an application using any of the following mechanisms:

- Setting the environment variable **NDDS_XTYPES_COMPLIANCE_MASK**
- Calling the function **com.rti.ndds.config.Compliance.set_xtypes_mask** (p. 680)

The environment variable will be automatically loaded when a **com.rti.dds.domain.DomainParticipantFactory** (p. 1039) is created. If you need to load it before that, use the function **com.rti.ndds.config.Compliance.load_masks** (p. 680).

The format of the environment variable is an unsigned integer, which can be in HEX notation. For example: 0x00000001.

The default value is com.rti.ndds.config.Compliance.XTypesMask.XTypesMask.COMPLIANCE_MASK_DEFAULT.

To be fully compliant with the XTypes specification, set the mask to com.rti.ndds.config.Compliance.XTypesMask.↩ XTypesMask.COMPLIANCE_MASK_VENDOR.

[default] com.rti.ndds.config.Compliance.XTypesMask.XTypesMask.COMPLIANCE_MASK_DEFAULT

When changing the mask for an application is not desired, the property dds.xtypes.compliance_mask will change the mask at the DomainParticipant or DataWriter level. When set in the DomainParticipant, it configures the mask for all DataWriters in the participant. See `Extensible Types Compliance Mask` in the RTI Connext Core Libraries Extensible Types Guide.

8.419.2 Constructor & Destructor Documentation

8.419.2.1 XTypesMask() [1/3]

```
XTypesMask ( )
```

Default constructor.

8.419.2.2 XTypesMask() [2/3]

```
XTypesMask (
            XTypesMask mask )
```

Copy constructor.

Parameters

mask	The **XTypesMask** (p. 2327) to copy.

References **Compliance.XTypesMask.get()**.

8.419.2.3 XTypesMask() [3/3]

```
XTypesMask (
            int mask )
```

Constructor.

Parameters

mask	int value of the mask.

8.419.3 Member Function Documentation

8.419.3.1 get()

```
int get ( )
```

Get the mask value.

Returns

The mask value.

Referenced by **Compliance.set_xtypes_mask()**, and **Compliance.XTypesMask.XTypesMask()**.

8.419.3.2 set()

```
void set (
            int mask )
```

Set the mask value.

Parameters

mask	The mask value.

8.419.3.3 set_bit()

```
void set_bit (
            int bit )
```

Set a bit in the mask.

Parameters

bit	The bit to set.

8.419.3.4 unset_bit()

```
void unset_bit (
            int bit )
```

Unset a bit in the mask.

Parameters

bit	The bit to unset.

8.419.3.5 is_dheader_in_non_primitive_collections_enabled()

```
boolean is_dheader_in_non_primitive_collections_enabled ( )
```

Check if the bit **com.rti.ndds.config.Compliance.XTypesMask.DHEADER_IN_NON_PRIMITIVE_COLLECTIONS_BIT** (p. 2335) is set.

Returns

true if the bit is set, false otherwise.

References **Compliance.XTypesMask.DHEADER_IN_NON_PRIMITIVE_COLLECTIONS_BIT**.

8.419.3.6 is_enum_as_primitive_in_collections_enabled()

```
boolean is_enum_as_primitive_in_collections_enabled ( )
```

Check if the bit **com.rti.ndds.config.Compliance.XTypesMask.ENUM_AS_PRIMITIVE_IN_COLLECTIONS_BIT** (p. 2336) is set.

Returns

true if the bit is set, false otherwise.

References **Compliance.XTypesMask.ENUM_AS_PRIMITIVE_IN_COLLECTIONS_BIT**.

8.419.3.7 is_parameter_length_with_padding_enabled()

```
boolean is_parameter_length_with_padding_enabled ( )
```

Check if the bit **com.rti.ndds.config.Compliance.XTypesMask.PARAMETER_LENGTH_WITH_PADDING_BIT** (p. 2336) is set.

Returns

true if the bit is set, false otherwise.

References **Compliance.XTypesMask.PARAMETER_LENGTH_WITH_PADDING_BIT**.

8.419.3.8 is_encapsulation_options_with_padding_enabled()

```
boolean is_encapsulation_options_with_padding_enabled ( )
```

Check if the bit **com.rti.ndds.config.Compliance.XTypesMask.ENCAPSULATION_OPTIONS_WITH_PADDING_BIT** (p. 2337) is set.

Returns

true if the bit is set, false otherwise.

References **Compliance.XTypesMask.ENCAPSULATION_OPTIONS_WITH_PADDING_BIT**.

8.419.3.9 is_accept_unknown_enum_value_enabled()

```
boolean is_accept_unknown_enum_value_enabled ( )
```

Check if the bit **com.rti.ndds.config.Compliance.XTypesMask.ACCEPT_UNKNOWN_ENUM_VALUE_BIT** (p. 2337) is set.

Returns

true if the bit is set, false otherwise.

References **Compliance.XTypesMask.ACCEPT_UNKNOWN_ENUM_VALUE_BIT**.

8.419.3.10 is_accept_unknown_discriminator_enabled()

```
boolean is_accept_unknown_discriminator_enabled ( )
```

Check if the bit **com.rti.ndds.config.Compliance.XTypesMask.ACCEPT_UNKNOWN_DISCRIMINATOR_BIT** (p. 2338) is set.

Returns

true if the bit is set, false otherwise.

References **Compliance.XTypesMask.ACCEPT_UNKNOWN_DISCRIMINATOR_BIT**.

8.419.3.11 is_select_default_discriminator_enabled()

```
boolean is_select_default_discriminator_enabled ( )
```

Check if the bit **com.rti.ndds.config.Compliance.XTypesMask.SELECT_DEFAULT_DISCRIMINATOR_BIT** (p. 2338) is set.

Returns

true if the bit is set, false otherwise.

References **Compliance.XTypesMask.SELECT_DEFAULT_DISCRIMINATOR_BIT**.

8.419.3.12 is_sentinel_in_empty_union_enabled()

```
boolean is_sentinel_in_empty_union_enabled ( )
```

Check if the bit **com.rti.ndds.config.Compliance.XTypesMask.SENTINEL_IN_EMPTY_UNION_BIT** (p. 2339) is set.

Returns

true if the bit is set, false otherwise.

References **Compliance.XTypesMask.SENTINEL_IN_EMPTY_UNION_BIT**.

8.419.3.13 is_initialize_discriminator_to_default_enabled()

```
boolean is_initialize_discriminator_to_default_enabled ( )
```

Check if the bit **com.rti.ndds.config.Compliance.XTypesMask.INITIALIZE_DISCRIMINATOR_TO_DEFAULT_BIT** (p. 2339) is set.

Returns

true if the bit is set, false otherwise.

References **Compliance.XTypesMask.INITIALIZE_DISCRIMINATOR_TO_DEFAULT_BIT**.

8.419.3.14 is_java_key_hash_750_enabled()

```
boolean is_java_key_hash_750_enabled ( )
```

Check if the bit **com.rti.ndds.config.Compliance.XTypesMask.JAVA_KEYHASH_750_BIT** (p. 2340) is set.

Returns

true if the bit is set, false otherwise.

References **Compliance.XTypesMask.JAVA_KEYHASH_750_BIT**.

8.419.3.15 is_python_int8_730_enabled()

```
boolean is_python_int8_730_enabled ( )
```

Check if the bit com.rti.ndds.config.Compliance.NDDS_CONFIG_XTYPES_PYTHON_INT8_730_BIT is set.

Returns

true if the bit is set, false otherwise.

References **Compliance.XTypesMask.PYTHON_INT8_730_BIT**.

8.419.3.16 is_must_understand_in_key_and_discriminator_enabled()

```
boolean is_must_understand_in_key_and_discriminator_enabled ( )
```

Check if the bit com.rti.ndds.config.Compliance.NDDS_CONFIG_XTYPES_MUST_UNDERSTAND_IN_KEY_AND_↩ DISCRIMINATOR_BIT is set.

Returns

true if the bit is set, false otherwise.

References **Compliance.XTypesMask.MUST_UNDERSTAND_IN_KEY_AND_DISCRIMINATOR_BIT**.

8.419.4 Member Data Documentation

8.419.4.1 DHEADER_IN_NON_PRIMITIVE_COLLECTIONS_BIT

```
final int DHEADER_IN_NON_PRIMITIVE_COLLECTIONS_BIT  [static]
```

When this bit is set, the serialization of sequences and arrays with non-primitive members includes a DHEADER.

Value: 0x00000001

To be compatible with the XTypes specification, this bit must be set.

This bit only applies to XCDR2 encoding.

Limitation: For FlatData, the compliant encoding is applied to arrays and sequences of mutable types, but not final types . The serialization of final types containing arrays of non-primitive types in the FlatData language binding is not compliant with Extended CDR encoding version 2 in any case.

This bit is unset by default. See com.rti.ndds.config.Compliance.XTypesMask.XTypesMask.COMPLIANCE_MASK_↩ DEFAULT

Referenced by **Compliance.XTypesMask.is_dheader_in_non_primitive_collections_enabled()**.

8.419.4.2 ENUM_AS_PRIMITIVE_IN_COLLECTIONS_BIT

```
final int ENUM_AS_PRIMITIVE_IN_COLLECTIONS_BIT  [static]
```

When this bit is set, enums are considered primitive types in collection types.

Value: 0x00000002

A DHEADER will not be added to collections of enums if **com.rti.ndds.config.Compliance.XTypesMask.DHEADER↩ _IN_NON_PRIMITIVE_COLLECTIONS_BIT** (p. 2335) is set.

To be compatible with the XTypes specification, this bit must be unset.

This bit only applies to XCDR2 encoding.

This bit is unset by default. See com.rti.ndds.config.Compliance.XTypesMask.XTypesMask.COMPLIANCE_MASK_↩ DEFAULT

Referenced by **Compliance.XTypesMask.is_enum_as_primitive_in_collections_enabled()**.

8.419.4.3 PARAMETER_LENGTH_WITH_PADDING_BIT

```
final int PARAMETER_LENGTH_WITH_PADDING_BIT  [static]
```

Initial value:

```
=
                get_native_PARAMETER_LENGTH_WITH_PADDING_BITI()
```

When this bit is set, the length of a member header in a mutable type or an optional member will include padding bytes to a 4-byte boundary.

Value: 0x00000004

To be compatible with the XTypes specification, this bit must be unset.

This bit only applies to XCDR encoding.

This bit is set by default. See com.rti.ndds.config.Compliance.XTypesMask.XTypesMask.COMPLIANCE_MASK_↩ DEFAULT

Referenced by **Compliance.XTypesMask.is_parameter_length_with_padding_enabled()**.

8.419.4.4 ENCAPSULATION_OPTIONS_WITH_PADDING_BIT

```
final int ENCAPSULATION_OPTIONS_WITH_PADDING_BIT  [static]
```

Initial value:

```
=
                get_native_ENCAPSULATION_OPTIONS_WITH_PADDING_BITI()
```

When this bit is set, RTI Connext will set the padding bits in the options field of the encapsulation header of a serialized payload.

Value: 0x00000008

When this bit is set RTI Connext will set the least significant two bits in the second byte of the options field to a value that encodes the number of padding bytes needed after the end of the serialized payload in order to reach the next 4-byte aligned offset. Specifically, the least significant two bits shall be set to binary 00 if no padding bits would be needed and binary 01, 10, or 11 if, respectively, there would be one, two, or three bytes of padding needed. These bits in the options field will be interpreted by a DataReader to determine where the serialized data exactly ended.

To be compatible with the XTypes specification, this bit must be set.

To be compatible with the following Micro versions this bit must be unset because those versions of Micro did not support padding bits and will discard any data with encapsulations options not set to 0.

- RTI Connext Micro 3.x.y.z
- RTI Connext Micro 2.4.15.1
- RTI Connext Micro 2.4.14.0 and 2.4.14.1
- RTI Connext Micro 2.4.13.1 through 2.4.13.5
- RTI Connext Micro 2.4.12.z

This bit applies to both, XCDR and XCDR2 encodings.

This bit is set by default. See com.rti.ndds.config.Compliance.XTypesMask.XTypesMask.COMPLIANCE_MASK_↩ DEFAULT

Referenced by **Compliance.XTypesMask.is_encapsulation_options_with_padding_enabled()**.

8.419.4.5 ACCEPT_UNKNOWN_ENUM_VALUE_BIT

```
final int ACCEPT_UNKNOWN_ENUM_VALUE_BIT  [static]
```

Initial value:

```
=
                get_native_ACCEPT_UNKNOWN_ENUM_VALUE_BITI()
```

When this bit is set, samples containing an unknown enumerator can be successfully deserialized to the default enumeration value.

Value: 0x00000010

To be compatible with the XTypes specification, this bit must be unset.

This bit is unset by default. See com.rti.ndds.config.Compliance.XTypesMask.XTypesMask.COMPLIANCE_MASK_↩DEFAULT

Referenced by **Compliance.XTypesMask.is_accept_unknown_enum_value_enabled()**.

8.419.4.6 ACCEPT_UNKNOWN_DISCRIMINATOR_BIT

```
final int ACCEPT_UNKNOWN_DISCRIMINATOR_BIT  [static]
```

Initial value:

```
=
                get_native_ACCEPT_UNKNOWN_DISCRIMINATOR_BITI()
```

When this bit is set, samples containing an unknown discriminator can be successfully deserialized, and the sample won't be dropped.

Value: 0x00000020

When this bit is set, samples containing an unknown discriminator won't be dropped, and the discriminator value assigned to the sample will depend on whether or not the bit **com.rti.ndds.config.Compliance.XTypesMask.SELECT↩_DEFAULT_DISCRIMINATOR_BIT** (p. 2338) is set.

To be compatible with the XTypes specification, this bit must be set.

This bit is unset by default. See com.rti.ndds.config.Compliance.XTypesMask.XTypesMask.COMPLIANCE_MASK_↩DEFAULT

Referenced by **Compliance.XTypesMask.is_accept_unknown_discriminator_enabled()**.

8.419.4.7 SELECT_DEFAULT_DISCRIMINATOR_BIT

```
final int SELECT_DEFAULT_DISCRIMINATOR_BIT  [static]
```

Initial value:

```
=
                get_native_SELECT_DEFAULT_DISCRIMINATOR_BITI()
```

When this bit is set, samples containing a discriminator value that does not select any member in the union will be assigned the default discriminator value; if the bit is not set, the sample will preserve the discriminator value.

Value: 0x00000040

When this bit is set, samples containing a discriminator value that does not select any member in the union will be assigned the default discriminator value. If the default value selects a valid union member, that member will be initialized to the default value of its type. If the bit is not set, the sample will preserve the discriminator value. The bit **com.rti.↩ ndds.config.Compliance.XTypesMask.INITIALIZE_DISCRIMINATOR_TO_DEFAULT_BIT** (p. 2339) determines what the default discriminator value is.

This bit is only relevant when the bit **com.rti.ndds.config.Compliance.XTypesMask.ACCEPT_UNKNOWN_↩ DISCRIMINATOR_BIT** (p. 2338) is set, and it is used to determine the value of the discriminator when the sample contains an unknown discriminator.

To be compatible with the XTypes specification, this bit must be unset.

This bit is unset by default. See com.rti.ndds.config.Compliance.XTypesMask.XTypesMask.COMPLIANCE_MASK_↩ DEFAULT

Referenced by **Compliance.XTypesMask.is_select_default_discriminator_enabled()**.

8.419.4.8 SENTINEL_IN_EMPTY_UNION_BIT

```
final int SENTINEL_IN_EMPTY_UNION_BIT  [static]
```

Initial value:

```
=
                get_native_SENTINEL_IN_EMPTY_UNION_BITI()
```

When this bit is set, samples of a mutable union that contain an unknown discriminator will be serialized with a 4-byte sentinel value.

Value: 0x00000080

When this bit is set, samples of a mutable union that contain an unknown discriminator will be serialized with a 4-byte sentinel value: 0x027f0000. This is the same sentinel value as the one used for samples of a mutable union that contain a known discriminator.

This bit only applies to XCDR encoding, Dynamic Data, and language APIs other than Java. When using Java and not using Dynamic Data, the sentinel is always added.

To be compatible with the XTypes specification and with Connext version 5.3.x, this bit must be set.

This bit is set by default. See com.rti.ndds.config.Compliance.XTypesMask.XTypesMask.COMPLIANCE_MASK_↩ DEFAULT

Referenced by **Compliance.XTypesMask.is_sentinel_in_empty_union_enabled()**.

8.419.4.9 INITIALIZE_DISCRIMINATOR_TO_DEFAULT_BIT

```
final int INITIALIZE_DISCRIMINATOR_TO_DEFAULT_BIT  [static]
```

Initial value:

```
=
                get_native_INITIALIZE_DISCRIMINATOR_TO_DEFAULT_BITI()
```

When this bit is set, the union discriminator will be initialized to the default value of its type.

Value: 0x00000100

When this bit is set, the union discriminator will be initialized to the default value of its type. This means 0 for numeric discriminators, false for boolean discriminators, and the first literal of the enumeration for enumerated discriminators. As a result, a union may be initialized with a discriminator value that does not correspond to any of its members.

The default value of the type can be modified by creating an alias type and using the **[default]** annotation to specify the desired default value. You can then use that alias type as the discriminator type, and the default discriminator value will be the one specified in the alias type.

When this bit is unset, the discriminator will be set to select to a value that selects the default union member, if one is defined, or otherwise to the lowest value associated with any member.

If you generated code (using Code Generator) with this bit configured one way using the -xTypesComplianceMask flag (for example, -xTypesComplianceMask 0x00000100) and then configure it the opposite way in the API (for example, unset at 0x00000000), you must regenerate code using Code Generator's -xTypesComplianceMask flag configured the same way as it is in the API (for example, -xTypesComplianceMask 0x00000000). Note that this bit is the only bit that Code Generator uses; therefore, you have to set it the same both in the API and in Code Generator. See information about Code Generator's -xTypesComplianceMask command-line option in `Command-Line Arguments for rtiddsgen`, in the RTI Code Generator User's Manual.

This bit affects **com.rti.ndds.config.Compliance.XTypesMask.SELECT_DEFAULT_DISCRIMINATOR_BIT** (p. 2338). (See that bit's description above.)

To be compatible with the XTypes specification, this bit must be set.

This bit is set by default. See com.rti.ndds.config.Compliance.XTypesMask.XTypesMask.COMPLIANCE_MASK_↩ DEFAULT

Referenced by **Compliance.XTypesMask.is_initialize_discriminator_to_default_enabled()**.

8.419.4.10 JAVA_KEYHASH_750_BIT

```
final int JAVA_KEYHASH_750_BIT  [static]
```

Initial value:

```
=
                get_native_JAVA_KEYHASH_750_BITI()
```

When this bit is set, the KeyHash calculation for a Java instance will match the one produced by the Java API in Connext 7.5.0 and earlier versions.

Value: 0x00000200

When this bit is set, the KeyHash calculation for a Java instance will match the one produced by the Java API in Connext 7.5.0 and earlier versions.

This affects KeyHash calculation only when using XCDR encoding and the Java language API for mutable types and either of the following conditions is met:

- The key is not a primitive type, and the maximum serialized size of a sample for the type exceeds 65KB.
- At least one key member has a member ID greater than 16128.

To be compatible with the XTypes specification, this bit must be unset.

This bit is unset by default. See com.rti.ndds.config.Compliance.XTypesMask.XTypesMask.COMPLIANCE_MASK_↩ DEFAULT

Referenced by **Compliance.XTypesMask.is_java_key_hash_750_enabled()**.

8.419.4.11 PYTHON_INT8_730_BIT

```
final int PYTHON_INT8_730_BIT  [static]
```

Initial value:

```
=
                get_native_PYTHON_INT8_730_BITI()
```

Set this bit to interoperate with Connext 7.3.0 Python applications that published or subscribed to types with int8 members.

Value: 0x00000400

When this bit is set, the TypeCode generation for a Python type that contains an int8 member will match the one produced by the Python API in Connext 7.3.0. However, this behavior is not compliant with the XTypes specification, and Python types with int8 members won't interoperate with other APIs.

When this bit is unset, the TypeCode generation for a Python type that contains an int8 member will be done according to the XTypes specification, allowing interoperability with all the APIs except Python in Connext 7.3.0.

To be compatible with the XTypes specification, this bit must be unset.

This bit is unset by default. See com.rti.ndds.config.Compliance.XTypesMask.XTypesMask.COMPLIANCE_MASK_↩ DEFAULT

Referenced by **Compliance.XTypesMask.is_python_int8_730_enabled()**.

8.419.4.12 MUST_UNDERSTAND_IN_KEY_AND_DISCRIMINATOR_BIT

```
final int MUST_UNDERSTAND_IN_KEY_AND_DISCRIMINATOR_BIT  [static]
```

Initial value:

```
=
                get_native_MUST_UNDERSTAND_IN_KEY_AND_DISCRIMINATOR_BITI()
```

When this bit is set, the parameter ID for members that are part of the key, or for the discriminator of a union, will have the parameter ID's FLAG_MUST_UNDERSTAND bit set when serialized using XCDR2.

Value: 0x00000800

To be compatible with the XTypes specification, this bit must be set.

This bit only applies when you are using XCDR2. (For XCDR, the parameter ID's FLAG_MUST_UNDERSTAND bit will never be set for key members and union discriminators, because doing so would change the key hash computation and disrupt communication with older versions of RTI Connext.)

This bit is unset by default. See com.rti.ndds.config.Compliance.XTypesMask.XTypesMask.COMPLIANCE_MASK_↩ DEFAULT

Referenced by **Compliance.XTypesMask.is_must_understand_in_key_and_discriminator_enabled()**.

8.419.4.13 COMPLIANCE_MASK_VENDOR

```
final int COMPLIANCE_MASK_VENDOR  [static]
```

XTypes vendor compliance mask. This value is fully aligned with the XTypes specification.

The mask sets the following bits:

- **com.rti.ndds.config.Compliance.XTypesMask.DHEADER_IN_NON_PRIMITIVE_COLLECTIONS_BIT** (p. 2335)
- **com.rti.ndds.config.Compliance.XTypesMask.ENCAPSULATION_OPTIONS_WITH_PADDING_BIT** (p. 2337)
- **com.rti.ndds.config.Compliance.XTypesMask.ACCEPT_UNKNOWN_DISCRIMINATOR_BIT** (p. 2338)
- **com.rti.ndds.config.Compliance.XTypesMask.SENTINEL_IN_EMPTY_UNION_BIT** (p. 2339)
- **com.rti.ndds.config.Compliance.XTypesMask.INITIALIZE_DISCRIMINATOR_TO_DEFAULT_BIT** (p. 2339)

The HEX value for the mask is: 0x000001a9.

Warning

This mask will always include all known fixes to ensure full alignment with the XTypes specification. As a result, its contents may change between releases or patches. If you want to ensure that your application's behavior remains unaffected by future changes, you should specify the exact bits you are interested in.

8.419.4.14 COMPLIANCE_MASK_DEFAULT

```
final int COMPLIANCE_MASK_DEFAULT  [static]
```

Default XTypes compliance mask.

The mask sets the following bits:

- **com.rti.ndds.config.Compliance.XTypesMask.PARAMETER_LENGTH_WITH_PADDING_BIT** (p. 2336)
- **com.rti.ndds.config.Compliance.XTypesMask.ENCAPSULATION_OPTIONS_WITH_PADDING_BIT** (p. 2337)
- **com.rti.ndds.config.Compliance.XTypesMask.SENTINEL_IN_EMPTY_UNION_BIT** (p. 2339)
- **com.rti.ndds.config.Compliance.XTypesMask.INITIALIZE_DISCRIMINATOR_TO_DEFAULT_BIT** (p. 2339)

The HEX value for the mask is: 0x0000018C.

Chapter 9

Example Documentation

9.1 HelloWorld.idl

9.1.1 IDL Type Description

The data type to be disseminated by RTI Connext is described in language-independent IDL. The IDL file is input to rtiddsgen (see the `Code Generator User's Manual` for more information), which produces the following files.

The programming language specific type representation of the type Foo = HelloWorld, for use in the application code.

- HelloWorld.java
- HelloWorldSeq.java

User Data Type Support (p. 58) types as required by the DDS specification for use in the application code.

- HelloWorldTypeSupport.java
- HelloWorldDataWriter.java
- HelloWorldDataReader.java

9.1.1.1 HelloWorld.idl

```
struct HelloWorld {
    string<128> msg;
};
```

9.2 HelloWorldSeq.java

9.2.1 Programming Language Type Description

The following programming language specific type representation is generated by rtiddsgen (see the `Code Generator User's Manual` for more information) for use in application code, where:

- Foo = HelloWorld
- FooSeq = HelloWorldSeq

9.2.1.1 HelloWorld.java

```
